However, as for concrete results, Resolution 118 has not brought the expected results. This happened primarily because the supply conditions and also the cooperative unions underwent considerable physical disturbances. Many enterprises are working under deficit conditions. This makes it impossible for them to conduct independent fiscal policies. At the same time pertinent information on the resolution was rather late in reaching some of the enterprises, even after 4 months time (sic!). The resolution itself has changed only part of the regulations, without altering the heretofore existing legal infrastructure and it has not effected any changes in the organizational structure.

During the conference portion dealing with the Council of Minister's resolution pertaining to material-technical supply certain controversies emerged. The draft

of this document provides for a guarantee of supplies to those producers who fulfill a significant role in the fulfillment of social priorities while at the same time it weakens the position of those producers who operate in the production means market. The entire document pertains to the interim period.

Relative to the preceding the conferees underlined the fact that referring to a temporary support of a supply diversification has only a verbal character. This was so because there was no clear indication of a gradual departure from the diversification system as the situation improved. A presentation of such solution even if it were premature from the point of view of the current, catastrophic economic situation would have a serious impact from the society's point of view as it would tend to confirm a conviction that the reform is really aimed [gra] independence to the enterprises. Also underscored was the not too clear connection between the diversification system and the economic-financial system.

The representatives of the government and work enterprises also paid a lot of attention to organizational matters in particular to the matter of removing the enterprises from under the leadership of ministries and combining and transferring them to the administration by functional departments. Some reservations were expressed by questioning whether we were sufficiently prepared for this step. Organizational awkwardness could, based on the known and still widespread supply difficulties, have a very negative effect on the course of the production process.

The matter of imports of supplies was also not clarified. The diversification of supplies originating abroad or from cooperative or investment sources has not been defined with precision.

Deputy chairman Z. Madej, in summing up this part of deliberations, said that even though a divergence of opinions had been noted on many points, nevertheless, the presented draft, after necessary corrections, would soon be submitted to the Council of Ministers.

The next item for discussion referred to the draft of a law concerning the matter of financial economy of socialized enterprises and was presented by the Finance Minister Marian Krzak. Although this matter includes many details we will mention here only a few.

Similarly to the draft of material-technical supply, an accusation was voiced that the borderline between the target model and the binding principles during the interim, was not clearly defined and this caused many misunderstandings already during the commission's deliberations. Lack of this differentiation, especially in case of a financial system, has a very serious meaning as it may give an impression that the entire reform process has been purposely limited.

The question as to whether profit or income were to become the principal criteria in evaluation of an enterprise has flared up anew. The commission had, for the second time, after a strong exchange of opinions, declared itself in favor of profit with a caveat whereby some conferees admitted a possibility of using income as a guide, particularly during the interim period.

A lot of attention was paid to incorporate anti-inflationary devices in the economic-financial system. Attention was also directed to the fact that the point

subsidy system as an improper instrument, however, it was unavoidable during the interim period. Nevertheless, this system has to be submitted for social control including submission to the Sejm. For the umpteenth time the question of sources for the financing of technological progress was brought up. Also discussed was a question of constructing a defensive mechanism which would work in an accumulative way to protect enterprises funds from being "swallowed" exclusively by wages.

The presented solution was accused of being too stringent. Minister M. Krzak, replying to the accusation, stated that the national budget is one of the most important guarantees in the fight against inflation. A tax system which would have an anti-inflationary effect should not be considered as it was an element of an order-directive apparatus.

One of the most fundamental principles of the banking system was presented by Leopold Gluck and concerns separation of the bank from the finance ministry. This became a controversial subject. In the eyes of several conferees, particularly financiers, such a separation would prevent the state from influencing the financial policy. This accusation was countered that such fears were unwarranted because such a move did not totally mean absolute bank autonomy because banks could be subordinated to either the government or the parliament. On the one hand, thanks to this separation, it will be possible to present publicly difference of opinion in the area of financial policy, a fact which had been occasionally camouflaged and has been conducive of proper management of the means.

OFFICIALS DISCUSS AGRICULTURE, FOOD PROGRAM

Comments of Deputy Minister

Warsaw DZIENNIK LUDOWY in Polish 18 Aug 81 pp 1, 3

[Interview with Prof Zdzislaw Grochowski, deputy minister for agriculture and food economy, by Hanna Lewandowska; 18 Aug 81, place not specified]

[Text] Extricating ourselves from the deep economic crisis will be hard. It will require the efforts and self-denials of everyone of us, and not just today but for many days and months, and even years. That is why it is important that we be able to define what it is that we want and can achieve, how soon, and what we are striving for. And this program does not have to be fascinating, suggesting that in a short time we will find ourselves at the peak of economic prosperity. What is important is that this program be realistic.

Such a program for the development of farm production and agro-food processing was prepared in the Ministry for Agriculture and Food Economy. The work on it was directed by Deputy Minister Zdzislaw Grochowski, with whom we are today conducting this interview.

[Question] Mr Minister: It was the group's ambition to prepare a program that could be implemented. But is this possible when the formation of a program is being begun at a time when the country's economy is as unstabilized as it is now?

[Answer] The program, which will be submitted within the next few days to the Council for Food Economy Affairs, is not a recent creation. It is the successive version of a program which, back in 1978, along with a group of other specialists, I began to work on as chairman of the Agricultural Economics Committee of the Polish Academy of Sciences. Naturally, this first program that we prepared at that time was more optimistic than the present one. However, we were starting from more favorable premises. Later, with the passage of time and the country's deteriorating economic situation, some very important revisions had to be made. This is an indirect reply to your question. The construction of a program under such conditions is not easy, but certainly it can be as realistic as possible.

The difficulties are further compounded by the fact that in the past 5-year period, and even earlier, we based the entire increase in animal production on import of fodder, which now is out of the question. In addition, within one 5-year period we had 3 years which were poor for farming, and so we had to deal with an atypical situation.

[Question] Do you believe that the picture will now change and the next years will be good for the crops?

[Answer] No one can guarantee that! We are assuming, however, based on data on the past, that such a large accumulation of poor crop years should not repeat itself. It would be fatalistic to believe that successively bad years would again appear.

[Question] Good weather is an invaluable factor in increasing yields. But agriculture does not live by weather alone. But before we talk about its needs, perhaps you would like to describe the more important assumptions of the program that has been prepared.

[Answer] There is no doubt that in the coming years Polish agriculture will develop under different conditions than it has thus far. Grain and fodder imports will not grow, but will shrink, and in 1985 we want to achieve full self-sufficiency in feeding the country. In practice, this means that the balance of foreign trade in agro-food products must be equalized in the near future. We often do not realize that in the last few years we have unconcernedly eaten up huge sums, a large part of the indebtedness which we must now repay. Since 1975 we have lived beyond our means; we have eaten up over 7 billion dollars, which, together with the interest, amounts to 9 billion dollars, or one-third of our present total debt. To continue that policy is out of the question, even though a return to life in keeping with our actual resources is now so unpleasant and difficult.

[Question] You speak of self-sufficiency in feeding the nation, and you say that this should occur in 4 years. Aren't these plans a bit bold?

[Answer] I believe that this is fully possible. But in order to do this, we must cut grain and fodder imports in half and increase the country's crop production. In addition, please do not forget that not too long along we fed ourselves and were also an exporter of food. That's the way it was for 20 years, until after 1973-1974. Why should it be impossible to return to that? But we must realize that in implementing this goal for 1985 we will not be able to increase meat consumption in the country to the 1980 level, when it was highest.

In developing the program we have accepted two variants. In the first we envisage an increase of mineral fertilization to 220 kg NPK [nitrogen-phosphorous-potassium] per hectare, and in the second, an increase of fertilization to 250 kg NPK/hectare. Assuming the first of these variants, which I believe is the most realistic, meat consumption in 1985 should be 54 kg per 1 inhabitant, i.e., 9 kg less than in 1980. In the second case, meat consumption should reach a level of 72 kg per statistical Pole.

[Question] This is not a happy prospect.

[Answer] No, I never said it would be. But we cannot continue to live off others or live on credit endlessly. In any case, I am not excluding the possibility that things may be better than we are predicting, but I would rather not, in my calculations, count on luck or manna from heaven.

[Question] We know that during the next few years we will not see pork chops on our tables very often.

[Answer] Yes, but the tables will not be bare. We do not have to be afraid of that. There will be enough of everything on them that is indispensable for nutrition, with the exception of meat, of which there will be somewhat less. All of our estimates indicate that.

We expect that in the coming years we will be dealing with a compensational increase in crop yields to allow for the lack of mineral fertilization in the second half of the 1970's. We believe also, that stopping the flow of land to the socialized economy will make it possible for us to allocate all of the increase in fertilization to the private farms, which also improves the chances for higher yields. Under these circumstances, we believe that the average level of grain yields in 1985 should reach about 29 quintals per hectare, and the yields of all crops should be about 35 quintals per grain units per hectare.

We anticipate important changes in the structure of farm production, particularly in the State Farms, which should occupy themselves to a lesser degree with animal production and concentrate on increasing the production of grain. We envisage that in 1985 a total of 8.2 million hectares will be earmarked for grain production. We will also reduce the acreage of lands allocated for potatoes to about 2.2 million hectares. The acreage for commercial crop production, however, will be increased: sugar beets, to 500,000 hectares, and oleaginous crops to 480,000 hectares. Yields of these crops will also increase. Vegetable production will increase 22 percent, in comparison with 1978-1980, and there will be 34 percent more fruit.

[Question] There is no doubt that we will have enough to eat. The question is, however, how much of what grows will we be able to use to feed animals, since the amount of produced meat will depend on this.

[Answer] There should be 14.8 million tons of grain for feed for the producer livestock, and according to the more optimistic variant--16.3 million tons. But I believe also that the fodder feeding effectiveness will improve, that it will improve about 4 percent. This will be the result of increasing the production of pork slaughter animals and milk at the expense of decreasing the production of beef slaughter animals, and also--what is very important--increasing the participation of the private economy in animal production and liquidating the less efficient farms, especially the farm circle group farms.

[Question] The widespread clamors will finally be acted on.

[Answer] Unfortunately, only now. Returning to animal-feed effectiveness, we expect that the small farms will become interested in animal production, since in the last few years a considerable amount of fodder on these farms remained unutilized. Assistance from industry is also indispensable, for larger amounts of mineral and chemical additives for fodder will be needed, and also better technical outfitting of the farms.

Finally, the matter--in my opinion the most important one--of farm policy, which should favor the activation of peasant farms.

[Question] It seems to me that there is a great deal of agreement on this issue between the authorities and society. But what is disturbing is the voices heard here and there recently about the need to return to compulsory deliveries.

[Answer] That is the worst thing that could happen to agriculture. After 1970, we discontinued these deliveries because they were an inhibiting factor in the development of farm production. A return now to these deliveries would produce the same effect. And those, who are afraid that the farmers will not want to sell what they produce should know that the way to settle this matter is not through orders, but through regulation of the market. Until we change retail prices, we will not solve this problem.

[Question] A good farm policy, furnishing agriculture with the necessary production resources--this would be a great deal. Wouldn't it be enough so that we could jump this low, for our appetites, bar in the form of 65 kg of meat per person in 1985?

[Answer] In our predictions we took into account both the material premises, which will determine the growth in production, as well as the nonmaterial factors, such as farm policy. It will be very difficult, however, as I just said, to cross this 65-kg-of-meat threshold.

In the next few years our population will increase. We will have to increase meat exports and bring them back to the former 300,000 tons a year, in order to equalize the balance of payments. To say nothing of the fact that the replenishment of the livestock population does not take place in one year. In the case of cattle, it will not be possible to halt the downward trend until 1983-1983, and even in 1985, a large share of the herds will be young animals, whose meat we will not eat until 1986-1987. In practice, therefore, most of the increase in slaughter animals during the period mentioned will come from pork slaughter animals. Nor will there be an increase in poultry, for its production on the large farms is wholly based on imported feed. Thus it will be maintained at about the same level as now.

Of course, the shortages in meat supplies will have to be compensated with other protein products. That is why we attach an enormous importance to increasing the production of milk and to managing it in such a way that the supply of milk and its products is as high as possible. We have chosen this way of compensating for the meat shortage because from one unit of acreage we can obtain more protein contained in milk than protein contained, e.g., in beef. What is important to us, and this was our goal when we were working on this program, is that the nation be fed as well as possible, both in terms of quantity as well as in quality, during the difficult period of crisis in the country. And it seems to me that we will be able to achieve this goal, and actually, to reconcile two goals: the development of agriculture and food production, based on a sound and reasonable foundation, and a return to self-sufficiency. I am, I repeat, firmly convinced, that Poles can and should feed themselves.

Grain Products

Warsaw DZIENNIK LUDOWY in Polish 25 Aug 81 pp 1, 3

[Interview with Dr Kazimierz Nowakowski, director, central office of the grain-milling industry, State Grain Elevators, by Waclaw Potocki; date and place not specified]

[Text] In the August 18th issue of DZIENNIK LUDOWY we began a series of articles aimed at showing methods of surmounting the food crisis. The first article was an interview with Prof Zdzislaw Grochowski, titled "Program for Agriculture". We want to acquaint our readers with the actions now being taken by the authorities which are of an immediate nature, as well as with the plans for the future. There is nothing more important at this time than a transition from regression to an albeit slow but systematic and consistent improvement in production and availability of market supplies. Without this, it will be difficult to implement the basic goal, which is the proper feeding of the nation.

[Question] Dr Nowakowski: In recent years, the grain-milling plants have been hard-pressed to keep up with the growing demand for their products: flour, groats, and flakes. Each year the commercial market orders thousands of tons more flour (this year it was even 300,000 tons more), while the production capacity of the mills remains the same. Will rationing of the grain products and increased prices help to normalize the market supplies in the near future?

[Answer] At the present time some assortments of bread and cereal products cost two to three times less than rye and wheat. The present low price of bread, flour and cereals is responsible for the large waste in these products, especially in the cities, and using them as feed. Rationing of flour and groats, while it fully filled the population's needs, reduced the use of these products as feed in the pigsties and cow sheds. However, it has not solved the problem. Higher prices will also result in reductions of bread purchases for feeding purposes and less waste of bakery products in the cities.

As a result of increased prices of bakery and grain products, it is envisaged that about 10 percent of the bread and grain products will not go for fodder. This will bring with it further results in the form of savings in electrical energy, since milling one ton of grain for flour or groats and using it in the form of fodder triples the energy consumption which would be needed to mill the grain for mash. There are further economic savings in baking and transporting, since mills are often dispersed and sometimes flour must be hauled hundreds of kilometers to the bakeries. The grinding of grain into mash usually takes place close to where the farmer lives.

A reduction in the demand for grain products will also facilitate improvement in the operation, maintenance and repair of the mills. At present, in order to satisfy market requirements, the mills operate at higher speeds and beyond their capacity. Since 1976, scheduled overhauls are performed on scarcely 50 percent of the installations.

[Question] What action is the central office of the grain-milling industry taking to normalize the grain-milling and bakery-goods market as rapidly as possible?

[Answer] During the fourth quarter of this year, our mills will deliver about 830,000 tons of flour and about 70,000 tons of groats. These quantities are about the same as this quarter's deliveries. It is anticipated that demand will drop somewhat as new prices go into effect. By maintaining the present work schedules in our plants and working on some of the free Saturdays and on Sundays, we should be able to deliver over 3,300,000 tons of flour and about 300,000 tons of groats next year. This is sufficient to meet our present requirements. In addition to operating on days that are normally nonworking days, and reducing the indispensable shutdowns for repairs and fumigation to a minimum, we are attempting to expand production in the mills of the Central Union of Agricultural Cooperatives and in the crafts for our orders. It is expected that next year these mills will deliver about 300,000 tons of flour.

In addition to the mills which are under our central office, we have 1,150 mills in the country that are under the Central Union of Agricultural Cooperatives. They have a production capacity of 500,000 tons of flour a year. There are also 1,060 crafts mills, with a grinding capacity of over 200,000 tons. We realize that due to lack of spare parts for the machinery, and lack of millers, we will not be able to start up all of the mills, and even those already in operation will not be totally available for State Grain Elevators' requirements, because their first priority is to grind the grain for the neighboring farmers.

Aware of the huge demand for grain products and the necessity for improvements in the field of operation and repairs, the central office of the grain-milling industry is also currently undertaking many noninvestment activities aimed at increasing the production capacity of the existing mills. These include production of dark rye and wheat flours, based on simplified methods. The load on the so-called grinding gap of the rollers is being increased and all mills are being inspected to eliminate bottlenecks in the operating systems. These activities should increase the production capacities of our mills by almost 6 percent.

In order to fully meet the demand, we must also contend with a shortage of millers and helpers. At the moment the working and wage conditions in our plants do not encourage people to take these jobs. Many basic materials and spare parts are also lacking, which increases the breakdowns and shutdowns. The fact that many bakeries are not prepared to receive deliveries of flour in bulk also makes it difficult for us to operate efficiently. Meanwhile, we have enough special vehicles and are able to increase deliveries of flour in bulk, which simplifies and speeds up transport and loading.

[Question] These are only emergency actions and will not improve the availability of flour and grain products to any great degree. There are not enough mills, and to ensure an adequate amount of flour new mills will have to be built. How does your program look in this regard?

[Answer] Indeed, there are simply not enough mills. At present, in the enterprises that are under the central office of the grain-milling industry there are slightly over 200 mills. Most of these are old buildings, tens of years old (only six mills were built after the war). They are also unevenly dispersed. There are not enough plants in the southern and eastern regions of the country, which means that grain for milling and flour must be hauled for large distances.

In order to increase the production of flour and grain products as quickly as possible, in May of this year the Council of Ministers approved a detailed program for flour-milling expansion during 1981-1986. It foresees the construction of several large mills with a grinding capacity of 300 to 600 tons per day in the large population centers, including in the Silesian region in Krakow, in Plonsk, Warsaw, and Pabianice near Lodz, and 30 small aggregate mills, with a 60 tons per day capacity, located principally in the southeastern voivodships where there now is a shortage of such installations. These mills will be located primarily near existing grain warehouses, and their production will be intended mainly to supply the local market.

The program also provides that mills will be located in farm buildings that have been adapted for this purpose, which should eliminate construction work and hasten completion and availability of the mills. Additional production capacity will be obtained also by modernizing existing buildings.

When all of the tasks envisaged in the government resolution are fully implemented, flour production during the next 5 years should increase by almost a million tons yearly, which will be a 30 percent increase in the present production capacity. This will eliminate all of the difficulties in supplying the market with the indispensable amounts of grain products and will also make it possible for all mills to operate at the proper level.

Dairy Products

Warsaw DZIENNIK LUDOWY in Polish 27 Aug 81 pp 1, 3

[Interview with Bronislaw Hyziak, president, Central Administration, Union of Dairy Cooperatives, by Stanislaw Ozonek; date and place not specified]

[Text] [Question] Mr Hyziak: Because of the difficult situation on the food market, our society is very interested in knowing what will be available on this market during the next few days and weeks. We know that milk and its products make up a large part of this market. We also know that the peak months for milk procurement have already passed and the time is coming that this procurement will fall below 30 million liters a day, and in the winter, even below 20 million liters. What, under these circumstances, can you promise the consumers of your products?

[Answer] The situation in milk procurement continues to be disturbing. In 7.5 months we procured 823 million liters of milk less than in the same period last year. The reasons for this are known: Last year's disastrous failure in fodder production and its much worse quality meant that dairy herds were reduced by 200,000 cows and the condition of the herds was greatly weakened. The cows went to pasture in the spring in wretched condition. Their lactation yield is lower than in previous years. Under these conditions we tried to reach every farm in which there is even a small amount of commercial milk. Through our network of wagons we call on up to 1.3 million farms in over 30,000 villages every morning. We go to some of them twice a day—weekdays, holidays, and on nonworking Saturdays, regardless of freezing or sweltering weather, blizzards or downpours. This is a good, disciplined cadre, who understands its duties and place in feeding the nation. Despite these efforts, however, milk procurement continues to be lower than last year. In July we procured 53 million liters less than in July of last year.

[Question] But those in the know say that you have good workers not just in procurement. In processing also, you have those who even from this small amount of milk are able to produce large quantities of products.

[Answer] This sounds like irony, but it is a fact. The milk cooperatives, indeed, in July produced and delivered to the market over 16 percent more consumable milk (i.e., 35 million liters) and 29 percent more cottage cheese (i.e., 4,870 tons) than in July of last year. This, of course, has nothing to do with miraculous multiplication or falsification. We have greatly reduced the production of casein and powdered skimmed milk. The minister of foreign trade will have reason to blame us for this, although the consumers who are constantly complaining that there are shortages in everything have not praised us. We make this cottage cheese in plants that are suitable for the production of casein, so they have no cooling equipment. Thus the cheese does not keep as long. But it goes like hotcakes.

[Question] Indeed it is lean, and this applies not only to the cheese. What do the dairymen and we, the consumers, gain by your pursuit for fat?

[Answer] The long-continuing pursuit for butter production has actually caused many big changes in our production. We defatted consumption milk to 2 percent, we defatted cottage cheese and cream, and we stopped producing full-cream cheeses. Since August 15th, in accordance with an Anti-Crisis Staff decision, we market-produce only cream with a 9 and 12 percent butterfat content, and even then, we produce 25 percent less. All to rescue the production of butter.

The structure of fats consumption in our country is very faulty, principically due to the faulty price policy. After several attempts to raise prices, it has come down to this: the cost of producing one kilogram exceeds 340 zlotys, but the sales price is 10 zlotys. Ten years ago, i.e., in 1970, we produced 127,000 tons of butter, and the market was saturated. The consumers complained that this butter is encrusted, that butter is rancid, for it lay in the stores too long. We were not able to sell all of the production on the domestic market—we exported 12,500 tons. Last year we produced 252,000 tons of butter, i.e., twice as much, and we had to import 18,500 tons. And even then, there was a butter shortage. This pursuit for butter forced us to a pursuit for fat. We had to further defat our products, and consequently, the quality, storage life and taste are worse. We've gone as far as we can in that direction.

We are committed to provide the Ministry of Domestic Trade and Services with 23,750 tons of butter monthly for rationed sales requirements and the mass nutrition plants. In order to maintain this level until the end of the year, the government Anti-Crisis Staff decided that the cream sold on the market must be defatted and its supplies reduced 25 percent. This operation, plus the larger than anticipated milk procurement in the fourth quarter (over the fourth quarter of last year) which we believe will be possible because the dairy herds have recovered, there is considerably more fodder and the quality of it is much butter, makes us believe that the present level of deliveries of butter, milk and cottage cheese can be maintained to the end of the year.

[Question] And what can we expect in the early months of next year, when the daily procurement of milk drops below 20 million liters?

[Answer] We are very worried. We have accumulated some stocks of milk in powdered form, both from our own production and from imports—which, in any case, we are continuing to import. This should make it possible for us to increase the production of cottage cheese, and thus, indirectly, consumption milk. We have small reserves of ripening cheeses, for melting, and we have accumulated some frozen cottage cheese, which, together with the ripening cheeses, should serve as a raw material for melting. In this way we want to maintain the level of supplies of consumption milk, cottage cheese and melting cheeses during the winter period. But we are very afraid that we may not be able to do this.

[Question] A great deal is being said recently on the subject of regulating retail prices, which in the case of your products is to be simply an increase in the retail prices, and a very large one at that. How does the management of the dairy cooperatives see this and what does it expect as a result?

[Answer] In our situation this is a necessary evil, for our dairy market is abnormal, having reached the point that for 1 liter of milk sold one can buy 5 liters of consumable milk that has been processed, homogenized and pasteurized on expensive equipment. For one liter of whole raw milk one can now buy a fourth of a kilogram of butter. All of this is an anomaly that cannot be maintained. The world has never seen anything like this. An increase in the retail prices of our products will make it possible to regulate this uncontrolled, upside down market. We look forward to a great improvement when the new price of butter goes into effect. We believe that it will produce a greater interest in margarine, vegetable fats, etc., and by doing so will reduce the consumption of butter. This will allow us to increase the production of cheeses, cottage cheese, powdered milk for infants, and consumption milk. We will be able to return to the production of milk with at least a 3 percent butterfat content. This milk can be used to feed children, which would alleviate the demand for powdered milk.

[Question] In your opinion, can the price increases planned by the State Price Commission restore the dairy market to the balance that was in effect during 1973-1974?

[Answer] They will not yet cover production costs, but we believe that they will have an influence on thrifty management, there will be a different approach to the job, and there will no longer be waste in the households. If, at the same time, there is an increased demand on the market for other food items, then we can definitely restore a relative balance to the market. I do not conceal the fact that our main purpose now is to reduce the consumption of butter. This fat is very necessary for the production of the better ripening cheeses and cottage cheese, and for milk that is tasty, highly nutritious, and fully suitable for feeding to children.

[Question] We know that the increases in retail prices of food will go into effect at about the same time as the economic reform now being prepared. To what degree will these operations influence an improvement in management in your plants?

[Answer] The recently disseminated opinions about a great waste of milk are highly exaggerated. A month ago, Prime Minister Jaruzelski ordered an inspection of our plants by a large team of inspectors. They pointed to many shortcomings, but no where did they ascertain that milk suitable for processing was being rejected

or wasted. On the other hand, they determined that even soured milk is processed everywhere into casein or cottage cheese.

As far as the fate of the future independent, self-governing district dairy cooperatives is concerned, we are sure that under the new conditions the activists and staffs of our cooperatives will be greatly interested in an improvement in management and increased turnovers. And thus, in an increase in procurement, or in the practical increase of dairy cow productivity in our country. I believe that only now will the work on increasing the lactation yield of cows become a very important matter for our cooperatives. Within the ranks of our raw-materials services we have many good specialists who are capable of making a significant contribution to increasing the lactation yield of our cows, which—why conceal it—is shamefully low, probably the lowest in Europe.

Fats and Oils

Warsaw DZIENNIK LUDOWY in Polish 3 Sep 81 pp 1, 3

[Interview with Jan Wawer, director, Association of the Oil Industry, by Franciszek Nasinski; date and place not specified]

[Text] [Question] Mr Wawer: This year's harvests are coming to a close, and everyone says the crops have been good. They are happy. The first to be gathered is the rape. It's procurement is ending. The storerooms already contain 460 tons of rape. A little more will still "flow" in, but that will probably be the end and in total there will probably be no more than half a million tons. How do you assess this situation?

[Answer] With restraint, for the yields are average and the crop also. After the rape is dried, the oil industry will have, I estimate, about 430,000 tons of raw material. The yields this year were average—17.6 quintals from one hectare. I do not conceal the fact that we wanted much more. The rape harvests in 1976 were sensational. Yields then were 24.6 quintals, and 960,000 tons were harvested.

[Question] Rumor from the guinea has it that the contracting for rape for next year did not go well.

[Answer] Unfortunately, that is true. By the end of August 20th, less rape was contracted for than last year. The farmers are grumbling that rape is hard to cultivate and that it is particularly sensitive to frost. Problems with the purchase of mineral fertilizers are also having an adverse effect, and rape, of course, requires high fertilization, especially with nitrogen, about 200 kilograms of fertilizer in pure ingredients. It also requires hard-to-get disease- and pest-resistant agents.

[Question] Yes, I heard the deputy minister for the chemical industry say, in the presence of Roman Malinowski, the deputy prime minister, that the seed dressing for rape will be produced this year early in September. This is already after sowing has taken place.

[Answer] Yet we have many loyal planters of rape both in the socialized sector, which supplied us with 360,000 tons of rape this year, and among the private farmers, who this year gathered slightly over 100,000 tons. They have been getting high yields, up to 30 quintals per hectare, and thus, high incomes.

[Question] But the situation indicates that the attractiveness of growing rape, in comparison to grain and other commercial crops, was not sufficient for the farmers.

[Answer] Especially, since insofar as grains are concerned, the farmer gets straw—from beets, beet pulp, etc. From rape, we get an oil cake, which is a valuable component of concentrated fodder. But the oil cakes go to the fodder processing plant and they support the national fodder balance.

[Question] Will this year's harvests ensure sufficient supplies of raw materials for the oil industry?

[Answer] No. We will be able to process approximately 800,000 tons of rape into oil. The remainder of raw material indispensable to us must be imported. It is true, however, that even if we had a million tons of our own rape, we would still have to buy soybeans or soya oil, sunflower oil or palm oil abroad, since they are indispensable ingredients of plant fats, palm butter and sugar fats. Except that if there is a surplus of rape or oil, then it is easier to import the indispensable supplementary ingredients.

The subbranch, despite the fact that foreign trade here is centralized and all revenues flowing from it go into a common treasury, does not feel then that it is "begging". We will have 160,000 to 170,000 tons of oil this year from our own rape. However, if we want to keep deliveries to the market at the planned level, we will need 120,000 tons of oil more.

[Question] Vegetable fats are becoming more and more fashionable. More are being bought and used all the time.

[Answer] In Poland, everything is "fashionable" right now. Everything disappears from the shelves. In 1979, we delivered 38,000 tons of oil in bottles to the market and there was plenty everywhere.

[Question] Aside from this, there was also olive oil imported from Spain and Greece.

[Answer] True, but these were not large amounts. Yet during the first six months of this year we delivered 28,000 tons of this same oil and you don't see it on the shelves at all.

It is true, however, that the consumption of vegetable fats abroad is much higher than here. There, their share in the structure of consumption is over 40 percent. Here it is slightly over one-third. During the first half of last year, there were a total of 309,000 tons of fats on the market, including pork fats, 77,000 tons, butter, 121,000 tons, and 110,000 tons of vegetable fats. During the same period this year, there were 1,000 tons more pork fats, 500 tons more of butter, and 18,000 tons more of vegetable fats.

[Question] What deliveries does the oil industry expect to make to the market by the end of the year?

[Answer] From August to the end of December, total deliveries will be 124,100 tons of vegetable fats, including 82,000 tons of margarine, which means that margarine supplies will be 4 percent lower than during the same period last year. I believe that these supplies can be increased if some work on the free Saturdays is done. But deliveries of oil will grow by 16 percent, and fats for processing will increase by about the same amount.

We will achieve this if we utilize our full production capacity. All our refineries and fat hydrogenation plants, except for three, operate continuously, just like the steel mills, and the margarine processing plants work three shifts on all working days. The free day is designated for washing and disinfecting the installation.

I do not have to explain that under these circumstances the oil industry is very sensitive to all reductions in supplies of power, coal, indispensable ingredients, and packaging. We stand on our heads to find solutions, because our production losses cannot be made up. We have more than enough troubles. But I will not cry on your shoulder, because certainly I am being paid, I and my co-workers.

[Question] It appears then, that the oil industry operates without any reserves.

[Answer] Unfortunately, that is true. Furthermore, our industry has installations of a high degree of wear—58 percent, to be exact.

Investments are indispensable. The Council of Ministers passed an appropriate resolution on this matter in May of this year. Outlays were anticipated for new investment and for modernization, totaling 5.5 billion zlotys, which would make it possible to increase the production capacity for margarine by 50 percent, refined oil by 70 percent, and hydrogenated oils, which are the basic semifinished products for the production of margarines and sugar fats, by 100 percent.

Until these investments are made, the size of the oil industry production, i.e., deliveries of vegetable fats from domestic factories next year will not increase and will amount to a total of 296,000 tons of vegetable fats, including 196,000 tons of margarine, 52,000 tons of edible oils, and 41,000 tons of fats and oils for other buyers for further processing.

[Question] Going back to your earlier statement that more vegetable fats are consumed abroad, I would like to observe that there they are offered to the consumer in a much broader range of selection, e.g., in the form of an excellent cocoa paste.

[Answer] We are very aware of this. We, too, would want to do this, and could, but we have no field for maneuvering, for our production capacity is fully utilized, and furthermore, enhancing our production with such products would require that imports of ingredients would have to be expanded. At the moment, we cannot do this. However, as I mentioned, we are trying to expand our industry and increase its production capacity. The economic situation, too, must finally improve. Then our export-import capabilities will improve and then we can also expand the assortment of fats produced by the oil industry.

Sugar Industry

Warsaw DZIENNIK LUDOWY in Polish 8 Sep 81 pp 1, 3

[Interview with Tadeusz Piasecki, managing director, Association of the Sugar Industry, by Waclaw Potocki; date and place not specified]

[Text] [Question] Mr Piasecki: The beet-sugar campaign this year is expected to be difficult and arduous. Difficult, because the farmers and the sugar factories have greater problems with the machines, the spare parts, transport and coal. Arduous because the beet crop is very plentiful, shapely and rich in sugar. The belief prevails that this should be a sugar-rich campaign. Do you confirm these opinions?

[Answer] This year is not an exceptional year in beet planting. Considering the last few years, we can say that this year is an average one. The condition of the plantation, however, is much better than last year's, which, due to the weather and low yields, was exceptionally bad for the sugar industry. This year we shall harvest beets from 482,000 hectares. We estimate that about 90 percent of the plantation will be good and average and there will not be much that is poor or soaked. The yields promise to be high. We expect that the farmers will deliver about 15.5 million tons of roots to the sugar factories. The factories will have plenty to process; they will have over 30 percent more raw material than they had a year ago, and more sugar will be produced.

[Question] How well are the sugar factories prepared for this year's campaign?

[Answer] From the technical standpoint, our 79 sugar factories are well prepared to process the beets. This year we spent over 2.6 billion zlotys for repairs and modernization. This included the construction of new boilers and turbines, replacement of worn cutters, centrifuges, strike pans, mixers and evaporating apparatus, and modernization of the filter plant. All work has been finished and on September 5th our factories were ready to process beets. On Saturday, September 5th, the first factories in the Lublin region started up. In the last few days the deliveries of the basic production resources, particularly coal and limestone, improved. Our most recent agreements with the Coal Sales Center on delivery, during the third quarter, of 1.2 million tons of coal, are at the moment being complied with without any large disruptions. We also expect that deliveries during the fourth quarter will be on schedule and that the campaign will not be disrupted or brought to a hault. Limestone supplies are even better. Almost 700,000 tons of beets have already been accumulated in the storeyards of the sugar factories. Another 400,000 tons are to come in during September and the entire fourth quarters, which should fully cover our requirements.

We have also established plans for delivering and hauling the beets from the fields to the procurements centers and sugar factories. In this year's campaign, the beets will be hauled principally by the State Motor Transport, the Polish State Railroads, the Agricultural Circle Cooperatives, and also by the planters. Contracts have already been concluded and approved. Despite the transport and fuel problems, our haulers have assured us that the beets will have priority and the sugar factories will not have to wait for them.

[Question] The campaign this year is beginning exceptionally early, during a period when the beets are still growing and their sugar content is increasing. The sugar factories are paying high supplements to encourage the farmers to dig up beets that are not ripe and contain less sugar. The farmer does not lose anything on this, but the state does, since there is less sugar from the September beets. Under these circumstances must we begin the beet-lifting so early and how much sugar are we losing by this?

[Answer] In our weather conditions the beet campaign should begin early in October. September, and the first days of October, are still a period of vegetation for the beets, and the sugar content continues to increase. Years of study have shown that under good weather conditions each hectare gains about 40 quintals of beet bulk in September. Beets that are lifted in September contain about 1 percent less sugar than beets lifted in October. Considering this, we should begin lifting and processing sugar in October and finish in the final days of December. The campaign should not go over 85 days. Unfortunately, with the present processing capacity of our sugar factories, now standing at 150,000 tons of beets per day, this is impossible. On an average, thus, the campaign last from 105 to 110 days, and in certain regions, even 130 days. If we were to begin to process beets in October, we would have to extend the campaign at least to the middle of February, and then the sugar losses would be much higher. Long-term data show that by processing beets in January we lose 5 to 6 percent more sugar than in September. When the beets are frozen and thawed, they also shrink in bulk. Also, from the standpoint of transport and fuel problems, a September campaign is less costly than a January campaign.

[Question] What can be done then, to prevent this and also other losses in sugar that we suffer during the campaign?

[Answer] Due to the inadequate processing capacity of our industry, we lose thousands of tons of sugar each year. These losses result from the extension of the campaign in time and they can be reduced only by increasing the average daily processing capacity of our sugar factories, thus shortening the processing to 85 days. But this requires enormous investment outlays.

In the absence of large investment outlays, we can, however, reduce the much greater sugar losses that occur through improperly conducted lifting, through premature topping, and leaving the beets in the ground. Scientists and practicioners have proved that a beet that has been topped and not dug up loses 1.3 percent sugar after 6 days, and sugar losses reach 2.25 percent after 9 days. Our studies have shown that farmers lift 22 percent of the beets 6 days after topping them, and only one-third of the beets are dug up immediately after they are topped. If lifting is done efficiently, thousands of tons of sugar additionally can be obtained. But if this is to become a reality, our agriculture must be equipped with harvesters to gather beets. Until this can be done, our farm and raw materials services must visit the planters more extensively to advise and assist them during the beet-digging period.

[Question] Will the earlier beginning of the sugar campaign mean also that the average sugar consumer will get more sugar sooner?

[Answer] The startup of the beet campaign in September will make it possible to produce about 100,000 tons of sugar during this month. We believe that the first

people to receive sugar should be the beekeepers, for winter feeding of the bees, otherwise there will be no honey next year. Also, we should increase supplies to the stores, to prevent supplies from falling to a critical minimum. There must be complete coverage for the September and October ration cards. The confectionery industry should also see a small increase in sugar supplies.

[Question] Will the abundant sugar campaign have a greater impact on the market at a later time?

[Answer] During this year's campaign we will produce somewhat more sugar than we need for normal domestic consumption. We believe that there should be enough sugar to replenish the reserves in trade and industry, to fully meet the requirements of the beekeepers and institutions, to increase the quotas for the confectionary industry, and also to increase the monthly rations for the people.

[Question] It appears then that the production of a larger amount of sugar will not mean that there will be enough of it. We will continue to be a force in the growing of sugar beets and we will continue to obtain our sugar by rationing. Does the association which you direct have a program for overcoming this sweet crisis?

[Answer] As I said earlier, our sugar industry is still underinvested. It requires huge outlays for the construction of new and modernization of already operating plants. At present, the average age of our factories is 94 years, and 12 plants have been operating for over 120 years. Their level of modernity and the technical condition of the machinery and equipment is below the average of the European level, and the average processing capacity of one statistical sugar factory is the lowest in Europe. In the postwar period, only four factories have been built in the country (the fifth is under construction). Yet during the same period we built 67 complete facilities abroad.

At present a program for the reconstruction of our sugar industry is being prepared in the Sugar Industry Association. It covers the modernization and reconstruction of old factories and the construction of modern plants. The technical facilities and the raw materials base of our industry will also be expanded. But only the implementation of this program will produce a perceptible improvement in the sugar market.

Fruit, Vegetable Industry

Warsaw DZIENNIK LUDOWY in Polish 15 Sep 81 pp 1, 3

[Interview with Jacek Fraczek, assistant director of the Association of the Fruit-Vegetable Industry, by Anna Staniewicz; date and place not specified]

[Text] [Question] Mr Fraczek: A year ago, processing was threatened by poor crops. This year there is talk of successive "disasters" in cabbages, tomatoes and cucumbers. How is this year's campaign proceeding in the plants which belong to your association?

[Answer] Early predictions suggested that fruit and vegetable crops would be good. But these hopes have had to be seriously revised and the situation in processing

is not rosy. A classic example, insofar as fruits are concerned, are strawberries. It was supposedly a record crop, yet we processed less than last year. The same with black currants: the plan called for 17,000 tons, we processed 10,000 tons. But still the picture is much better than last year, which was disastrous. In general, however, the fruit crop did not measure up.

We know already that there will only be half of the 250,000 tons of apples expected. The MacIntosh and Star King varieties did not bear fruit and the total lack of pesticides greatly reduced the yields of the other varieties. Only the apples in the protected centers, such as Grojec or Radom, look better. In the Carpathian and Lublin regions, where household orchards dominate, the situation is much worse. After last year's record yield, the "Hungarian" plum crop was a disappointment. Today I talked to the manager of the enterprise in Nowy Sacz. It seems that in this main base for plums, only half as much will be picked as last year. Fruits, this season, are scarce and expensive, sometimes totally out of relation to the harvests. Before the season began, for example, the procurement price for cherries was set at 40 zlotys per kilogram.

And so cherries never reached the processing plants, for they cost 100 zlotys and more on the market.

[Question] Is it the farmer who demands more based on production costs or is it the dealers who are running up the prices?

[Answer] Of course, most of the harm is done by the dealers. But production in the village costs more and more. Take, for example, currants. The planters had to pay the pickers very dearly. Mechanization for picking currants is still in its infancy.

[Question] We know that there will not be enough canned fruits and jams from this year's crops. How about vegetables?

[Answer] This is really a year for vegetables, and crops are very good. We have finished processing peas and string beans. The situation in pickling cucumbers is much better than a year ago. The weather conditions—warm nights and precipitation, helped and we have already exceeded our planned tasks: for 18,000 tons planned, we processed 216 tons above that, and the campaign continues. As for tomatoes, we have thus far processed 50,000 tons, which is about one-third of what was planned. Rains and cold weather have slowed down deliveries. Although at the beginning of the season, the daily procurement was over 4,000 tons, now it is not quite 2,000 tons. We do not expect to fill the planned requirements for processing, particularly since the market is tremendously absorptive. What is happening to our cost is even worse: the dealers are buying out tomatoes en masse right at our growing points.

[Question] On the one hand you say that there are not enough tomatoes, but on the other hand until recently there was waste at the procurement centers. Processing plants in the Sandomierz region, in Dwikozy, among others, took a holiday on the free Saturdays, while the tomatoes rotted.

[Answer] I have not heard of any waste and I know that all of our plants operate on free Saturdays and on Sundays. No one has days off during the season, that is an

occupational requirement. We have no problems in processing tomatoes, because at this time the deliveries are far below the industry's production capability. In the large processing plants we now have to stop the larger lines, for there is nothing to be processed. That is how it is, e.g., in Milejow and Lowicz.

[Question] Which means that there will not be as much tomato concentrate as is needed....We hear more and more about the "disaster" in cabbage.

[Answer] The association is processing small amounts of cabbage, principally for meat-vegetable canned goods. The lack of meat has automatically reduced planting. And in certain regions, e.g., around Lipno in the Wloclawek voivodship, and in the Rzeszow area, we will have problems in handling the late varieties of cabbage which are being grown under contractual arrangements.

[Question] What, then, can the consumer expect this year? How many plants does the association have and what is the processing capacity of your industry?

[Answer] We supply the market with about a thousand different kinds of products, based on what grows in the fields and in the orchards. This year we delivered more canned string beans, for a total of 16,000 tons. This should fully meet the need, just as should the supplies of peas. But we observe that our products our being bought out en masse. This situation is reflected in our shop, "Fructopol", on Nowy Swiat street in Warsaw. As soon as something reaches the shelves, it disappears immediately. If someone is buying peas, then he immediately buys the entire packet and in no way can sales continuity be maintained.

But the situation with tomato processing will be much better. From this year's harvest we want to deliver about 13,000 tons of concentrate. For comparison, during the entire year last year, there were only 7,000 tons of tomatoes in all. Normally, such an amount of concentrate fully covered the demand. Now, during the first 6 months, the market received about 13,000 tons of imported concentrate and in actuality it could not be seen in the stores. Tomato juice is being made in all the processing plants at full steam. But there will be less stewed tomatoes, and furthermore, in view of the cost of the raw material and the sugar, it will be much more expensive. We will deliver about 70,000 tons of jam.

I recall that at one time even half that amount was sufficient for a whole year. But as long as a jar of jam costs 6.80 zlotys, and the price has not changed for 20 years, jam will not always be available in the stores.

[Question] A great deal is said about priorities for the food industry. For you this principally means sufficient allotments of sugar, vinegar and containers.

[Answer] We need 65,000 tons of sugar for three quarters. The allotments provided for 20,000 tons less, but are being implemented. In order to save sugar, we have reduced the production of wines, but at the same time we have expanded the production of low-sweetened jams and marmalades.

For the time being we have enough sugar, and vinegar and seasonings also. Nor do we have any big problems with glass containers. Unfortunately, there was a very

threatening situation insofar as cans were concerned. And if we had not had funds of our own to import the ingredients for lacquer, the production of peas and string beans would have come to a halt. In general, however, the problem of containers must somehow be solved. We cannot begin production of cans at the same time that the peas campaign is drawing to a close.

Employment is another matter. The association has 69 plants. And I would like to stress the attitude of our work force. The people work without a break for hours, on free Saturdays and on Sundays, despite the fact that the fruit-vegetable industry is one of the most poorly paid. The recent period, due to the accumulation of deliveries of beans, cucumbers and tomatoes, was particularly hard. Everyone, office workers, warehouse workers, and others, who do not normally work at production, worked at the vegetables.

None of the vegetables that we contracted for and received were wasted, and I am sure that it will be like that for the rest of the season.

[Question] When will your products reach the stores in larger amounts?

[Answer] Already in the next few weeks. But we must also think about stocks for the winter. We cannot eat up everything now. And that is why deliveries must be made strictly in accordance with the agreements with the trade.

Potato Products

Warsaw DZIENNIK LUDOWY in Polish 25-27 Sep 81 pp 1, 5

[Interview with Dr Jozef Gladkowski, manager of the Association of the Potato Industry, by Andrzej Piszczota; date and place not specified]

[Text] [Question] Dr Gladkowski: Poland ranks second in world production of potatoes. In an average year, we harvest close to 50 million tons. Yet for years there has been a shortage of potato flour, starch and recently also other derivative products, including spirit. What is the explanation for this? Can this be possible?

[Answer] It is true that we produce about 40 million tons of potatoes, but last year's disastrous harvest produced only half that amount. The producers use most of the yield for fodder purposes. Practically speaking, the commodity potato in our country constitutes 10 to 12 percent of the yield. That includes the seed potatoes and the edible and industrial potatoes, whose combined mass fluctuates between 4 to 6 million tons. The plants which belong to our association process the potatoes into starch and dried consumption products. During the fall campaign we process about 70,000 tons into the latter, and about 1 million tons into starch.

[Question] Processing for consumption purposes is still in its infancy, despite the fact that the potato is the mainstay of our diet. In western countries, most of the potatoes reach the table in a processed form. Could we not fill some of the empty shelves in our stores in this way?

[Answer] In general, the production of food from a potato is based on dehydrating it, or freezing it in the form of fried potatoes. Unfortunately, this type of

production is energy-intensive, requires extensive warehouse space and involves transport. We are producing dried products, which we supply to refrigeration plants, who in turn make them into various kinds of dumplings and other products. We are actually a supply industry. It may be said that our production capacity during the next 3 years will fully cover the requirements of the refrigeration plants and the food concentrate industry.

[Question] In the current difficult market situation, can't these supplies be increased? Because of the lack of meat and dairy products, and problems with grain products such as noodles or rolled oats, people are buying more of these dumplings. Unfortunately, they are not always available in the shops.

[Answer] This year we began the campaign already in the middle of August. All departments producing these products are working. Very shortly, the refrigeration plants will receive flakes, grits and the potato granules, and also the meal, which are the ingredients of the frozen products. In September, products from this year's potatoes should already be on the shop shelves.

[Question] And the production of starch, which is the raw material for about a thousand ultimate recipients, from the pharmaceutical, food and paper industries all the way to oil mining and the coal industry?

[Answer] Our production capability in this field is now able to cover only 60 percent of domestic requirements, excluding so much as a single ton for export. But because we are a traditional supplier for many world markets, even if we reduce our commitments to a minimum, we still need about 20,000 tons of potato flour to maintain ourselves on the dollar markets. Thus we see the necessity for an immediate expansion of starch production. At the moment we envisage a stage of modernization, particularly in the regions of the raw-materials sources, i.e., Lomza. Making use of the raw materials in Ostroleka, Bialystok, Lomza and Ciechanow, we intend to expand the plant in Ilaw, on the border of these voivodships. Using the raw-materials resources in the Plock region, we want to expand the production capacity in Glowno, near Lodz and in Staw in the Konin voivodship, because we have a surplus of raw materials there.

The next stage should be construction of a new plant in the southeastern region of Poland, because our industry hauls half of the potatoes from that side of the Wisla [River] to processing plants located on the western side.

[Question] I am afraid that under the present circumstances we cannot expect such an investment to be approved for a long time. Every ministry, every branch and region, presents iron-clad arguments why they should have these investment millions, which, unfortunately, our country cannot provide. For many years, the Poznan voivodship has been fighting for meat plants which were initially located in Oborniki. The argument here is the slaughter animals, a good part of which are hauled to slaughter houses in Wroclaw, Legnica and other distant places. The sugar industry is demanding, not without justification, a new factory in the western part of the country. The city of Poznan is fighting for a dairy, because the queues in front of the shops are getting longer and longer. I don't want to negate your arguments, but in this context I see no great prospects for you. If the construction of a

new potato processing plant in the eastern part of the country is disapproved, then what can you propose to make the work more efficient? For certainly hauling raw materials in today's energy crisis makes no sense at all.

[Answer] I realize that the present situation eliminates this matter for the next three years. We have revised our program by precisely that period of time. I am thinking of the future, for the preparation of an optimal design solution and completion of machinery for such a plant requires these several years. Insofar as selection of the particular site is concerned, however, then the present variant, in which we have chosen the Siedlce voivodship, has not been approved by the Planning Commission.

We are also considering the Biala Podlaska voivodship and others. All of this requires further preparation and studies. However, we must realize that there is no other solution if we are to process at least 2 million tons of potatoes, which we must have in order to provide starch products for factories and for the market.

[Question] How is the industry accomplishing its present tasks? How are the current plans being fulfilled?

[Answer] Our current staff effort is directed toward steady production, processing the daily requirements of products, by each of the now-operating plants. We can do this if electric power is not cut off and coal deliveries are not disrupted, which our highest authorities assure us will not happen. At this time we have enough coal for a month's production. We are attempting to get more.

We have decided to procure potatoes in all 30 voivodships in which we have own sources of raw materials and to advance processing as much as possible. We envisage that we will buy about 1.3 million tons. During the fall campaign, we want to process over a million tons.

But because we lack the processing capacity, we should bury about 300,000 tons in pits for the winter. Of course, we have to pay the planters an additional 100 zlotys per quintal for storage. In March we want to start up the spring campaign.

[Question] This is a way of meeting the demand? An attempt to overcome the obstacles reducing the level of production?

[Answer] Exactly. It is our aim to have all of our plants go into operation on the 15th of August in the next few years. We want to provide the planters with deliveries of suitable seed potatoes in the fall. For every quintal, they will give us back next year 1.5 quintals of potatoes of the appropriate varieties, which in the middle of August will be ready for processing. This is extremely important, both from the standpoint of being able to start up additional production and from the standpoint of economic results, because the campaigns conducted during the winter were a total waste of raw materials. There were cases where for one ton of starch, over 20 tons of potatoes were used. Where normally 6 tons are used, with the earlier varieties, which contain less starch, 7 to 10 tons are needed. It is to the interest of the farmer and the national economy to use raw materials more effectively.

[Question] Does the industry have the materials of the quality it needs? As far as I know, there is a general shortage of high-starch varieties, particularly the early ones.

[Answer] Until 1968 the potato industry produced seed potatoes for its own needs. These potatoes contained over 16.5 percent starch. Now we are processing potatoes that contain 14.5 percent starch. We rely on several general-purpose varieties, such as Lenino and Uran. We have now obtained the right to reproduce seed potatoes. In the next few years we want to recover the position we lost, to restore starch to at least 15 to 16 percent.

[Question] You mentioned export. The country is tremendously hungry for foreign exchange currency. I believe that potato products could be a very strong point in obtaining this currency. But we have nothing to sell.

[Answer] This year the state made a great effort and imported 70,000 tons of potato flour, mainly for the needs of the pharmaceutical industry where it is used in the production of medicines. Unfortunately, we will be able to allot only 15,000 tons for export this year.

At one time we traded in potato flour with 27 countries. We sold 80,000 tons a year. Now we have restricted ourselves to 5 or 6 of the traditional sales markets, which we do not want to give up, despite the fact that we are not fully covering the requirements of domestic industry.

[Question] I understand that this export is not too profitable. Perhaps, then, we should give it up.

[Answer] Why? If the Dutch, who trade in starch products with the whole world, find it profitable?! I think that we, too, should not back out of this. The French producers and the FRG also finds it to be profitable. Starch products are a profitable trade object, even though in our case they do not achieve the required indicators. But this is a matter of how you calculate. We are a force in the cultivation of the potato. We should take advantage of this on the world market.

CAPACITY OF POLISH AIRLINES REPORTED

Actual Status of Polish Airline

Warsaw TECHNIKA LOTNICZA I ASTRONAUTYCZNA in Polish No 6, Jun 81 pp 6, 7

[Article by Dr Jan Lason: "Air Transportation of Polish People's Republic Against the Background of the Modern World"]

[Excerpt]

Actual Status of the Enterprise Polish Airlines LOT

Currently the Polish Airlines LOT [PLL LOT] maintain connections with about 50 foreign aerial ports (CEMA countries about 100) and receive on their airports over 20 foreign carriers, not counting charters and unscheduled flights. The air routes of PLL LOT extend for over 90 thousand kilometers. In 1979, the average distance of travel by our aircraft was: per one ton cargo—1,706 km (CEMA average 3,401 km), per passenger—1,401 (CEMA 2,407). The value of transportation and associated services to air transportation in 1979 amounted to 6.9 billion zloty.

Generally speaking PLL LOT have four kind of aircraft: two jet types—destined for medium or long range flights and two turboprop types—used mainly for domestic routes. In 1980 we had 45 civilian air transports: 8—IL-62 (including two IL-62M), 11—Tu-134 (including six Tu-134A), 17—An-24 and 9—IL-18. Altogether these aircraft coult accommodate a little over 3,800 passengers at one time. Average age of PLL LOT aircraft is considerable, about 60 percent are over 10 years old. Thus, because of their mechanical status the oldest types and those which are overused will have to be withdrawn from service in the near future, these aircraft are principally An-24's and IL-18's which form the largest segment of our fleet. For the withdrawal from service of these oldest and uneconomical aircraft also speaks their unproductivity, low degree of passenger services and comfort status and the increasing costs, per passenger, or per unit of freight. To the newer types of PLL LOT aircraft belong the jets: Tu-13A and IL-62M. The latter has an improved comfort level of the passenger compartment and consumes less fuel per one flight hour, as compared to IL-62, mainly because of utilization of more efficient engines. In domestic flights the An-24 and IL-18 aircraft do not provide an actual degree of passenger comfort, on the long distance lines the IL-62 and IL-62M cannot compete with Western carriers who use modern, wide-body aircraft with more cargo space, with a higher state of the art and which are more economical.

From the foregoing it becomes apparent that there's an urgent need for the rotation of the PLL LOT flying inventory in order to obtain new, economical transport aircraft. For intercontinental service we need far better aircraft than the heretofore used IL-62M, something in the class of DC-10 or B747D. On the intermediate range lines the most economical aircraft appear to be the so-called airbuses, for example A-310 or IL-86. We also lack aircraft for freight transport, like the IL-76, which are capable of large, single cargo movement (up to 40 tons) to include perishable food articles--because of special refrigeration facilities. We also do not have a capability of flexible manipulation of aircraft inventory which could be adapted to situational changes in domestic or foreign air transportation situations. From the statement made by M. Sierakowski, it appears that during 1981-1985 PLL LOT will receive four IL-86's (of which two will be delivered in 1981), with the proviso that their actual utilization will not begin until 1982-1983. Also planned is the introduction of YAK-42 aircraft and other types in connection with foreign firms. In the sharp competition with foreign air carriers PLL LOT is facing even more difficult times, mainly in connection with a well founded, economical use of the more expensive, larger capacity transport aircraft which are currently being introduced. These are very difficult tasks, though necessary ones for the development of our country which, from among 180 countries in the world is not a separate island but is in competition with them in the achievements of civilization among which is also air transportation.

Plans For Development of Polish Airlines

Warsaw TECHNIKA LOTNICZA I ASTRONAUTYCZNA in Polish No 7, Jul 81 pp 8, 10

[Text]

Development Program of Polish Air Transportation

The Polish air transportation development program which was prepared at the onset of the seventies, by the Committee for National Space Management of the Polish Academy of Sciences, provided among others for 1970-1990 period for deliveries of modern transport aircraft and for construction and expansion of civilian airports. According to a forecast, prepared by this Committee, concerning the development of transportation in Poland until 1990, the domestic air transportation was to increase form 0.9 million passengers in 1972, to 6 million passengers in 1990 (Table 6) [14].

For over thirty years the technical and economic circles speak with one voice for a better and more energetic development of Polish civil aviation, despite consistent efforts by the opponents to cut down these proposals. Many articles appeared, during the sixties, which described the effectiveness and future prospects of this mode of transportation as well as its social and economic advantages. The same also applies to the later years. For example, working teams of the Committee for Science and Technology, at one of their meetings in August 1971, also have indicated a need for development of the transportation net, taking into account those heretofore neglected means such as aviation. At the beginning of the seventies we had a rather optimistic vision for Polish aviation development. The, at that time, Minister of Communications Mieczyslaw Zajfryd, speaking for the publication "PERSPEKTYWY" stated: "No later than during 1981-1985, the entire international transportation

should have been moved from the Okecie airport to the newly constructed airport near Warsaw, which will be equipped for transcontinental service and for all types of medium and long range aircraft."

6. Urban transportation
7. Suburban transportation
8. Railroad transportation
9. Air transportation
10. Water transportation

Unfortunately these intentions and forecasts remain nothing but words. Bureaucratic machine and dillettantes in the area of aviation planning and development for the country caused that the most justified resolutions and forecasts and worthwhile postulates of economists remained principally paper declarations. Stemming from this, lately, one can observe a regression of air transportation in Poland, as it pertains to the degree of its development and comparability to world-wide programs. Independently of this generalized policy of the state, as it was justifiably stated by B. Rzeczynski [15]: "The Ministry of Communications owes us an answer as to why was the plan of aviation infrastructure and transportation system development not realized by 1980." It is difficult to understand from where do we get such a scornful relationship towards air transportation in general and the domestic airlines in particular which—according to the experts—experience a 20 percent yearly increase in demand. Meanwhile, as it becomes even more apparent from the heretofore submitted solutions, neither the airport net, or airport facilities nor the number of aircraft or their quality are undergoing any beneficial changes as compared to the world-wide aviation development. As it was already stated, the decisions concerning Polish air transportation must be undertaken with an appropriate lead time since they will decide if PLL LOT will be able to withstand competition, make up for the neglect, create conditions for further development and will come nearer to the world average in air carrier statistics.

Taking into account the critical situation in our civil aviation, on 28 November 1978, the then Political Bureau of the Central Committee PZPR examined information pertaining to the status of our civil aviation and the prospects for its development. Among many projects deserving particular attention is a recommendation to build a new, international aerial port in the vicinity of Warsaw, to expand the technical-exploative rear base (support facilities) of civilian airports and to purchase airbuses IL-86 and domestic commuter aircraft An-28. It has also been

determined that the PLL LOT transportation capability on foreign routes should be doubled by 1985. From the available information data it appears that PLL LOT will be introducing exclusively jet aircraft which insure greater passenger comfort and a more economical fuel consumption.

All this should be considered as being rather half-measures when compared to the dynamic development of air transportation in the contemporary world. Towards the end of the seventies and into the eighties there still was no comprehensive prepared program for the future development of Polish air transportation. Thus, fast and rational decisions are needed which would aim at making up the lost time and speed up the development of this mode of transportation services. On the eve of the 5-year plan, with respect to years 1981-1983, the investment amounts are not known, there is a lack of final confirmation for all decisions pertaining to the aerial inventory view concerning the problem of integration of institutions and services supporting air transportation. These and other unknowns make it presently very difficult to describe precisely the actual needs in the area of Polish air transportation infrastructure, crew training for the new types of aircraft, planning for modern airport facilities, etc. An extended period of such data uncertainty will result in us cutting through the limb on which we are "sitting."

Conclusions and Suggestions

--Even in view of the difficult economic situation of the country one cannot any longer treat the Polish air transportation like a stepchild, this will lead to even more serious social and economic consequences. Our national ambitions should be able to liberate simple and complex reserves in this area and become a great creative force aimed at the progress of civilization in which the time factor is regarded as the deciding factor in the development of societies. In this development, principally in the race with time and space, Poland is not a separate island; we enter in ever increasing measure those foreign markets which are concurrently in competition among themselves. This competition and the development of the international division of labor, together with individual affluence, will force those particular countries, Poland among them, to a widening and intensification of air transportation in order to be able to stand up to the competition at home and abroad. Therefore, we must aim not only at achievement of world norm in aerial transportation but to project our thoughts into the future in order to be able to equal the rapid development of modern world's civilization.

During the eighties--regardless whether someone likes it or not--in the area of air transportation, Poland should place herself in, at the least, the third ten-percentile (currently we are in the fifth) on the world scale. For this we need not only desires and declarations but a change in the heretofore practiced system of investment outlays expenditures, in order to increase them in the area of air transportation share with a corresponding reduction and limitation of expenditures on: production of raw steel, ineffectual and unnecessary administrative investments (in this chiefly for intermediate, useless (administration) branches, duplication of functions, bureaucratism, etc), excessive propaganda, etc [16]. From a survey of available materials it becomes apparent that investment outlays for socialized transportation (and communications) are much lower in our country in comparison with other sectors of economy and also in reference to other progressive countries. The indicators point to an increase by 15 percent in those investments, on a yearly scale, mainly for air transportation. During 1976-1978, they amounted to 9.4 per-

cent, during 1971-1975 it was considerably more, i.e. 11.6 percent. Pointing in favor of this action is our 10th place in global material production, a leading place in the exploitation and mining of geological raw-materials, our relatively highly developed industry, a large share in international exchange and many other indicators. But we should no longer camouflage the negative aspects of Polish air transportation, it is necessary to publish in ROCZNIK STATYSTYCZNY of the Central Statistical Office (GUS) and in other publications the true actual data to include investment outlays for this mode of productive services.

—It becomes apparent, from the discussion, that despite the fuel crisis and the very high cost of civilian aircraft purchase and utilization, also of construction and modernization of airports, air transportation is continuously undergoing dynamic development and that the prospects for this mode of transportation are rather optimistic. This is chiefly due to technological and scientific progress which goes on in aviation and in the benefits reaped from air transportation which is becoming increasingly less costly and more accessible. Air transportation either saves or brings into the treasury considerable foreign exchange and exerts influence on the growth of national income, it also stimulates international exchange of goods and secures necessary production services for the country, it also is a stimulant for tourist movement. Because of the foregoing the need for air transportation, even in Poland, is and will be increasing at a considerably faster rate than for the substitutes of other transportation forms.

The need for the services of air transportation will keep on increasing dynamically because domestic and foreign tourism are on the increase as well as the numbers of people who desire faster and more comfortable travel and a more effective utilization of their leisure time, away from their professional chores. Another real reason is a more effective utilization of the nominal work time whose societal value keeps on increasing. For example: while the societal value of one hour of a statistical clerks work was, in Poland, 26 zloty in 1970, in 1985 it will be over 32 zloty. There is also a great need for air freight transportation, presently PLL LOT participate in only one half of air freight transit of our goods. Our goods are often brought up by different transportation modes to foreign aerial ports and from there are sent on by air freight over the ocean, it seems that every Pole would wish that we could move as many goods as possible, not by transit but directly from Polish airports and on Polish aircraft. Unfortunately in order to accomplish this we need modern and economic aircraft and corresponding airports and we do not have either. This makes for high costs in foreign exchange, which does not flow into the country as would be the case if we had our own aircraft and airports at our disposal.

—From the actual status of the PLL LOT enterprise it seems that things are not at their best in our aircraft inventory. From among the carriers belonging to IATA the PLL LOT flying inventory constitutes 0.1 percent (at the beginning of the seventies it was 0.5 percent). Polish transport fleet is too small and too old, for example 60 percent of the transport aircraft are over 10 years old and are in need of being recalled, in particular the older type machines such as An-24 and the IL-18. Aircraft employed on short and medium routes are uneconomical and the passenger comfort is disheartening. On the long routes even the IL-62M aircraft cannot stand up to the competition with the Western carriers who use the more economical wide-bodied aircraft which, additionally, are aircraft of a higher state of the art. We also lack aircraft for specialized freight movement including that of moving perishable goods. Containerization has been introduced far too slowly in our aviation, even

though IATA awards tariff relief for it. We also lack sufficient numbers of transport aircraft which could be rapidly and expediently adapted to varying transportation contingency needs.

A brief survey shows that the problem of qualitative and quantitative status of PLL LOT aircraft is so immense that a solution cannot be postponed, this problem threatens serious socio-economic consequences for Poland and may result in us becoming a backward country with respect to the civilized nations of the world. The present plans for augmenting the PLL LOT inventory with some transport aircraft like IL-86, An-28 and YAK-42 could be a good, though insufficient and not the best indicator and a green light for Polish air transportation and help it achieve its rightful place in the world and in the national economy structure.

--Polish air transportation makes a poor showing on the world scene and because of that even is some scientific publications it is either omitted or listed in the "others" column. As a result of insufficient investments in this area Poland has noticeably worse indicators (except for the 1971-1975 period) on the world scale and among the CEMA countries. In recent times many countries which are poorer and have smaller populations and area than us have surpassed Poland in their dynamic development of air transportation. In 1978, Poland participated in the regular, worldwide air transportation as follows: passenger transport (passenters per kilometer)--0.26 percent, freight movement (tons per kilometer)--0.11 percent. Also unprofitable for Poland are the statistics pertaining to freight movement in ton/kilometers per one statistical inhabitant of the country: Switzerland--68.4, Netherlands--58.6, Belgium--38.9, Sweden--24.5 Romania--6.7, Greece--6.4, Bulgaria--3.9, GDR--3.8 and in Poland--0.9. The picture in passenger transportation, expressed in passenger/kilometers per 1,000 square kilometers of nations surface is as follows: Netherlands--302, Switzerland--280, Belgium--150, Portugal--36, Greece--35, Bulgaria--19, GDR--17, Yugoslovia--11, Romania--9 and in Poland--8. Any comment becomes superfluous and constructive conclusions should be self-evident.

--It is high time to think seriously about the future of our aerial ports, mainly Warsaw-Okecie and Gdansk-Rebiechow. It appears that we do not appreciate our geographical location, that is to say the prospects offered by air communications lines. "Some powers" prefer to spend money on cosmic research and space travel rather than on earthly matters i.e. construction and modernization of civil airports which are indispensable for social and economic needs. However, the construction of these, expensive as they are, airports with an annual transit capability of 4-7 million passengers, and about one million tons of freight, appears to be the key matter which will decide on the further development of Polish air transportation. It is no longer realistic to deter further the development of an airport base because of lack of funds or the critical economic situation of the country. There are smaller and poorer countries (for example Denmark or Bulgaria) who are constructing new airports and are dynamically developing their air transportation.

With regard to the difficult national [economic] situation we could sublet the construction of a new airport, near Warsaw, to a foreign aviation firm or--as it was done with the Shermentovo-2 aerial port--let a Western firm have an "exclusive" contract to build such an airport. This would considerably shorten the time, from 5 to 2.5 years, when the airport would be completed. Another possible: because of the critical national situation it could be possible to issue national debenture bonds earmarked for the immediate start of work connected with construction and moderniza-

tion of aerial ports in our country. It would also be a possibility to create a public fund, just like the one proposed by the shipyards workers' for the rapid exploitation of natural gas and petroleum oil in the Koszalin region, or even to have the government set aside a sum of money to the account of Ministry of Communications, and they would pay off that sum from air transportation income. Still another way would be by limiting unnecessary, material intensive expenditures (like Huta Katowice steel mill) in order to free investment outlays. Once the need for the development of air transportation is understood then the means for the construction and modernization of airports can be located.

It is difficult to answer the question, at the present time, if we are indeed looking at a prospect of dynamic and realistic development of air transportation in Poland. Few newly acquired planes would increase the flying inventory of PLL LOT, however, with the current, unsatisfactory condition of civilian airports we will not be able to unfurl our wings the way we would like to do it now. Construction of a modern airport is costly and time intensive. For instance a decision regarding such construction must have about five years lead time, the actual realization of the enterprise may take several, or even a dozen years. Until the end of 1980 there was no comprehensive, long range program for the developmental dynamics of Polish air transportation. This is having a negative influence on work organization and on a detailed preparation of the internal organization of the particular enterprises and institutions pertinent to this mode of transportation. There are no prospects for economical deliveries of planes with intercontinental range. Also it has not been determined if we will use intercontinental aircraft for freight or general transportation. Up to the present time there are no decisions pertaining to future optimalized structure of Polish air transportation or for its comprehensive infrastructural development iwth a veiw to the future. Therefore, we need speedy and thoroughly thought out decisions which would aim at a rationalization of our activity.

ROMANIAN REPRESENTATIVE CALLS FOR GREATER CEMA COOPERATION

Bucharest ERA SOCIALISTA in Romanian No 15, 5 Aug 81 pp 1-4

/Article by Nicolae Constantin, deputy prime minister of the government, permanent representative of the Socialist Republic of Romania in CEMA: "Romania's Active Participation in Development and Improvement of CEMA Collaboration"/

/Text/ A decade ago the 25th Session of CEMA, held in Bucharest, unanimously approved the General Program for Intensification and Further Improvement of Collaboration and Development of the Socialist Economic Integration of the CEMA Member Nations.

Initiated by decision of the 28th (Special) Session of the Council, which was attended by the heads of the communist and labor parties in the socialist CEMA countries, the General Program was drafted by the collective efforts of those countries in more than 2 years of intensive work.

In its content the program applies the experience acquired in the two previous decades in the field of expanded reciprocal economic collaboration, and it also sets the guidelines for intensification and further improvement of this collaboration for a new period of 15-20 years.

As a founding member of CEMA, Romania played and active part in drafting this basic document for the council's activity and greeted its approval as a high point in the history of the manifold relations among the member nations. As the decision ratified immediately after the 25th Session of CEMA pointed out, "The RCP Central Committee, the State Council and the Council of Ministers attach particular importance to the General Program, the provisions of which are intended to expand cooperative relations in CEMA in order to enhance the economic potential of every participating country, to accelerate the growth of the productive forces in all the member states, and to relate and gradually equalize their levels of economic development for the greater unity of the socialist countries."

I. As a document basic to development of all-around economic collaboration among the CEMA countries and to improvement of the council's activity, the General Program is important because it crystallizes the essential principles, standards and objectives of collaboration, determines the areas, methods and specific forms of collaboration, and establishes a whole series of priority programs for cooperation in production, science and technology to be implemented by the member countries in a first stage of this program.

Accordingly the CEMA countries, in pursuance of the provisions of the organization's charter, agreed to base the whole structure of their all-around economic and technical-scientific collaboration upon the principles of socialist internationalism, observance of state sovereignty and national independence and interests, noninterference in the nations' internal affairs, full equality of rights, mutual benefit and friendly mutual aid. On the basis of these principles it was determined that collaboration among the member nations is to be based upon free consent, that it will not be accompanied by formation of supernational organs, and that it will not interfere with matters of internal planning, financial activity or economic administration of national organizations.

As specific objectives of mutual collaboration, the General Program attaches first importance to meeting the growing long-range requirements of the member nations' economies for fuels, energy, raw materials, equipment, modern technologies, agricultural food products and industrial consumer goods, especially through joint construction of large production capacities.

Special emphasis is placed on expansion of mutually beneficial specialization and cooperation in production and on further involvement of the industrially underdeveloped countries in that activity, especially in the peak sectors and subsectors of modern technology.

The main objectives of collaboration entered in the General Program also include expanded cooperation in scientific-technical research, joint treatment of highly urgent problems in that field, intensified exchanges of technical-scientific advances, faster expansion of reciprocal trade and its greater effectiveness.

Approximation and gradual equalization of all CEMA countries' levels of economic development are decribed in the General Program as vitally urgent objectives of the member countries and their mutual collaboration that are to be taken into consideration in all areas and forms of that collaboration.

In the 10 years since the General Program was approved, the CEMA countries have achieved important results in implementing its provisions and especially in concluding and implementing a large number of accords and agreements for specialization and cooperation in production, in joint construction of a number of important economic capacities, and in solving problems of scientific-technical collaboration. As it was noted at the recent meeting of the CEMA Session, expanded and intensified mutual collaboration increased the exchanges of goods among the CEMA countries by 3.3 times in 1971-1980, and the total volume of these exchanges reached 121 billion rubles in 1980. Among these exchanges the volume of reciprocal exports of specialized machine building products increased from 1.3 billion rubles in 1971 to 9.1 billion rubles in 1980 and their share in the total deliveries of machinery and equipment among the CEMA countries reached 34 percent.

II. Effective implementation of the principles and aims specified in the General Program has been and still is of particular importance to socialist Romania in its all-out effort toward overall development and modernization of its national economy on the basis of the latest advances of human knowledge and toward transition from the stage of a developing country to that of a medium developed country as a strategic aim specified in the RCP Program. For these considerations and in full accord with its main position, Romania has made consistent efforts to carry out the provisions of

the General Program and of the special programs for long-term collaboration, which were drafted in the specification and development of the document approve a decade ago.

Romania's interest, initiative and resolve in this direction are definitely reflected by its participation in the implementation of more than 200 multilateral agreements concluded by the CEMA countries concerned for international cooperation and specialization in production, and especially in machine building and the chemical industry; joint construction of large production capacities in the pulp, asbestos and ferrous alloys industries and exploitation of a deposit of natural gases in the USSR, as well as construction of a nickel and cobalt plant in Cuba, Romania to receive in exchange the agreed quantities of the outputs of those units; collaboration with partners in the other CEMA countries on the basis of more than 100 agreements for collaboration on particular research and development problems and in laboratories, collectives and international institutes for scientific studies; and the formation by the CEMA countries of many specialized international economic organizations and unions wherein Romania is active on behalf of an efficient and active cooperation in various fields.

And finally, participation in all these multilateral programs as well as the constant expansion of Romania's bilateral economic and scientific-technical relations with the other CEMA countries are reflected by the volume of reciprocal trade exchanges, which increased by 3.5 times in 1871-1980 at an average annual growth rate of 13.3 percent.

Successfully implementing the decisions of the 11th RCP Congress, Romania has logged great progress in its socioeconomic development. In 1971-1980, its social product increased by 2.3 times, its national income by 2.4 times, its net industrial output by 3 times, its agricultural output by 1.6 times, and the total incomes of its population were doubled.

All these achievements, as well as the prospects for Romania's economic development in the current five-year plan and in the period up to 1990 provided by the 12th Party Congress, create extensive opportunities for intensifying cooperation in production and exchanges of goods, primarily with the neighboring socialist countries and with all the CEMA countries. In this connection Nicolae Ceausescu said in his speech at the Second Congress of Workers Councils that the current five-year plan calls for "further expansion of relations with the CEMA countries and intensified specialization and cooperation in production within that framework, for increasing satisfaction of the mutual needs for raw and energy-bearing materials, materials, machines, equipment, etc. I wish to mention that there is still much to be done in CEMA in this respect and that we shall try, jointly with the other states, to improve the effort toward these ends."

For this purpose and in view of the importance of developing economic cooperation in CEMA, the party secretary general renewed his proposal at the beginning of last year to organize a conference of secretaries general of the communist parties in the member countries to discuss the problems of improving collaboration.

III. In evaluating the general results already obtained in implementing the provisions of the General Program and their contribution to the accelerated socioeconomic progress of the member countries, it must also be said that those results are not commensurate with the progress they have made in the last decade in strengthening their industrial, scientific and technical potentials, in expanding and modernizing the

production capacities in the main sectors of their national economies, and in assimilating manufacture of products on a high technical level. As it was also said at the Sofia meeting of the CEMA Session, some important objectives specified in the General Program have not been entirely accomplished, nor has full use been made of the possibilities it offers for solving some vital problems upon which implementation of the economic plans now depends, as well as the greater effectiveness of social production and the growth of labor productivity in every one of these countries and acceleration of the process of correlating and equalizing their developmental levels.

That is why the CEMA Session concluded that the aims and objectives of collaboration specified in the General Program are also urgent for the future and requested the CEMA organs to concentrate their entire attention upon more effective collaboration especially in the fields of material production and science and technology.

In this connection, meeting the member countries' growing requirements for fuels, energy, raw materials and materials has been and still is a vital objective of collaboration. There were a number of nonfulfillments in this crucial area in the last decade, which were noted during the proceedings of the recent meeting of the CEMA Session. Concerning Romania, the contribution of collaboration to its requirement for fuels, mineral raw materials and metals has declined from about 47 percent at the time the General Program was approved to only 21 percent at present, necessitating considerable efforts to procure those products from third countries for payment in convertible currency.

So far the results of coordinating the national economic plans for 1981-1985 have not served to solve this problem, since the volume of reciprocal deliveries agreed upon for the current five-year plan is short of the requirements for further development of the Romanian economy. The volume of Romanian imports of coking coal, metallurgical coke, copper and cast iron is less than in 1980, and imports of crude oil and electric power have not yet been agreed upon. This means Romania will have to buy most of its required imports of fuels, raw materials and metals from third countries in this five-year plan, with payments in convertible currency. Of course this situation will inevitably affect the extent of Romania's participation in collaboration with the CEMA countries.

In order to prevent such a development, the Romanian delegation to the recent CEMA Session emphasized continuation of the joint efforts to find viable solutions to this problem and effective implementation of the respective provisions in the General Program and the special program for collaboration in this field and of the decisions previously approved by the CEMA Session.

And so it would be particularly important to expedite the negotiations to settle the specific terms for collaboration in prospecting and exploring for crude oil and the natural gases, in developing the capacities for iron ore and pulp, and in expanding extraction of coals, copper, nickel, phosphorites and other mineral raw materials. And it would also help to emphasize these problems in drafting proposals to supplement the special program for long-term collaboration with new cooperative actions, especially to build production capacities that will more fully meet the member countries' economically substantiated requirements.

As for Romania, it has confirmed its interest in participating, on terms of equality, equity and mutual benefit, in development of additional production capacities in the CEMA countries with resources through deliveries of equipment and materials and

through technical aid, including the necessary manpower, in order to more fully meet its needs for the said products and to considerably reduce its imports of such products for payments in convertible currency.

Collaboration in more complete use of existing production capacities is another important solution to this problem, with favorable effects upon growth rates of the national economies and proportioning of the investments and upon exchanges and cooperation as a whole. Romania for example has the production capacities to process 8-10 million tons more crude oil a year as well as other petrochemical raw materials, delivering in exchange products obtained from those materials or other products, and it made specific proposals for this some time ago. Romania also has capacities for additional outputs in the aluminum and cement industries, if supplied with sufficient quantities of fuels, energy and raw materials by the countries concerned.

A consistent effort to more fully meet the CEMA countries' requirements in the abovementioned areas would enable those countries to set a graphic example of joint solution of a very far-reaching problem facing a great many countries throughout the world under the conditions of the present worldwide economic and energy crisis.

IV. Intensified specialization and cooperation in production, especially in machine building and other peak industrial sectors such as electronics, electrical engineering and chemistry, is another consideration of great importance to the member nations' accelerated industrial and technical progress and further collaboration.

Although important results have been obtained so far, they cannot be considered commensurate with the progress these countries have made in industry.

As for Romania, its position in the CEMA division of labor or in specialization and cooperation in machine production is not in keeping with Romania's industrial level or the Romanian people's efforts toward industrialization. Consequently the products that consume much energy, metals and materials still predominate in the structure of Romanian exports of machinery and equipment, while products of the electronics and precision machinery industries amount to less than 1 percent of Romanian deliveries of specialized products. Romania's per capita exports of machinery and equipment in reciprocal trade are 5-6 times less than the exports of comparable products by most of the European socialist CEMA countries.

Meanwhile Romania cannot entirely supply, within CEMA, its requirements for a number of investment commodities such as mining and energy equipment, installations for the metallurgical and chemical industries, multipurpose assemblies, machine tools for metal processing by unconventional methods, heavy and special machine tools, industrial robots and manipulators, etc., which it still has to import from third countries for payments in convertible currency.

In general the socialist countries must annually import a considerable volume of machinery and equipment from third countries for convertible currency, although they have real possibilities for joint organization of production and intensified exchanges of complex products on a high technical level. Expanded specialization and cooperation is the main route to solution of this problem and stimulation of their cooperation as a whole. In this area three policies must be pursued with great perseverance: first, preferential treatment of some sectors, subsectors and new or scarce products on a high technical level and of great complexity; second, agreement upon and joint construction of production capacities for the new types of equipment and

installations; and third, the necessary provision for a more pronounced increase in reciprocal deliveries of specialized products. As it was stated in the General Program, in all these cases priority and greater opportunities must be given to the underdeveloped CEMA countries with manpower and technical potentials to enter into these activities more intensively.

As for Romania, it has large and modern capacities for making electric and diesel-electric locomotives, trucks, dump trucks, tractors and products of the electronics and electrotechnical industry that enable it to intensify its exchanges and to expand specialization and cooperation in production with the other CEMA countries. Moreover Romania is interested in cooperating with other CEMA countries in building new capacities on its territory, in peak sectors, by forming mixed companies and promoting other ways of combining the interested countries' efforts.

In order to enhance the contribution of technical-scientific collaboration to the solution of the major problems of economic, scientific and technological progress in the CEMA countries in view of the worldwide explosion of advances in human knowledge, cooperation in this field must be concentrated on such priority problems as development of technologies for rational management and better processing of mineral raw material and energy resources, production of highly productive equipment to reduce inputs of resources and to make better use of them, design of machine systems for complete automation and control of production processes, and assimilation of new materials and products with superior technical-economic characteristics and competitive power on the world market.

One problem which the member countries have agreed to solve in the first years of the General Program but which has not yet been solved is adequate stimulation of production and export of agricultural and food products by means of prices and other economic levers. Preparation and promotion of effective measures and programs for collaboration in this matter would help to improve supply of the CEMA countries' populations with these goods and they would stimulate the growth of trade exchanges and favorably affect these countries' socioeconomic development itself.

For Romania, expanded collaboration and cooperation with the other CEMA countries is also vital from the standpoint of the necessity of a more pronounced increase in its trade exchanges with those countries. Despite the efforts and specific proposals to expand these exchanges that Romania has made over the years, the share of the CEMA countries in Romania's total foreign trade declined from about 50 percent in 1970 to 34 percent in 1980. For this five-year plan, Romanian originally intended to double the volume of its trade exchanges with the other CEMA countries and submitted new proposals for cooperative production and reciprocal deliveries for this purpose. The proceedings to coordinate the plans allowed an increase to be expected of only 38 percent in these exchanges in 1981-1985. Therefore, on the basis of the understandings reached on the level of the party and state administrations, Romania is continuing negotiations with other CEMA countries in order to accelerate the growth of trade exchanges in this five-year plan and is trying to arrange such negotiations with all the socialist countries.

CEMA has a very important part to play in solving the foregoing problems, as well as its representative and operational organs and the other international economic organizations formed by the member nations. They are called upon to concentrate all their efforts on seeking and finding the most effective and efficient solutions and on initiating specific programs for collaboration and cooperation in production that will

meet with the approval and participation of all the interested member nations and will provide terms of equality, equity and mutual benefit for all the partners. By acting in that way the organization for collaboration will really perform its mission and will considerably enhance its contribution to the joint solution of the far-reaching problems of socioeconomic progress facing the member nations at the start of this decade. And by resolute action in the said directions to implement the agreed upon objectives and programs, the CEMA countries will conclusively prove the complete viability of the document approved a decade ago and the effectiveness of their collaboration and of CEMA's activity, thus enhancing the prestige and power of attraction of socialism throughout the world and substantially contributing to the consolidation of detente, peace and cooperation in the whole world.

As for Romania, as Nicolae Ceausescu has pointed out on many occasions it is resolved to make its full contribution in the future as well to collaboration in CEMA so that the work of that organization will set a true example of equitable relations and fruitful cooperation among free and sovereign socialist states and will lend a new impetus to socialist and communist construction.

In emphasizing strengthened friendship and cooperation with the socialist states and with all peoples building the new order, Romania is also militating for stronger relations of solidarity and collaboration with the developing and unaligned countries, promoting, in the spirit of peaceful coexistence, economic and scientific-technical relations with the developed capitalist countries and with all states of the world regardless of social order, and actively participating in the international division of labor and in the worldwide exchanges of material and intellectual values, thus contributing to the construction of a new international economic order and to the creation of a better and more just world.

DEFICIENCIES IN PREPARATIONS for 1982 INVESTMENT PLAN

Bucharest REVISTA ECONOMICA in Romanian No 41, 9 Oct 81

[Article by I. Mihai]

[Text] Implementation of the investment program requires continual concern with preparing each goal forecast so that the new production capacities are carried out on schedule and under conditions of high efficiency. In this context there is special importance in placing the investments into operation on and even ahead of schedule, investments intended to raise the energy potential and fuel resources, determined by the need for us to develop our own base of raw materials and energy resources.

Appropriate preparation of investment projects in this area requires ensuring the conditions needed for continuity in the normal flow of activity on the jobs being carried out and, at the same time, beginning new jobs planned within the schedules forecast in the timetables approved. Especially since the investments tie up large material and financial resources for the entire duration of the job, whose positive effects are felt only after the jobs have been completed and the new capacities put into operation.

In order to carryout the investment programs it is necessary both to substantiate on the basis of strict analysis the timeliness and efficiency of them as well as to have concern with creating all the material conditions needed to implement them on time. Taking measures which ensure preservation of a balanced working front and permit the building and start into operation of the new investment projects in the shortest possible time--as thus specified in the legal regulations (for jobs in the competence of approval of the enterprises and centrals it is 9 months, 12 months for those in the competence of approval of ministries and 24 months for those approved by presidential decree)--is an important means for increasing the contribution of the new capacities to raising the base of raw materials and the country's energy base as well as the national income.

Valuable Experience--Broadly Extended

Experience until now has confirmed that when the problems in placement, technical-economic documents, building capacity and technological equipment have been solved on time for new investment projects , the investments are carried out within the schedules forecast in the timetables, while the period during which the material and financial resources are tied up in the new investments is minimal. Ensuring the necessary conditions has made it possible in the first 9 months of 1981 to place into operation, within the schedules planned, a large number of production capacities in all

branches of industry, including energy and fuel industries. Among these capacities we should mention the stage III thermoelectric energy sector and No 3 basic steel works, both at the Galati Iron and Steel Combine; the Pestesna-Gorj pit; the opening and start into operation of the Amaradia-Tiriia mining field (500,000 tons of lignite per year in the first stage); a capacity of 2,000 tons/year of technological equipment for mining jobs and heavy mining hydraulic equipment at the Filipesti-Prahova mining equipment enterprise and so forth. By their profile these capacities are participating either directly in increasing the extraction of coal and other fuels or in increasing the capacities in the branches of the extraction industry by supplying them with new equipment.

At the same time, it should be shown that a number of large production capacities could not be placed into operation within the schedules forecast, particularly due to failing to ensure the working front which would permit the assembly of the equipment and installations to start on the dates included in the timetables or the failure of the domestic and foreign suppliers to deliver certain technological equipment in conformity with the contractual obligations. This is the case of the capacities intended to extend the Borzesti electric power thermification central, the Slatina hydroelectric power central on the Olt River, the Moldova Noua mining operation and other capacities forecast to be placed into operation this year or, for some of them, behind from 1980. Due to the failure of the supplying plants in the Ministry of Machine Construction Industry to deliver equipment on schedule in most cases, or the existence of defects found during technological testing, they could not be placed into operation on time, its being necessary to reprogram the initial timetables.

Of course, the nature of the preparatory jobs for each project separately varies depending on the stage of building and each one's particular features. The preparation for a normal flow of activity also raises other problems for the investment projects being built, for which a 1982 start into operation is forecast, problems such as the following:

Having the builders provide the working front, which would permit the assembly to begin within the schedules forecast in the timetables and, correlated with this, providing base per onnel for operation, personnel who, along with the assemblers, would participate directly in assembling the main technological equipment and installations;

Creating the conditions needed to do the breaking in hot and cold, as well as the tests for placing the new capacities into operation on schedule and within the periods forecast in the timetables;

Having the holders and beneficiaries resolve all the cooperation connected with providing the raw materials, materials and semimanufactured items, electric energy, fuels and other utilities, supply and access networks, as well as other problems which are conditions for operation of the new capacities at the parameters approved within the shortest periods of time from the time they are placed into operation.

A Major Requirement: Speeding Up the Contracting and Delivery of Equipment

Analyzing the stage of preparation of the investments which are to be carried out in 1982, we find that during this September a large volume of jobs was not fully ensured with the technical-economic documents and technological equipment. So, less than half of the number of new investment projects, whose building is forecast to start this year (in order to provide the working front needed next year), had their order notes approved, while the building designs from this viewpoint were in even less

favorable situations. Of the 30 investment projects having the Ministry of Electric Energy as the holder, projects whose building is forecast to start this year, only 19 had their building designs approved at the start of last month. And similar situations exist at other ministries, too.

The situation is not exactly satisfactory with regard to providing the new investment projects with technological equipment, including the equipment and installations produced in Romania by our machine construction industry. At the start of September, only something more than half of the volume of technological equipment produced domestically and allocated for 1982 for the new investment projects were provided with technical-economic documents and only around 30 percent were contracted with the supplying plants.

A large volume of equipment needed for the new projects and forecast to be built next year was not contracted with the production enterprises, while the main domestic producer of technological equipment and installations for investments--the Ministry of Machine Construction Industry--at that date had only provided technical-economic documents for around 60 percent of the volume of equipment and contracts for approximately 80 percent.

In the extraction industry branches, where the investment capital is allocated in particular for creating new production capacities of raw materials and fuels needed to increase Romania's energy potential and for ensuring the conditions which permit a good flow of investment activity, although better than in other sectors, one may not say that it is at the required level. On the job sites of some very important economic projects, where concern continually has been demonstrated with ensuring high rates of building from the builders, beneficiaries and suppliers of equipment, the plan tasks have been fulfilled and in some cases even overfulfilled at the Rosia Jiu and Pestesma lignite pits, the Lupeni pitcoal operations, the Anina bituminous shale operations and the Amaradia-Tiriia lignite deposit, the Doicesti thermification electric power central, the Strejesti, Aricesti, Susag, Brezoi and other hydroelectric power centrals. On other job sites in the same branches, however, there are lags in the stage of building.

Generally, the reason lies in failing to provide certain equipment within the schedules correlated with the timetables for spreading out the investments. In this regard the case of the Anina electric power thermification central--Group No 1 of 330 MW is graphic, planned to go into operation this December, but which currently is reprogrammed to go into production in 1982. This reprogramming is the result of the failure to deliver 4,100 tons of electrofilters by the specialized enterprises in Bistrita, 1,100 high-pressure pipes by the Vulcan enterprise in Bucharest and so forth. Such situation, however, also are found at other jobs. In other cases, relatively minor problems such as, for example, failure of the supplying enterprise to deliver certain equipment within the schedules planned (electrical filters, automation panels to Turceni, supply pumps and others) contribute to delaying the start of some production capacities into operation, bringing to society large losses by maintaining material and financial assets in tie-ups and, by this, depriving the economy of certain products needed for domestic consumption or intended for export, by failing to include new workers in the production activity within the time forecast.

In the current situation, where the evolution of technical progress in the world is unrolling with such a lively speed, the economic result of which primarily is the substantial rise in labor productivity and, as the reverse, moral usage of the means of production built in previous periods, providing all the material conditions needed

for the planned new investment projects so that they can be built and placed into operation in minimum periods of time is a basic element.

Priorities of Action

Achieving a qualitative leap in the direction of creating the necessary conditions for recovering the lags for projects being built, speeding up the start into operation of production capacities forecast in the investment plan and using them at the technical-economic parameters planned are a basic task for all those working in this important sector of activity.

Taking into account the experience of previous years and the good results obtained on some job sites where, due to the measures ensured on time, the planned capacities were placed into production sometimes even before the time forecast in the timetables and taking into account the efficiency of the best measures adopted and applied within the times established and cooperation among the concerned factors, we see that the following are needed to have total fulfillment of the investment plan tasks forecast for the second year of this five-year plan:

Continuing to keep the most restricted possible working front in investment activity and concentrating priority efforts on the projects in an advanced stage of building, with a view to putting them into operation in as short a period of time as possible;

Speeding up the rate at which the technical-economic documents are worked out and advised on for the investment projects whose building is forecast to start next year and establishing timetables with firm schedules for the designers, beneficiaries, the notification organs and builders regarding turning over the documents and beginning the building, particularly for projects of special importance, such as the centrals on coal, capacities intended to recover materials and utilize new raw materials, utilization of secondary resources and so forth;

Speeding up the closing of contracts with domestic and foreign suppliers for delivery of technological equipment and installations, predominantly for those for which a delay in assembly affects the start of new capacities into operation as provided with production which was caught in the balance for domestic and foreign consumption; speeding up the deliveries of equipment contracted in Romania or imported, which are conditions for placing the capacities planned for 1982 into operation and, correlated with this, analyzing all the possibilities for assimilating as large a volume of technological equipment as possible for investments in Romania and avoiding the importing of equipment as much as possible;

Establishing on time the measures which permit the technological tests to begin on time, doing them within the terms set and creating the conditions needed for the new equipment and installations being placed into operation to operate at full capacity, providing a labor force for the operation and maintenance and qualifying it at the level required by the technological progress, raw materials, materials and equipment, and the sale of production domestically and for export and cooperation with other enterprises and so forth.

All investment factors must understand that only through strict coordination of efforts among the builders, suppliers of equipment and beneficiaries, correlated with providing the needed material-technical base, can the tasks in the investment area in general and those for developing the raw material and energy base in particular be fulfilled, tasks which the second year of the five-year plan is placing before our country's workers for the purpose of continuing to develop the national economy and raise all our people's well being.

INCREASED EFFICIENCY OF AGRICULTURAL INVESTMENT SOUGHT

Bucharest REVISTA ECONOMICA in Romanian No 41, 9 Oct 81 pp 5-6

[Article by Nicolaie Savu]

[Text] In the current stage of raising the entire Romanian economy, within which the problem has been posed of carrying out a new revolution in agriculture, the role of investment in the technical modernization of this basic branch of our economy is becoming particularly important. Actually they are the material support for fulfilling the goal of doubling Romania's agricultural production. Intensification of agricultural production, industrialization of labor processes in agriculture, the change of agricultural work into a version of industrial work and obtaining results at the highest world level require achieving a large volume of investments for extending all the fixed assets in agriculture on modern bases. Also, it should be stated that an optimum correlation must exist between the investments intended for the modernization of agriculture and those intended for development of the industry which produces the labor resources for agriculture, so that both categories can be turned to good account with maximum economic results.

World experience shows that the growth rate in general and the volume of investments intended for the technical modernization of agriculture are dependent on the general level of the country's economic development and, in particular, on the level of industrialization, with industry being the branch which supplies the labor resources required by the modern agricultural technology. This also becomes the source for financing a higher volume of investments for agriculture at a certain stage of development of industry, through the accumulations it achieves. This order of priorities in investment policy today is recognized as a law of economic growth, without respect for which a revolutionizing of the production forces of society cannot be carried out in general and in agriculture, in particular.

Regardless of their nature, the investments in agriculture have as their source the state's capital and the capital of the agricultural enterprises. Added to these, but with less importance, are the investments achieved through the population's contribution in work for various projects, such as those setting up flows of water in local interest and those for maintaining the riverbeds (investments which were 3.2 billion lei in the 1976-1980 period). Whereas the main source of investment for agriculture as a whole is the state's capital, in the cooperative sector the main source is the cooperative members' own capital. We feel that in the interest of speeding up the process of intensifying agriculture, under conditions of strengthening economic self-management in this branch, too, we need an increase in the role of investments from the people's own capital, with a view to amplifying interest in the fullest possible utilization of it.

Romania is among the socialist countries in which the investments for agriculture have risen and are continuing to record high growth rates and they represent a large share of total investments. The average annual volume of agricultural investments rose from 1.287 billion in 1951-1955 to 25.24 billion in the 1976-1980 five-year plan, with 155 billion lei to be invested in this five-year plan, the amount proposed and approved at the 2d congress of agriculture. The investments per hectare of agricultural land also have seen a similar growth, reaching nearly 1,800 lei, while the increase in investments per person employed in agriculture has registered a much faster rate of nearly 25 times in 1976-1980 compared with 1951-1955, which proves the rise in degree of technical supply of agricultural wori.

Despite this, we feel that efforts must continue to be intensified. Even if we supposed that an equal coefficient exists both in industry as well as in agriculture of the correlation of investments with net production, it would be useful for the more powerful development of agriculture, also taking into account the country's higher potential, for investments to be proportional to its contribution to creating the national income. Particularly because, although agriculture's share in creating the national income has diminished in the last three decades, agriculture still has not reached a similar correlation, despite the fact that during the three decades the gap between industrial and agricultural investments has been reduced more than seven times.

Precisely for that reason, starting in the 1976-1980 period, compared with the 92 billion lei forecast initially, the investments for agriculture were increased to 120 billion lei (of which 14 billion are from the agricultural cooperatives' own capital). On the other hand, starting in 1950, the volume of investments in agriculture rose at a higher rate (42 times) than the national economy as a whole (31 times) and even for industry as a whole (35 times). This policy should be continued and even emphasized because, as I was saying, the amount of investments for agriculture to be able to become proportional in the future to the portion of the national income created. However, we stress that in order to reflect reality in calculating investments for agriculture, also to be taken into consideration should be that portion of the industrial investments whose result is intended for agriculture.

Referring to the method of utilizing othe investments, we may proceed from the idea that it is a specific means of correcting the natural conditions in agriculture; a basic feature of a modern agriculcure is precisely the uniformization of the production forces, with a view to equalizing production and living conditions for the agricultural producers.

In our agriculture the greatest portion of investments has been directed toward the state sector (the state agricultural enterprises and SPIA [expansion unknown]). The state agricultural enterprises utilize around two-thirds of the investments coming from the state capital, an orientation characteristic of a stage when such a directing of investments sought the rapid increase in production in order to cover the national economic needs. However, investments in the cooperative sector also are proving to be particularly profitable.

Under these conditions an aspect of the modernization of agriculture also is elimination of the gap in technical supply between the state and cooperative sectors, creating similar working and living conditions in both sectors. The united agroindustrial councils established on the basis of the RCP CC Plenum decision of 1 February 1979, intended to create the necessary organizational framework for concentrating and specializing

agricultural production, is an important step toward equalizing production conditions and developing both sectors in proportion to the zone of fertility. Speeding up the growth rate of investments in the cooperative sector also is in agreement with the requirement for setting up investment projects depending on the conditions and possibilities existing in each unit.

Particularly complex is the problem of concentrating andterritorially distributing the investments, which must be well substantiated scientifically on the basis of the projects for zoning agricultural production. Equalization of production conditions by differentiating investments means choosing between two main directions of priority: on one hand, for the zones with the most favorable conditions for agricultural production with a view to total and superior utilization of these conditions and, on the other hand, the priority for the zones with harder production conditions, to change these conditions with a view to improving them and increasing agricultural production as a whole.

The counties known as big agricultural producers are enjoying a clear priority; thus, in Dolj, Ilfov, Constanta, Ialomita, Braila, Timis, Arad, Teleorman, Olt and Iasi nearly half of the investments for agriculture in 1976-1978 are concentrated. Yet, we believe that a reorientation of investments also is needed toward the less developed zones, the ones with more difficult conditions, such as Gorj, Alba, Bistrita-Nasaud, Hunedoara, Harghita, with the ratio of investments between these counties and Braila County (for example) being 1:4.5.

On the other hand, if we refer to the coefficient of correlation of investments with the increase in total agricultural production, we see that a greater efficiency in investments may be obtained precisely in the zones with themore difficult production conditions. In the 1976-1978 period this coefficient exceeded1:4(taking the country average as a unit) in Alba, Hunedoara, Bistrita-Nasaud, Gorj, Neamt and Suceava counties, while it reached values of only 1.6-.7--thus a ratio of 1:2-1:3--in Braila, Constanta and Tulcea counties.

Making a substantiated evaluation of economic efficiency of investments in agriculture requires taking into consideration the particular features of this branch of material production as well as the particular features of the various subbranches and production goals of agriculture. The basic particular feature is determined by the effect of the land on the efficiency of agricultural investments. In this regard, we need to move the economic results of the new investments away from the ones due to the quality of the land by making an economic evaluation (qualitative) of the land. Another factor affecting the efficiency of investments in agriculture is the complexity of production conditions in all its subbranches. The efficiency of investments, of course, depends on the efficiency of production, but in no case can it be confused or reduced to this.

The characteristics of various production projects in agriculture give a certain specific nature to the way of determining the system of indicators which express the economic efficiency of the investments. Referring to tractors and agricultural machinery, we must take into account their contribution to raising labor productivity and to increasing production but also the fact that they are subject to faster usage, while the decreasing output is also accompanied by rising operating expenses. Investments for water improvement projects directly affect the level of production by recovering new lands and increasing the production capacity of the lands cultivated, but they also mean a certain loss of land (irrigation channels) and, having a prolonged use, they are subject to moral usage. Investments in construction (except for the combines

for the industrial raising of animals) do not contribute directly to increasing production; in exchange, they bring a different degree of performance ability and of improvement in working conditions and they have a long operating period which, however, differs from case to case, they are suited for modernization, have a high residual value and remove land from agricultural circulation. Investments for live labor resources are affected by the long period of time for achieving them, by the production curves for these labor resources and by the direct action of natural factors. Depending on these particular features, a certain indicator for evaluating economic efficiency of investments may have a different ability of expression or it is necessary to use specific indicators.

The economic efficiency of investment refers equally to total as well as new investment. This method of treatment is conditioned by the fact that, from the viewpoint of results and the point at which they are made, all investments are new, regardless of whether or not they are intended only to replace and/or broaden fixed capital and the above thesis is confirmed by the fact that the depreciation itself is changed in time into accumulation.

According to what the sphere contains, we must distinguish many steps in determining the efficiency of investments: total investment (for agriculture as a whole), directional investment (on the main directions of mechanization, land improvement, zootechnics, construction and so forth) and investment on versions of the same capital project. For example, we must bear in mind that general, partial and specific indicators exist for calculating the efficiency of investments.

In the case of total investment, a first evaluation among the general indicators of economic efficiency may be given by the value of supplementary production for each leu of supplementary investment, but of greater economic significance we feel is the net supplementary production and net supplementary income for each leu of new investment (the profitability or coefficient of efficiency of the supplementary investment).

The most important general indicator of the economic efficiency of investments (primarily, total abut also those by directions and versions) is the term for recovery. The speed of recovery of the investment,which shows us during a period of use how many times the investment is recovered from the net income obtained, is a direct result of the term of recovery. As partial and supplementary indicators of the efficiency of investments the following may be used: savings of production expenses, improvement in quality of products, easier working conditions, reduction in need for work (growth in live labor productivity) and the prevention and reduction in production losses. Taking into account the continual growth in investments intended for agriculture, the efficiency with which investment capital is used has become a very current problem.

The rise in efficiency of investments requires that agriculture, too, seek to reduce the percentage of construction projects and to distribute an increasingly greater portion of investment capital in the supply with machinery and equipment. Currently agriculture has reached the situation where around two-fifths of the investments are for construction-assembly projects, while investments for machinery and equipment represent more than one-third, with a clear rising trend. Still, measures are needed to select the construction solutions which exclude architectural excesses, tendencies to oversize, useless finishing jobs; also, it is necessary to improve the quality of jobs and industrialize projects by a gradual move to prefabricated building of agrozootechnical constructions.

From the viewpoint of efficiency, also important is the relationship between investments and fixed capital placed into operation in the socialist sector of agriculture; despite the increase in percentage of placement into operation (from 88 percent in 1966-1970 to 92 percent in 1976-1980), projects valued at around 650 million lei still remain unplaced in operation annually. Clearly, the delays recorded in starting new projects in operation negatively affect the growth growth of agricultural production.

Referring to these shortcomings, in January 1981, at the working meeting in Brasov, Comrade Nicolae Ceausescu stressed: "Many investment jobs last very long. We have complexes and stables begun years ago, which have not been placed in production. In order to carry out the programs I have proposed, we must provide the appropriate shelter base for the animals. But because some comrades have raised the problem of supplementing certain investments, I wish to draw attention to the fact that for 1981-1982 we have established not to start any new project. Let us finish the irrigation jobs begun, let us perfect the existing systems and ensure their good operation."

In light of these indications by Comrade Nicolae Ceausescu, the elimination of delays in working out documents, in drawing up designs and building new capital projects, in order to put them into use in useful time, is a basic obligation for all cadres in our agriculture and is an important reserve for the rational use of the investments for raising their efficiency.

YUGOSLAV-GDR COOPERATION REVIEWED

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 16 Oct 81 p 3

[Article by V. Karakasevic]

[Text] Long-term cooperation makes up about 50 percent of the total annual volume of trade. The goods lists for 1982 will be published by the end of October.

The basic feature of Yugoslav economic relationships with the GDR is the continuity of growth in both imports and exports. In the period 1971-1975, the total reached 1.7 billion dollars, and leaped to more than 3 billion in the period 1975-1980. This trend has continued in the first year of the 5-year plan that extends to 1985.

Thanks to these results, Yugoslav economic relations with the GDR are third in importance among the socialist countries, following the USSR and Czechoslovakia. One should recall that economic cooperation includes regular trade in goods, long-term industrial collaboration (specialization and cooperation), long-term credit arrangements, joint capital investments, cooperation in light industry and in the textile, shoe and woodworking industries, joint entry into third markets, scientific and technical cooperation, and financing.

The Delivery Dynamics are Unsatisfactory

Yugoslav trade in ship repairs and shipbuilding, construction, prefabrication and transportation services are increasing from year to year.

In the first 8 months of this year, trade was on the increase, although certain delays in implementing contracts were encountered. As a result, in that period exports totaling 429 million dollars were contracted: according to Yugoslav data 235.2 million dollars worth of these contracts were fulfilled, while GDR data show 246 million dollars in deliveries. Contracts for Yugoslav imports totaled 385 million dollars, with Yugoslav data showing 297.8 million dollars of completed transactions. GDR data show 224 million dollars worth of completed shipments to Yugoslavia. The difference in dollar values comes from the GDR practice of recording only the implementation of contracts concluded in a given year in that year's statistics, while Yugoslav records include deliveries based on contracts from previous years.

The GDR has pointed out its dissatisfaction with the dynamics of contract fulfillment (for toolmaking machinery, textile producing machines and agricultural machines), and the members of the GDR section of the Yugoslav Economic Chamber have been informed of this.

In this period the Yugoslav trade deficit amounted to about 62 million dollars, but it is estimated that the difference will be compensated for by export of services, which are of significant magnitude and thanks to which the Yugoslav consumer balance during 1981 has been fluctuating between 10 and 15 million dollars.

Projections Until 1985

Long-term industrial cooperation and transactions (credits and joint investments) will account for about 50 percent of the total volume; they are registering steady increases. Prospects for cooperation are regarded as significant for heavy machine-building, mining equipment, toolmaking machinery, electronics and electronic technology, agricultural equipment, food processing, automobile and chemical industries. Contracts have nearly been completed for many transactions in these fields. The efforts of businessmen of both countries in this direction received full support from the Mixed Committee for Economic, Scientific and Technical Cooperation at it session at the end of 1980.

On the basis of completed transactions in the past 10 years, an agreement has been reached between the GDR and Yugoslavia for trade in the period 1981-1985, to increase exchange by about 50 percent compared to the preceding 5-year period (up until 1980). Considering continuity in the volume of goods and services to be exchanged, the total trade for the 5-year period until 1985 will be as follows:

Structure in 1,000 dollars

Goods	2,538,160	
Services	102,500	
Of which		
A. Scientific and Technical Services and Licenses		7,500
B. Other Services		95,000
TOTAL	2,640,660	

For this year, the first in the 5-year period to 1985, Yugoslav expoets are to be 534.19 million dollars, while imports will be 505.5 million.

DEVELOPMENT OF SOCIALIZED AGRICULTURAL SECTOR SURVEYED

Belgrade GLASNIK POLJOPRIVREDNE PROIZVODNJE, PRERADE I PLASMANA in Serbo-Croatian No 9, Sep 81, pp 3-7

[Article by Danilo Tomic, MA]

[Text] Introduction

After the end of the war in 1945, an agrarian reform in Yugoslavia created a land fund of 1,566,000 hectares. About 755,000 hectares of this total were distributed to poor peasants, while 791,000 hectares were transfered to state ownership and represented the basis for state agricultural land holdings. That was actually the origin of the developmental concept for Yugoslav agriculture that was adopted later. The land consisted of small, fragmented agricultural holdings and socially owned operations with small amounts of land, poor equipment resources for production, and unsufficient trained personnel. Later, through the rapid development of the country's agriculture and general economy, which were caught up in the processes of integration and internal transformation, these organizations gradually were transformed into complexes that today are modern agroindustrial complexes. They are true giants with the most modern production equipment, and the newest scientific, technical and technological advances are applied on them. They are counted among the most modern organizations in the world. Their accelerated development represents a qualitative change in the development of Yugoslav agriculture. Agricultural organizations have had pivotal influence on the results of Yugoslav agriculture, which has reached a world level. Besides that, various forms of cooperation and association have contributed markedly to increasing goods production on private lands.

Despite a series of positive results in the development of these organizations, various weaknesses have also been revealed, meaning that all the possibilities for increasing agricultural production have not been utilized.

In this paper, an attempt will be made at analyzing these state land operations from the standpoints of their organization, equipment (primarily with agricultural mechanization), and motivation for more rapid modernization of production processes, as essential prerequisites for obtaining better results in agriculture.

The increased effects will be regarded through the average level of labor productivity (the physical volume of production and the social product per permanent farm worker), the average level of production intensity (the physical volume of production

and the social product per hectare of cultivated land), as well as the percentages of accumulation, reproduction and reinvestment.

The Results of Research and Discussion

The level of development of productive forces in Yugoslavia was very low after the war. Industrialization was the basic method for accelerated economic development. Agriculture represented a source for accumulation in that process. Therefore, in the period 1947-1956 the overall development of agriculture as a whole, and thus the socially owned sector as well, was very much neglected. The turning point in the development of Yugoslav agriculture came with the approval of the Resolution of the Federal Popular Assembly (in 1957) and of the Program of the League of Communists of Yugoslavia (in 1958). At that time, they adopted the concept of advancing agriculture on the basis of accelerated development of socially owned agricultural organizations, along with gradual collectivization of individually owned agriculture. After 1957, the process of modernization began in these organizations, which then and now represent the bearers of overall agricultural development. That was the beginning of the development of powerful, highly productive agricultural production on industrial foundations, along with a strengthening of cooperative efforts in the village. The development of these organizations show chiefly a rising trend, with occasional fluctuations.

Source: Yugoslav Statistical Yearbook

On the basis of data in Table 1, we can perceive a decline in the number of agricultural organizations until 1970, followed by increasing numbers. That is a consequence of the concentration and centralization of Yugoslav agriculture, the expansion and strengthening of these organizations through various integrational processes that were implemented after 1960. Beginning with 1970, actually after the approval and implementation of the Yugoslav Constitution in 1974 and the Law on Associated Labor in 1976, the former enterprises were transformed into organizations of associated labor, and their numbers grew. Other than that, the increase in cultivated surface held by these organizations has been slow. For example, in 1979 they had only 16 percent of the total cultivated surface in Yugoslav agriculture at their disposal. The number of permanent and temporary employees grew until 1965, and then began to decline. This resulted from the increasing modernization and better equipment of these organizations (see tables 2 and 3).

Source: The Statistical Yearbook of Yugoslavia

Total basic capital investments in agricultural organizations show a rising trend until 1960, and then begin to decline steadily: they did not return to 1960 levels of investment again until 1978. Similar tendencies are seen in investment in construction. In equipment, however, investments showed a constant increase both in absolute and relative terms. A significant increase in investments in equipment was noted after 1965, which coincided with the beginning of the drop in employment. That confirms the assertion about rapid modernization and mechanization of agricultural organizations in the period after the reform. A consequence of this investment activity can also be seen in the increasing mechanization of agricultural organizations.

On the basis of Table 3 we can perceive a growth in the number of agricultural machines, until 1965. After the economic reform, their numbers tended to decline. That can be explained by the motivational levels of organizations for acquiring more powerful machines with greater operational effectiveness. For example, in 1965 the number of tractors with more than 35.8 horsepower was 8,854, while in 1979 it totaled 18,213. That means that the number doubled in 15 years. The satisfactory level of agricultural mechanization is a qualitative change in the development of agricultural organizations. The question arises as to what motivates the agricultural organizations to make these changes.

Professor R. Stojanovic has studied the role of motivation systems in developmental policy; he stresses: "The two basic forms of motivation are developmental motivation and consumer motivation. Their interaction, the strength of each one's effect has the most direct impact on the pace and the nature of the entire society's development, it is essential that these two forms of motivation be in the optimum relationship.[1] The same author offers the following basic components of motivation for development:

a. The accumulation motivation
b. The motivation for the growth of specialized knowledge that cannot be put to direct use;
c. The motivation for integration in all spheres of economic life, seeking a integration process that will support development; and
d. The motivation for maximizing all of society's positive external factors.[2]

Stojanovic's ideas can find application in Yugoslav theory, policy and practice of agricultural development. The basic motto for the development of agricultural organizations is to increase and provide more stable growth and more favorable structure in agricultural production to "implement the policy of more ripid growth of personal consumption and the standard of living, for more complete satisfaction of the increasing needs for agricultural raw materials in industry, and for increasing exports while gradually reducing imports of foods."[3]

The mechanization of agricultural organizations and increases in the number of specialists have significant roles in realizing these goals. Mechanization will replace human work and contribute to higher quality and more prompt preparation of the land, sowing, cultivation, and harvest of grains, more rapid transport, better storage and so forth. And precisely increasing production and yields of wheat, corn and sugar beets in agricultural organizations (see Table 4) can be explained in part by social motives, goals and tasks in food production, good supplying of mechanization, and the growing number of specialists.

An essential factor in the development of socially owned agriculture after the economic reform can be perceived in the increase in work performed by machines (greater mechanization of the production processes) and the reduction of human labor (the number of employees.

The basic motive for these changes was to increase labor productivity in agricultural organizations, as an important prerequisite for more rapid agricultural development. In the last 25 years (1955-1979), labor productivity in socially owned agriculture, measured in terms of the physical volume of production per worker, has grown nearly six-fold (see Table 5).

Index, 1955 = 100

Key:

1. Year
2. Production in agricultural organizations
3. Permanent employees
4. Productivity (volume per worker)

Source: The Statistical Yearbook of Yugoslavia

Measured by value indices, labor productivity in the socially owned sector of agriculture shows the same trends. Expressed in value terms, the growth is more than 4.8 times the 1955 value (see Table 6).

Table 6. Trends on Social Production and Social Production per Worker in Agricultural Organizations

Key:

1. Year
2. Social Production in million dinars, calculated in 1972 prices on the principle of repeated activities
3. Labor productivity (social production per worker)
4. Index: 1955 = 100

The growth in labor productivity is an important indicator of not only the development of agriculture to the present, but also of its likely future development. The achieved growth in labor productivity in socially owned agriculture is satisfactory and has reached the level of productivity of agriculturally advanced countries such as Denmark, Holland, and the United States.

However, for analysis and evaluation of the development of socially owned agriculture, which is the most representative indicator, there are also other important parameters. One of them is the intensity of production, which is obtained by analysis of trends in social product per hectare of cultivated land. Actually, that is a significant indicator of the effectiveness of utilizing land capacity. The average level of intensity, expressed in physical and value terms, reveals growth trends. The intensity of production, calculated in terms of the physical volume per hectare of cultivated land, has increased five times in the past 25 years (see Table 7).

Table 7. Trends in the Physical Volume of production of Cultivated Land and the Physical volume per Hectare of Cultivated Land in Agricultural Organizations
Index: 1955 = 100
Key:
1. Year
2. Production in agricultural organizations
3. Cultivated land
4. Intensity (production per hectare of cultivated land)

Index: 1955 = 100
Key.
1. Year
2. Social Production in million dinars
3. Intensity (social production per hectare)
Source: The Statistical Yearbook of Yugoslavia

Analysis and comparison of the data on the growth of labor productivity and intensity of production in agricultural organizations indicate that prior to the economic reform, labor productivity grew more slowly than the intensity of production. After the economic reform, the level of labor productivity grew faster than the level of production intensity. A similar conclusion results from analysis of microeconomic indicators of the operations of agricultural organizations. (According to data of the Public Accounting Office, in 1966 income per employee amounted to 32,012 dinars, while in 1979 it was 258,060 dinars. In 1966 income per hectare of cultivated land was 3,905 dinars, while in 1979 it was 22,358. All quotations are at current prices. That means that when 1979 is compared with 1966, the income per employee increased eight times, while the income per hectare of cultivated surface increased 5.7 times.)

On the basis of these analyses, it can be concluded that Yugoslav agricultural organizations are better motivated to improve labor productivity, and have been less

motivated to increase the intensity of production, during the postwar period. A consequence of this motivation is found in increased extencivity of production, whereby the basic feature is the high share of grain production in the crop structure of cultivated and plowed land. Grain planting involved increasing mechanization and decreasing human labor. A further feature is the very small share of total land devoted to industrial crops, vegetables, fruits and fodder. The possibilities for more rapid development of animal husbandry, irrigation and other intensive agriculture are not being sufficiently utilized. In other words, Yugoslav agricultural organizations are giving insufficient attention to labor-and income-intensive production (see Table 9).

Table 9. The Structure of Sowing Land of Agricultural Organizations (in percentage)

1. Year
2. Planted surface
3. Grains
4. Industrial crops
5. Vegetables
6. Fodder crops

Note to 1955: The data for 1955 should be taken carefully since harvested rather than sowed land totals are given.

Source: Statistical Bulletins No 923 and 1220, and The Statistical Yearbook of Yugoslavia

The data in Table 9 confirm previous assertions. Of particular concern is the minimal amount of vegetables planted and the constant decrease in fodder crops in the sowing structure. The decrease in fodder crops planted is a consequence of fluctuations and stagnation in livestock production in agriculuural organizations. For example, in 1979 only 12 percent of the country's livestock belonged to these organizations. Concentration on extensive production in these organizations can be explained by the insufficient development of processing facilities, lack of coordination of development plans and programs between primary agricultural producers, processing facilities, consumer centers and food reserves. The overcoming of these shortcomings would hasten the development of labor- and income-intensive production in agricultural organizations, and that would contribute to better utilization of land capacity, to an increase in the average level of production intensity. Therby, total income and income per hectare in these organizations would be increased, and this would be reflected favorably in their capital accumulation, reproductive and reinvestment capability. Additionally, their income provides funds for the development of secondary, tertiary and public activities.

Therefore, the working people in these organizations must be constantly better motivated, along with the need for increased labor productivity, to steadily raise the level of production intensity, and thereby the accumulative, reproductive and reinvestment capability of agriculture. These are also important indicators of the development of agriculture.

The accumulative, reproductive and reinvestment capability of socially owned Yugoslav agriculture is unsatisfactory; in the past 14 years it has tended to decline (see Table 10).

Table 10. Rates of Acummulation, Reproduction, and Reinvestment in Agricultural Organizations

Year	Accumulation rate (1)	Reproductica rate (2)	Reinvestment rate (3)
1966	3.8	7.0	3.8
1970	2.2	6.4	1.6
1975	2.5	6.0	3.2
1978	1.2	4.0	0.6
1979	1.4	4.1	0.4

Source: Data of the Public Accounting Office

1. $Sa = \frac{PF}{PKPA\ (Aos + Aob)}$

Sa = the accumulation rate
PF = the operations fund
PK PS = average use of operating funds (basic capital + working capital)

2. $RS = \frac{PF + AM}{PFPS\ AAos + Aob)}$

RS = reproduction rate
AM = amortization — total funds

3. $Srs = \frac{PF + Am - Ot}{PKPS\ (Aos + Aob)}$

Srs = reinvestment rate
Ot = total repayments received for unpaid debts based on investment credits for basic and working capital, and repayments for investment credits for basic and working capital to be received the following year.

This has resulted from the deterioration in the position of agriculture in primary and secondary capital distribution. The deterioration in the position in primary distribution is seen in the more rapid rise of prices for industrial products intended for agricultural use, compared to the rise in prices for agricultural products. In secondary distribution, it is seen in the more rapid increase in personal, joint and general consumption (personal income, and contributions to interest communities and sociopolitical communities), compared to the increase in pri es for agricultural products.

Improving the position of socially owned agriculture in primary and secondary capital distribution is a crucial issue for the agricultural, econimic and socioeconomic development of the country in the coming period.

ERRATUM: The following is a corrected version of an article published on pages 42-44 of JPRS 79285 of 23 October 1981, No 2192 of this series.

YUGOSLAVIA

FOREIGN TRADE OF REPUBLICS, PROVINCES, JAN-JUL 1981

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 15 Sep 81 p 3

[Article by Milorad Urosevic]

[Text] Exports covered 58.5 percent of imports, but for every 100 dinars imported for foreign exchange only 44.7 dinars of goods were exported. Serbia proper had the best success, with 72.8 percent of imports covered by exports, while relatively the worst record was Croatia's 40.5 percent coverage.

The end of summer vacations also meant the coming of increased activity in the assemblies of sociopolitical communities and organizations of associated labor, as well as in other organizations and institutions involved in implementing the conclusions of the Council of Republics and Provinces approved on 16 July. These decisions relate chiefly to overcoming inflation, which cannot be achieved without balancing exports and imports and reducing the negative balance of trade.

To improve the country's position in economic relations with foreign countries, reduce the trade deficit and the degree of indebtedness, and increase exports to foreign exchange areas, special responsibility must be assumed by the republics and provinces. The Conclusions continue to state that the interest communities for economic relations with foreign countries and organizations of associated labor must also accept their obligations, while the Federal Executive Council and the National Bank should make it impossible to accept import applications that exceed the balance of payments and the deficit that has been approved.

Regarded in this manner, and taking into consideration that the Federal Statistical Office is overburdened with work related to the population census and therefore is late in publishing its regular reports on economic trends, the data published last week on foreign trade for the January-July period gain in significance. Here it is not only significant to note the increase in exports and imports, but also the indicators regarding the negative balance. Nor should one ignore the degree to which the sociopolitical community has contributed to the results achieved.

Those elements are apparent from the data about the degree to which imports were covered by exports and the share of individual republics and provinces in the total negative balance. From this will come their tasks until year's end. Comparison of the most important elements of this exchange during 7 months this year and the same period last year will be possible later; below are the results for 1981 so far.

Data for the Period January-July 1981

Sociopolitical community	In million dinars			Percent imports covered by exports	Share in:		
	Exports	Imports	Deficit		Exports	Imports	Deficit
Yugoslavia-total	157,832	269,739	111,907	58.5	100.0	100.0	100.0
Bosnia and Hercegovina	23,202	35,663	12,461	65.1	14.7	13.2	11.1
Montenegro	2,219	6,158	3,939	36.0	1.4	2.3	3.5
Croatia	34,087	73,282	39,195	40.5	21.6	27.2	35.0
Macedonia	7,866	12,456	4,590	63.2	5.0	4.6	4.1
Slovenia	31,110	44,735	13,635	69.5	19.7	16.6	12.2
Serbia proper	41,822	57,467	15,645	72.8	26.5	21.3	14.0
Kosovo	3,132	6,479	3,347	48.3	2.0	2.4	3.0
Vojvodina	12,740	24,175	11,435	52.7	8.1	9.0	10.2
Federation	1,654	9,324	7,670	17.7	1.0	3.4	6.9

The numbers on the table require some explanations and additions. Compared to the same months of last year, exports increased by 16 percent, while imports were down by 1 percent. The negative difference increased from 99,401 billion dinars to 111,907 dinars, or by 12.6 percent. Recalculated on the basis of the Federal Executive Council Resolutions on Establishing Foreign Exchange Rates, the deficit reached 4,099 billion dollars, compared to 3,641 billion during the same time period of the previous year. The negative balance with convertible currency countries, however, is even worse. Last year the 7-month deficit was 3,298 billion dollars, while this year it reached 4,140 billion, meaning a 26.2 percent increase.

All of these figures represent the Yugoslav total, to which it should be added that last year the amount by which exports covered imports in the period under consideration amounted to 58.5 percent, while this year it was better by half a percentage point. The various sociopolitical communities contributed differently to the overall Yugoslav balance, with some improving their shares and others showing worse results.

Taking their share in the overall results into consideration, Serbia proper and Croatia have a great impact on the whole, and this has been true in the year so far.

Increasing the amount its exports covered imports from 72.2 percent during the first 7 months of last year to 72.8 percent, and its share of total exports to 26.5 percent, of total imports to 21.3 percent, and its share in the negative balance to 14 percent, Serbia proper contributed at least to a minimal improvement in the Yugoslav balance of foreign trade.

The Croatian economy saw its exports/imports ratio decline from 55.6 percent during January-July last year to 40.5 percent this year, while its share of total exports was 21.6 percent, of total imports, 27.2 percent, and of the trade deficit, 35 percent.

Bosnia and Hercegovina also improved its contribution with the exports/imports ratio going from 63.9 to 65.1 percent, while its share of total exports was 14.7 percent, of total imports, 13.2 percent, and of the trade deficit, 11.1 percent.

Macedonia recorded a significant improvement, with the exports/imports ratio rising from 57.8 percent for 5 months of last year to 63.2 percent this year and with declining shares in exports, imports and the trade deficit.

After Serbia proper, Slovenia showed the best exports/imports ratio, improving from 66.8 percent for the 7 month period last year to 69.5 percent this year, while its share of total exports declined to 19.7 percent, of total imports to 16.6 percent, and of the trade deficit to 12.2 percent.

Vojvodina showed the greatest advances, although given its low starting point, there was little reason for satisfaction. The exports/imports ratio improved from 40.1 percent for 5 months to 52.7 percent, with its share of total exports at 8.1 percent, of total imports at 9 percent, and of the trade deficit, 10.2 percent.

Montenegro and Kosovo increased their negative balances and lost ground in the exports/imports ratio, but their shares of total foreign trade are very modest, so that they have little impact on the final results.

Regarded in this manner, and combining basic elements that are published by the Federal Statistical Office with supplementary calculations, it is possible to perceive both the results so far and the obligations that are before the republics and provinces. This, however, is not enough, because the role of organizations of associated labor is not apparent. Research into the extent that exports cover imports for individual economic branches and sectors, combined with total employment and personal income figures, would reveal very different behavior and contributions to economic stabilization. These features deserve a special study.

CSO: 2800/362

BRIEFS

OIL PRODUCTION--This year our country will produce from domestic sources 4,355,000 tons of crude oil, valued at $1.3 billion. INA-Naftaplin will produce 3,105,000 tons of this amount, and Nafta-gas will produce 1,250,000 tons. These two enterprises will also produce about $400 million worth of natural gas this year. They expect to intensify exploration of the Pannonian basin and also invest more in exploring the Adriatic sea for oil. [Excerpt] [Zagreb VJESNIK in Serbo-Croatian 19 Oct 81 p 3]

CONSTRUCTION WORK ABROAD--Yugoslav construction enterprises will complete about $1.5 billion worth of work abroad this year (about $200 million more than in 1980), largely in Iraq, Libya, Algeria, the USSR, the FRG, and Kuwait. [Text] [Belgrade EKONOMSKA POLITIKA in Serbo-Croatian 21 Sep 81 p 9]

WORK IN DEVELOPING COUNTRIES--At the beginning of the year Yugoslavia concluded new agreements on investment work in Iraq, Libya, and Algeria, valued at more than $2.5 billion. With Libya it drew up contracts for forming a joint company to build a $1 billion aluminum complex, for $350 million worth of construction at the port of Misurata, and for $220 million worth of work on a maritime academy. In Algeria our workers will build three $350 million dams and two $60 million shoe factories. An agreement was made with Iraq to build a $572 million hydroelectric plant. Planned capital investment work by Yugoslavia in the developing countries this year is valued at $1.1 billion. In the first half of this year 67 percent ($449 million) of all capital investment work (totaling $742 million) was carried out in developing countries. The plan for such work in these countries is expected to be met this year. In the first 9 months of this year 16 percent more was exported to the developing countries than a year ago, amounting to $1,292,000,000 in value. The covering of imports by exports was 72 percent compared to 57 percent in all of 1980. Total exports to these countries should be about $1.9 billion. Through ship exports alone about $140 million is expected to be earned, namely, from Iraq, Libya, Algeria, Iran, Egypt, and India. By 1985, at least 26 percent of Yugoslavia's economic relations with foreign countries should be with developing countries. [Excerpts] [Belgrade BORBA in Serbo-Croatian 23 Oct 81 p 1]

KOSOVO SUPPLY PROBLEMS--The supply of consumer goods to the Kosovo market is not satisfactory, i.e., the market has all the more important items but not in adequate quantities, so there is a shortage in certain areas of the province. In the last few months there has been a largely sufficient supply of sugar; 6,000 tons was recently imported but another 6,000 tons cannot be imported until foreign exchange is found to pay for it. After the sugar beet harvest and processing,

supplies are expected to improve. Vegetable oil is available but deliveries from producers are not regular. Market supplies of wheat are also unsatisfactory. Because of lack of funds, the province has not yet decided to purchase additional quantities of flour from Vojvodina but imports will be necessary because there are not sufficient quantities of wheat. The market also is not supplied fully with milk because producers are sending only small quantities to market, since it is being used to make cheese, and farmers are waiting for price increases for milk. In the last 3 months there has also been a shortage of technical household goods (refrigerators, freezers, color television sets, air conditioners) because producers do not have enough producer goods or foreign exchange, so they must reduce the quantities of these goods to the market for this year and next year. The supply of construction materials has not improved; reinforced concrete continues to be in greatest demand because the combine in Zenica is not delivering agreed-upon amounts. There is also large demand for cement which continues to be in short supply because of the lack of mazut, and for wood and coal for fuel, but supply is very poor. [Excerpt] [Pristina JEDINSTVO in Serbo-Croatian 9 Oct 81 p 8]

TRADE WITH CHINA--In the first 7 months of this year Yugoslav-Chinese trade amounted to only $43.3 million (including $16.3 million of Yugoslav exports (a 26 percent decrease/compared to the same 1980 period) and $27.1 million in Yugoslav imports (a decrease of 69 percent compared to the same 1980 period). Data for the 8-month period are also not encouraging: $27.15 million worth of goods were imported and $18.47 million worth of goods were exported. In the 9-month period $19.2 million were exported and $28.6 million were imported. As of 19 October, Yugoslav exports to China amounted to $20.3 million, while imports amounted to $34 million, with total trade amounting to $55.3 million, while the Yugoslav deficit was $13.7 million. [Excerpts] [Belgrade PRIVREDNI PREGLED in Serbo-Croatian 28 Oct 81 p 1]

TRADE WITH MEXICO--Last year oil accounted for $45 million of the total $55 million in total trade value with Mexico, thus creating a large deficit on our side. Negotiations are still underway, having started a full year ago, for Yugoslav construction of two cement plants in Mexico, as well as Yugoslav exports of industrial equipment and other goods. In the January-August period we exported machine tools and electric equipment valued at $3.7 million, but we imported oil, and small amounts of copper, zinc, and coffee valued at $40 million which means that also this year trade will be on the level of previous years (during the same period last year exports were $2.9 million, and imports $24.5 million). FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

YUGOSLAV-GDR COMMODITY TRADE LISTS FOR 1980

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 10, 9 Oct 81 MEDJUNARODNI UGOVORI pp 599-603

[Trade protocol for 1980 between the Socialist Federal Republic of Yugoslavia and the German Democratic Republic signed in Belgrade 17 November 1979 and ratified in Belgrade 31 January 1980 by the Federal Executive Council and signed by chairman Veselin Djuranovic]

[Excerpt] Commodity List A/1980. Exports From the Socialist Federal Republic of Yugoslavia to the German Democratic Republic

No 1	Commodity 2	Unit of Measurement 3	Quantity 4	Value in Thousands of Dollars 5
1	Fresh fruit and vegetables, pulps, juices, processed fruit and vegetable products			5,000
2	Miscellaneous seed, transplants and nursery stock			2,000
3	Wine			13,600
4	Tobacco	Thousands of tons	1	
5	Feathers			1,500
6	Hemp yarn			750
7	Leather footwear	Thousands of pair	400	
8	Leather garments			2,000
9	Finished textile products			9,000
10	Handicrafts			200
11	Bauxite	Thousands of tons	42	
12	Bentonite			100
13	Mineral wool, glass wool and fabric			400
14	Glass and ceramic products (including laboratory glass)			1,200

Commodity List A/1980 (continued)

1	2	3	4	5
15	Chemical products and raw materials			8,000
16	Exchange of PVC--"S"			8,400
17	Exchange for PUR [expansion unknown]--"S"			2,200
18	Titanium dioxide	Thousands of tons	12.50	
19	Superphosphate, phosphoric acid--"S"			2,400
20	Pharmaceutical raw materials and products (including zinc bacitracin)			3,000
21	Clay for whitening	Thousands of tons	3	
22	Products and equipment of the electrical products industry			4,500
23	Cooperation in the electrical products industry--"S"			2,300
24	Electronic components, including "S"			5,500
25	Low-voltage products--"S"			4,000
26	Cables and conductors			300
27	Technical refrigeration equipment--"S"			1,200
28	Railroad cars*	Units	150	
29	Automobiles	Units	1,000	
30	Parts for the motor vehicle industry			5,800
31	Miscellaneous instruments and gear			2,000
32	Optical components			1,100
33	Precision optics--"S"			1,000
34	Electronic products			1,500
35	Fittings			300
36	Accessories			3,500
37	Pneumatic devices (including $1.3 million under "S")			4,000
38	Drive chains--"S"			4,300
39	Chain			600
40	Tools			7,500
41	Cooperation in the manufacture of sewing machines--"S"			500
42	Miscellaneous metal goods			1,400
43	Castings and forgings of ferrous metallurgy			12,000
44	Cast pipe, including light sewer pipe and fittings			1,500
45	Exchange of miscellaneous rolled materials of ferrous metallurgy--"S"			1,500
46	Exchange of steel pipe--"S"			9,500

* Fifty of which are to be delivered without the GDR delivering components for incorporation.

Commodity List A/1980 (continued)

1	2	3	4	5
47	Rolled aluminum, copper and zinc products			1,000
48	Aluminum castings			4,000
49	Motorbikes, including "S"			800
50	Machines, equipment and parts			35,000
51	Machine tools and accessories			8,500
52	Machine tools--"S"			1,300
53	Parts for railroad cars			1,500
54	Nickel-cadmium storage batteries			900
55	Lead storage batteries			200
56	Tires for motor vehicles			3,000
57	Automotive spark plugs			700
58	Beech lumber			1,200
59	Other hardwood lumber			1,000
60	Veneer	Millions of m^2	0.75	
61	Miscellaneous paper and pasteboard			2,000
62	Sporting goods and toys			100
63	Office machines			3,000
64	Components for incorporation into intermediate tabulators			3,000
65	Silicate brick			200
66	Refractory materials			300
67	Consumer goods			6,000
68	Books, magazines and films			500
69	Cooperation in light industry--"S" As follows:			
	In the textile industry			38,000
	In the footwear industry	Thousands of pairs	1,000	
	In the paper and pulp industry			2,400
	In the wood industry			2,400
70	Construction and installation services			25,000
71	Ship repairs			2,400
72	Services			32,000
73	Aluminum in bars and semifinished products	Thousands of tons	50	
74	Slab zinc and semifinished products	Thousands of tons	14	
75	Electrolytic copper and semifinished products	Thousands of tons	3.50	
76	Cellulose textile fiber	Thousands of tons	10	
77	Miscellaneous			4,000

Commodity List B/1980. Exports From the German Democratic Republic to the Socialist Federal Republic of Yugoslavia

No 1	Commodity 2	Unit of Measurement 3	Quantity 4	Value in Thousands of Dollars 5
1	Potassium salts 60%	Thousands of tons	268	
2	Potassium sulfate 50%	Thousands of tons	4	
3	Kaolin--sand for glassmaking			700
4	Fluorite			250
5	Acrylonitrile, monomer	Thousands of tons	5	
6	Organic and inorganic chemicals			18,000
7	Exchange of VCM [(?) vinyl chloride monomer]--"S"			8,400
8	Exchange for PUR--"S"			2,200
9	Organic dyes--including auxiliary agents used in the textile and leather industries			2,000
10	Miscellaneous chemical products and raw materials			7,000
11	Pharmaceutical raw materials and products			1,600
12	Plastic products			1,300
13	Synthetic rubber	Thousands of tons	14	
14	Ammonia--"S"			2,400
15	Miscellaneous film products			2,000
16	X-ray films--"S"			1,800
17	Seed and nursery stock			1,100
18	Machine tools and accessories			18,000
19	Machine tools--"S"			1,300
20	Machines and equipment			77,000
21	Tools (power tools, hand tools and measuring instruments)			1,800
22	Cooperation in the manufacture of sewing machines--"S"			500
23	Automobiles	Units	5,000	
24	Miscellaneous metal goods (including hunting guns)			2,600
25	Drive chains--"S"			500
26	Fittings			1,000
27	Technical refrigeration equipment--"S"			1,700
28	Hydraulic products--"S"			3,000
29	Diesel engines for ships and power plants			1,000

Commodity List B/1980 (continued)

1	2	3	4	5
30	Intermediate tabulating machines			16,000
31	Computers			2,000
32	Miscellaneous devices for telecommunications			200
33	Technical medical and laboratory equipment			2,000
34	Products of precision machining and optics			2,000
35	Pieces of equipment used in scientific research			4,000
36	Precision optics--"S"			2,500
37	Spare parts for vehicles, electrical, and accessories			3,400
38	Automotive spark plugs			450
39	Parts for rail vehicles			1,000
40	Products and equipment of the electrical products industry			2,600
41	Cooperation in the electrical products industry--"S"			2,300
42	Electronic elements, including "S"			1,700
43	Low-voltage products--"S"			4,000
44	Cables and conductors			300
45	Electrographite and other carbon products			200
46	Rolled materials of ferrous metallurgy (including $4.5 million worth of alloy steel)			6,000
47	Exchange of steel pipe--"S"			9,500
48	Exchange of miscellaneous rolled materials of ferrous metallurgy--"S"			1,500
49	Optical, laboratory and other glass			700
50	Construction glass and ceramic building materials			1,200
51	Tires for motor vehicles			900
52	Consumer goods			20,000
53	Finished textile products			7,500
54	Handicrafts			200
55	Motorbikes, including "S"			1,500
56	Products of ferrous metallurgy for Riesa			6,900
57	Miscellaneous paper and pasteboard			1,400
58	Licenses			200
59	Cooperation in light industry--"S"			
	As follows:			
	In the textile industry			38,000
	In the footwear industry			4,200
	In the paper and pulp industry			2,400
	In the wood industry			2,400

Commodity List B/1980 (continued)

1	2	3	4	5
60	Books, magazines and films			500
61	Services			16,000
62	Goods on the basis of the general* aluminum contract			38,900
63	Goods on the basis of the general zinc contract, including: Products of ferrous metallurgy worth $1.9 million Payments against equipment for open-cut mining in the amount of $1.5 million			3,400
64	Goods on the basis of the general copper contract, including: Products of ferrous metallurgy worth $1.0 million Payments against equipment for open-cut mining in the amount of $800,000			1,800
65	Goods on the basis of the general contract on cellulose fiber for the textile industry**			5,900
66	Products of ferrous metallurgy			10,500
67	Miscellaneous			4,000

* Covered by Appendix 1.
** Covered by Appendix 2.

Appendix 1. List of Goods Which the German Democratic Republic Will Deliver Under Item 62 of List B of the Trade Protocol for 1980

General Aluminum Contract

No 1	Commodity 2	Value in Thousands of Dollars 3
	A. Miscellaneous Goods	21,400
1	Anodes and cathodes	6,500
2	Fishmeal	6,000
3	Ground soybean oilcake	2,000
4	Chemical products	4,000
5	Products of ferrous metallurgy	2,900

Appendix 1 (continued)

1	2	3
	B. Supplemental Commodities	17,500
6	Payments on ships (payments for ships already delivered in the amount of 8,400 and for ships newly contracted for 4,600)	13,000
7	Construction glass (ornamental, shaped and prismatic)	500
8	Hotel porcelain and ceramics	1,600
9	Sporting goods and camping equipment	1,000
10	Hand tools	400
11	Spare parts for automobiles	1,000

Appendix 2. List of Goods Which the German Democratic Republic Will Deliver Under Item 65 of List B of the Trade Protocol for 1980

General Contract on Cellulose Fiber for the Textile Industry

No	Commodity	Unit of Measurement	Quantity	Value in Thousands of Dollars
1	2	3	4	5
1	Chemical products			2,000
2	Cement	Thousands of tons	60	
3	Lumber			500
4	Spare parts for automobiles			500
5	Furniture upholstery fabrics			200
6	Miscellaneous goods			700

MINISTER DWELLS ON STATE OF POWER INDUSTRY, FUTURE TASKS

Sofia ENERGETIKA in Bulgarian No 6-7 Jun-Jul 81 pp 4-8

[Speech by Nikola Todoriev, minister of power supply, delivered at Georgi Kirkov Hall on 9 June 1981: "Let Us Multiply Our Seventh Five-Year Plan Achievements by Implementing the Decisions of the 12th BCP Congress"]

[Text] Dear Comrades and Guests:

On the eve of this celebration, on behalf of the leadership of the Ministry of Power Supply, the central council of our trade union and the party and Komsomol organization and trade union committee of the ministry, to congratulate all those present here, our guests, and all workers and specialists in the national energy complex on the occasion of Power Worker's Day, and to wish them sincerely good health, good cheer, happiness and new successes in the development of the power industry and the upsurge of our socialist homeland!

Today we are praising the work of people who used their hands, knowledge and experience in order to provide us last year with an adequate amount of electric power and heat for normal production activities by the working people in fields and plants and for their proper relaxation and comfort at home. We praise industriousness--this fabulous feature of the Bulgarian people--thanks to which they were able to withstand the trials of life over 1,300 years, to build and defend their state against the vicissitudes of fate, to create their rich history and culture and to develop and retain the loftiest possible national virtues.

The tradition of our holiday demands above all to report to the BCP Central Committee and its Politburo and to the entire country the results of our efforts during the past year. Our report must be based on the requirements stipulated in the decisions of the congress. We must consider our accomplishments in the light of the problems we are resolving. We must express our gratitude to those who have contributed most to this true holiday spirit and to repay the homeland's acknowledgement of our efforts with new accomplishments leading to its upsurge.

The distinguishing feature of the balance we are drawing today is that it is being done only two months after the historical 12th BCP Congress. The congress provided clear answers to all basic problems of our development. It formulated qualitatively new objectives and future tasks and armed us with the ways and means with which to achieve them.

Let me add that the atmosphere of our holiday is enhanced and unusual also because we are celebrating it at the beginning of the 1980s of the 20th century, at a time when the Bulgarian state is entering its 14th century of life. By a coincidence, 1981, which was marked by the bright light of the 1,300th anniversary of Bulgaria, included remarkable, outstanding and immortal Bulgarian historical anniversaries. This year, we celebrated the 25th anniversary of the historical April Plenum, the fruitful renovation of which provided conditions for rich and creative thinking and action.

We are about to celebrate the great 90th anniversary of the founding of our heroic Blagoev-Dimitrov communist party, which is one of the oldest consistently revolutionary Marxist parties in the world.

As I note these outstanding events which highlight our holiday, I wish to emphasize that we add to our patriotic feelings enhanced by the bright dates of our more ancient and more recent history the feeling of legitimate pride in our presence, in our contribution to the great accomplishments of our people and to their constructive toil in building a beautiful Bulgaria--beautiful because of its great past and even more beautiful because of the optimism and thrust of its present.

Now, when the time has come to draw the balance of 5 remarkable years, we can confidently state that we, the Bulgarian power workers, account for a proper share of the great accomplishments of our homeland in the Seventh Five-Year Plan. Such was the assessment provided at the 12th congress, an assessment which creates an inspiration and an obligation.

Directed by the farsighted April Party course, the power industry developed upward, reaching a scale worthy of our time, of the behests we are fulfilling and the cause we serve. It is a cause to which thousands of great people in the past and the present selflessly dedicated their youth, life, strength, minds, knowledge and talent. It is a cause which is recorded in the constructive program of the 12th party congress as the first and main formula for action: "Everything for the sake of man, everything for the good of man!"

As Comrade Todor Zhivkov said, the decade we sent on its way created a second Bulgaria. In other words, we entered the final period of the 20th century with two Bulgarias.

During this most fruitful period of our socialist development we, power workers, can proudly state that we ensured the power base of two Bulgarias. This was the result of the adamant, dedicated and selfless toil of the hundred-thousand-strong army of working people in the power industry. Allow me, therefore, from this lofty rostrum, today, on the occasion of our beautiful holiday, to express the warmest and most sincere gratitude to all workers and employees, scientific associates, specialists and heads of combines, economic enterprises, organizations and institutes and the personnel of the ministry for their work, their efforts and creative searchings, calm efficiency and discipline in daily work and dedication and heroism at critical moments of natural calamities and disasters, for their properly fulfilled professional and civic duty and for the dedication with which they are defending the honor of their profession.

Comrades:

The Seventh Five-Year Plan marked a new stage in the development of the power industry. It was fruitful and dynamic and saturated with a great deal of tension and success. It was a period of basic changes in the organizational-production structure of the sectorial economic system and further production concentration and specialization. These were years of struggle for high quality and effectiveness.

Let me emphasize that the basic feature during that period was the qualitative changes which took place in the approach to the solution of power problems. This approach ensured the implementation of the major tasks of the five-year plan on the maximum utilization of our own resources, coal above all, the accelerated development of nuclear power capacities and the decisive course taken toward improving the energy effectiveness of the entire economy.

For the past 2 years these strategic objectives have been implemented on the basis of the systematic application of the new economic mechanism.

The period under consideration proved that the new mechanism is already actively influencing the increased effectiveness of the power industry. The overall system of economic levers developed by the party decisively strengthened the role of the labor collective and the individual worker in planning, production, distribution and management. The purpose of the new mechanism is to ensure the even more effective solution of the social problems of labor collectives and a tie between their work and its end results.

Let me also emphasize the growing effectiveness of counterplanning. Counterplans were created by the labor collectives, on the basis of the initiative, ideas and suggestions of their individual members. Counterplanning brings up on a permanent and current basis new reserves and the hidden springs as yet unused in our march toward further progress.

The exceptional attention which the party and the government ascribe to the power industry needs no proof. Its steadily growing power is the best argument in favor of the consistency of the April line in ensuring the faster development of this sector.

Every one of us realizes that without this line, without the constant concern for and understanding of our problems, today's successes would have been impossible. That is why, from the rostrum of our professional holiday, I would like to express on behalf of the Bulgarian power workers our warm gratitude to the BCP Central Committee and personally its General Secretary, Comrade Todor Zhivkov, for the great concern and attention which are the basis and inspiration for all of our accomplishments.

At the end of the last five-year plan, Bulgaria's energy base reached 8,800 megawatts. Over the past 5 years alone, an additional 2,000 megawatts were installed in three of the biggest power projects of the Seventh Five-Year Plan: the Kozloduy AETs [Nuclear Electric Power Plant], the Maritsa-Iztok 3 TETs [Thermoelectric Power Plant] and the Varna TETs.

Today, 40 percent of the country's total electric power generating capacity is concentrated in five thermoelectric power plants, three of them at the Maritsa-Iztok

complex. After the fourth reactor has been commissioned at the end of this year at the Kozloduy AETs, the nuclear complex will generate 1,760 megawatts with an additional output in excess of 10 billion kilowatt hours. These are figures characterizing a modern and highly developed power base.

In 5 years, capital investments in the power industry increased from 1.5 billion to 2.3 billion leva. In the coal industry alone, they doubled. The lag in the coal industry is being successfully surmounted. Last year the Bulgarian miners extracted a record-setting amount of coal--31.5 million tons.

During a 5-year period electric power consumption increased by 10 billion kilowatt hours. Currently, our annual per capita consumption of conventional fuel is 5 tons, which is twice the world average, and 4,400 kilowatt hours of electric power alone. The specialists, and not only they, know that electric power consumption is a comprehensive indicator of the living standard of a society. The figures I mentioned are close to and even outstrip the indicators of many industrially advanced countries. Let me remind you that only less than four decades ago, Bulgaria was in the penultimate position in Europe in terms of these indicators. At that time, our biggest power plant in Kurilo generated 19 megawatts. Today the Varna TETs has 1,260 and tomorrow the Kozloduy AETs will generate 1,760 megawatts. It is becoming increasingly difficult to draw such comparisons between our present and our recent past, for they must be expressed in three-digit figures.

This does not apply to the power industry alone, which began just about from scratch. This applies to all areas of our life. Today in a matter of hours we produce as much as we once did in a number of years. Could there be a better proof of the power of our ideas and of the opportunities which our socialist reality offers!

The power industry is a sector which creates prerequisites for the fast development of scientific and technical progress in all fields of life. The pace of its development is based on the broadest possible application in the sector of peak scientific and technical achievements.

In a period of no more than 5 years, with the invaluable help of the Soviet power industry, we mastered an essentially new method for power production, virtually from scratch, based on the breakdown of the atomic nucleus, and installed a nuclear power capacity of 1,320 megawatts, which today accounts for one fifth of the overall volume of electric power produced in the country.

As a result of the qualitatively new approach adopted for the meeting of power requirements and the use of primary energy resources, there has been an increasing trend toward lowering the amount of energy needed per unit of output. Whereas in the Sixth Five-Year Plan we averaged an electric power consumption of 5.5 percent per year, in the seventh it dropped under 3 percent. What does this prove? It proves a developed awareness of the need to save, raised to the level of state policy. This was the result of a conversion from words to actions and from promotion to decisive action in conserving energy and resources, particularly of scarce liquid and imported fuels. The times are such that there is no alternative to the conservation of energy and raw materials. The consumption of fuel and energy resources in the world has doubled in less than 20 years, and 90 percent of such resources we are using today are nonrenewable. Tremendous scientific and technical forces throughout the world have become involved in the development and utilization of new ways and means with which to meet energy requirements.

The energy crisis of the 1970s caused decisive changes in the supply and demand of resources on the energy market and in the approach to their use. We can already notice a substantial adaptation to the new conditions created by the crisis. The conviction that the pace of socioeconomic development can remain on a relatively high level as a result of sensible and substantiated activities has become gradually accepted.

A forecast prepared by the World Energy Conference on the development of energy through the year 2000 stresses that mankind will not be threatened with an energy hunger even in the more distant future. However, increasingly inaccessible capital-intensive resources will have to be used, such as the deep-sea and the polar shelf, natural gas from remote areas, extracted from great depths and areas with very high pressure, and so on, as well as the capital-intensive nuclear and, in the more distant future, thermonuclear energy.

Naturally, the changes which occurred in the energy situation in the world after the 1970s were reflected in the socialist countries as well. However, they were not decisive, mainly thanks to the systematic pursuit of the strategy I mentioned, which makes us relatively independent of scarce oil and natural gas supplies and of the increasing scarcity of high-quality coal.

Energy will retain its priority as a basic factor in development and progress and as a factor in the multiplication of material and spiritual values of society. That is why we must conserve it. This is the basic direction of our energy policy, which will be assuming an increasing importance.

In this important activity of the national energy complex, we are cooperating with all economic ministries and departments on the basis of a coordinated long-range program. Its tasks are being included in the counterplans of all labor collectives in the production area.

The technical retooling of energy production facilities and the application of contemporary technology led to significant improvements in our technical and economic indicators. During the five-year plan, fuel outlays per kilowatt hour were reduced by 18 grams. Over the 5-year period this equaled savings of 950,000 tons of conventional fuel.

The country's electric power system expanded considerably and was subjected to major quality changes. One hundred ten kilovolt-hour conduits are being converted into a distribution system; the construction of a 400-kilovolt grid is being expanded as an electric power carrier, and the development of 220-kilovolt grids is being limited. The purpose is to optimize the carrying, transformation and distribution of electric power.

Reducing electric power outlays for power plant house requirements saved nearly 1.5 billion kilowatt hours of electric power during the five-year plan.

Great attention is being paid to population services. The power supply combines and the ministry have focused their attention on improving heat and electric power supplies to the end consumer. They are trying to respond better and more promptly to the needs of the individual citizen. However, we still have a debt to the citizen,

being clearly aware of the need to work seriously in order to meet his requirements based on high modern living standards.

As we review our accomplishments, let us add that some problems have not been fully resolved and that we are paying a great deal of attention to them.

We would be hard pressed to give a positive answer to the question of whether technological discipline in all power production and supply sectors is on the necessary level. We would have to stop and think before answering the question of whether we have achieved proper use of electric power in all our subunits.

Have problems related to the application of internal cost effectiveness and of the brigade organization of labor been resolved entirely? Have we turned these factors into a powerful lever of economic influence?

A deeper study of losses from the transportation, transformation and distribution of electric power, something which is already being done quite thoroughly, would reveal that an important reserve for electric power conservation remains underestimated.

Again, if asked whether we have reached the limit of material and raw material conservation in each one of our organizations or branches, we should honestly answer that many unused reserves remain. These are some of the things which cast a shadow on our achievements. However, even during a celebration we have no right to conceal that which concerns us and hinders our work. Let me repeat Lenin's words that the best way to celebrate an anniversary is to draw the attention to unresolved problems. This is our communist, professional and civic duty and a strict requirement of the spirit of the time in which we live.

Comrades:

Almost 3 months have passed since the 12th BCP Congress. The fact that the high level tone which marked our precongress preparations has been maintained proves clearly that the spirit of the congress influenced the activities of power workers profoundly. Today we have the results of the first 5 months. Our best and most important accomplishment during that period was that all requirements of the national economy and of private consumers for energy and fuel were met fully and systematically. Let me emphasize that this was accomplished without any considerable increase in power consumption. This proves that power outlays in our economy are being increasingly reduced.

During those 5 months, electric power production increased by about 8 percent compared with the same period of last year. This shows a strengthening of electrification within the power balance as a result of the predominant use of local fuels and nuclear power.

In the first 3 months conventional fuel outlays per kilowatt hour were reduced by 3 grams. The profit plan was overfulfilled. As you can see, this is a good accomplishment for which we can congratulate ourselves.

The facts prove that the precongress competition, which created a high level mobilization, expanded on the eve of our professional holiday. New initiatives and

projects are being undertaken. New pledges were given by the frontrankers and the economic aktiv in the electric power industry on the eve of their conference at the Mala Tsurkva VETs [Hydroelectric Power Plant]. At the national conference held at the Kazanluk TETs, heat supply specialists formulated their own appeal in answer to the appeal of order-bearers and frontrankers in the country. Preparations for the autumn-winter season are entering their peak period. Experience has taught us that we must plan in advance the stockpiling of sufficient quantities of coal. Our power repair units are operating "under a high-tension system," for this is their hour of action. It is clear that this will be a hot summer. However, there is no doubt that the Bulgarian power workers will retain and increase their results in the second half of the first year of the five-year plan as they will throughout the entire five-year plan.

This is guaranteed by their pledge, will, ambition and skill. I am repeating this, for once each year, on our holiday, we have the right to be more generous in assessing our accomplishments, while at any other time we let others speak about us, while we are doing our job and are in constant readiness. The reason is that many production processes may be stopped but the flow of electric power must not. We keep saying that the rate of our pulsebeat today is 50 hertz and that it is the power workers whose duty it is to maintain its nominal rhythm without interruption.

As I emphasized at the beginning, the spirit of our time demands of us to be exigent when we draw a balance on the basis of the requirements of the congress. Today it is not our yesterday's accomplishments but our skill to use them adequately that constitutes the criterion of our work.

The 12th congress called for a comprehensive development of the economy. Whereas in the past quantitative achievements represented the overall assessment of all activities, today, if I may say so, the system of coordinates has changed. It is not a question of equipment, people and labor tools and objects but of their most efficient utilization. It is not a question of maintaining a high rate of energy consumption but of attaining the plant economic growth with minimum outlays of energy resources.

Along with the term "intensification," the concepts of the basic directions for the implementation of this term have become an intrinsic part of the economic dictionary of our society. This involves comprehensive automation, mechanization and reduction of manual labor, further improvements in the socialist organization of labor and production and the most extensive application of leading experience. The main thing now is to implement the slogan of comprehensive intensification, organic linking of science with production and most effective utilization of the material and technical base created.

It is absolutely clear that power industry intensification is inconceivable without the extensive development of scientific research and the fast application of its results in engineering and production. The development of science in this case must outstrip that of production and technology, for the more fruitfully it supplies practical activities with new ideas and with constructive and technological solutions, the faster will technology develop and social labor productivity rise. This is the major mandatory task of scientific workers, researchers and specialists in our scientific units, scientific-production enterprises and combines and university departments. We cannot make science the main productive force, the powerful lever of

production intensification without their creative dedication and without a total cooperation and understanding on the part of economic managers.

In order to be able to meet growing energy needs in the forthcoming period and to ensure the balanced development of the national economy and power industry, major energy-generating capacities must be commissioned in the Eighth Five-Year Plan.

The problems being resolved within the Maritsa-Iztok complex are complicated and important. Above all, we must commission the fourth 210-megawatt power unit at the Maritsa-Iztok 3 TETs. Secondly, important assignments must be carried out in the reconstruction of existing power plants which must operated without drying facilities. The expansion of the Maritsa-Iztok 2 TETs has been undertaken on the basis of the new technology applied at the Maritsa-Iztok 3 TETs. Five hundred megawatt power units will be built at a later stage. As you can see, this entire new construction and updating of old capacities within the complex is based exclusively on the use of our leading scientific and technological accomplishments. This applies to coal mining as well. Coal mining assignments within the complex are particularly difficult, for by the end of the five-year plan output must be raised by 50 percent. This growth as well will be achieved essentially through the extensive use of top scientific and technical achievements and high-level mechanization in strip mining.

Let me emphasize that the role of domestic coal will increase during this decade. To begin with, henceforth the entire increase in each generation's capacities will be planned exclusively on the basis of coal; secondly, the development of centralized heat supplies of many cities such as Stara Zagora, Pazardzhik, Yambol, Khaskovo and others will be based on domestic fuel.

From the decisions of the 12th congress you are familiar with the great role which nuclear power industry has been assigned during this and subsequent five-year plans. Five years from now 26 percent of our overall output of electric power will come from nuclear power sources. This means the implementation of an exceptionally stressed construction program which, as with the development of Maritsa-Iztok capacities, is inconceivable without the tremendous technical aid of the Soviet Union. The practically tested Bulgarian-Soviet friendship and cooperation are the safest guarantee for the successful implementation of our great tasks in the Eighth Five-Year Plan as well. That is why on the day of our holiday we warmly say "Thank you, dear Soviet comrades!"

During this five-year plan we must install at the Kozloduy AETs the fourth and fifth nuclear reactors. The fourth is well familiar to us. It belongs to the VVER-440 series. It carries a number of improvements in terms of technological circuits and seismic stability. The fifth, however, is unique. It is unique not only in terms of our practical experience but of that of all socialist countries, for we are the first country to which the Soviet Union is granting a 1,000-megawatt block. One can easily see the strict requirements with which this fact faces the collective of the Kozloduy AETs and the skill and qualifications of its cadres. However, we well know that one could rely on the Kozloduy AETs collective. We know it, for with every passing year it has been proving it and proving the great unused possibilities it has.

In the next few years we shall continue to develop our hydraulic power resources. We have done a great deal to ensure their utilization. However, many unused opportunities remain.

The Spanchevo VETs of the Pirinska Bistritsa power plant was commissioned recently. The Devin VETs will be commissioned also in the near future.

In the Eighth Five-Year Plan we shall continue with the construction of 860-megawatt one-of-a-kind Chaira PAVETs [Pumping-Storage Hydroelectric Plant], which will have particularly important assignments in terms of optimizing the electric power system.

I shall terminate this detailed enumeration of the tasks facing us. They are known to all, for counterplans are being currently drafted and the labor collectives are already clarifying the details of their assignments and possibilities. I have tried to present to you a panoramic view of the power industry as it will be in the Eighth Five-Year Plan and as it was outlined at the 12th congress within the context of the national tasks related to our socioeconomic development in the forthcoming stage.

What I would particularly like to emphasize is the place and role of each one of us in the implementation of these plans.

In the course of the comprehensive intensification, which is the general strategy for the immediate future, we are relying above all on the main productive force—man—the creator of all material values. In the final account, it is he who will be able or unable to make use of the factors which determine the acceleration of intensification. You realize what is involved: our individual skills and knowledge, our ability to apply them at our jobs. The researcher, through his imagination; the designer, without routine and sterotype; the engineer, with taste; the cashier, with accuracy; the technologist, with precision; the repairman, with skill; the dispatcher, with accuracy; the manager, with sensible risk, and so on. Above all, however, we must put our hearts in it. We must display a feeling of responsibility and duty. We must know the work. We must think. From the high rostrum of the 12th congress Comrade Todor Zhivkov said: "We must clearly realize that the future of our homeland depends on increasing the personal qualities of the people, on their steady self-advancement as citizens, workers and creators."

Turning the example of frontrankers into mass practice is a mandatory requirement of the present.

During this celebration I would like to recall again the merits of labor collectives and individuals, properly noted by the party and the state. Many of our collectives and individual specialists became the bearers of the highest possible state rewards and distinctions for their dedicated toil during the Seventh Five-Year Plan and for high labor successes in the socialist competition. The Varna TETs and the Kozloduy AETs were awarded labor glory banners; two of our enterprises were awarded the Georgi Dimitrov Order and 20 others the Order of the Bulgarian People's Republic. There are four new Heroes of Socialist Labor among the miners and power workers, five bearers of the Georgi Dimitrov Order, 20 of the Order of the Bulgarian People's Republic and many other bearers of other state awards.

I am pleased to report by State Council ukase, on the occasion of Power Worker's Day, the high title of "Honored Power Worker" was awarded to Comrades Dimitur Kovachev, Vasil Sultanov, Milko Todorov, Petur Gaburov and Petur Kutov. These people are sufficiently well known within our system that introducing them to you becomes unnecessary; 116 people were awarded the Excellent Worker of the Ministry of Power Supply

badge; 50 people were awarded the badge "Excellent Worker of the Ministry of Power Supply and Electrification of the Soviet Union."

On this holiday allow me, dear comrades, to express on your behalf our warm thanks, our respect and gratitude for the tireless efforts of our frontrankers, honored power workers and excellent workers, and our leading collectives for the successes through which they increased the achievements of the power industry and contributed through specific actions to the growth of its prestige. Allow me to tell them most warmly, "Thank you very much!" and "Good luck to you, may you have more high successes and creative victories!"

Comrades:

Our times are difficult and conflicting; we are living in the worrisome circumstances of aggravated international relations. Global reaction, headed by U.S. imperialist circles, is doing everything possible to prevent detente, trigger a new arms race and hinder the just struggle of progressive forces throughout the world for freedom, independence and social progress.

We, the Bulgarian power workers, are proud of the fact that, loyal to the principles of international workers' solidarity, the Bulgarian People's Republic supports with all its forces and adopts as its own program the peace program of the CPSU, elaborated under the guidance of Leonid Il'ich Brezhnev, and that through its foreign policy it is actively contributing to the strengthening of good neighborly relations on the Balkans, the strengthening of the socialist comity, the just settlement of international problems and the preservation of peace on earth. To us, friendship with the great Soviet Union and the socialist countries is the best guarantee for the successful solution of energy problems and for the implementation of complex and responsible tasks and the further strengthening and development of our power base.

On the day of our professional holiday, allow me to assure the BCP Central Committee, Comrade Todor Zhivkov, its general secretary, and the government that the Bulgarian power workers, inspired by the decisions of the 12th congress, inflexibly and confidently, and with even greater energy and daring, will dedicate all their forces, knowledge and experience for their implementation, for the triumph of the party's cause and for the well being of our people.

"Actions, actions and actions only!" is our slogan for a new upsurge in the power industry, for increasing its power and prestige and for the bright communist future of our homeland.

It is under the banner of this slogan that I call you to fight and work creatively for the fulfillment and overfulfillment of the major and important tasks which face the power industry this year and throughout the five-year plan.

Congratulation, dear comrades, on the occasion of our beautiful holiday.

BIOGRAPHIC PROFILE OF FIRST DEPUTY MINISTER ZANCHEV

Sofia ENERGETIKA in Bulgarian No 6-7 Jun-Jul 81 p 26

[Text] Engineer Vasil Zanchev, first deputy minister of power supply, celebrated his 50th birthday anniversary on 15 July 1981.

V. Zanchev was born on 15 July 1931 in Izvor Village, Pernik Okrug. He grew up in a poor peasant family with communist convictions, which were defended by his father during the resistance period, arms in hand as a member of the Georgi Dimitrov partisan detachment in Radomir.

Following his secondary school graduation with excellent grades, V. Zanchev became a teacher and, subsequently, principal of the grammar school in Uglyartsi Village, Radomir Okoliya. He combined professional obligations with active political and social work in Komsomol management.

He graduated from the Moscow Mining Institute as mining engineer-economist, again with excellent grades, in 1955. V. Zanchev began his career as a young specialist and alumnus of a leading Soviet mining school, at the Bolshevik Mines, where he spent many years in close touch with the difficult miner's profession.

He worked 2 years as chief dispatcher and chief of sector at the Bolshevik State Mining Enterprise, after which, as the winner of a competition, he became scientific associate at the Scientific Research Coal Industry Institute.

He returned to the Bolshevik State Mining Enterprise as its director in 1960, a position he held until 1969. This was his great practical training which led to his profound knowledge of his profession as a necessary prerequisite for subsequent management activities and creative developments.

Between 1969 and 1970, V. Zanchev worked as chief engineer and head of section at the Coal DSO [State Economic Trust]. He spent the next 4 years as chairman of the okrug management of the scientific and technical union and with the central management of the scientific and technical union for mining and metallurgy.

He spent the next 3 years as Sofia Okrug BCP Committee secretary.

V. Zanchev became deputy minister in 1974 and, 2 years later, first deputy minister of power supply.

Since 1976 he has headed the Bulgarian delegation to the CEMA Permanent Coal Industry Commission.

He was elected Central Committee candidate member at the 12th BCP Congress.

Engineer V. Zanchev's rich economic and party experience is the basis for his extensive and comprehensive activities in assessing opportunities and discovering reserves for the adoption of additional plan assignments by the Ministry of Power Supply in the Seventh Five-Year Plan, upgrading social labor productivity, improving the utilization of basic equipment and lowering material production outlays.

The successful elaboration of engineering and counterplans by the ministry's economic organizations was organized with his direct participation.

Engineer V. Zanchev's contribution to the implementation of Bulgarian coal mining assignments has been particularly substantial.

Along with his numerous obligations as an economic manager and a political and social leader, Comrade V. Zanchev has done scientific work as well. He was elected senior scientific associate second class in 1980. He is the author of a number of works and a regular contributor on problems of the utilization of local coal and on power problems to our scientific and technical periodical, considered in terms of their broader aspects.

He is the bearer of high state and other awards such as the Order of the Bulgarian People's Republic Second Class, People's Order of Labor, Golden, the commemorative medals "Twenty-five Years of People's System," "Thirty Years of People's System," "Ninety years of Georgi Dimitrov's Birth," the Soviet medal "Miner's Glory," and others.

On the occasion of his 50th birthday, the editors of the periodical ENERGETIKA warmly greet Comrade Zanchev and wish him many more years of health, cheer and creative successes in his responsible work for the development and upsurge of our power industry.

BIOGRAPHIC PROFILE OF DEPUTY MINISTER TADZHER

Sofia ENERGETIKA in Bulgarian No 8, Aug 81 p 11

[Article: "Flowers for the Hero of the Anniversary"]

[Text] Comrade Tadzher became 50 years old on 12 August. Congratulations, Comrade Tadzher! The editors present their warm congratulations and wish you many years of health and happiness, tireless energy, firmness and success for the cause of socialism which you have been serving for the past 25 years with dedication, youthful thrust and optimism! Congratulations and many new successes!

We use this pleasant opportunity to present to our readers Engineer Oved Tadzher, deputy minister of power supply and regular reader, and steady author and contributor to this periodical.

Comrade Tadzher is a construction engineer by training. The excellent grades with which he graduated from the Engineering-Construction Institute in Sofia 25 years ago prove that his choice of this profession was not accidental. This choice was both a vocation and a feeling of duty to a behest inscribed in blood in the struggle for freedom which defined his road as a person, a communist and a builder.

Oved Tadzher was born in Tel Aviv to the family of the Bulgarian emigre Leon Tadzher. His father dropped out of Vienna University, where he was studying law, to share in the joyless life of his parents who emigrated to Israel. Expelled back to their homeland because of their uncompromising anti-Zionism and defense of the cause of Palestine Arabs, and member of two communist parties--that of Palestine and of Bulgaria--and totally dedicated to the revolutionary struggle, Leon Tadzher died for the revolution.

He named his son Oved which means "worker" in Hebrew. He gave him his profession as a legacy with the behest to build for the people.

After graduation, Oved Tadzher worked at the construction site of the copper extraction combine in Pirdop, as technical manager, where he was awarded the Golden Order of Labor. He then worked at the building of the Accumulators Plant in Pazardzhik and the Lead and Zinc Combine in Plovdiv as technical manager, chief engineer and head of construction rayon and was awarded the Red Banner of Labor order. He then worked at the Chemical Combine in Vratsa as head of the construction site and was awarded the Georgi Dimitrov order. Subsequently he participated in the building of the chemical plants in Vidin, the Semiconductor Plant in Botevgrad and the plants in Berkovitsa and

Etropole. At the beginning of the 1970s he worked at the Kozloduy AETs [Nuclear Power Plant]. At the nuclear power plant he was chief of construction and, subsequently, representative of the BCP Central Committee and the Council of Ministers. As chairman of the State Commissioning Commission he had the honor of switching on from the control panel the first nuclear reactor in Bulgaria and the Balkan Peninsula, in July 1974.

O. Tadzher was awarded the highest state distinction "Hero of Socialist Labor" for his participation in the construction of the first stage of the Kozloduy AETs.

Subsequently he became first deputy minister of construction and power supply and, in 1976, deputy minister of power supply, a position he still holds.

O. Tadzher has combined his management activities with active creative and rationalization work on construction methods and project design.

As head of the development unit of the Ministry of Power Supply, today O. Tadzher coordinates and ensures the implementation of annual and long-term draft plans for the development of the sector. His responsibilities also include planning and economic activities, capital construction, international cooperations, scientific services and development and application of scientific and technical progress.

O. Tadzher closely participated in the preparation and building of new nuclear and hydraulic energy capacities and the expansion and modernization of the Maritsa-Iztok power complex as an experienced manager with 25 years of construction and organizational experience.

His direct participation in managing the Varna TETs and the building of the Maritsa-Iztok 3 TETs was a great contribution to their timely completion.

Comrade Tadzher's contribution to the development of the power industry in the Seventh Five-Year Plan was rated highly by the party and the state. He was awarded the Order of the Bulgarian People's Republic Second Class. Now, on the occasion of his 50th birthday, the same order is being awarded to him for the second time.

REPORT, COMMENT ON INDUSTRIAL DEVELOPMENT FOR JANUARY-JULY PERIOD

Sofia IKONOMICHESKI ZHIVOT in Bulgarian 26 Aug 81 p 4

[Committee for Unified Social Information System Report: "Industry in the Bulgarian People's Republic in the January-July 1981 Period"]

[Text] The plan for commodity output between January and July was overfulfilled. Above-plan goods worth 315 million leva were produced and above-plan sales totaled 283 million leva, or 1.6 percent more than the planned figure.

The volume of industrial output rose by 6.2 percent compared with the same period of last year.

The production and marketing plan by ministry was as follows:

Ministry	Fulfillment of January-July 1981 Commodity Output Plan	Fulfillment of Plan [illegible] Marketed between January-July 1981
Ministry of Power Supply	100.8	103.3
Ministry of Chemical Industry	101.0	100.2
Ministry of Machine Building and Electronics	101.1	101.7
Ministry of Light Industry	103.4	101.9
National Agroindustrial Union	102.0	103.6
Ministry of Construction and Architecture	101.2	98.6
Ministry of Metallurgy and Mineral Resources	100.3	93.3
Ministry of Transportation	102.5	101.8
Ministry of Forests and Forest Industry	103.8	102.3
Ministry of Internal Trade and Public Services	104.0	102.2

Production of some basic industrial commodities in the January-[July] period:

	Measure	January-July 1981 Output	January-July 1981 Output in % of January-July 1980
Electric power	million kwh	21318	106.6
Coal	thousand tons	17995	100.7
Briquettes	"	814	101.1
Steel ingots	"	1429	98.8
Rolled ferrous metals	"	1869	105.9
Cold rolled steel sheets	"	376	104.1
Hot rolled steel sheets	"	793	107.0
Steel pipes	"	152	108.1
Electrical instruments	"	197	120.0
Lathes	pieces	5423	101.8
Internal combustion engines	"	11403	129.6
Electric hoists	"	68776	102.5
Cranes	"	1411	120.2
Phosphorus fertilizers	thousand tons	139	121.6
Oil paints and lacquers	"	29	96.6
Chemical fibers and fabrics	"	61	106.4
Cement	"	3144	104.1
Asbestos cement pipes	thousand meters	1506	125.1
Bricks	thousand pieces	789901	103.0
Tiles	"	44744	101.4
Cellulose	thousand tons	106	107.3
Paper	"	197	110.5
Cardboard	"	38	111.4
Household glassware	thousand leva	16108	107.4
Porcelain tiles	million pieces	152	104.9
Household porcelain ware	thousand leva	21754	104.2
Cotton fabrics	million meters	204	103.6
Silk fabrics	"	21	106.0
Upper knitted clothing	million pieces	24	101.4
Ready-made clothing	million leva	175	105.3
Shoes	thousand pairs	10414	101.3
Meat	thousand tons	254	101.5
Meat products	"	53	105.9
Canned fruits	"	127	134.8
Cheese	"	67	104.9
Casseri cheese	"	16	120.3
Tobacco products	"	50	112.1

Comment:

The rhythmical implementation of the annual industrial production and marketing plan continued in July as well. The overall output for the first 7 months already exceeds

57 percent of the industrial output planned for the year, and 57 percent of the revenue from sales has already been received. A higher rate of growth of output was reached in July compared with the first 6 months of the year. Compared with July 1980, output rose by 7.6 percent; compared with the first 7 months of last year it rose by 6.2 percent.

Despite such positive trends in industrial development, the facts show that objective possibilities of even higher output have not been used by all economic organizations and their branches. During the past period, 229 or 11 percent of all industrial branches failed to fulfill their plans. The implementation of the plan for important items is lagging. This includes briquettes, phosphorus fertilizers, polyvinyl chloride, pressed wood tiles, cement, machine systems, structural-grade steel, cold rolled steel sheets and so on.

The study of the reasons for nonfulfillment indicates that it is due to the poor maintenance of machines and equipment, weaknesses in the organization of the work, violations of technological discipline, failure to master the technology and production of new items, violation of contracts for supplies of raw materials and cooperated parts, and other internal reasons. The surmounting of such weaknesses would make it possible to develop an even higher rate of output and higher earnings in the remaining months of the year.

CELLULOSE INDUSTRY PERFORMANCE SUMMARIZED

Prague HOSPODARSKE NOVINY in Czech 9 Oct 81 p 2

[Commentary by Jiri Skladal, member of the CPCZ Central Committee: "Paper Industry"]

[Text] The enterprises of the Paper and Cellulose Industry Economic Production Unit, [VHJ] exerted maximum efforts in the past months to secure the fulfillment of the plan and, at the same time, to implement all new principles brought into the economic practice by the Set of Measures for Improving the Planned Management System of National Economy.

The fulfillment of the plan in this area is characterized by the fact that it is taking place under complex conditions caused by the stabilization of the technical and technological regimes in the Steti II facility and in the plant for production of corrugated board in Opava.

The plan's assignments as determined for 1981 represented increases for production over actual data for last year by about Kcs 167 million. In terms of basic product mix, there has been an increase of 6,636 tons in nonbleached cellulose, 4,433 tons in bleached cellulose, 10,785 tons in paper and cardboards, 2,984 tons in paperboards, 6,502 tons in corrugated boards and 6,404 tons in corrugated board boxes.

These assignments in the area of basic material production have a corresponding effect on the area of the financial plan, where an increase in output is represented by a 101.5 percent rise on the index.

Surveying the economic results achieved in the past 8 months of 1981 it can be noted that all Paper and Cellulose Industry indicators show fulfillment of this year's plan.

Since the beginning of this year, the supplies for the consumer goods inventory in retail prices have been fulfilled 107.5 percent, with the relatively favorable 63.7 percent of the volume objective for the year being achieved. Deliveries of exports to socialist countries in terms of wholesale prices have been fulfilled 113.9 percent since the beginning of the year and a very favorable 69.2 percent of the year plan has thus been achieved. Similarly, exports to these countries in terms of prices including handling and shipping charges are being fulfilled (122.5 percent for the year, equalling 69.7 percent of the year's volume). Supplies for exports to nonsocialist countries in terms of wholesale prices have been fulfilled 110 percent for the year, exceeding the plan in absolute terms by Kcs 41.3 million.

The labor productivity for the year from adjusted output with value added has been fulfilled 100.8 percent and a 65.4 percent portion for the year plan assignment has been achieved. The profit accumulation has been fulfilled 100.2 percent since the beginning of the year, exceeding the plan by Kcs 1.3 million in absolute terms. With this indicator, it is necessary to emphasize that despite favorably fulfilling the assignments, only a relatively low portion (60.8 percent) of the year plan has been achieved.

In the area of output, the consequences of the breakdown of the chlorination tower at the Steti works bleaching plant caused a production drop of about 3,500 tons of bleached cellulose and unfavorably affected the level of realization prices.

As for profit realization in relation to production assets, this indicator has been 100 percent fulfilled for the year, however, the securing of its fulfillment in the rest of the year is directly related to the problems of securing the plan in terms of profit.

In the area of capital investment, the assignments have been fulfilled completely since the beginning of the year, and the relatively low portions achieved in the first half of the year are related to the extension and intensification of actions taken at the most important project of the Paper Industry, the construction of the Paskov integrated cellulose and paper works.

Despite the fact that since the beginning of the year, the enterprises of the VHJ Paper and Cellulose Industry have been fulfilling all the indicators stipulated for a year evaluation of plan fulfillment, there is a whole series of partial problems which are reflected particularly in the areas of basic material production and stock.

Since the beginning of the year, the production of nonbleached sulphite cellulose has been fulfilled 97.8 percent, including the 2,219 ton fallout, which represents a 65.4 percent portion of the year plan. The production fallouts are related to technological and other technical problems in the North Bohemian and South Bohemian Paper Mills; the North Bohemian Paper Mills especially have not fulfilled the plan objectives from the beginning of the year, their fallout amounts to about 1,800 tons. The South Bohemian Paper Mills have been fulfilling the plan at the rate of 98.5 percent since the beginning of the year, including a fallout of about 600 tons.

The production of nonbleached sulphate cellulose has been fulfilled 98.4 percent for the year, the whole year volume portion amounts to 66.3 percent. The fact that the tasks in this material product selection are not fulfilled is related to the cellulose production at the Steti mills, where the tasks given by the plan have been fulfilled 98 percent for the year, equalling 65.6 percent portion of the volume for the whole year.

The bleached cellulose production has equalled 95 percent for the year, which constitutes a 64.3 percent portion of the year plan. The fact that this material product selection has not been fulfilled is related to the breakdown of the chlorination tower in the Steti II bleaching plant, where this year plan has been fulfilled 92.8 percent.

The total production of papers and cardboards has been fulfilled 98.8 percent since the beginning of the year (65.3 percent of the year assignment). The area of this

material product selection has been affected unfavorably by problems of a technical and technological character in the North Bohemian Paper Mills, primarily in Rotostroj, and partially other problems with some rebuilt equipment, for instance, problems with paper machine No 4 at the facility in Ceska Kamenice. The production of smooth boards has been fulfilled 100.1 percent for the year.

Despite the fact that the assignment for the basic selection of products has not been fulfilled, the production volume indicators have been secured within the VHJ since the beginning of the year.

The inventory situation is not as favorable at present. The total inventory has been exceeded by about Kcs 35 million, the material inventory by Kcs 42 million and the controlled inventory by about Kcs 22 million.

During the last 8 months of 1981, similar tendencies have also appeared in the VHJ Slovcepa. The basic indicators have been fulfilled as follows: production assignments 100 percent, consumer goods supplies in terms of wholesale prices 101.9 percent, in terms of retail prices 100.8 percent.

In addition, notebooks and school exercise books have been supplied by the Slavosovce facility and roof and insulation materials from Sturovo. In comparison with the corresponding period of last year, Slovcepa has increased its consumer goods supplies by about Kcs 24.4 million.

Exports to socialist countries have been fulfilled 109.4 percent in terms of wholesale prices and 114 percent in "all charges paid" prices. The South Slovakia Cellulose and Paper Mills, Sturova, take credit for exceeding the plan by profitably exporting roof raw plasterboards to Yugoslavia and the Slovak Cellulose and Paper Mills, Ruzomberok, by exporting paperbags. The increased supplies of wallpapers by Slovpap, picture postcards from Grafobal and corrugated board cartonnage cannot be overlooked, either.

Exports to nonsocialist countries have been fulfilled 105.6 percent in terms of wholesale prices and "all charges paid" prices 103.6 percent.

As far as other indicators are concerned, Kcs 33.3 million savings in the total costs have been achieved through accomplishing a 102.1 percent increase in manufacturing output and through increased economizing. The best profit fulfillment has been achieved by Slavosov Paper Mill (124.3 percent), Harmanec Paper Mill (116.8 percent) and Grafobal Skalica (115.7 percent).

Since the beginning of the year, the capital investment plan has been fulfilled 107.9 percent in the volume of work and supplies, the construction work portion has been fulfilled 107.2 percent. Completing the construction of the cellulose mill (second stage) in Chemiceluloza Zilina, putting the intensified cellulose mill in Bukoza Vranov into operation again after a factorywide shutdown and opening a new factory of the Cellulose and Paper Integrated Works in Ruzomberok are the main problems solved by Slovcepa at present.

The results acheived by the Paper Industry VHJ in the 8 months of this year are not bad. However, all enterprises must also exert maximum efforts in fulfilling their assignments in the period to come and endeavor to fulfill successfully the plan for the first year of the Seventh Five-Year Plan.

BRIEFS

SOKOLOV COAL MINE SAID DROWNING IN MUD--Bulldozers and other equipment were stuck in mud for days and even though it had stopped raining 2 days earlier, men and equipment still were sinking. That was the situation at the Jiri Coal Mine near Sokolov. At the time that the need for coal is critical, this mine has been out of operation for over 2 weeks. Heavy trucks were used to move in tens of thousands of heavy rock to line the roads at about Kcs 100 per cubic meter. In the meantime, other mines were trying to make up the shortage. BALANCE OF PAYMENTS PROBLEM ANALYZED

Warsaw ZYCIE GOSPODARCZE in Polish No 44, 1 Nov 81 p 2

[Text] The Ministry of Finance and the NBP National Bank of Poland have presented detailed data on Poland's balance of payments in the years 1971-1980, which was earlier announced by Minister Marian Krzak.

The data prepared by the NBP Bank gives an insight into the major items of the country's balance of payments in that period. The bank's statistics show who shouldered the burden of financing the imports in the past decade. The data dispels the myths created by electrical/engineering industry men, as well as appreciating the raw materials industries and pointing to the degradation of the agricultural and food-processing sectors.

The Finance Ministry says that the data on the country's balance of payments will now be systematically published in the Statistical Yearbook or in the Financial Yearbook. The NBP bank says it will publish data on the shaping of the country's balance of payments every quarteryear.

Balance of Payments With Hard-Currency Area [Capitalist Countries]

Earnings from the export of goods and construction services to the hard-currency area reached in the discussed period the level of 142,638,000,000 foreign exchange zlotys, while import expenditures reached 196,812,000,000 zlotys. Thus import expenditures were covered with export revenues by only 72 percent. The trade deficit amounted to 54 billion exchange zlotys (approximately 16 billion dollars).

Exports stopped covering the imports as far back as 1972. In the successive four years, the country's debt was growing like an avalanche. In 1975, the ratio of exports to imports dropped to as little as 59 percent. This was alarming enough to make the then economic leadership try to reverse the trend. But because of the inefficiency of attempts to make the economy more export-oriented, the growing restriction were applied to imports. This reduced some results in the balance of trade, but simultaneously there appeared ever more severe shortages of raw materials and coproduction components. The trade deficit start decreasing in 1977. In all, it dropped from 9,961,000,000 exchange zlotys in 1975 to 2.4 billion exchange zlotys in 1980.

Table 1 (in millions of foreign exchange zlotys)

Year	Indebtedness (long-, medium- and short-term loans)	Costs of foreign credits
1971	3,947	187
1972	4,594	192
1973	8,715	317
1974	17,344	975
1975	27,847	1,674
1976	40,335	2,210
1977	49,558	2,996
1978	58,984	3,822
1979	71,238	5,271
1980	76,632	7,545

The trade deficit of 54 billion exchange zlotys, as well as other costs connected with debt servicing, were covered primarily with foreign credits. I write "primarily" because some part of the trade deficit was covered with money receipts from abroad and service revenues. During the last decade the surplus in service revenues and receipts totalled 9,124,000,000 exchange zlotys.

The negative balance of trade led to the following major consequences: First, it was positive for the current consumption, since the national income distributed was higher than the national income produced, (in other words we lived beyond our means, eating away the loans), but on the other hand, it led to the rapid increase of indebtedness, together with the debt servicing costs. This is refected in Table 1.

The ratio of debt servicing to exports reached 101 percent in 1980. This means that export revenues did not suffice to pay the principal and interests on the foreign loans. It is generally considered that the ratio of 25 percent is a limit that must not be overstepped, if the economy is to remain sound and healthy and if the debt trap is to be avoided. Such a situation was the case during 1974. With export revenues standing at 12,853,000,000 exchange zlotys and debt servicing (principal and interests) totalling 3,080,000,000 exchange zlotys, the respective ratio amounted to 24 percent.

This was a major signal to halt the programme of capital projects (which our paper suggested, exposing itself to dirty accusations of anti-socialist activity), to shift the resources to agriculture, which began to place a burden on the balance of payments, and to introduce financial mechanisms stimulating exports. Nothing of the sort happened. The development of the situation is presented in Table 2.

The structure of trade was another factor prompting the undertaking of the above mentioned measures. Data on trade pattern indicated that in the first stage, the growing trade deficit was the result of intensive investments and the resulting purchases of capital goods. Gradually, the growing role began to be played by imports of food.

Table 2. (in millions of foreign exchange zlotys)

Year	Export revenues	Foreign debt servicing	Foreign debt/exports ratio (in percent)
1975	14,466	3,696	32
1976	15,032	6,234	41
1977	16,852	9,277	55
1978	18,082	13,697	76
1979	20,308	19,016	94
1980	24,324	24,679	101

The deficit of trade in food and farm produce was rising incessantly from 1975. Over the whole decade, it totalled 13.2 billion exchange zlotys. A full picture of the contribution of major sectors to the country's balance of payments is presented by Table 3.

Table 3. (in millions of foreign exchange zlotys)

Year	Total		
	Revenues	Payments	Balance
1971	5,841	5,403	+ 438

1980	3,033	6,889	- 3,856

Source: Data provided by the NBP National Bank of Poland, based on the banking payments statistics

Balance of Payments With the Soft Currency Area [Socialist Countries]

Data provided by the Ministry of Finance indicate that the trade deficit with socialist countries was gradually growing over the past decade. In 1980, import payments exceeded export revenues by 3.7 billion exchange zlotys. More detailed data are available on the current situation.

Current Situation

As far as trade with hard-currency partners is concerned export revenues fell in the first nine months of this year to 14.2 billion exchange zlotys--24 percent less than the level of 18.7 billion exchange zlotys in the same period of 1980. Respective figures for imports were 20.6 and 16.8 billion exchange zlotys (a 19 percent drop).

The level of exports is falling also in the monthly breakdown--from 1.7 billion exchange zlotys on the average in the first seven months of 1981 to some 1.3 billion exchange zlotys in the August/September period. In connection with this situation, it became necessary to suspend the servicing of foreign debt and to enter into negotiations with foreign creditors on the rescheduling and postponement of debt repayments. The agreements concluded make it possible to decrease the burden placed on the balance of payments by debt servicing by some 15 billion exchange zlotys.

In the same, 9-month period, export revenues in trade with socialist partners dropped by 10 percent--from 21 to 18.8 billion exchange zlotys as compared with the corresponding period of 1980. At the same time, a rise was reported in import payments, mainly because of increased supplies of Soviet raw materials and processed products. In all, import payments rose by 4 percent--from 21.7 to 22.6 billion exchange zlotys. The trade deficit with socialist countries reached the record level of 3.8 billion exchange zlotys.

Debt Level

The general level of Poland's debt to foreign partners presently stands at 24 billion dollars, including 22 billion dollars owed to creditors in capitalist countries and 2 billion dollars owed to socialist countries.

PRICE COMMISSION INTERVIEWED ON FURTHER PRICE INCREASES

Warsaw ZYCIE WARSZAWY in Polish 10-11 Oct 81 p 6

[Interview with Zdzislaw Krasinski, Chairman of State Price Board, Wojciech Prus, and Anton Gryniewicz, Deputies of the State Price Board by Marek Przybylik, ZYCIE WARSZAWY editorial staff: "Will Prices Surpise Us?", date and place not given]

[Text] [Question] What will you gentlemen surprise us with next? Not long ago you surprised us by increasing the prices of cigarettes, and now people are talking about an early increase in the price of sugar. When does that threaten us?

[Answer] We are being swamped with teletypes, letters, resolutions, and petitions of protest against the increases which were introduced without consultation not only in that case but, also, in the case of pears, prunes, services, fish, etc. It is only with respect to fresh-water fish that there can be any claims against us, although, along with the increase, we announced that compensation would follow with the next increases.

The increase is not great, 4.60 zlotys a month per person. It could be argued whether it is too large or too small; however, it is difficult to involve millions of people to debate about a couple of zlotys, and the average quantity of these fish per Pole each year amounts to 0.6 kg., or 5 decagrams per month. Meanwhile, the matter was urgent, even "Zycie" wrote about that. Following the reform, state farms did not want to sell fish at low prices without a subsidy nor did Fish Central want to add anything to this.

[Question] Thus, I come back to the earlier question. Are you going to be springing surprises on us?

[Answer] No, we will not.

[Question] However, chaos reigns in the market, prices are going up here and there. Once it is the barber who costs more, then it is cigarettes, then eggs. It is no wonder that people are nervous.

[Answer] A clear picture should emerge from that chaos fairly soon. After the complete price increase operation, there will not be any startling changes. Unfortunately, for the time being, there will be chaos, there will be fortuitous controlled and uncontrolled price increases, something that the State Price Commission, the government, and labor unions are aware of.

A part of these increases, for which we are now being attacked, are, however, beyond our control.

[Question] That does not explain everything.

[Answer] Let us try then to introduce order, dividing products into a coupled of basic groups. The first of these, calculated according to value, includes two-thirds of the food products. In the main, these are items which, until recently, have been or still are subsidized by the state: bread, milk products, fats, fish, sugar, salt, potato flour, jams, vegetable-fruit products, and so on.

Electricity, gas, coal, central heating, and warm water can be added to the foregoing group. Increases in the prices of these items will be recompensed.

We include products made by small industry in the second group. After the reform, it will be able to set its prices. There are some items in this group which, partially, appear in the first group. Such, for example, as vegetable-fruit products or ocean fish caught by fishing cooperatives. Prices here are dependent on demand and supply; on costs; and, thus, are the result or, properly speaking, should be the result, of the operation of competition. These prices will be compensated in consequence of calculating the increase in the costs of living.

The third group are items whose increased prices will not be compensated .... tobacco, alcohol (including beer, cognac, and wine), as well as gasoline.

The next group, one about which there has already been a great deal of noise, is the service group: barbers, tailors, laundries, dry cleaners, etc., as well as public services, local transportation, State Motor Transport, and the railroads. As in the second group, apparently the increase in the price of many of these services will be equalized by taking the cost-of-living index into consideration.

[Question] But that is not all. There still are television sets, washing machines, sewing machines, mixers, etc.

[Answer] The Main Board of the Polish Economic Society (PTE) which has taken on the job of stabilizing the market is debating price increases for those articles. It must be remembered that, except for prices of food stuffs, which have an almost exclusively drain-type character, others, because of the compensation of the inflationary curve, do not balance out. Thus, that is why increases in the prices of manufactured articles can eliminate this imbalance. Besides the articles named, there is talk of raising the price of footwear, clothing, and wool. To be sure, there is a series of articles whose prices must be protected, among others, children's clothing, powders, soaps, razors, etc., articles of everyday use.

[Question] Thus, we have everything divided up and arranged, but why have these increases not taken place yet? I suspect that a large number of people have already done enough waiting for increases which you judge to be essential. Could it be that you are more afraid of those increases than those who will have to cope with them? Everyone knows that many of the market shortages come about precisely because of the lack of new prices. Jams, potato flour, and confectionery products are not to be had, although it is known that there are more of them in warehouses

than ever. Why then do you not raise the prices? People are waiting, and what is important in the end, is compensation and not the increase itself.

[Answer] Yes, there are many products in warehouses from this year's harvest campaign which are being processed by the food industry. However, they do not reach the stores because enterprise personnel are awaiting early independence and do not want to sell the products at today's unprofitable prices because these do not even cover the costs of production. For example, the price of jam has not changed since 1953.

[Question] However, they are not the same jam.

[Answer] Neither is the money the same. We will increase the prices following consultations; or, if the labor unions will not agree to a discussion of compensation after an increase, we can establish those prices right now. However, we must have the consent of the labor unions or, rather, of the entire society.

[Question] Much is said--and this is also in agreement with the prevailing experience--that the amounts of compensation are essential, that they are the most important.

[Answer] Indeed, but that is what is going to be the primary subject of consultations and not prices. In determining compensation, we have prepared several available variants based on average family budgets.

[Question] Yes, but generally the average does not correspond to any individual household budget.

[Answer] Not everyone is aware of what he spends at home. Of the people polled, 39 percent were unable in the course of a week to say how much they spend for food or for personal consumer items. However, we are continuing our studies. Assuredly, during our consultations it will be possible to determine the amounts of compensation fairly closely. This is very important--that the consultations are universal and that everyone will be able to express their opinion.

[Question] Gentlemen, you have more than once promised to issue a pamphlet concerning the price increases.

[Answer] It was subjected to final discussion the 7th of this month (October) at a meeting of the committee on agricultural reform. It ought to be available in kiosks between 20 to 25 October. Two million copies will be printed.

[Question] Will the pamphlet contain a schedule of increases?

[Answer] Yes, it will be in two variants. The first one is based on two stages, the first of which, the increases in bread and flour, are already behind us. The second is an increase in the price of heating fuel, electricity, central heating, gas, sugar, and potato flour. The third stage will include dairy products, milk, cheeses, butter, and vegetable fats. The next stage will be a price increase in meat and meat products, ocean fish, and animal fats. In between these stages, there will be increases in the prices of alcohol and gasoline. That is one variant.

A second variant anticipates a one-time increase of all prices. Compensation, agreed upon in consultations, will be paid at every stage. The first or second variant will be introduced pending the outcome of consultations.

[Question] When then can the increases be expected?

[Answer] About a month from the start of consultations, that is, from issuance of the pamphlet, somewhere in the second half of November.

[Question] You have been accused of initiating price increases without regard to the reform. And, although, gentlemen, you have said that that is an inseparable component of agricultural reform, somehow it does not appear to be like that in reality. Only the increases can be clearly seen, and relatively little is heard of agricultural reform.

[Answer] Despite the fact that we have been speaking of increase projects since June, it is precisely because of the public's reservations that the entire reform will be determined and ready; but it may be delayed because of the relatively late effective date of the new prices.

[Question] I would like to get back to the first question. "Zycie" has written many times about price increases in other countries, increases that were announced earlier, a month or even a year earlier. Why was that impossible in Poland with respect to cigarettes? You speak, gentlemen, of an undefined time for increases in the prices of alcohol or gasoline. Are we therefore also going to be surprised by that event? After all, alcohol is regulated just like cigarettes and that protects stores against excessive purchases.

[Answer] Increases in alcohol prices during the last 10 years have resulted in the creation of many millionaires. With current prices, and advance notice of relatively high increases, hundreds of millionaires would arise. Delaying a whiskey-carrying vehicle one day would be sufficient to earn hundreds of thousands of zlotys.

[Question] That is what the police are for, while the feelings of people are more essential than those of several, or 10 to 20 criminals.

[Answer] The announcement of an increase in the present situation could introduce chaos in the market; however, if labor unions agree, if people agree to allow the market to become disorganized with respect to those few articles, then, in that event, we will also announce the increase earlier. Although, to tell the truth, that is not done like that anywhere in the world. The Hungarians, for example, once announced a change in the price of wine before it became effective, and it was difficult to buy it for a half year.

[Question] What has been the Board's experience with the recent increases in bread and cigarette prices? The new bread prices probably have not changed much.

[Answer] How is it that everybody evaluates the effect of the increase in bread prices only from the viewpoint of Warsaw, actually it is in Warsaw, and perhaps also in Lodz that it is worst. The baking there is inefficient and trade, speaking delicately, is not too proficient. Progress, for example, is observable in Poznan,

and also in rural and small city stores. If the supply situation with respect to potato flour, sugar, and fats improves--it will be better. As far as cigarettes are concerned, that was a decision whose purpose was to draw money from the market in order to cover social needs, among others, the so-called old pocket-book. It would be possible to continue discussion on the form, but our partners in consultation also did not always play fair.

Bad experiences, those are unfulfilled hopes because of reduced sales, but that 10 percent drop is also a lot when there is a shortage of other products. Perhaps few of our premises have been fulfilled; however, they have evoked hopes in society which resulted in people's learning to demand good product quality. That also provides satisfaction. On the basis of experience to date, we have hopes that it will be possible during the next consultations to set such prices and compensations and, as a result, a division of goods that will permit better access to store counters, particularly for those most troubled by the present shortages.

We also need to become aware that we are not going to be eating less.

WATER SHORTAGE PROBLEM, NEW REGULATIONS DESCRIBED

Warsaw ZYCIE GOSPODARCZE in Polish No 43, 25 Oct 81 p 8

[Article by Mieczyslaw Gadkowski: "How to Manage the Water"]

[Text] Thus far in Poland, water management has been understood to mean principally the construction of water reservoirs. In developing this course of action, it was indicated that construction of a sufficient number of storage reservoirs will make it possible to increase the flow capacity enough so that the anticipated demand for water will be fully satisfied. In practice, activity in this direction consisted of planning reservoirs while neglecting the problem of technical advancements in hydraulic engineering and the methods of accomplishing the storage itself. For example, the design system used in developing the Seine and Marne Rivers, where storage reservoirs are located in natural valleys beyond the riverbed, has not been examined in Poland at all. French experience has shown that these systems are more economical, they allow the reservoir to be located in a region with minimal development, thus making it easier to construct the reservoir in stages, and they also make it possible to consume the water selectively, allowing for shutoff of inflow to the reservoir in case of emergency pollution of the river.

In designing reservoirs, the fact that water shortage and water requirements are, as a rule, not in the same territorial location, and that to connect these two components of water management an expensive technical infrastructure must be created, has generally been touched on very lightly.

In the field of sanitary engineering, mainly the problems of water-pollution control were exposed, problems, which although generally regarded as being important, in actual operations were given merely lip service. The results are widely known, both from the standpoint of river cleanness and work effectiveness of the existing treatment plants. The fault in water-pollution control was the construction of water-treatment plants as independent facilities, without creating water-pollution control systems, and without linking the treatments plants with water-production stations to supply industrial plants.

The Most Critical Tasks

First of all, the present research methods must be verified. We cannot accept a system of calculating water resources based on comparing total requirements with available river flow capacity. These methods ignore the fact that the flowing water

is being used by a number of consumers located along the river, which means that the available resources cannot be comparable to the physical flow capacity of the water in the river. To estimate the available resources, the multiplication factor of water utilization should be determined. However, to date no studies have been made on this. The new method, on which the recently conducted regional water-management balance-sheet is based, also has some serious shortcomings. The incorrect accounting method is responsible for the fact that in certain regions now regarded as water-deficient, no shortage actually exists. But in many regions of the country there are problems in obtaining water of the required qaulity.

The method of interpreting restricted flow capacity also arouses misgivings. At the present time, the concept of minimal filling of the riverbed should be advanced. Minimal filling can be maintained either through flow or through proper hydraulic engineering. Acceptance of the new, proposed interpretation of "restricted flow capacity" would make it possible to increase the available resources on sections of low-water-level and canalized rivers by 20 to 25 percent.

Neither is the widespread viewpoint acceptable that unrecoverable water losses in 1985 will amount to approximately 100 cubic meters per second, and in the year 2000, about 150 cubic meters per second. This opinion is based on faulty computational methods. Verification of the size of unrecoverable losses based on the country's energy balance shows that during 1956-1976, 20 to 25 percent of the country's energy balance was consumed to evaporate water in industrial utilization. This corresponded to unrecoverable losses in the 8-to-10-cubic-meters-per-second range, i.e., one-tenth of the amounted cited in the professional reports. As the development of the national economy proceeds in an energy-effective direction, this amount will increase greatly.

The viewpoint, prevalent in the country, that industrial demand for water can be satisfied with inland waters alone, should also be verified. This opinion completely ignores the fact that at present most countries that have seacoasts use seawater, in its natural state, for industrial purposes. We find many examples of this in Italy, France, England, the United States, Australia, New Zealand and other industrial countries. In some countries, seawater's share in total industrial water requirements is 30 to 50 percent. For example, in England, of 36 thermal electric power plants that were put into operation during 1965-1975, with a total 46,000 MW generating capacity, 17 of them, with over 28,000 MW generating capacity combined, are cooled by seawater. This is 60 percent of the generating capacity released during that period. In addition, two thermal electric power plants with a combined capacity of 3,576 MW were located in river estuaries.

Thus far, about 20 of the country's industrial plants take water from the Motlawa and Martwa Wisla harbor basins, of similar water quality. Considering the fact that the Baltic is a sea of low salt content, and that utilization of seawater causes no serious technical problems, efforts should be made to establish industrial zones connected with seaports, thereby alleviating the problems of transport and growth of industrial demand for water.

Where seawater is used by industry, the construction of treatment plants becomes more simple, since the biological pollution which is the most damaging to the sea can be eliminated by relatively simple methods. On the other hand, the difficult-to-remove chemical pollution, and particularly the salts which are a serious threat to inland waters, are not a large problem insofar as the sea is concerned.

Cooperation in utilizing surface and subsurface water is very important in water management and has been totally neglected in our studies and in the operations of our economy. In world water management, this course of action has been intensively developed for almost 30 years. It encompasses:

-- applying intensified infiltration to the excess of surface water over subsurface water,

-- replenishing surface water through treated surface water or treated sewage,

-- using hydrogeologic systems for storing surface water and moving it to more distant points,

-- creating hydrogeological barriers to the inflow of seawater.

By 1970, 90 facilities had been built throughout the world simply to study subsurface waters in countries such as England, Austria, Czechoslovakia, France, Iran, Israel, Jamaica, Japan, Morocco, Mexico, South Africa, Switzerland, the United States, and Hungary.

Without orienting the research, it is very difficult at this time to determine which of the courses of action mentioned would be most useful under our conditions.

Water in Industry and Agriculture

Changes in water management in industry and agriculture should cover both the supply of water and how it should be used. The changes are urgent because of the past unrestrained use of the water, with minimal interference on the part of water management. In view of the present structure for supplying water to industrial plants, action should also be taken at the same time to restrict the consumption of subsurface water, and to create in the large industrial urban centers and newly industrialized regions, central production stations for producing industrial water. The proposed stations for treating industrial water should be connected with large or central sewage-treatment plants.

This course of action was initiated in many of the world's industrial countries as early as the 1940's.

In Poland, the use of treated sewage for industrial purposes is only incidental. This use may be considerably expanded--in Silesia, for example--after the once-envisaged "Klimzowiec" river treatment plant is built and after other river, group municipal and municipal-industrial sewage-treatment plants are constructed. This design system combines water-pollution control and the supply of water to industry into a single technological line, and it may also make it possible to reduce consumption of water from the public-supply system.

Preliminary calculations showed, in the case of Silesia, that the cost for reconditioning water, in investment outlays, is about two-fold less, and in operating costs, about 1.5-fold less, than the cost of transporting water from the Dunajec [River]. A similar relationship exists in the costs of transporting water from the reservoirs of the Sola Cascade.

But insofar as new industrial regions are concerned, this course of action requires planning discipline and consistency in applying the central idea, from the planning period all the way to the implementation of the individual technical facilities.

An example of such action abroad may be the French industrial zone Fos-Berre and a number of industrial zones in the United States.

In addition to changes in industrial water supply systems throughout the world, extensive activity was also begun to reduce water consumption in factories and plants. This produced a 40 percent reduction in total water consumption, as compared to supply figures recorded in 1968.

An example of domestic solutions aimed at reducing water requirements may be found in the Katowice Steelworks, which in its time was regarded as modern and progressive. Now, the water requirements in the Katowice Steelworks, at an annual production of 4.5 million tons of steel, are 1.1-1.2 cubic meters per second, which is equivalent to a water consumption index of 8.05 cubic meters per ton. However, according to documentation submitted to the water authorities and the permission obtained for an initially planned ultimate production of 9 million tons, water requirements are supposed to increase to 3.5 cubic meters per second, which is the equivalent of a water consumption index of 12.2 cubic meters per ton of steel. This index may be compared with the water consumption index in the Thyssen Steelworks in Duisburg (FRG).

In 1957, the Thyssen Steelworks' annual production was 9 million tons of steel at a total fresh water requirement amounting to 1,304 cubic meters per second, which was equivalent to 4.56 cubic meters per ton. After the steelworks was expanded and modernized in 1974, its annual production was 15 million tons, while the water consumption index dropped to 2.72 cubic meters per ton of steel and the total requirement for water remained at 1,296 cubic meters per second (slightly lower than in 1957). Of this amount, the steelworks returns to the river 0.87 cubic meters per second of wastewater, treated to a quality complying with grade 2 water purity--the purity grade established for the Rhine River.

Even the small, pre-war Hungarian steelworks in Miskolc, with an annual production of approximately 1 million tons of steel, has a water consumption index of 5 cubic meters per ton, which is lower than our Katowice Steelworks.

One of the more interesting examples of local design systems which are conducive to efficient water utilization, is the Kedzierczyn Sheetmetal Shop Chemical Plants, where several years ago full recycling of wastewater was instituted. Also in two Silesian thermal electric power plant in 1980, part of their own industrial wastewater and residential sewage was used to feed the closed-cycle cooling. These systems have been operating successfully for several months. Preliminary figures show that use of these systems has reduced water requirements about 15 percent, has greatly reduced the number of sewers and the load of discharge pollutants, and has also resulted in a savings of about 11 million zlotys a year. Some interesting conclusions can also be drawn from an extensive study conducted for the Oswiecim ZPCh [chemical industry plants], which now consume 4.45 cubic meters per second of water from the Sola River. The study showed that this consumption can be reduced 60 percent, with a simultaneous 4.3 percent reduction in operating costs.

Water management in agriculture requires a new approach. It should be pointed out that agriculture thus far has not presented any convincing evidence to show that irrigation is profitable. The problem of irrigation has been regarded as more political than economic. The result is that very large doses of irrigation have been provided in many design systems. For example, in the water-management design for the Lublin Coal Basin for 1990, 35,155 hectares of irrigation area with a water dosage of 10.75 million cubic meters per 1,000 hectares per year was provided, and by the year 2000--50,160 hectares of irrigation area with a water dosage of 9.27 million cubic meters per 1,000 hectares per year. The above irrigation should be compared with two Bulgarian irrigation systems: Biala Slatina, with 1,063 hectares, and Kneza, with 1,200 hectares, where similar irrigation dosages amount to 1.5-2 million cubic meters per 1,000 hectare.

In our agriculture, as in our industry, water is regarded as an unlimited resource. Furthermore, in agriculture, the principle of surface distribution of water has been adopted. This means that water is stored in surface reservoirs and transported by canals or pipelines to the irrigation systems, whereas from the technical and natural-science standpoint, these systems should be expanded to take into account the supply of water drawn from the first level of the subsurface waters. This system is used, for example, in many farming areas in the GDR. It is more flexible and economical in its operation and it also takes advantage of the large water-retention capacity of the soil. But to do this, modern, economical irrigation methods must be applied, such as sprinklers, and in some areas, a drip-feed system. To determine where and how much water is required by agriculture, a macroscale model should first be constructed. The management study on the Bulgarian farm region of Silistra, made by the International Institute for Systems Research in Laxenburg, is an example of such a model.

There is extensive material for preparing such a model in many specialized institutes. Until such a model is prepared, the following proposals on courses of action in water management in agriculture can be safely advanced:

-- institute irrigation first in those regions of the country where water is most plentiful,

-- form, in areas under irrigation, local research stations to determine the sum total of water in agriculture,

-- related water-management research in agriculture with economic research.

Using Mine Water

Coal mining now pumps out approximately 540 million cubic meters of water annually, of which about 20 percent is salt water and about 3 percent is brine. The rest, i.e., about 80 percent, is pure water which can be used in the municipal economy and in industry. Some of this water is already being used for these purposes, but there is still room for improvement in efficient consumption of mine water. Better water management in coal mining would make about 300 million cubic meters of fresh water, pumped out of the mines, available for the economy. But in many cases this will require changes in water management in the existing mines and a change in the habits and methods of approaching this problem by the mining organization and services.

The same applies to the draining-off of water. For example, in draining the Belchatow mine, about 6 cubic meters per second of high-quality water is being pumped out constantly--water which could be used as municipal water. This installation will have to operate about 30 years. The matter has been known for several years, but thus far no important studies have been undertaken on optimizing the utilization of this water. Yet, Belchatow is only 100 kilometers from Silesia and only 60 kilometers from Lodz. The transport of this water to Silesia would cost much less than the water intake on the Dunajec [River], which is under consideration for the future. Neither does it require construction of any kind of storage reservoir. Studies on optimizing the utilization of water from the draining of the Belchatow mines should also take into consideration the large excavation which will remain in this region after the coal has been mined. It may be worthwhile to convert it to a large storage reservoir, taking advantage of the local resources of the Widawka, Grabia, and possibly the Warta rivers, and accumulate substantial amounts of municipal water.

New Regulations and Organization

The actions that are proposed require changes in the legal bases and organization of water management, enabling, first of all:

1) The creation of regional water-management systems, operating as management enterprises authorized to:

-- verify the needs of water consumers, taking into account changes in production technology and water-treatment methods,

-- conduct a cost-effectiveness analysis to decide how the water is to be supplied in view of local resources, water-treatment stations, storage reservoirs, water transfers, and changes to methods that are water-conserving,

-- intervene in water management inside the plants in order to adapt the system to periodic changes in the supply of water or to protect the receiver against the possibility of emergency pollutions,

-- indicate sources of water consumption and require the user to adapt the water quality to his own needs.

2) Institute the rule that the wastewater that is being dumped must correspond, from the standpoint of pollution, to the future expected grade of the receiver, regardless of the quality of the water being consumed. In many cases, this means that the water that is being dumped must be cleaner than the water that is being taken. Experience abroad has shown that this course of action is, in many cases, the most natural incentive for efficient water utilization.

3) Take systematic action to control pollution and use subsurface water resources efficiently. First of all, payment for water for industrial production should be increased, with a large increase in payments for water being consumed for nonproduction purposes. The principle of issuing temporary permits for consumption of subsurface water should be introduced.

Another important course of action in connection with stimulating the economy and water management, is the reconstruction of small storage facilities which have diverse and generally well-documented utilitarian functions.

Because in the case of small storage facilities not only their reconstruction, but also their proper operation is an important factor, it is proposed that the following courses of action be considered:

-- stimulate the construction of small energy facilities by local industry,

-- support the comprehensive development of small rivers by water companies and other local organizations,

-- support the reconstruction of fishing-economy facilities.

To stimulate the above-mentioned courses of action, use should also be made of the Water Management Fund, which should participate in the design and construction of these facilities and also fulfill the role of technical supervision over their implementation.

I would like to cite Prof K. Kopecki's position (1981) on this subject. He points to the "feasibility of constructing and reconstructing numerous (8,000!) small (up to a couple hundred kilowatts) electric power plants making up the so-called small hydropower industry (former mills, windmills, etc.). Up to now, they have been unprofitable, but with complete standardization of assumptions, average serial production of standardized units, and full automation of motion, they could fill a nonservice role of rather cheap sources of energy with a combined production of about 500 GWh/a."

PROPOSAL TO LIMIT INTERNATIONAL INTEREST RATES EXPLAINED

Bucharest REVISTA ECONOMICA in Romanian No 43, 23 Oct 81 pp 27-28

[Article by Ilie Magura: "The Requirement of Reducing the Level of Interest Rates on International Credits"]

[Text] For over 400 years, credits have represented a means of stimulating commercial trade. In our times, when trade and international cooperation are designed to intensify each country's own efforts, credit has taken on a role of stimulating international commercial trade, becoming a necessary component in the process of developing and increasing international economic relations. In this regard, it is clear that any delivery of complex installations and industrial equipment between countries, regardless of their level of development, is done on the basis of credit.

Today, however, we are witnessing a basic erosion of the function of credit as a result of an unprecedented increase in interest rates caused by a complex group of factors that involve the essence of capitalism and by the crisis phenomena that are confronting these countries, as well as by the deliberately conducted restrictive monetary policy of monetary authorities in some Western countries.

The considerable growth in the level of interest rates is clearly shown by several figures. Compared to 1977, the level of interest rates on the money market in the United States and on the international Eurodollar market was in 1980 and 1981, 10 to 12 percentage points higher. As a result of the "interest rate war" waged between the main Western countries, there was a 6 to 10 percentage point increase in the interest rates on the West European money markets. The upward spiral of interest rates was transmitted from the Western countries to all categories of credit, including those long-term credits granted by international financial institutions for financing the development of those countries that are behind in their development. In this regard, we can mention the fact that in recent years the World Bank, which acquires its resources from the Western capital markets, increased the interest rate levied on credits by over 4 percentage points, reaching 11.6 percent.

The increase in the cost of international credit has a powerful negative influence upon all countries, and especially upon the developing nations required to support the burden of payments for certain ever greater interest rates. As a result, the high level of interest rates not only makes it ever more difficult to go beyond the stage of underdevelopment, but also considerably contributes to its aggravation.

Each percentage point increase in the interest rates is equal to considerable supplement payments that the developing nations must make into the account of the party with which the loan was contracted. At the level of the foreign debt that these nations have, one percent of interest currently means approximately $4 billion. That is why the developing nations' payments for interest on foreign debt accounts, payments that doubled from 1978 to 1980, reaching $30 billion and this year moving up to approximately $55 billion, exceed all the capital put into these nations through official development assistance (in 1980, approximately $26 billion). In addition to this, we must note the interest paid on short-term loans (under 1 year), assumed by these nations to cover urgent needs, loans that had interest rates that were especiall high, 20 to 24 percent in the first part of this year.

The ever greater burden of the interest rates is illustrated by the doubling of the percentage of this burden in the receipts from the exports of the developing nations, from 4-5 percent in 1976 to 8 percent in 1980 and approximately 10 percent this year, while payments on the debt have been maintained at around 10-12 percent. Thus, a situation has been reached where the effort to reimburse the interest rates equals and has a tendency to exceed the effort to reimburse the so-called credit. Together, the interest rates and the decreasing payments on the foreign debt today absorb nearly one-fourth of the already modest hard currency earnings of the developing nations made from their entire export of goods and services.

The increase in the interest rates and the reduction in the repayment timeframe have reduced the volume of the net transfer of capital which can be effectively used by the developing nations to pay for imports and other development projects from 40 percent in 1978 to only 22 percent in 1980, requiring these nations to use an ever greater portion of the incomes earned from exports for the annual payment of interest and term payments.

The high level of interest rates on international credit is especially powerfully reflected in the foreign trade of the developing nations, inevitably bringing about the restriction of the volume of this trade and, as a result, the decrease in overall international trade and the narrowing of the world market - a phenomenon that affects all countries, including the powerfully developed ones. The chain effects of this process are illustrated by the last annual GATT report which noted that in 1980 the volume of world trade had increased by only 1.5 percent, while this year the first absolute decrease since 1975 is forecast.

The burden of the interest rates in 1980 has required the developing nations to pay to the Western countries 1.8 percent of their gross national product, compared to .4 percent in 1970. One-third of the increase in the gross national product of the countries that are lagging behind is transferred to the developed countries in the form of payments on interest. The conclusion is clear: the high level of interest rates contributes to perpetuating the state of underdevelopment, with all the serious consequences that stem from it.

The future is even more unsettled. If currently a portion of the repayment debt is made up of foreign credits and loans previously contracted when the interest rates were more reasonable, during the coming periods they will have to repay credits contracted during 1980-1981 at a time of unusually high interest rates. The loans obtained from the private Western banks at the high market interest rates by the developing nations increased from $13 billion in 1977 to $42 billion in 1979 and $47 billion in 1980.

If we keep in mind only the bank loans obtained by the "third world" nations in 1979 and 1980, of $90 billion, and the fact that they are currently paying 15 to 20 percent interest in the money markets. the result is that this year the developing nations will have to allocate, just to pay for the interest, $15-18 billion or more than half of what they will receive in development aid or another 5 percent of their incomes from exports or more than one-fourth of their hard currency reserves. Let us remember that we are speaking only of the bank credits obtained in 2 years, as well as the fact that the development aid is slated for the achievement of certain projects needed to improve these countries and not pay off debts. Additionally, the hard currency reserves of many of the developing nations are already very small, to the point where they can barely cover their import requirements for just several weeks.

Caught in the vice of these difficulties, many developing nations see the need either to once again appeal to the private capital markets - which at the current level of interest rates means a future of even more enslaving debts - or to proceed with a drastic reduction in domestic consumption and investment. This latter option is, for its part, especially painful. For the poor nations having a per inhabitant income of under $300, the reduction in the level of consumption is, in many cases, practically impossible, with consumption already standing at the threshhold of subsistence. Generally, in the case of all the developing nations the move to reduce investments is equivalent to slowing down and frequently abandoning their development programs, resulting in a further widening of the gaps that separate them from the advanced countries.

Realistic, Constructive Proposals

Keeping in mind the negative effects of the exaggerated level of interest rates, it seems an absolute necessity to renounce the deliberate policy of high interest rates and to move to the practice of having certain rational interest rates. Beginning with the finding that all countries, including the developed ones, are

interested in the final analysis in this course, Romania feels that the entire international community must firmly work to stop the escalation of interest rates and to put an end to these practices of power and oppression, which in fact represent expressions of neocolonialism pursuing, through new, refined, but equally painful forms, the perpetuation of the exploitation of the weak by the powerful.

In defining Romania's position in this problem, comrade Nicolae Ceausescu stressed: "It is necessary to work in a fully decisive manner to put an end to these new forms of exploitation, including those used by financial capital institutions - the use of certain high interest rates, which place an ever greater burden on the shoulders of the developing nations and, at the same time, disorganizing the entire world economy. It is necessary to be understood that this damages the general interests of the people and is a path that will lead to a deepening of the economic crisis and certainly bring a sharp rebuff to the poor people who will not be able to suffer the oppression and imperialist plundering forever."

Beginning with this principled position, Romania proposed, within the framework of the current session of the United Nations' General Assembly and at the recently concluded annual session of the International Monetary Fund-International Bank for Reconstruction and Development, taking certain specific measures to reduce interest rates to levels that are justified from an economic point of view. In the opinion of our country, it should come to an international understanding where the maximum level of the interest rates does not exceed 8 percent under normal economic conditions.

Romania's proposal primarily has in mind the level of usual, normal profits for investment projects that are financed with international credits. It is easy to understand that the level of the interest must normally be kept under the level of the profits of the investment project financed by this credit so that the project will be workable and efficient. In contrary cases, the credit leads to a loss and national income flows out of the country. And, international credits should not constitute a roadblock in the path of each country's progress, but rather a stimulent for material production and economic trade between countries.

Second, the Romanian proposal regarding the maximum level of interest rates has in mind the need to resolve economic problems - inflation, recession - within the framework of each country where these problems appear and not by throwing these difficulties onto other countries, especially onto the developing nations.

Under the conditions of the special role credit plays in contemporary economics, especially for stimulating investments, progress and economic growth, and keeping in mind the seriousness of the problems related to foreign debt, Romania feels that the policy of granting international loans must continue to have favorable elements for the developing nations.

This course of action is justified by at least two considerations.

1) Investment projects are normally achieved with greater difficulty in the developing nations because of weaknesses in their infrastructures, a lack of a highly qualified workforce and other inherent difficulties in the poor countries. As a result, the level of profitability in these countries has a tendency of being lower, and a higher level of interest rates means, as we have noted, the flow of a portion of the national income out of the country. The requirement of eliminating underdevelopment and helping, not hindering these countries and ensuring an effective growth of national income in the third world requires, therefore, practicing certain favorable interest rates for the developing nations.

2) The burden of foreign debt has become so great that many developing nations are encountering serious difficulties in repaying it and honoring their repayment schedules. Calling for new expensive credits at high interest rates means a rapid worsening of the situation, which, in the final analysis, runs counter not only to the interests of the debtors, but also the creditors. The only solution to this problem is the practice of certain advantageous international credits having lower interest rates in relations with the developing nations.

Beginning with this consideration, Romania proposed at the current session of the United Nations' General Assembly and the annual meeting of the International Monetary Fund and World Bank that the level of interest rates on international credits granted to the developing nations be 5 percent, compared to the 8 percent general maximum level, and credits granted to the least developed nations should be interest-free or the rates should not exceed 2-3 percent.

Similarly, keeping in mind the situation that has been created, our country feels that the solution of the problems related to the developing nations' foreign debt constitutes an objective that deserves special attention within the framework of the process of establishing a new international economic order. In this regard, right from the special session of the United Nations' General Assembly in the fall of 1980, Romania proposed measures to ease the developing nations' foreign debt and to equalize their balance of payments, such as the cancellation of the foreign debt for countries having a national income under $500-600 per inhabitant, the reduction of debts, the institution of moratoriums and the rescheduling of payments, including the delay of repayment on certain debts for long periods of time, 15 to 20 years, without applying interest, for those developing nations overwhelmed by debts.

The implementation of these realistic, constructive and equitable proposals would correspond to the true long-term interests of all countries and to the general cause of progress and peace in the world.

ROMANIA

OPERATION OF RESITA-RENK JOINT COMPANY DECLARED SUCCESS

Bucharest REVISTA ECONOMICA in Romanian No 43, 23 Oct 81 pp 12, 19

[Article by Dr G. Cristea, a director in the Ministry of Foreign Trade and International Economic Cooperation: "A Successful Cooperation Initiated at the Bucharest International Fair"]

[Text] Nine years ago at the second Bucharest International Fair (1972), we signed a contract for international economic cooperation regarding the establishment of a joint company for the production and sale of reduction gears, gears, couplings and other toothed mechanisms - the "Resita-Renk S.A.", headquartered in Resita and composed of the following partners:

- on the Romanian side: the Resita Machine Building Enterprise, having an over 200 year tradition in machine building, and the UZINEXPORTIMPORT Foreign Trade Enterprise, having rich experience and broad commercial relations in other countries;

- on the German side: the company ZAHNRADERFABRIK RENK A.G., one of the oldest and most famous reduction gear companies in the world, having an over 100 year tradition in the production of reduction gears.

In order to achieve the objectives of the company, investment funds were set aside totalling DM 49 million. The construction was carried out under a contract to the Romanian Construction Enterprise ARCOM, on the basis of the architectural and construction design drawn up by Romanian designers in the Timis Design Institute, with this phase being completed in the fall of 1975 when the reduction gear factory began operations.

The investment project was completed on the basis of the capital contributed by the shareholders at the start of the company, with the Romanian party contributing at the rate of 100 percent for the construction of the factory and 40 percent for the supply of the necessary equipment.

Located within the Culnicel industrial complex in Resita, the "R.R.R." factory covers 22,000 square meters and is composed of a main production building (12,000 square meters), a thermal treatment and welding annex building and space for storage and warehouses.

For technical equipment, the factory has modern, specialized machinery for processing the component parts of the reduction gears. Similarly, we can point our the quality control system that is of great precision and equipped with machinery and devices both for checking the quality of the production of the component parts and for checking the performance of the reduction gears on the test stand.

The company produces, under license and on the basis of the RENK company's know-how, reduction gears of various types and sizes, depending upon the user's requirements, for maritime and industrial uses. To date, over 1,800 reduction gears have been produced for domestic consumption and export, having weights between 300 and 65,000 kilograms for use in a broad range of industrial equipment.

The collaboration between the two partners led in a short time to a good mastery of the design, technological and production know-how so that, today, the company completely designs the construction and technological documentation on the basis of the most modern methods, using automated data processing in computers.

It can be said that the designers, workers and engineers in the Resita industrial center, which has a tradition and long experience in machine building, succeeded in a short period of time in mastering the bases for designing and producing reduction gears on the basis of the RENK Company in Augsburg, so that, today, in its sixth year of operation the "R.R.R." company designs, produces and sells products of its own creation.

One of the premises of establishing the joint company in Romania was the promotion of exports in third markets so that up to 50 percent of the production would be sold for export, of which 25 percent would be done through the efforts of the West German partner.

In accordance with the licensing contract, the company has the right to sell its products - directly or through the Romanian foreign trade enterprises - throughout the world, with the approval of the party holding the license. It should be mentioned that all financial activities are carried out in hard currency.

In order to be supplied with raw materials, materials and services, the company is staffed with the appropriate personnel, who, through the foreign trade enterprises in the country, place the necessary orders. Imported products are obtained by the company through direct contracts with different firms, both in the West and the East. Regardless of whether we are talking about domestic or imported products, their purchase is accomplished according to quality and price.

The company is organized on the principle of self-administration, with all financial activities being carried out on the basis of resources stemming from the sale of production, payments from clients and bank credits. When contracts

are concluded, there must be payment of a minimum of 20 percent in advance on the value of the contract, which constitutes a portion of the resources needed to cover material and financial costs. Organizationally, the joint company has all the functions of an enterprise: sales, supply, planning, production scheduling and accounting and finances, as well as technical, design, production preparation, investment and other departments. Despite all this, the number of personnel in the company is small, while the productivity that is attained is comparable to that obtained by similar factories in the developed countries, with this being the result of the high level of equipment as well as a modern processing and assembly technology that is applied during the production of the gears.

By the end of 1980, a production worth over DM 100 million had been achieved, reaching during the fifth year of operations a sales figure 2.6 times greater than that of the first year of production.

R.R.R reduction gears have been exported to a series of countries, including the People's Republic of China, Czechoslovakia, Yugoslavia, Poland, Syria, Japan, FRG, Iran, India, Italy and Norway.

Products delivered by R.R.R. enjoy a high regard on the part of the users because of their technical and quality level, thus being competitive with the best reduction gears produced in the world.

Technical comments obtained during visits made by the representatives of the users to other countries, visits for the purpose of accepting products or contracts, contain especially favorable evaluations regarding the factory's organization and technical equipment, evaluating the enterprise as one of the most modern in the field of reduction gears production and as a success of the good Romanian-West German cooperation.

Recent design and production activities oriented towards the field of special reduction gears having a completely rectified set of teeth and a high degree of reliability have led to the introduction of products on new segments of the market. The fact that a series of Western firms, like Werner and Pfleiderer, G.H.H., Krupp-Polysius and so forth, are buying R.R.R reduction gears fully shows the quality and competitiveness that the company's gears enjoy on the market.

The results obtained to date through the good cooperation between the partners also ensures the further development of the company, with an appropriate level of profitability, as was planned at the beginning. At the same time, it has created the premises for establishing new joint Romanian-West German companies.

At the seventh Bucharest International Fair, Resita-Renk-Reduction gears is present among the exhibiting industrial firms with products of great commercial attractiveness.

FIRE PREVENTION IN INDUSTRIAL, AGRICULTURAL UNITS

Bucharest PAZA CONTRA INCENDIILOR in Romanian No 9, Sep 81 pp 2, 10

[Article by Maj Gen Gheorghe Briceag, commander of the firefighters: "Firm Pledge to Protect the National Wealth"]

[Text] Each year on 13 September, we celebrate "Romanian Firemen's Day." On this day we not only remember and render homage to the heroic deeds performed 133 years ago at Dealul Spirii by the Bucharest Firemen Detachment against the Ottoman invaders, to protect the land of their fathers and the holy cause of the 1848 Revolution; we also take the opportunity to show the high regard in which our party and state holds the activity of those who today are serving to protect the national wealth, as well as the lives and property of workers, against fires and other calamities.

This year, the 13 September celebration is held in a climate of strong and enthusiastic involvement in labor, by means of which our entire socialist nation, closely united around the party and its secretary general, Nicolae Ceausescu, fulfills the provisions of the first year of the five-year plan of quality and efficiency, bringing to fruition the decisions--so exceptionally important to the nation's future--adopted by the 12th Party Congress.

Joining the general effort and the sacrifice with which workers have undertaken to fulfill the state and party decisions regarding our nation's socioeconomic development, military and civilian firemen report with the greatest pride that the successes which they have obtained are the fruits of the conscientious application of the valuable indications provided by our supreme commander, Nicolae Ceausescu, according to which "the matter of fire prevention and of the measures that must be taken to this end, are extremely important. We must be capable to put out fires when they occur, but an essential aspect are also the measures that are taken to prevent fires." The full understanding of this concept, so clearly formulated, has stirred firemen's units and sub-units, and responsible factors in work units and localities, toward a more concrete and efficient effort designed to give new and qualitatively superior values to entire activity conducted to protect the national wealth against fires. With the direct contribution of party organs and organizations, of unit leaders, of specialists in various ministries and sectors of activity, and of technical commissions and civilian firemen formations, fire

prevention inspections, as well as the instruction and educational activities carried out with workers in enterprises and localities in the country, have been more efficient, have instilled a spirit of responsibility and discipline, and have reduced the number of fires and consequent material losses in most sectors of activity. The entire prevention activity has been focused on objectives of outstanding importance to the national economy, chemical and petrochemical sites, steel enterprises, enterprises involved in energy or complex technologies, wood industrialization combines, units with large cable investments, as well as many other categories of units, such as those which shelter large crowds or protect large amounts of material goods.

One reason for justifiable pride in the good organization and conduct of activities, are the fire prevention and fighting results obtained by many unit managements, technical commissions, and civilian firemen formations, such as the ones at the Electroputere enterprise in Craiova, the Telejean Petrochemical Combine, the Tulcea Ship Building and Technical Equipment Enterprise, and the Caransebes Wood Processing Enterprise, as well as those in the localities Strehaia in Mehedinti County, Codlea in Brasov County, Negresti in Vaslui County, Mociu in Cluj County, Hateg in Hunedoara County, Panciu in Vrancea County, and many others who took first place in their counties during the patriotic competition.

It should be noted that these good results were obtained through the constant support provided by local party and state organs to managements, workers' councils in industrial and agricultural units, and citizens who have made a real contribution to the high quality fulfillment of the firemen's tasks and missions. That is why it is our pleasant duty on this 13 September, to express our warmest thanks to all those who have acted together with us to assure the safety of lives and of the national wealth against fires, with the conviction that we will be able to rely on their unstinting support in the future.

Placing great stress on prevention activities, military and civilian firemen have also devoted constant attention to efficient organizational measures to obtain superior results in preparing for intervention and in strengthening their firefighting capabilities. Their high level of instruction, and their strong moral and fighting qualities placed in service to protect lives and the national wealth, were demonstrated during direct confrontations with flames or with the fury of waters, confrontations in which today's firemen were victorious, enriching with new pages of heroism the book of beautiful fighting traditions; their courage and tenacity have saved many human lives and great material values, as demonstrated by the military personnel in the firemen companies of Ploesti, Pitesti, Brasov, Bistrita, Cluj-Napoca, and Turceni, as well as by the members of the civilian firemen formations at the petrochemical combines of Borzesti and Brazi, the Electrocentrale enterprise in Turceni, and the Petrila Mining Enterprise, or in the localities Pascani in Iasi County, Saveni in Botosani County, Maureni in Caras-Severin County, Valenii de Munte in Prahova County, and many others.

In presenting the good results that have been obtained so far, we must not overlook that shortcomings did arise in preventing and fighting fires, that all the necessary attention has not been devoted everywhere to eliminating dangerous conditions at some installations, plants, departments, shops, and warehouses, and that there still

exist some leaders of socialist organizations, technical commissions, and civilian firemen formations, whose activities do not meet expected standards, a fact demonstrated by violations of regulations and by infractions of internal order and discipline, which have facilitated the occurrence of fires. It goes without saying that the elimination of these conditions implies more responsibility in organizing and conducting prevention activities and in assuring intervention in firefighting, requires greater initiative in effectively solving the problems raised in protecting the country's units and localities against fire, and imposes that the most efficient and viable measures be taken to bring out of danger socialist property, and the lives and personal goods of citizens. All the necessary conditions have been created in industrial objectives, agricultural units, and localities to achieve these goals. For this, we have valuable technical personnel, specialists, superior technical endowment, and appropriate conditions for carrying out a better organized long-range work, based on the firm and consistent application of prevention regulations, on the constant introduction of new developments, and on the use of approaches and methods with maximum immediate efficiency.

The successful completion of the priority objectives that are facing leaders of socialist organizations, the personnel in county firemen groups, technical commissions, and civilian firemen formations, requires a closer connection with workers, through the performance of efficient instruction and education activities, capable of increasing the contribution to a sustained effort for assuring sound protection against fires at industrial, chemical, petrochemical, and steel sites, at units whose technical processes use raw materials or manufacture combustible or flammable products, at commercial units and storage areas which house large material values, at constructions sheltering large numbers of people, in forests, and at citizens' farms.

In addition, particular attention must be devoted during the fall, to fire prevention in agricultural units. The fact that fires have recently occurred at warehouses, animal shelters, and fodder stores belonging to some agricultural production cooperatives and state agricultural enterprises, and that these fires resulted from preventible causes (short circuits, cigarette butts casually tossed out, open fire operations at insecure locations, children playing with matches, spontaneous combustion, sparks from tractor and truck exhausts, and so on), imposes the performance of systematic inspections, the adoption of firm measures to eliminate the causes of fires at their source, as well as the organization of as many instruction and education activities as possible with the personnel which harvests, transports, and stores fall crops and animals. As the secretary general of the party, Nicolae Ceausescu, has pointed out in his speech to the recent Workshop on Problems of the Agriculture: "We must do everything we can for the fall crop to be harvested without losses, and stored under the best possible conditions." The same care and the same attention must understandably also be devoted to assuring the security of animal shelters and fodder stores, where any violation of fire prevention regulations can result in considerable material losses.

The continued improvement of fire prevention and fighting activities, in accordance with our country's dynamic socioeconomic development, with the increasingly exacting requirements made by party and state documents, and with the valuable indications provided by the secretary general of our party, imposes that we assign priority to

the following major actions: firm enforcement of legal regulations for fire prevention and fighting; improved guidance and technical inspection activities; formation of technical commissions and specialists; greater contribution from civilian firemen formations in fire prevention activities, and increased intervention capability for these formations; intensified and diversified instruction and education activities; increased intervention capabilities for sub-units and civilian firemen formations for firefighting and for the removal of the results of natural calamities and catastrophes; and continued improvement of forms and procedures of action, in order to fight fires rapidly and with minimum material losses.

Firmly involved in the protection of the national wealth, animated by the burning desire to perform their duties with devotion and abnegation, and profoundly devoted to the nation, the party, the people, and our supreme commander, Nicolae Ceausescu, military and civilian firemen reafirm, on this, their day, their unwavering determination to increase and devote all their strength and skills to the exemplary fulfillment of the mission entrusted to them, aware that in this manner they will make their contribution to the protection, development, and blossoming of our beloved country, the Socialist Republic Romania.

HIGH INCIDENCE OF FIRES IN FODDER DEPOSITORIES

Bucharest PAZA CONTRA INCENDIILOR in Romanian No 9, Sep 81 pp 19-20

[Article by N. Balesteanu and Victor Serban: "Animals Do Not Feed on Self-Criticism and Pledges"]

[Text] In previous issues of this magazine, we have discussed fire prevention in fodder depositories, stating that a higher production of meat and milk depends on their security. We also drew attention to the fact that the failure to take preventive measures leads to a higher danger of fire. Despite this, nearly 2400 tons of fodder were destroyed in more than 45 fires, proving that not all managements of state and cooperative agricultural units have given due attention to the protection of fodder against fires. In analyzing the causes for these fires, we note that nearly one half of them were the result of spontaneous combustion, leading us to ask whether the specialists in the animal raising sector are not aware that fodder stored before it is fully dry or while still damp, will self-ignite. Why then are they not taking steps to respect the provisions of articles 1030 and 1031 of the regulations issued by the Ministry of Agriculture and the Food Industry (MAIA)? What is more, many fires were caused by short circuits in the electrical installations of equipment used to stack the fodder (moving belts, transporters), by lack of supervision of feed preparation installations, by sparks from tractor and other vehicle exhausts, and by the negligence of smokers, all of which demonstrate that the respective units have ignored elementary measures for fire prevention and the regulations of their respective ministry (articles 1032 and 1033 in particular). And finally, a significant number of fires were caused by atmospheric electrical discharges, which raises problems that need to be solved effectively and efficiently.

Calling on statistics, we note that until 20 August, only 18 counties were free of fires (Bacau, Botosani, Brasov, Braila, Constanta, Galati, Giurgiu, Harghita, Teleorman, and others), while the situation is more serious elsewhere: Mures has had seven fires; Alba and Neamt have had four each; Arges and Bihor, three each; and Dolj, Arad, Bistrita, Gorj, Iasi, Salaj, Vaslui, and Vilcea, two fires each. Two-thirds of the fires thus occurred in 13 counties, and one fire each in other ones, testifying to the lack of concern for fire prevention and fighting. Issue No 7 of this magazine analyzed some of the largest fires, but others have occurred since then, resulting in significant losses: at the agricultural production

cooperatives of Dor Marunt, Calarasi County, a fire caused by a smoker burned 80 tons of lucerne; at Caldararu, Arges County, 96 tons of straw burned because Constantin Ciobotea was welding 5 meters away from a stack of fodder; and at Coltu, Arges County, where 495 tons of straw burned because of poor intervention in a fire caused by atmospheric electrical discharges. In analyzing the causes for these fires, we note that they were all based on negligence and failure to respect prevention regulations, while losses were higher because of poor and indecisive intervention on the part of the personnel on the spot and of civilian firemen formations, and because of delayed alarms to military firemen.

Many agricultural units continue to store their fodder under unsuitable conditions: locations are poorly selected (far from water supplies or near buildings), no fences have been constructed, and the personnel assigned to work on them has not been soundly trained. The findings of this magazine's editors also indicate that although no fires have occurred in such counties as Botosani, Caras-Severin, Teleorman, Prahova, and others, violations of prevention regulations do exist, which could easily lead to fires with the most serious consequences. The unsatisfactory security of fodder in many counties, places upon general county directorates for agriculture the duty of taking decisive steps to correct this situation, and punish those guilty of not performing established tasks or respecting regulations. We also draw the attention of the proper organs to the fact that in addition to the fire dangers listed above, other irregularities have also been found, such as the absence of initial firefighting means, failure to instruct those responsible for the depositories, failure to enforce labor order and discipline, and so on.

We recently carried out a surprise inspection in Iasi County. Our first day in the county coincided with the conclusion of the courses given to secretaries of committees and executive bureaus of peoples's councils, and to chiefs of civilian firemen formations. Taking advantage of the opportunity, and with the support of local organs, we organized a discussion about the measures taken to protect fodder depositories against fires. Remembering that two fires have occurred in that county, we asked those present--by title and in fact chairmen of technical commissions for fire prevention and fighting in their localities--to indicate the level of preparation at fodder depositories; however, they all spoke in general terms about the prevention and fighting of fires. And they had good reason to do so, because during our inspection we found many violations of prevention regulations, as was the case at the fodder depositories of the agricultural production cooperatives (CAP) in the localities Ciurea, Grajduri, and Scinteia. The Scinteia and Rebricea farms of the State Agricultural Enterprise (IAS) Miroslava, were pouring concrete and erecting fences at their fodder depositories. But we failed to understand the thinking of the head of the Rebricea farm, Eng Mircea Mardare, who had ordered that the wheat seed culling be conducted on the grounds of the fodder depositories, thus bringing into it equipment which could cause fires, as well as other workers than those assigned to feed the animals.

On the basis of our findings and of existing shortcomings, we believe it necessary to stress the need for concluding more rapidly the preparation of all fodder depositories and their endowment with intervention equipment, so that they may be protected from destruction by fire. It is imperative that instruction and education activities be bolstered through the use of various means, so as to disseminate and create respect for regulations, and to combat negligence in fodder depositories.

General county directorates for agriculture and the food industry, through their specialized technical personnel, have the obligation to support the managers and technical commissions of agricultural units in correctly applying fire prevention and fighting regulations. At the same time, it is imperative that all control organs in county directorates supervise the enforcement of these regulations at fodder depositories, and take effective measures to eliminate negligence.

It is important to forbid access to children and strangers, to provide the water necessary to extinguish fires, and to equip fire stations in accordance with specifications. Considering that many fires were caused by spontaneous combustion, the temperature inside stacks must be monitored, and steps to open the stacks must be taken when it reaches 45-55 degrees C. It is also compulsory that a guard be maintained in permanence, and that signs be installed to forbid access and smoking inside the depositories area. We would like to point out that animals cannot be fed with self-criticism or pledges, both of which we heard everywhere we went. Unit managers are therefore expected to apply to the letter, fire prevention and fighting regulations for protecting fodder depositories from the fury of flames.

In his speech to the Workshop on Problems of the Agriculture, held on 27-28 August, Nicolae Ceausescu stated that "the problems of animal farming during this year strongly demonstrate that the program for the development of animal farming, and for assuring the fodder resources necessary for increasing the production of animals, must be definitely be completed." The sustained efforts that are made to assure animal feed must be backed up by a constant concern to protect it against fires. Some counties are still lagging, not only in providing the necessary feed, but also in taking security measures and in applying the regulations which protect the fodder against destruction by fire.

Recently, the staff of the Firemen's Group of Mehedinti County undertook a specialized technical inspection in agricultural units, to observe the application at fodder depositories and animal farming sectors, of fire prevention and fighting regulations issued by MAIA through Order 150/1976. On this occasion, the inspectors noted that in some units, such as CAP Danceu, IAS Rogova, CAP Fintina Domneasca, and others, the managements of units and the technical commissions for fire prevention and fighting had taken steps to assure suitable conditions for eliminating dangers from fodder depositories and animal farm sectors.

Some other agricultural units however, have exhibited an indiference toward the application of fire prevention and fighting regulations. At CAP Gruia, for instance, large amounts of scrap iron and polyethylene have been stored at the fodder storage site, fire stations are not equipped with first intervention materials, or these materials are safeguarded in locked areas whose keys are hard to find. Similarly, some agricultural unit managements, such as the ones at CAP Gruia, CAP Ghelmegioaia, and others, did not seek to obtain the extinguishing materials necessary for 1981. And if at IAS Timna, the head of the farm, Eng Elena Mateita, does not know what steps to take in case of fire, we can imagine how she instructs the personnel and how fire prevention and fighting measures are respected in the sector which she leads.

The inspection also disclosed other violations of prevention regulations, such as: no plowing was performed around fodder depositories, some water tanks are used to store molasses, extinguishers are rusty, means of transportation--trucks, tractors--are not equipped with extinguishers or spark arrestors, electrical installations are defective, and warning signs against smoking and open fires have not been installed. Moreover, those designated to guard fodder depositories were not found at their posts.

Unit managements, together with fire prevention and fighting technical commissions, must urgently take all necessary measures to eliminate the noted shortcomings, and to firmly protect fodder depositories against fires.

MEASURE TO IMPROVE NON-FERROUS METAL PRODUCTION

Bucharest BULETINUL OFICIAL in Romanian Part I, No 72, 12 Sep 81, pp 1, 2

[Decree Regarding Measures for Improving the Research, Design, and Production of Non-Ferrous and Rare Metals]

Article 1. The Industrial Central for Non-Ferrous and Rare Metals (CIMNR) will be established on 1 October 1981; it will fall under the jurisdiction of the Ministry of the Chemical Industry, will have its own administrative structure, and will be headquartered in Bucharest; the purpose of its activity will be to extract from concentrates and scraps, heavy and rare non-ferrous metals and aluminum, and to manufacture anodes, sulfuric acid, and other chemical products.

Article 2. On 1 October 1981, the following will be established under the jurisdiction of CIMNR:

a) The Moldova Noua Metallurgical Enterprise for Non-Ferrous Metals (IMNN), located in the town of Moldova Noua, county of Caras-Severin, whose purpose of activity will be to extract copper from concentrates, and to manufacture sulfuric acid and other chemical products.

For the year 1981, five management, administration, and clerical positions are approved to manage, supervise investment operations, and provide tooling and manpower for the Moldova Noua IMNN;

b) The Tulcea Alumina Enterprise, located in the city of Tulcea, county of Tulcea, whose purpose of activity will be to manufacture calcined alumina and other chemical products.

This enterprise is formed by separating the Tulcea Alumina Plant from the Tulcea Metallurgical Combine.

Article 3. The CIMNR is composed of the units shown in the appendix. The central's own administration has 98 positions and will be managed by a director general with the title of deputy minister.

Article 4. The units stipulated in articles 1 and 2, and the Slatina Aluminum Enterprise operate on the principle of economic-financial self-management, as legal entities, and according to legal regulations regarding the organization and

management of socialist units. The CIMNR falls in the category of special grade organizations, group II branches, and the Moldova Noua IMNN, as well as the Tulcea Alumina Enterprise, in the category of grade I organizations, group II branches.

Article 5. The research and design activities for non-ferrous and rare metals at the Baia Mare Institute for Research and Design for Non-Ferrous Ores and Metallurgy, and the Slatina Center for Research and Design for Aluminum Technology, are transferred to the Bucharest Institute for Research, Technical Engineering, Design, and Production for the Inorganic and Non-Ferrous Metals Industry, within the Central Institute for Chemistry.

Article 6. The assets and liabilities established on the basis of the balance sheet of 30 September 1981, together with economic and financial plan indicators, and economic contracts associated with transferred activities, are transferred from the respective units to CIMNR, the Tulcea Alumina Enterprise, and the Bucharest Institute for Research, Technical Engineering, Design, and Production for the Inorganic and Non-Ferrous Metals Industry.

Article 7. Remuneration, rights for special working and toxicity conditions, and for labor groups I and II, work schedules, as well as other legal provisions established for workers in non-ferrous and rare metal units, transferred according to the stipulations of the present decree, will continue to be applied at approved levels.

Article 8. The State Planning Committee and the Ministry of Finances will propose for approval within 45 days from the date of the present decree, modifications in economic and financial plan indicators in the unified national plan for socioeconomic development, and in the volume and structure of the 1981 state budget, resulting from the application of the provisions of the present decree.

Article 9. Appendixes and 2 to the Decision of the Council of Ministers No 367/1973 regarding measures for reorganizing industrial centrals, units associated with them, and some state enterprises, are modified in accordance with the provisions of the present decree.

Nicolae Ceausescu
Chairman of the Socialist Republic Romania
Bucharest, 11 September 1981
No 276

APPENDIX

List of units composing the Industrial Central for Non-Ferrous and Rare Metals

Name of unit in CIMNR	Locality	County	Transferred from
1. Baia Mare Metallurgical Enterprise for Non-Ferrous Metals	City of Baia Mare	Maramures	Baia Mare Central for Ores and Non-Ferrous Metallurgy

2. Copsa Mica Metallurgical Enterprise for Non-Ferrous Metals	Town of Copsa Mica	Sibiu	Baia Mare Central for Ores and Non-Ferrous Metallurgy
3. Zlatna Metallurgical Enterprise for Non-Ferrous Metals	Town of Zlatna	Alba	Baia Mare Central for Ores and Non-Ferrous Metallurgy
4. Slatina Aluminum Enterprise, composed of the Computer Center and the Plant for Metallurgical Tooling and Spare Parts for the Aluminum Industry	City of Slatina	Olt	Slatina Central for Non-Ferrous and Rare Metals
5. Oradea Alumina Enterprise	City of Oradea	Bihor	Slatina Central for Non-Ferrous and Rare Metals
6. Tulcea Alumina Enterprise	Town of Tulcea	Tulcea	Tulcea Metallurgical Combine
7. Neferal Metallurgical Enterprise, Bucharest	City of Bucharest	--	Slatina Central for Non-Ferrous and Rare Metals
8. Moldova Noua Metallurgical Enterprise for Non-Ferrous Metals	Town of Moldova Noua	Caras-Severin	Deva Ore Central
9. Industrial School No 3, including the Professional School for Metallurgy	City of Baia Mare	Maramures	Baia Mare Central for Ores and Non-Ferrous Metallurgy

CALLS FOR ECONOMIC, SOCIAL REFORM IN AIR

Economists' Gathering

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1605, 4 Oct 81 pp 19-20

[Article by Scepan Rabrenovic: "Demand for Reform"]

[Text] The members of the Federal Economic Council spent two days (on Monday and Tuesday) in the Federal Executive Council building, and because of their intense work they did not even have time to go to dinner; their meal was instead prepared "on the premises."

In the view of the Vice President of the Federal Executive Council, Zvone Dragan, this was one of the most well attended meetings of economists in the last few years. The economists (more of them were invited than the Council has members) were discussing the first, although not yet official, draft resolution on development for next year.

The Federal Executive Council, in fact, rushed to draw up this resolution, along with all of the accompanying documents, much earlier, in order for them to be adopted earlier, so that associated labor would be "informed" in time of what awaits it and how it should prepare. This was not done in previous years: the resolution for the following year was adopted on the last or next to the last day of the old year, and the adoption of some of the accompanying documents was delayed for five of six months.

An Unsystemic System

The economists, however, were not satisfied with just evaluating what was offered by the official planners, but in regard to this searched for the causes of the crisis in which the economy finds itself. They were also inspired by the words of the director of the Federal Institute for Social Planning, Spasoje Medenica: "We planners could not say whether this is a realistic assessment, but we feel that it is a vital issue and a condition for the further development of the country."

This "vital issue" is stated as: export or die. This is because next year alone, Yugoslavia will have to pay back about 5 billion dollars in debts or interests on debts. The Federal Executive Council is therefore seriously considering a drastic reduction in the balance of payments deficit (that would again have to be covered by credits), and there are also those who assert that we should "eliminate" the balance of payments deficit next year, "even at the cost of slowed economic growth."

The economists searched primarily for the causes that have led us into a situation in which the balance of payments deficit has become one of the main factors limiting our growth. According to them, the payments deficit is a mirror image of what is happening in our economic and social system.

Belgrade economist Zoran Popov explains the growth limiting factors as a result of the literal application of systemic decisions, and says: "In the last few years investments have been reduced, real incomes have been reduced, inflation is galloping, and there is not enough of some goods on the market. The growth rate is approaching zero."

Along with all of this, Zoran Popov asserts, the system of self-managing agreement and social agreement is, on the whole, not functioning. ("The people have not been corrupted, but rather we have a system that does not stimulate labor.") Thus this economist seeks to have a long-term stabilization plan drawn up that would also entail a change in the systemic decisions.

Administrative Self-Management

Professor of the Economic Faculty in Belgrade Zoran Pjanic said: "This moment is such that it threatens the heritage of the self-managing socialist system, and the country's legal order is also threatened." And further: "As soon as someone mentions that something in the system is not working, he is met with criticism. I do not dispute the basic systemic orientations, but in my opinion, the systemic laws are debatable. Through the ZUR [Law on Associated Labor], 23 wanted to create a system of free associated labor, but we ended up with fragmented enterprises... We have more and more administration, which will lead us to central management."

Ante Markovic, the director of the Zagreb enterprise Rade Koncar, called the present economic system an "administrative socialist self-managing system."

"This is the ruin of that system," said Ante Markovic, and added, "we must necessarily leave administrative paths for others, self-managing ones. We must create a system and relations in which no one will have to close up shop, and in which no one, quite normally, will remain without an income. Otherwise, we will continue to exhaust ourselves in discussions."

According to Ante Markovic, the very fact that 93 percent of income is earned by a price increase, and only seven percent comes from the results of labor, may explain how much the market criteria for economic activity have been curtailed.

Both Ante Markovic and other economists emphasized that the autarchic conception of development has failed, but that we are not yet acknowledging it. He furthermore illustrated this by the foreign exchange system that has "enthroned" eight economies that are opposed to each other.

The fact that we have a great variance between what has been agreed upon and legalized, and what is happening in practice, led Voja Rakic to suggest: "The situation, not only economic, but social as well, is such that it requires a fundamental social and economic reform, not only [reform] of the systemic laws."

On What Is and Is Not Debatable

According to Titograd professor Bosko Gluscevic, our problem consists of the fact that "we believe that economic problems can be solved by political means, and so we are therefore seeking solutions where there are none. But it should be the reverse: first we must have economic solutions, and only then political ones."

Speaking about the fact that an extraordinary situation also requires extraordinary measures, Professor Bosko Gluscevic advocated greater consideration for economic criteria, but primarily a revitalization of self-management, "which is the fundamental guiding idea of this society." But how is this to be achieved, wondered Professor Bosko Gluscevic, when social parasitism presents the greatest opposition to work and savings, and when we have so many of those who spend and who, in spite of the situation we are in, manage to organize numerous celebrations.

There were a fair number of economists who expressed appreciation of some measures, even though partial ones, taken by the Federal Executive Council, but there were also some who explained the helplessness of Federal Executive Council (the "culprit on duty") as a result of questionable and inefficient coordination among the republics and provinces, which, in several cases, insisted too much on their own interests. Thus one has often received the impression that the Federal Executive Council, as the one who proposes individual measures, is only the ninth partner in the process of negotiation.

This was also discussed by Vice President of the Federal Executive Council Zvone Dragan, who furthermore stressed that during coordination it is necessary to go to the public and put the arguments on the table, and see who defends his own interests to the bitter end.

Over Each Dollar

Speaking about whether economic and social reform is necessary, Zvone Dragan said: "There is a great deal that is open, but it would be good if we waited for some more assessments." Otherwise, Zvone Dragan does not disagree either with the need to reexamine some systemic decisions and laws: "We have already formed commissions that are discussing some systemic laws."

This meeting did not only discuss how much individual systemic decisions have and have not contributed to the current situation. A lively debate was also caused by the idea that every dollar received from the exportation of goods and services is socially profitable. Professor Zoran Pjanic feels that the slogan "export or die" cannot be accepted without a model that would be verified, while Ljubljana professor Aleksandar Bajt, in spite of the current situation, does not agree that the priority should be given to exports and that in doing so all of the problems that are actually hindering greater exports should be neglected--economic growth, prices, and social and economic policy.

At this meeting there was almost no disagreement among the economists, except one thing: how to give preference to exports and how to maintain exports. On the very first day Ante Markovic threw down the glove when he said: "What we need is a new concept of development that will contain an export orientation and modern technology, so let whoever can get involved in it do so."

Ante Markovic furthermore observed that a policy of priorities (food, raw materials, energy) is expensive and that the policy of encouraging the development of priority activities is actually an integral part of the autarchic development policy.

This opinion of his was disputed by Titograd professor Risto Vukcevic ("Such a policy has a reason only if the structural problems of the economy have been solved.") and Aleksandar Bajt ("We created the problems ourselves and we have to solve them ourselves. One of those problems is the development of primary production."). According to Bosko Gluscevic we have not utilized all of the advantages given to us by nature, and this is the reason for the structural problems that have contributed to the high balance of payments deficit.

Zvone Dragan also thinks that no development policy can ignore the production of food, raw materials, and energy: "The question is only about how many priorities we will agree on. If there are more of them, there will be less money."

Director of the Federal Institute for Social Planning Spasoje Medenica spoke at the end about the difficulties of the planners, who are working in a situation in which little is known and when there are a considerable number of unpaid bills and systemic omissions. At the end he almost shouted, "Don't leave us alone."

It remained unclear what he meant by this: whether he was requesting concrete assistance from his colleagues, or support for the kind of economic policy advocated by the economists.

Member of Legislature Interviewed

Blegrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1606, 11 Oct 81 pp 22-24

[Interview with Ljubisav Markovic, member of SFRY Assembly, by Aleksandar Novacic; date and place of interview not specified]

[Text] "Conditions, material ones and those regarding consciousness and experience, have become ripe for us to prepare and carry out resolutely an economic and social reform. It also includes reform of the ideas of certain economic and political institutions. We should also examine some decisions in the political system"--stated Ljubisav Markovic, a prominent scientific and sociopolitical worker, in a conversation with NIN [NEDELJNE INFORMATIVNE NOVINE].

Comrade Markovic, a theoretician of the economy of socialism but also a practician, was once a member of the Federal Executive Council (from 1969 to 1971 when Mitja Ribicic headed the government), and is now chairman of a committee in the Council of Republics and Provinces in the SFRY Assembly. This activity has made it possible for Ljubisav Markovic to perceive the problems of the Yugoslav economy from two angles: the practical and everyday one, and the scientific and analytical one.

In his conversation with NIN, Ljubisav Markovic points out a unique method of analyzing our economic situation that also contains a criticism of some ideas about the possibilities of socialism and the habits that have been formed.

[Question] The economic difficulties, which are becoming increasingly greater, are also influencing public opinion. It is full of worry, hostility, and many

questions. Nevertheless, even very important officials feel that the public is not yet acquainted with the true state of affairs...

[Answer] Some indicators warn that individual relations in economic reproduction really are in a crisis. But the economy is showing growth, and production is also increasing this year at a dynamic rate. The problem is that its economic inefficiency is being intensified.

[Question] You mentioned the word "crisis"?

[Answer] Some crisis situations are developing, but this is not analogous with the economic crisis known by the Western world. After all, a crisis begins there as a result of a surplus of capital, as a result of a surplus of goods...Here we have the opposite phenomenon: a deficit of capital, and in spite of this a high volume of investments, and a deficit of goods for both the domestic and foreign markets.

[Question] What do our main problems consist of? Insufficient exports, which, judging by several recent statements, are becoming a question of "life or death" for the Yugoslav economy?

[Answer] Exporting goods and services is necessary to our economy and industry because it exceeds the limits of the domestic market through its strength. In accordance with this, potential exports would be a factor in further expanded reproduction. But our demand for increased exports today has another meaning; it is simply caused by economic difficulties and the need to acquire the means of payment for imports, especially material for reproduction.

These are all, nevertheless, manifestations of certain internal reasons.

[Question] Which ones?

[Answer] There are several of them. For the moment, we should turn our attention to the state of the internal market. Intensified demand has developed there which is, in almost all domains, considerably in excess of the supply of goods and services. Apparently the strength of this purchasing power does not originate in the state of production and real income. Its stimuli are numerous and are to be found in the position and behavior of the state, the economy, and the citizens.

The problem is industry itself, in which over the last five years, only from abroad, we have imported modern equipment worth about $14 billion. Why isn't the use of modern equipment in production economically efficient? Obviously it is something in the method of management and planning, in the method of the formation of the demand for goods, in the social and economic labor relations, economic activity, and the distribution of income, in social protection, and investments.

In our society many functions and many rights have been formed independently of the labor and wages of people. Many state activities are developed independently of economic forces. This is explained by "requirements" and "progressiveness."

Salary is also an uneconomical concept. It is not used to pay for the actual equivalent of the basic means of living used by people and their families. An individual pays out of his salary, for example, for only part of his rent, electrical energy, etc. This is one idea that was justified while the country was somewhere on the way to a thousand dollars per inhabitant. Possibly it could even be raised to $1,500.

[Question] And now, when the salaries range between $2,500 and $3,000, and in the cities even $5,000?

[Answer] There is some concealed indifference by a person in this toward the effects of the use of material production forces, and toward the work of enterprises. I mean to say that there is a lack of economic criteria among citizens, that is the worker and his elementary living requirements. This is why we have a demand that is continually exceeding the limits of the available material resources.

[Question] The phenomenon has been observed and through politics one hears a frequent refrain that demand must be coordinated with the available production.

[Answer] Yes, but in what way, through an appeal, administrative restrictions, or in some other way? Economic reproduction must be permeated with economic criteria through all of its relations, through salaries, through credits and even subsidies, and through the "rights" of enterprises, banks, and workers. It is necessary to remove the curtain of financial protection and security from idleness and business failure, and losses.

[Question] If I have understood you correctly, the main concern for economic trends and for the material and social status of the workers, is not present so much either in the work organization or in the producer himself. Who is taking care of this?

[Answer] Look at the agendas of the state institutions. It is symptomatic that they are heavily burdened with so-called supply problems. Various products are cited, measurements are made of how well the market is supplied with them, and the government occupies itself with the problems of reserves, in order to mobilize funds for purchases from abroad...The government is concerned with how to buy oil, derivatives, wheat, corn, how to purchase various components for the chemical industry, how to provide coal, etc. This exceeds the limits of the necessary responsibility of politics.

[Question] In other words, the role of the state is growing?

[Answer] The role of the administrative authorities, in essence the state, is growing. This has become a real chaos. Take all of those discussions about various balances, for example, energy, food, raw materials, and foreign exchange positions.

Economic reproduction has set off through currents in which economic criteria cannot be expressed, and this exaggerates the significance of policy and creates a difficult situation for policy itself as well.

[Question] This idea of the relationship of policy to the economy is opposed to all of the principles that have been proclaimed.

[Answer] I think that the concept of economic policy that has its roots in the past is playing a role here. Side by side with the development of the economy and industry, with self-management, there has not been any transformation in man's position with respect to the world of requirements that he has to satisfy, primarily through his work. This is why the "disproportion" with respect to "productive and nonproductive labor" has been expanded. The inefficiency of the funds invested in many projects of social activities has become apparent.

[Question] You mentioned that there is a great deal of chaos in all of this?

[Answer] It is becoming an absolute chaos. For example, I do not agree with the opinion that it is possible to carry out a turnabout in the economy from a situation in which it is increasingly less economically efficient, in spite of the modern equipment and knowledge and personnel, and that at the same time it is not also necessary to carry out an alteration in the habits and relationships toward expenditure and toward labor. How can people be induced to behave in that way at all? Should we appeal to their consciences? It appears that the limits of conscience and the limits of state compulsion, from the long term point of view, are not successful in this. After all, we have socialist states in which conscience is an extremely present factor, but those countries are in fact in a sort of stagnation, although they have enormous investments.

Socialism must rely a great deal more on economic laws and indicators. But now matters in our country are such that the main problems are actually beyond the concern of the producers and the economic organizations—they have been passed over to state institutions.

[Question] Will abandoning the rights that have been achieved have an effect on the standard of living?

[Answer] The necessary turnabout in the economic state of the country will affect the standard of living. It must endure various corrections for some period of time. To some extent the standard of living will also have to "pay" for the social expenditure of converting the economy from uneconomical to economical.

[Question] Has such an idea prevailed?

[Answer] This matter has been ready [for action] for several years already. There has been some deception because in the last few years we received additional capital and additional funds from abroad in abundance. Now our foreign exchange obligations have increased so much that some industries will begin to suffer a serious shortage of materials for production and will operate at reduced capacities, which means that there will be greater losses from the economic point of view.

For politics, it is more reasonable to discuss these issues openly, because continually accumulating money to stimulate exports neither favors economic forces nor stimulates productivity. All of this is creating a false idea that we can still do this, in spite of the limits...

[Question] Can you identify a point in time when this trend began?

[Answer] I think that we were imperceptibly entering into this throughout the whole of the last decade, but somewhat more rapidly in the last five years, and even very rapidly during the last three years.

[Question] Have these economic difficulties simply forced the government and the state to engage in such increased administration?

[Answer] But you see, economic difficulties are a relative matter. When the productivity of labor is not high enough and the pressure from "requirements" is becoming increasingly stronger, then the discrepancy between the material product and demand becomes deeper, i.e., shortages appear. Thus, economic difficulties are relative.

[Question] Recently there have been discussions about whether the system or inconsistent implementation of it is responsible for the present situation?

[Answer] It is certain that our general orientation is good. But in the practical establishment of various economic institutions and various mechanisms, we have obviously become entangled in something in between realism and illusions. We should not have a fetish about various decisions, or criticize the state of our knowledge and our consciousness 5-6 years ago. We know more today. I think that a society can be capable of critically examining some of its previous opinions and convictions.

At any rate, this is already done in Yugoslavia. I wish to call your attention to the 15th meeting of the Central Committee of the LCY, at which subjectivism in economic policy was criticized. Room has been made for an orientation toward making possible the action of economic laws and the market.

I think, however, that we have been occupied with our present problems, so that serious social issues have been put aside.

[Question] You are advocating a turn toward greater action of market laws, and you are mentioning difficulties in future production, a decline in the standard of living, and so forth. This will undoubtedly also lead to social tensions?

[Answer] If this situation continues, we cannot avoid social and other problems, because this situation means a gradual decline in productive and economic capabilities. Through this alone the decline in the standard of living is being added to the agenda. It cannot be avoided.

We have overemphasized the phenomenon of social policy. We are losing sight of the fact that a large part of the population, even of those employed, has high additional incomes. I would even say two-thirds of those employed, although this is not documented anywhere. We cannot maintain the present inefficiency in the use of the social product under the guide of some general social policy, because this, to put it mildly, discourages production and production forces. The main trunk [of the tree] has to be green. Let me put it another way: the productivity of labor has to be the major fact that determines the position of both the

individual and his family. Only after this does it become possible to intervene in the field of social policy from the position of a product surplus.

Finally, if I may shift to the area of doctrine, we must carry out the law on distribution according to work. We have not carried out that law. There is no distribution according to work in such a state of the economy, in such a state of distribution. But the state must also subject itself to this law. It is very relaxed about seizing social funds and piling up some of its tasks. If we examined our society critically on the basis of this law, we would find that it [our society] is filled with many relationships and ideas that actually contradict it.

[Question] The question that suggests itself is whether your views lead toward a new economic and social reform.

[Answer] Conditions, both material ones and those regarding consciousness and experience, really have become ripe for this, and we should resolutely prepare and carry out an economic and social reform. It is not solely economic, because it includes as well reforming the ideas of some economic and political institutions. We were ready for this several years ago. We should also examine some decisions in the political system.

[Question] Can you explain more specifically the main outlines of the reform, as you see it?

[Answer] The principles and foundations are present in our political thought. We also have a fund of theoretical discussions available. In short: economic forces must be efficient and governed by the domestic and foreign market, which will mean that they must be capable of producing accumulation first of all, and only in connection with this, the incomes and expenditure of various beneficiaries. Labor must be stimulated. The function of past work must be affirmed in the relationship between economic entities and workers. The function of prices must be different. Likewise, planning must proceed from the standpoint of self-management, commodity production, and large-scale industry, which is a unified process. The position of the state must be consistent with the economy's ability to compete, to do business on the world market, and to accumulate [capital] etc. This means a social transformation and many adjustments, which is neither easy nor painless. The state of the so-called interest organizations must be thoroughly discussed. A considerable part of services should be paid for from the net income of an economic organization and the workers. Does the term "reform" apply to these trends? I think it does! But if this acts as an incentive for efficient production and economy, then it will bring prosperity to self-management and to people, and to our entire way of life.

One should not forget that our social capital and the potential of our small-scale industry, and the farmers, as well as our knowledge, is solid, that two-thirds of those employed have a secondary school education or higher, and that a great part of the equipment for work--the production machinery--is modern. So where are we going?

ELECTRICITY OFFICIAL INTERVIEWED ON POWER SHORTAGES

Belgrade ILUSTROVANA POLITIKA in Serbo-Croatian No 1192, 8 Sep 81 pp 14-15

[Interview with Mile Jesic, director of Associated Electric Power of Belgrade, by Predrag Aleksijevic, date and place not given]

[Text] In order to dispel the mysteries surrounding past and future shortages of electrical energy, and to obtain detailed answers to one of the most vital questions of the year, ILUSTROVANA POLITIKA interviewed engineer Mile Jesic, director of Zdruzena Elektroprivreda Beograd [Associated Electric Power of Belgrade], a complex organization of associated labor that is involved in the production and transmission of electrical energy.

[Question] Comrade Jesic, you know everything about the theme that interests us. Is there anything you have to keep silent about regarding the impending shortages?

[Answer] There is not! Nor is there any need to pass over anything in silence. The better informed people are, the better they will be prepared for eventual adversities, and for cooperation by which we can soften and even eliminate momentary difficulties. We can neutralize the shortages with care and the efforts of every household and every production worker, and everyone else at his or her place of work. That means that we are seeking a certain amount of denial, and not so difficult a denial at that. But there are no mysteries. I am ready to explain everything to you.

[Question] Then tell us first about your enterprise, how it is organized, and what power and reserves it has at its disposal.

[Answer] We produce power. Zdruzena Elektroprivreda includes as its associated enterprise the Kolubar-Tamnavski mines and thermal electric power plants at Veliki Crljeni and Obrenovac, along with the Kostolac mines and the power stations of Kostolac and Morava at Svilajnac, which are supplied with coal from various sources. The Belgrade power plant is also included, but it goes into operation only in the case of extreme need, because it burns a petroleum derivative that is especially expensive. Zdruzena Elektroprivreda also includes hydroelectric plants such as Djerdap, Zvornik, Bajina Basta, Vlasina, and the Lim river plants, as well as Elektromorava in Cacak and finally, "Elektroistok" with four basic organizations of associated labor in Belgrade, Valjevo, Bor and Krusevac; these are involved in transmission. All of these plants provide electrical power for Serbia, but not only for Serbia. Perhaps some "mysteries" surround that factor from the layman's

standpoint, and in terms of excuses. The fact is that Zdruzena Elektroprivreda transmits power to consumers in Vojvodina, Macedonia and Croatia. The question is when and under what conditions. It goes only to those who have invested in our plants and who, under long-term agreements, have the right to regular power supplies; these obligations are fulfilled depending on the available power supply. That will never happen at the expense of Serbian consumers; rather, everyone will take their share in bearing the shortages that occur, in predetermined percentages. We will also cooperate with the Kosovo electric plants, which transmit power to Macedonia as well as to us. When they have a crisis, they get power from us. It is well known, but it would not be bad to reiterate, that there is a unified Yugoslav power grid connecting the entire country, and neighboring countries as well. It is important that consumers from any part of the country can count on power from those sources in which they have made investments. We also know that overproduction from one part of the country goes to those who need power.

We Have Exported Power

[Question] Please, comrade Jesic, explain to us the fact that we have exported power abroad, perhaps even on days when we needed it.

[Answer] Yugoslavia has agreements with neighboring countries for export and import of electrical energy, as well as for many other commodities. When we have excess power in Yugoslavia, we have exported it or "loaned it," which is a common practice. But there is no mystery in this fact...It may have been thought that a broad public should not be burdened with technical nuances relating to power, but it seems that that too is necessary at times. Let us take an example. Recently we have been exporting power to Greece! What do you say to that? Why are we exporting it? First, we export it only before noon, when we need it less, while we import the same quantity after noon the same day, when Greece has more and we have less. Perhaps stories originate about that. Similar exchanges and assistance take place within the framework of the unified Yugoslav power grid. No one is trying to get another's share, but each understands the other's needs. Every hour, Yugoslav dispatching centers monitor power consumption and the occasional exchanges with neighboring countries.

[Question] If everything is going so smoothly, why are we being threatened with shortages in such a stern tone, with the possibility of turning down the power spigots? Why was everything, including sufficient energy production, not foreseen in advance?

[Answer] First, let us eliminate the figurative expressions and calm down the tone of our conversation. No one is threatening, but warnings are essential, if we want to avoid occasional power outages without any warning at all! Everything is, in a manner of speaking, anticipated in advance when we are talking about a possible shortage. We can talk about higher production, but not about attaining the necessary production level in the foreseeable future. We are not a sufficiently rich country to be able to build the amount of production capacity that would enable us to produce the needed power during the worst weather conditions and other circumstances.

[Question] We think that once, 10 years ago and more, we were better and more regularly supplied with power.

[Answer] That is a short memory. There were also great shortages earlier. There was much less power then, but also much lower demand. Remember how few households had electric heat, electric hot water heaters and refrigerators, how many fewer apartments and factories there used to be. I would like to stress the fact that today, 40 percent of total energy consumption is in Serbia! During the winter months, Belgrade and a few other cities use as much as 60 percent in households.

[Question] Doubtless the experts had that in mind for this year.

[Answer] The planning anticipated less difficulty this autumn, and somewhat more this winter. We were more concerned for the winter of 1982/83, on the basis of comparisons and probability projections indicating that there would be more water. We expected that the equipment, which is 80 percent new, and has not completed 50 percent of its projected operational life, would function as it should. But it happened that the water flow was less than expected in July and August by 25 percent, when compared to last year. For now, that is not much, but the problem is that there is a very high likelihood that the flow decline will continue. In planning, a 40-year average of the water flow is taken and hydroelectric power production is estimated at 70 percent of the probable flow. Based on that estimate, Yugoslav hydroelectric power plants are supposed to provide 4 percent of this year's total annual power production. That means that thermal power plants are to provide 56 percent. But the 300 megawatt plant at Obrenovac went out of operation on 28 June, meaning 10 percent less total power production. That 10 percent decrease lies at the base of the present difficulties and the coming restrictions. Now we know that the problem will not be repaired by mid-December; the causes are being examined both here and at the French equipment manufacturer.

[Question] Did the failure result from careleseness, poor maintenance or ignorance?

[Answer] The experts have already rejected those possible causes. It is a technical fault that we will certainly uncover and about which we will inform the public. Similar problems have happened elsewhere in the world with such complex devices, and rapid repair is not possible; nor can the cause be determined in a short time. Despite everything that has been said, up to now there have been no forced power stoppages, although that has been accomplished thanks to greater use of our reserve hydroelectric power plants (at Vlasina and the Lim).

Rely on Ourselves and the Sky

[Question] But can the hydroelectric plants pull us out of this situation?

[Answer] Even if everything worked as anticipated and a little better, we would still have a shortage of about 10 percent in September, October, November and the first half of December, when the failure at Obrenovac should be repaired. You asked whether producers located around Serbia would help us. That, of course, is not excluded, but Montenegro has a deficit and is importing power from Albania, and to a degree from Serbia when there is some there to export. Macedonia as well is in a poor situation, while Croatia and Slovenia are short of fuel for their power plants. Bosnia and Hercegovina have no surpluses other than what they will return to repay earlier loans. Objectively then, there are no surpluses in Yugoslavia that Serbia could use in significant amounts on days of shortage. The only hope is that all the operating plants will function well, that there will be rain and snow, and that we will conserve power.

[Question] But in case of need, without help from the sky, can't we count on deliveries from abroad?

[Answer] To some degree we can, if we have an abundance of foreign exchange. Isn't that clear from these facts? We could buy power or perhaps fuel.

[Question] Will neighboring countries return us old power loans?

[Answer] They will, but that will cover only 2 percent of our needs.

[Question] How can we get out of this situation, now and in the future?

[Answer] The society will have to answer that. For example, the explanation is not simply that at the moment we do not have enough coal, or that we lack sufficient funds for oil. The question of investment priorities is much more important. It is said that everything depends on electric power, development, the living standard, the GNP. But in truth it should be said that the energy that we would use if the supply were greater must be used properly. The question of development is always important and timely, but we should leave it for some other time. Right now it is essential to understand that for now there will not be enough heavy oil or gas, and great pressure by consumers is expected on the electric power industry. We have foreseen an 8 percent increase in consumption, but now even greater demand is expected.

[Question] To be practical, what awaits us, the citizens and workers, now?

[Answer] I have already said attention and savings. In that regard, the situation is quite simple. You as a citizen should save 10 percent of the energy used in your apartment; then you will have done your duty. If everyone does that in the home and workplace, there will not be any forced power cutoffs. How can that be done? I think we already know that, but to repeat some ideas: Turn on the television only if we are going to watch a program, and not just to have it on. Wash the dishes in cold water, if hot water isn't necessary. Keep the heat down to 18° C (64.4°F) because that will let the people in the next city and the next street have power too. Don't let the hot water tank heat until it starts to steam, but only to the necessary heat level. Use on less burner on the stove. I think all of that is possible and simple, and it would not be a big sacrifice!

What is Wrong with Djerdap?

[Question] Comrade Jesic, every citizen in Serbia would ask you what is happening with Djerdap. Didn't we all expect 10 or 15 years ago that that marvellous Djerdap project would eliminate all our power worries for the coming century?

[Answer] No expert ever reported that. Djerdap is a technical feat, but not a miracle. Annually it produces about 25 percent of Serbia's power, sometimes more, sometimes less, but that is all. For example, this month it will produce about 20 percent of total power production in Serbia, depending on the Danube's water level. The Djerdap dam must let a certain amount of water flow through for navigation, and it cannot store either power or water. It can hold the water during a particular day, for certain production hours, but no longer than that. It is true that once the Djerdap production was enough for Serbia in some periods of the year, but it is not enough today.

[Question] You promised the whole truth about power. Recently it was published that a quarter of all the machinery for producing power does not work....

[Answer] Yes, but those are data from August, when regular maintenance shutdowns take place. At that time, based on water levels, all the hydroelectric plants were operating, while the thermal power plants were being prepared for fall and winter, as planned. Now those preparations have been completed. As you see, that fact is not related to eventual shortages.

[Question] Still, we would insist on pointing out that the facilities we have do not always work at full capacity.

[Answer] That is correct. Long repairs have been conducted at Kostolac, Bistrica, and Nova Varos, but those are smaller production installations. Sometimes the industry does not fulfill its planned delivery due to specific difficulties that are encountered at times. Naturally, there are weaknesses too. Every shutdown did not have to happen, but the power plants that were not under repair, excluding the 300 megawatt plant at Obrenovac, operated during 90 percent of their theoretical available time, with some working 100 percent of that time. That is an excellent result, even by European standards of measurement.

Use Power Wisely!

[Question] Have there been plans for facilities that would make possible reserves and greater security for the consumers?

[Answer] Yes, such plans have been adopted. We have not implemented them primarily because of a lack of resources. We are not an isolated part of society, and the electric power industry is not without its shortcomings, particularly regarding delays in building facilities for which funds were in hand. Domestic industry and other building partners also have a hand in that. I think the basic problem is that economic priorities as a whole have not been properly determined. Yet to provide for all our needs by building sufficient capacities would be too expensive for us. If such enormous installations were to work all the time, who or what could utilize such enormous quantities of power. If they do not operate, that is an even greater shame.

For now, we are among those European countries that use the least power per capita, but also among those that use the most energy per unit of GNP. Thus here in Yugoslavia as in Germany, for example, the saying holds that the largest future sources of energy are conservation and intelligent consumption. We must do more with the same amount of power!

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

POLISH-SOVIET TRADE, ECONOMIC COOPERATION REVIEWED

Problems, Aims of Economic Cooperation

Warsaw HANDEL ZAGRANICZNY in Polish, Special Issue, 1981 pp 3-7

[Article by Maciej Deniszczuk]

[Text] The state and achievements of economic cooperation with foreign countries usually are judged through the prism of volume, structure and dynamics of trade turnover. Trade with the Soviet Union constitutes approximately one-third of the value of trade turnover in Polish foreign trade. The indicator is universally known and repeated many times both on ceremonious occasions and in objective analyses. However, an evaluation of the exchange proportions is released less frequently, not to mention their structural characteristics and resulting current and potential benefits for the Polish economy.

Structure of the Exchange

Let us begin from fundamental structural characteristics in Polish-Soviet trade exchange. An analysis reveals that among Polish exports to the USSR, highly processed industrial products constituted 75 to 80 percent during the 1970's. On the other hand, the share of this category of products in Polish import from the USSR constituted 40 to 45 percent. Goods made from a comparatively lower degree of processing (e.g., fuel, raw materials, other materials and agricultural articles) constituted in Polish export to the USSR not more than 20 percent, while they were 55 to 60 percent in Polish import from that country. The tables illustrate the structure of Polish-Soviet trade turnover in four commodity groups during the 1970's.[1]

On the basis of that data, which present only a very general picture of the structural characteristics of Polish-Soviet trade turnover, above all the range of our purchases from the USSR should be emphasized, especially some raw materials and other materials and, resulting from them, their meaning for supplying the Polish economy. In 1980, Soviet crude oil constituted 80 percent of the import of that raw material (which is almost synonymous with its general consumption in Poland); iron ore, 78 percent of our import; potassium fertilizers, 72 percent; cotton, 73 percent; and natural gas, 100 percent. Together, fuel, raw materials and other

1 See I. Cieniuch's article for a discussion of the trade turnover structure for 1981.

materials imported from the USSR constitute over 40 percent of general Polish import in this category of goods.

Products from Soviet processing industries imported into Poland are—as indicated in table 1--primarily capital investment machinery and equipment. Their import was connected above all with the implementation of specific capital investment ventures (e.g., iron and steel, energy, the chemical industry and others) and encompassed cooperative elements and subassemblies (e.g., for the motoring industry, textile machinery and aircraft industry), as well as special machinery or means of transportation. Furthermore, the importation of consumer goods supplements the supply in the Polish market chiefly of goods of universal use (e.g., refrigerators, radio and television sets, electronic equipment and so forth), as well as automobiles.

It is somewhat more difficult to assess the role of Polish export in satisfying the import requirements of the Soviet economy. It is perhaps preferable to speak about the impact of this export for individual segments of the economy, like the industrial branch or a region. For example, the scale of deliveries of Polish bituminous coal to the USSR (during the 1970's those deliveries constituted around 9 million tons per year) is minimal, compared to Soviet needs for the fuel. On the other hand, those deliveries have an essential impact for border areas of the USSR. Moreover, a portion of our exported bituminous coal is sent to the German Democratic Republic, although it is credited to the USSR.[2]

In the export of processed industrial products, the deliveries of Polish consumer goods (predominantly products of light industry) had an essential impact on the Soviet domestic market. For example in 1978, deliveries from Poland of consumer goods comprised around 28 percent of Soviet import of those products from all the CEMA countries; those deliveries covered a significant portion (15 to 32 percent) of Soviet import requirements for these particular groups of goods.

Table 1. Structure of Poland's Trade with the USSR during the 1970's Percentage (current prices)

Specification	Export (average)		Import (average)	
	1971-75	1976-80	1971-75	1976-80
1. Machinery and equipment	49.7	54.0	34.9	34.6
2. Fuel, raw materials and others	19.3	18.5	52.9	58.6
3. Agro-food articles	5.1	2.5	7.9	2.0
4. Consumer goods	25.0	25.0	4.3	4.8
Total	100.0	100.0	100.0	100.0

2 This fact for unknown reasons is rarely disclosed, although its execution is profitable for us because of differences in the structures of export offers.

Further, Polish export of goods from the electromachinery industry, which is the chief--with respect to size--group of goods, related generally to traditionally trained specialization (e.g., ships of various types), cooperative connections (e.g., in the motoring, machine tool and construction/road-building industries, etc.) and implementation of capital investments in some industrial branches of Soviet industry (e.g., in the sugar beet, chemical and wood products industries). This typology of Polish export of capital investment goods, as well as of elements and cooperative subassemblies, is not exhausted, although it does compromise the predominant portion of our export to the USSR of this category of goods.

On the other hand, it was essential that the export to the USSR of some products from industrial branches constituted--especially during the period of their formation and development (also in some cases in later periods)--the foundation of their pro-export orientation. This concerned above all the shipbuilding industry, which developed, in part, because of the support of large orders from Soviet shipowner enterprises, followed by other branches from the machinery industry creating specialized equipment for complete industrial installations (sugar beet factories and sulfuric acid plants). Likewise, some branches of the chemical industry (like the pharmaceutical industry, paints and varnishes, and inorganics) are counted exporters thanks to deliveries made to the Soviet market. This also concerns, although to a lesser degree, some branches of light industry, especially the clothing, leather, purse-making or hosiery industries.

The size of the economy and the degree of its requirements--along with the premises resulting from the political and economic alliance--are influencing the formation of decisive connections with the Soviet economy for the development of some branches of Polish industry.

Efficiency, Prices, Balance

The structure of Polish export to the USSR, and also the degree of deliveries of many goods, above all with respect to a comparatively large series of processed goods and relatively large amounts of deliveries of homogeneous goods, prejudge its great efficiency. As indicated in information supplied by Finance Minister M. Krzak,[3] the degree of earning capacity of Polish export to the USSR achieved on the average in 1980 around 50 percent; in some groups of goods (e.g., machinery and equipment or chemical products) it was even higher. Next to the activity of factors with a structural character or with a degree of high export profitability is the influence of the exchanger rate of the zloty to the transferable ruble. Moreover, in evaluating the efficiency of exchange from the import side, in relation to the use of the system of so-called creeping prices in accounts among the CEMA countries, the prices of basic raw materials imported from the USSR are lower than world prices (as compared to prices paid on other, nonsocialist markets). For example, the price we paid last year for Soviet crude oil was--as regards the official ruble rate to the dollar--over 50 percent lower than the price used by the OPEC countries, and the price of iron ore, 20 to 40 percent lower than world prices of principal exporters. While the prices of our raw materials exported to the USSR are lower than world prices, the influence of these differences on the

3 This information was given during a forum on Polish-Soviet economic and trade cooperation, which was organized by the Main Board of the Society for Polish-Soviet Friendship and occurred 28 February 1981.

efficiency of Polish export is comparably smaller regarding the share of goods for export.

Based on general information on the structure and efficiency, the question of equivalency for the so-called import batch from the free foreign exchange area in export goods must be raised again. This is a problem from the macroeconomic point of view, above all with respect to the structural characteristics of the exchange (especially the large share of fuels and raw materials having a free foreign exchange character, acquired after relatively lower prices), which in practice has no meaning. On the other hand, it can have a practical meaning for some exporters, especially with respect to the scarcity of foreign exchange resources for the import of components from the capitalist countries. We shall return later to this area.

Another problem raised repeatedly in discussions is the efficiency of so-called joint capital investments of raw materials and related construction and assembly services realized by Polish specialized firms. The conception of participation in capital investment outlays has a relatively long history; its fundamental justification was the distribution of the capital investment burden into the development of particularly capital-absorbed fields of production, to which the output for the majority of raw materials was added. For justification, one can find an analogy in the processes of shifting capital resources within the global economy, especially between the developed and developing countries.

However, the lack of proper means of capital transfer among the CEMA countries and especially the unresolved problem of mutually comparable exchange rates for national currencies constitute factors impeding not so much the realization of joint efforts but rather the support of their objective--in a uniform degree for each partner--calculation. In practice, this signifies the necessity of supporting these calculations in the domestic price of a given country and not tying them to the prices of foreign trade. In this situation, the profitability of the share in a capital investment undertaking within the portion dealing with construction and assembly services can be evaluated not so much through the prism of costs from the partner's foreign exchange units but rather through the right to purchase specific amounts of a given raw material. Such reasoning may have a place in principle in case of a lack of alternative sources for acquiring raw materials (or a lack of alternatives for the employment of production potential). It cannot be doubted, however, that this problem points to a weak side in the mechanism of exchange and cooperation, restraining more complicated forms and especially a more complete utilization of various production factors by cooperating countries. Thus, this matter was strongly accented in the composite program of socialist economic integration, and the issue of its resolution remains.

Returning to the practical problems of our share in the USSR's capital investment of raw materials, we lost our initially established credit character during the mid-1970's. As known, on the basis of the share of capital investments, the assumption was that importers of raw materials could, carry their contribution of capital investment outlays in forms delivered under conditions of long-term credit for machinery, equipment, materials and other goods. Based on these principles, capital investments were implemented in the copper and sulfur industries in Poland or for potassium fertilizers in the Soviet Union. The form of credit for

deliveries of indispensable outlays to implement capital investments has been renounced. Those deliveries have been added to the clearing of accounts from current trade exchange; this has not changed the honoring of participation in outlays authorizing later purchases of specific amounts of raw materials. As known from this form of participation, Poland is already importing from the USSR raw materials like crude oil, natural gas or cellulose in amounts exceeding "traditionally" agreed contingencies.

One of the reasons for the change in conditions was the appearance of a structural imbalance in Polish-Soviet trade exchange, caused by the sharp increase in prices for some raw materials exported by the USSR, above all crude oil. As a result of the rapid increase in world prices for crude oil (beginning in 1974) and the introduction of the previously mentioned principle of creeping prices, the increase in prices for Soviet raw materials has followed--although several years later--at a more rapid rate than the increase in prices for goods imported by the Soviet Union.[4] This also has affected Polish-Soviet trade turnover; as a result of this imbalance in trade exchange, the initiation of an appropriate credit mechanism has been required. These credits, which have been earmarked for equalization of the price differences in mutual exchange, are of a lower percentage, and their repayment has been extended for a period after 1985.

During the past 5-year period, the increase in value of Polish-Soviet trade turnover has been characterized by high dynamism; i.e., the trade turnover has grown in 1980 by over 66 percent as compared to 1975, import by 83 percent and export by around 50 percent. A 50 percent increase in the material size of the trade exchange and a 50 percent increase in prices have had an influence--as evaluated--on the shaping of growth proportions; the latter dealt with a larger degree of import than export. The year 1980 witnessed the initial visible symptoms of the breakdown of development of Polish export to the USSR: the value decreased as compared to 1979, while import from the country increased significantly. This resulted from the negative balance of goods turnover (over 3 billion foreign exchange zlotys in value). The situation is intensifying the imbalance this year, in which--in accordance with the assumptions of trade protocol--export will be lower than in 1980. Consequently, both a negative balance resulting from the current trade exchange (and also the balance from the differences in trade exchange from world prices) and the emergency credit assistance granted to Poland last year and again this year are influencing the imbalance in Polish-Soviet trade turnover.

During the foreseeable period needed to stabilize the Polish economy (to the end of the present 5-year period and undoubtedly for the entire decade of the 1980's), it will be necessary to intensify Polish export to the USSR as a first step, in order to halt the process of incurring debts in this country, followed by the need

---

4 Nonetheless, the prices for these raw materials, especially crude oil, are significantly lower than OPEC prices.

to guarantee the repayment of accumulated debts. It seems that--as a result of the efficiency of export to the USSR, comparatively lower outlays from import for export production earmarked for the Soviet market and above all the Soviet economy's great absorptivity—an increase in export should constitute the fundamental means to balance Polish-Soviet trade exchange.

Production Specialization and Cooperative Ventures

In the practice of economic cooperation among the CEMA countries, the concept of international specialization of production in processing industries has been developed, based upon the intervention of two- or multiparty understandings, located for the most part in centralized agencies that plan the economies of individual countries. Allegedly, although undoubtedly to a lesser degree, cooperative ventures (in various degrees of connection and complication) have been instituted through the intervention of appropriate agreements and understandings. A decisive portion of understandings defining the specialized division of labor or establishing obligations in the matter of creating or delivering elements and cooperative groups deals with the electromachinery industry.

After evaluation through a prism of the activities of these forms of cooperation between Polish and Soviet industries, a fairly meaningful degree of their specialized and cooperative links can be ascertained. At the end of the 1970's, the essence of these links was regulated by 55 multiparty agreements (in which both countries participated) and 26 two-party agreements. The installations and conditions of cooperation between the two countries' industrial branches within the electromachinery industry were regulated by the 22 two-party agreements.

In relation to the domination in an industry of a specialized division of labor and cooperative connections, the impact of these forms is evaluated through the prism of the size of trade turnover implemented in accordance with the appropriate agreements. Independent of the criteria used to acknowledge something as sufficiently objective, it can be stated that--as evaluated--over 50 percent of the machinery and equipment trade turnover in Polish-Soviet trade exchange was implemented within the confines of specialized or cooperative agreements. Within Polish export from the USSR in 1980, for example, deliveries were valued at over 3.5 billion foreign exchange zlotys, and in Polish export to that country--deliveries had a value of 5 billion foreign exchange zlotys.

The essence of cooperative connections among processing industries in individual countries is the assumption of cooperation of the entire, or a significant portion of the, production process of a particular product, family of goods or even their group. The expected benefits from higher efficiency in the production factors are the fundamental justification for the creation of these connections. Although the measurement of these benefits is complex, it is obvious that the cooperation of specific segments of production (or selected phases of a given process) lowers social costs of manufacture for both partners. It also potentially broadens the range of development possibilities. On the other hand, however, the risk tied to possible nonadherence (or incomplete adherence) to the conditions stated in agreements or understandings increases. Under conditions of a stabilized economic situation for both partners, the risk of international cooperation as regards specified production should not be greater than one country's domestic

cooperation. On the other hand, in particular situations like the current crisis in Poland, the consequences of disturbances in production processes are transferred in some degree to the partner; for example, incomplete fulfillment by some Polish cooperatives of their obligations to our Soviet partners and the possibilities for drawing too far-reaching conclusions about the illusiveness of this form of cooperation with Polish enterprises.

Problems of Development

There is a close union between stabilizing the Polish economy and returning it to its position in the international division of labor. The Polish economy is so dependent on external factors that the return of its internal balance requires the intensification of its ties with foreign markets. This deals to a significant degree with ties to the Soviet economy both in degree and in structural characteristics. This fact undoubtedly explains this year's trade protocol with the USSR, in which Soviet deliveries were set at a higher level than the limited possibilities of the Polish economy. However, as already stated, the imbalance in Polish-Soviet trade exchange must have a transitory character, which requires a concept for the development of Polish export in the near future. This concept's framework resulted from existing work on the coordination of project plans for Poland's and the USSR's economic development for the years 1981 to 1985.

Although some assumptions of the 5-year plan for development of the Polish economy must be reevaluated, this does not mean--as may be thought--a complete change in the concept. Above all, there is no basis to assume that existing trade and production ties with the Soviet economy could be broken in a radical way. The majority of these ties should be continued in the 1980's. Essential problems can arise in these fields of the economy, in which--as a result of the breaking of internal cooperative ties, seriously limited import means or finally the decapitalization of wealth--the export supply is seriously limited. Such a situation exists in the Polish bituminous coal industry. The possibilities for a relatively rapid improvement in this industry's situation lie in better work organization; the possibilities for enlarging the export supply of bituminous coal are in the rationalization of its domestic consumption. Supply price reform, which is tied to reform of the enterprises' economic-financial system, should "force" this rationalization (stated more simply--reduce waste of the fuel). Achievement of these results is already possible during the period of implementing the stabilization program (to 1984), although undoubtedly the restoration of the general dimensions of coal export before 1980 will require longer time. Nonetheless, enlargement--in relation to a particularly low state this year--of the export supply of this fundamental Polish raw material will constitute an important factor in the process of restoring Poland's credibility as a trading partner.

A second, particularly important, factor is correcting as quickly as possible the implementation of active cooperative agreements. Above all, this concerns the fulfillment of orders for those cooperative elements placed in Polish industry, and for which incomplete implementation caused--in a chain reaction--serious production disturbances in specific Soviet enterprises. The necessary means for the complete implementation of orders should be an absolute priority.

Finally, a third fundamental factor both in the process of restoring the credibility of the Polish economy as a partner and restoring its developmental balance

is the ability to devise new concepts for cooperative development. In this particularly important activity, it will be necessary to rely both on past experiences, including new developmental conditions tied to initiation, and economic reform.

As regards past experiences, one can add both positive and negative examples, which bear witness to one's own and the partner's well-understood interests, and the lack of insight into developmental perspectives.

One negative example may be the production and export supply of complete industrial installations, insufficient technical progress in traditionally produced installations and failure to introduce new types into the Soviet market (for example, factories making felt records) have been the cause of our not entering into any new contracts with Soviet enterprises. Therefore, the aims of Polish producers to increase the export of complete installations rely in a greater degree on wishes than on reality.

On the other hand, a positive example could be the chemical industry's dependence on the shape of Polish-Soviet production specialization in the coming years, in order to broaden Polish export offerings of several highly processed products by importing as replacements mass-produced semifinished articles, generally of an energy or raw material nature. The essence of the concept depends upon the possibilities of utilizing the differences in scale between the Polish and Soviet economies. This is particularly important in some branches of the chemical industry toward a specific degree of technological divisibility for production installations. For example, the Polish economy's requirements for methanol, polyethylene or ammonia constitute a relatively small percentage of production in the Soviet chemical industry. On the other hand, Soviet requirements for products like teflon, resins or light-colored dyes are several times greater than those of the Polish economy. The production of these goods for the Soviet market can enlarge significantly the efficiency of capital investment and guarantee relatively lower costs for current production. Thus, this concept appears particularly interesting, although its implementation will require new capital investments.

On this basis, a broader reflection emerges on specific program demands of cooperation with our largest economic partner. This specificity depends precisely on the necessity of taking into consideration the range of the Soviet economy, which as a rule dictates the range of requirements. Experience shows that our export offerings, if they constitute the remainder of domestic requirements and export to other markets, are as a rule less attractive for our Soviet partner than those of specialized production, whose eventual acceptance "will be saved" for outlays of new capital investments.

Much points to the fundamental mechanisms of projected economic reform in Poland enlarging considerably the interest of enterprises in developing effective export. This is an immeasurably important prerequisite for permitting the establishment of greater export activity of Poland industry in the Soviet market. In order for these expectations to become reality, it is necessary to strengthen the coordinating role of organs programming the development of trade exchange and cooperation to supply significantly better information for Polish industry as to the needs of the Soviet economy and finally to invest properly in the market, especially in the field of trade and technical service.

Polish-Soviet 1981 Trade Turnover

Warsaw HANDEL ZAGRANICZNY in Polish, Special Issue, 1981 pp 8-9

[Article by Irena Cieniuch, affiliate of the Ministry of Foreign Trade and Maritime Economy]

[Text] The breakdown of economic development in our country, the further fall of national income and the simultaneous continuing high requirements for import and reduction of supply for export, along with the burden of high indebtedness to the capitalist countries, bring out the role of factors that can exert a stabilizing influence on the economy and overcome existing difficulties.

On this basis, the impact of treaty stipulations with the USSR for 1981 should be emphasized. These go beyond the framework of all previous stipulations, constitute an expression of understanding by our partner of our economic situation and attest to its readiness to participate in restoring the balance. In accordance with acknowledged totals in trade protocols of previously obtained (over many years of stipulations) sizes of deliveries to Poland, the Soviet Union has granted us assistance by facilitating credit purchases under easy terms (credit rate of 5 percent to be repaid over a 10-year period starting in 1982). The value of these purchases stands at 150 million rubles. This year, additional import contains both raw materials and other materials (e.g., 20,000 tons of cotton, 300,000 tons of laminated goods, 46,000 tons of nitrogen fertilizers, 120,000 tons of ammonia, 200,000 tons of apatite, 5,000 tons of newsprint, 4,000 tons of synthetic rubber) and market goods (in particular, 500 tons of cheese, 10 million cans of fish, 2,000 tons of cereals, 10,000 automobiles, 10,000 color television sets and 100,000 refrigerators).

Besides these additional deliveries of goods, the USSR granted Poland assistance in the form of financial credits, primarily in exchangeable currencies. The value of this financial assistance is $1.1 billion. This amount also covers credit to cover Poland's negative balance for price changes in 1980. Together with understandings signed for goods deliveries, an understanding was concluded to defer until after 1985 the repayment of credit granted to Poland from 1976 to 1980 for equalization of the negative balance caused by price changes (so-called price credits). These deferred payments amount to around 500 million rubles.

At the same time, the Soviet side, acknowledging the complexity of the situation in Poland, has accepted the reduction of our export deliveries for some goods in 1981, in relation to those usually implemented, to a total value of 400 million rubles. These include goods currently deficient in our domestic market; i.e., coal, copper, paints and varnishes, some products from light industry and food products.

Taking into consideration all treaty stipulations with the USSR for 1981 (together with additional import credit deliveries), the Polish-Soviet goods turnover accounts for around 8.5 billion rubles this year as compared to not quite 8 billion in 1980. A characteristic of this year's turnover with the USSR is the relatively high growth of import compared to a lack of growth in export. This results both from difficulties cited in the introduction and from agreed solutions.

Import from the Soviet Union stands at 4,915 million rubles and will grow by 13.6 percent compared to 1980. This import will still be dominated by fuel, raw

materials and other materials for production (64 percent). The Soviet Union will still cover around 40 percent of our import needs for raw materials, including 100 percent of natural gas and sawn timber and 75 percent of crude oil, iron ore and cotton. Thus, in 1981, we shall import from the USSR 13.1 million tons of crude oil, 3 million tons of petroleum products, 5.3 billion cubic meters of natural gas, 9 million tons of iron ore (accounting for 100 percent of the iron), 69,000 tons of asbestos, 400,000 cubic meters of wood and sawn timber, 95,000 tons of paper and cardboard, 53,000 tons of aluminum, 125,000 tons of cotton and 118,000 tons of cellulose. Additional deliveries resulting both from credit understandings and understandings of Poland's participation in the development of a raw materials base in the USSR also are included in these amounts. The value of deliveries within the framework of participation in common capital investments this year stands around 400 million rubles, which constitutes almost 13 percent of the raw materials import from the USSR. These deliveries encompass 1 million tons of crude oil, 2.8 million cubic meters of gas, 2.5 million tons of ferro-related raw materials, 42,500 tons of asbestos, 8,000 tons of cellulose and around 62,800 tons of ferro-alloys.

The large (around 19 percent) growth in the raw materials imported from the USSR compared to last year has resulted to a large degree from consecutive price changes, especially prices for crude oil and natural gas. As known, the so-called floating price base is used in turnover among the CEMA countries. This deals with the annual changes in prices based upon the average world prices from the preceding 5 years. The current structure of prices and the continual increase are causing us to benefit from differences in the prices paid for goods imported from the CEMA countries compared to world prices. This especially concerns raw materials imported from the USSR in large amounts. For example, the world price of crude oil (light Arabian crude) will settle this year at a level of around $280/ton. Last year, the Soviet Union sold its crude to the capitalist countries for prices similar to OPEC's; i.e., $230-$250/ton (FOB). On the other hand, Poland paid for the same crude $113/ton (to the Polish-Soviet border carriage-free) and this year will pay $135/ton.[1]

Despite these undoubted benefits, the prices of raw materials imported from the USSR are rising significantly more rapidly than of goods exported by Poland. Trends in world prices are deciding this, above all crude oil and natural gas as compared, for example, to the prices for bituminous coal and especially highly processed goods. For Poland, the negative consequences of price changes have a bearing to a small degree on the growth of the imbalance in mutual turnover. Price credits under easy terms, as discussed, have tempered this slightly.

Within our import from the USSR, machinery and equipment will constitute around 32 percent in 1981. As a result of limitations on capital investment outlays in Poland, the following will be reduced compared to 1980: equipment for some installations; machine tools for metals, road-building and construction machinery; transport trains; mining machinery; and calculating equipment. On the other hand, the import of supplies (spare parts) and machinery for agriculture (e.g., tractors, of which we are importing around 15,000 this year from the USSR) will increase significantly.

---

1 According to the current exchange rate of the ruble to the dollar--0.68.

Soviet deliveries will play a vital role in supplying the domestic market. They will include 300,000 refrigerators, 150,000 color and black-and-white television sets, 300,000 portable radios, 2.4 million watches, goods from the chemical industry, bicycles, cameras and coffee grinders. We shall also import 18,000 automobiles. Agro-food articles include tea, cheeses and canned, salted and frozen fish valued at 25 million rubles. In 1981, Polish export to the USSR will stand around 3,613 million rubles (together with the export of construction valued at 140 million rubles). This export will be around 1.2 percent lower than the level in 1980 and around 4 percent lower than last year's agreed stipulations.

Established in 1981, the export of machinery and equipment to the USSR is holding at last year's level. Poland continues to be a net exporter of machinery and equipment to the USSR. These articles constitute close to 60 percent of our deliveries. The most important items of our export continue to be ships, transport trains, automobiles, electrotechnical equipment, road-building/construction machinery and finished industrial installations, especially for the chemical, wood products/paper and food industries. A certain reduction compared to last year is in high buoyancy engines and current-producing groups, electrical engines, agricultural machinery and delivery trucks. Fuel, raw materials and other materials constitute around 12 percent of our export to the USSR. For 1981, a significant decrease in deliveries of these goods to the USSR was established, around 17 percent lower than deliveries in 1980 and around 34 percent lower than planned. We are delivering 5.5 million tons of coal (instead of 9.5 million tons), 7.500 tons of copper (instead of 10,000 tons), 100,000 tons of sulfuric acid (instead of 200,000 tons) and much soda lime, paints and varnishes. The decrease is worsening our export market. We are delivering to the USSR fewer market goods at a sum of around 300 million rubles, at a current exchange value of 13.3 billion zlotys. In consumer goods (23 percent of our export), we are reducing--as a result of the situation in the domestic market--the export of ready-to-wear clothing; i.e., by 13 percent for leather shoes (4.4 million pair), by over 30 percent for sewing machines and by 40 percent for pharmaceuticals and cosmetics. The export of detergents has been stopped completely. In agro-food goods (note quite 2 percent of the export to the USSR), deliveries of vegetable preserves and frozen vegetables to the USSR have been reduced significantly, while the traditional export of eggs and fruit products has been stopped completely.

As a result of the difference between import and export established in 1981, a quite serious deficit in the trade balance with the USSR appeared this year. It has been worsened by the additional negative balance in our payments balance with the Soviet Union, which occurred in earlier years primarily because of the previously discussed price changes in mutual exchange. The constantly worsening deficit in the payments balance with the USSR will bear on further development in mutual trade turnover. It stands at the center of attention for intensifying export, economizing export surpluses (indispensable for equalizing payments), paying credits and above all financing the growth of needed imports in our economy. The burden of increasing export rests in principle both in the totality of ready-made industrial goods and the intensification of their deliveries, which should favor the development of specialized and cooperative ties.

Polish-Soviet specialized and cooperative turnover is implemented through 55 multiparty and 26 two-party agreements. In 1980, the dynamics of trade turnover--in

comparison to the entire 5-year period--weakened, especially as regards our export. However, participation in specialized and cooperative deliveries comprised in 1980 close to 53 percent of mutual trade turnover of machinery and equipment. Ensuring the necessary menas to implement cooperative agreements has an important meaning. It is also necessary to create the conditions for further functioning of existing cooperative ventures that have operated well. At the same time in the current economic conditions, it is necessary to look for new, long-range areas of cooperation, above all from the point of view of eliminating cooperative import from the capitalist countries. In this regard, these views are verified by both countries' economic development and worked out in accordance with the Long-Range Program for the Development of Specialization and Cooperative Production, and so-called industrial branch and subprograms. Coordination is set for the development of mutual cooperation in such advanced areas as the production of cranes and tractors, specialized car bodies, calculating equipment, precise instruments and measurement devices, machine and other tools.

Another direction favoring cooperation to overcome Poland's economic difficulties aims at common actions to take full advantage of idle production strengths in some subsectors of Polish industry through additional deliveries of machinery and equipment, raw materials and other materials and cooperative elements that facilitate enlarging production for domestic requirements and export. These possibilities lie above all in the chemical industry, metallurgy, the machinery industry, telecommunications and construction materials. There are also possibilities for cooperation in the continuation of construction of installations whose implementation has been stopped periodically. Understanding within the framework of industrial branch groups outline in a concrete way the principles and directions of this cooperation this year and in the future.

Trends in Polish-Soviet Trade

Warsaw HANDEL ZAGRANICZNY in Polish, Special Issue, 1981 pp 10-13

[Article by Kazimierz Starzyk, affiliate of the Main School for Planning and Statistics]

[Text] The impact of foreign exchange for the Soviet economy is above all the influence this exchange has on the level and structure of national production, technical and technological progress and ability to supply the domestic market. Therefore, its impact is tied primarily to the influence on the efficiency of managing the economy and the structure of consumption.

The growing influence of foreign trade on the efficiency of managing the economy has its source in the implemented--beginning in the second half of the 1960's--strategy of intensive development. Within this framework, such factors as work output, efficiency of investments and lasting means and the material inclination of production take on an even greater meaning. Implementation of this strategy follows through active functions in economic cooperation with foreign countries, which depends primarily on consideration of needs and international market conditions in the development of production. The granting of such cooperative functions is reflected in successive resolutions passed by the 24th, 25th and 26th CPSU Congresses, whose development is tied to, among others, the possibilities for implementing social and economic tasks, primarily by increasing production efficiency and accelerating progress in science and technology.

The granting of such functions of economic cooperation with foreign countries denotes the subordination of import policies to modernization processes adopted on a broader scale during the 1960's. In practice, it denotes the active import of machinery and equipment and of technology characterized by high quality and modernity. As a result, the share of imported machinery and equipment constitutes around 15 percent of Soviet machinery. Imported capital investment goods have been sent for the most part to the following industries: electrotechnical, electronics, chemical, machinery and mining.

Intensifying the development of the Soviet economy through the increasing participation of foreign trade should be understood above all as a way to solve economic problems through import. The following are included primarily as directions "for opening" the economy: foreign possibilities addressed to the level and structure of domestic production, technical and technological progress and satisfying consumer pressure. In turn, consideration of foreign needs is expressed above all in the production of raw and other materials. The development of production strengths directed toward activation of export is primarily in this area. These are also the principal factors for creating import capability within the Soviet economy. Their share of Soviet export in 1979 was around 80 percent, while it attained around 70 percent in 1970. This increase resulted both from an increase in the physical size of exports of raw materials and other materials for production and from price changes on the world market. As known, the prices for raw materials were higher than those for capital investment goods and some other produced articles. This has been expressed in changes in the material structure of Soviet foreign trade as regards a certain--at least not large--decline in the share of machinery and equipment, which in 1975 attained 18.7 percent and in 1979, 17.5 percent.[1]

Import and capital investment strategy implemented in the USSR gives rise to the fact that there are two structural tendencies in the Soviet export of industrial goods. One is the traditional export of capital investment goods, which include machinery, equipment and complete industrial installations for metallurgy, mining and energy, delivered both to socialist and capitalist countries, and which constitute an important factor for modern technical and technological solutions for the importer. Developing at the same time--and tied to import--is new pro-export potential, examples of which include the automotive, chemical and electronics industries, as well as a wide array of industrial branches producing consumer goods for long-range use.

Level and Dynamics of Trade Turnover

Soviet foreign trade turnover from 1970 to 1979 (see table 1) grew almost four times (from 22.1 billion rubles to 80.3 billion rubles); of that, export increased from 11.5 billion rubles to 42.4 billion rubles, and import from 10.6 billion rubles to 37.9 billion rubles. In 1979, the USSR maintained trade contacts with 131 countries, including long-term two-party agreements and trade understandings with

1 Stated in current prices. On the other hand, using unchanged prices, this share increased from 24.7 percent in 1975 to 26.3 percent in 1979 (FOREIGN TRADE, March 1981, p 30).

111 countries. There was a particularly dynamic development in Soviet trade turnover with foreign countries, chiefly import, during the 1971-1975 period. During the same period, Soviet import increased faster than world import. The same case existed in the CEMA countries as a whole and among developed capitalist countries. On the other hand, Soviet export in the first half of the 1970's grew slower than world export, at an identical rate with all the CEMA countries but somewhat slower than the capitalist countries.

Long-range tendencies in the USSR's trade turnover compared to world trade turnover are given in table 2.

The dynamics of the USSR's foreign trade surpassed the dynamics of national income and industrial production; i.e., the average annual rate of growth in generated national income reached 5.7 percent during the period 1971-1975 and 4.4 percent during the period 1976-1979, while industrial production was 7.9 percent and 5.7 percent, respectively.[2] This picture would be changed somewhat if the dynamics of

2 CEMA countries, 1980, GUS, Warsaw, pp 39, 40.

trade turnover were expressed in constant prices. To a certain degree, it would reduce the difference in rate of growth, but it would not change general tendencies.

Table 2. Average Annual Rate of Growth in Foreign Trade Turnover for USSR Compared to World Turnover, 1971-1979

percentage, current prices

Source: "Soviet Foreign Trade in 1979." STATISTICAL YEARBOOK, p 18.

Machinery and equipment have a fundamental meaning in Soviet import, while in export, raw materials and other production materials are more important. The material structure of Soviet foreign trade does not respond in full to the country's achieved high level of economic development nor to the structure of its material production.

As the data in table 3 show concerning the structure of Soviet import, the most important share constituted--during the entire period of the 1970's--machinery, equipment, and means of transportation.

The value of imported capital investment goods (i.e., machinery, equipment and means of transportation) was around 14.5 billion rubles in 1979. As in previous years and in 1979, the prevailing portion of this import was complete industrial installations and technological lines. This import was directed primarily toward the following industries: chemical (1,753.6 million rubles), textile (390.5 million rubles), energy (350 million rubles), food (334 million rubles), metallurgy (291.2 million rubles), wood products, cellulose and paper (215.7 million rubles) and printing (72.8 million rubles). Imported goods earmarked for the development of transportation included ships and shipbuilding equipment (at a value of 1,229.3 million rubles) and transport trains (at a value of 665.5 million rubles).

The 1979 share of capital investment goods from the CEMA countries in Soviet import stood around 65 percent, at 9.3 billion rubles. These included equipment for the chemical industry, calculating equipment, agricultural machinery, forging equipment, printing machinery, cranes, ships, rail cars, diesel engines and so on. The value of capital investment import from the capitalist countries was 4.5 billion rubles, around one-third of global Soviet import of capital investment goods. Most of this import was implemented on the basis of compensatory transactions.[3] This type of transaction has a long-term character. These transactions include purchases of machinery, equipment and production materials, as well as technical and other services. According to EEC data, the share of compensatory transactions in industrial cooperation contracts at the end of the 1970's reached around 20 percent, although in value terms their share was around 25 to 30 percent.[4] The Soviet Union adopted this type of cooperation with the capitalist countries between the 1960's and 1970's.

The initial transaction of this type was an understanding concluded in 1968 with Austria. It dealt with purchases in Austria of wide pipes and other equipment for extraction of gas in place of Soviet deliveries of natural gas. This year, an understanding was concluded with Japan for deliveries of machinery and equipment in place of goods from the wood products industry. Since 1968, this type of understanding has become one of the characteristic means for East-West industrial cooperation. To date, the USSR has concluded around 60 such transactions with countries from the West, primarily in the field of raw material industries. Because export within the framework of compensatory transactions does not supersede traditional export in the majority of cases, it has increased--in an important measure--the

---

3 Compensatory transactions are credit purchases in the capitalist countries to implement capital investment undertakings, through which the repayment of credit follows from production achieved from the initiated installation.
4 ECONOMIC BULLETIN FOR EUROPE, Vol 29, p 76.

Soviet economy's export base. In professional Soviet literature, the view is expressed that compensatory transactions guarantee both sides complex approaches to resolving problems of cooperation between East and West. This means their more rapid development in relation to classicial forms of barter transactions.

The import of machinery and equipment has become in the 1970's an important factor for guaranteeing the capital investment balance within the Soviet economy. Its share in supplying the economy with capital investment goods stands around 15 percent. However, the impact of this import is much larger than the cited indicator shows. This import, a conveyor of modern techniques and technology, exerts an important influence on modernization processes in many industrial branches; in effect it furthers the intensification of production and growth in the output of work and quality of goods and also lowers costs.[5] Only during the period of 1971-1975 did the Soviet Union purchase abroad complete furnishings and modern machinery and equipment for around 2,000 industrial plants within various fields of the national economy; e.g., metallurgy, automobiles, chemicals, petrochemicals, gas, cellulose and paper, light industry, food, transportation (both water and rail) and also agriculture.

During the second half of the 1970's, the share of import of consumer goods to supply the Soviet market stood around 10 percent. If the import of raw materials for their production is taken into consideration, the role of import in supplying the domestic market is significantly larger. The growing reinforcement of production in consumer goods through the importation of raw materials and other materials, as well as of production means, is a relatively new phenomenon in the Soviet economy; all indications are that it will continue in the future.

Within Soviet export, raw materials and other materials for production, as well as agro-food goods, play the fundamental role. Their share in 1979 stood at 82.5 percent (in 1970, it was 78.5 percent). A certain decline in the share of raw materials from plants and animals, and also food stuffs, followed. During this same period, a decline in the share of industrial products also followed, which for the most part resulted from the more rapid pace of price increases for raw materials and other production materials than for industrial goods.

The fundamental characteristic of the USSR's geographical foreign exchange structure is the growth in the share of trade t urnover with the developed capitalist countries. This does not change the fact, however, that the socialist countries continue to play the fundamental role in the USSR's foreign trade by satisfying a broad range of the Soviet economy's import needs and at the same time constituting an important factor in its development. In turn, exchange with the USSR plays the essential role in the development of the socialist countries' national economies.

Factors in the Development of Trade Cooperation between Poland and the USSR

Intensifying the Soviet economy's share in the international division of labor exerts a beneficial influence both on the dynamics of its development and on its structural transformation. One can anticipate, especially as regards the

---

5 See W. Alchimov, "Soviet Foreign Trade Contacts as Presented at the 25th Congress of the CPSU," FOREIGN TRADE, July 1976.

fundamental goals and directions for development of the Soviet economy laid out by the 26th CPSU Congress, further growth in the role of exchange and cooperation with foreign countries. Let us recall that the congress's resolution for the 11th 5-year plan (1981-1985) calls for an 18 to 20 percent increase in the USSR's national income. Ninety percent of this increase is supposed to come from a growth in societal work output, which should increase by 17 to 20 percent. Industrial production is supposed to grow 26 to 28 percent, and production of consumer goods, 27 to 28 percent. The growth in work output in industry is supposed to reach around 23 to 25 percent, which also should guarantee a 90 percent growth in production. During the period 1981-1985, real income per inhabitant will increase by 16 to 18 percent, which will see an increase in domestic trade turnover (state and cooperative) of 22 to 25 percent. Many new and stylish goods, characterized by good quality, will be introduced to the market.

The program anticipates that capital investment activity will be concentrated in the most important--for the economy--industrial installations. This means the construction of a smaller number of installations than in the preceding 5-year period and a reduction in their construction cycle. The capital investment program has a long-term character. Both in the 5-year periods 1976-1980 and 1981-1985, and also based on assumptions for the period through 1990, capital investments will be concentrated in the areas that convey scientific and technical progress, thus allowing the rapid development of the entire economy and raising the standard of living for the populace. These areas in the Soviet economy are primarily metallurgy and mining, energy, the chemical industry (along with petrochemicals), some branches of the machinery industry (including calculating equipment), the construction materials industry and also those industries producing consumer goods (primarily light industry, ceramics and glass, articles for recreational use and food).

Planned directions for development of the USSR's economy and of economic cooperation with foreign countries indicate during the 1980's a further growth in import demand, especially within the capital investment and consumer categories. Therefore, from the point of view of the Soviet economy's requirements, our position as an exporter is potentially beneficial. There is no need to prove that taking advantage of these possibilities depends above all on overcoming the crisis situation and stabilizing the Polish economy. Only on this basis will it be possible to formulate a constructive program for cooperation tied to a realistic plan for development. However, both current exchange and cooperation with the USSR have an essential influence on stabilization of the Polish economy.[6]

From the point of view of economic and scientific-technical cooperation with the USSR, two important phenomena within the Soviet economy have a significant meaning; i.e., acceleration of scientific-technical progress and, resulting from that process, enlargement of the level and efficiency of material production. In order to achieve the desired level of export to the USSR during the 1980's, therefore increasing the attractiveness of our economy for the importer to create real conditions for reducing our indebtedness to the USSR, and to raise the efficiency of mutual trade turnover, it is necessary fully and constantly to consider the demands

---

6 See I. Cieniuch's article, "Polish-Soviet 1981 Trade Turnovers."

of the Soviet market within the area of individual goods, the structural characteristics of the exchange and the forms of cooperation. This deals primarily with the range of our export offerings, their quality and modernity and also the development of cooperation in production.

The largest share of our export to the Soviet Union is machinery and equipment. Demands for proper quality are especially felt here, because large deficiencies in this area bring the severest losses in the trade exchange with our Soviet partner, and in effect to the Polish economy. The quality of exported market goods also has a particularly significant meaning when these goods are produced on a massive scale and their final receiver is the individual consumer. To a large degree, these products form Soviet society's general opinion about our economy.

The Soviet market differs from others because of the degree of its absorptiveness. This trait signifies the necessity for plans by producing exporters toward a broad utilization of the mechanism of specialized and cooperative understandings.

The irrevocable condition for economic cooperation and export is the promotion and organization of technical and economic information flow concerning export offerings and production possibilities. These are served above all by direct contacts between economic organizations in both countries on various levels, mixed workers' groups discussing economic and technical cooperation, symposia, publications, exhibits and, finally, participation at international trade fairs and shows.

Servicing of Soviet Machinery, Equipment

Warsaw HANDEL ZAGRANICZNY in Polish, Special Issue, 1981 pp 25-27

[Article by Boris Logniov, deputy to the Soviet trade representative in Poland]

[Text] Economic cooperation and trade exchange between the USSR and Poland have been characterized, especially recently, by high dynamics and significant dimensions in turnover. To a large degree, this has resulted from the more rapid development of mutual deliveries of machinery and equipment, whose share has constantly increased; in 1980, in accordance with stipulations, this share rose to over 40 percent of Soviet-Polish goods turnover. Within the entire Soviet export to Poland, the share of machinery and equipment increased from 14.5 percent in 1975 to 27.5 percent in 1979.

The Soviet Union is one of the largest suppliers of machinery and equipment for the Polish market, especially for those industrial branches and sectors of the economy like the machinery industry, metallurgy, energy, the construction industry, railroads, automobiles and airlines, light industry and agriculture (tractors and agricultural machinery).

The increasing significance of these deliveries is supported by the fact that from 1976 to 1980 the export of Soviet machinery and equipment to Poland reached a value over 4 billion rubles and increased over 2.5 times as compared to the 1971-1975 period, including 4 times for automobiles and 3 times for tractors and agricultural machinery. In 1980, the export of Soviet machinery and equipment delivered to Poland achieved a value of 954 million rubles and increased by 5.5 percent as compared to 1979.

At the end of 1980, the following Soviet machinery and equipment were utilized in Poland: 113,000 automobiles, 81,000 trucks (including 15,000 Kamaz trucks, 45,000 machine tools for forging and pressing metal, 1,300 electric locomotives, 17,000 pieces of equipment for electrical welding, 139 electronic calculators, 7,000 pumpless weaving machines, 150 airplanes and helicopters, over 80,000 tractors, 155,000 agricultural machines of various types, 14,700 mechanical shovels and other road-building machinery.

Beyond these, Poland purchased from the USSR 1.5 million refrigerators, 900,000 radios, 650,000 television sets, 800,000 cameras, over 10 million watches and hundreds of thousands of other mechanized devices for the home.

The specifics of foreign trade of machinery and equipment differ significantly from those of other goods. Machinery and equipment are earmarked for long-term use in specific indus rial processes or for use by other sectors of the economy and finally for the client's individual needs. As a result, one of the basic responsibilities of the exporter of machinery and equipment is the guarantee--during the entire period of their use--of proper technical servicing, regular supplying of replacement parts and training of personnel in the proper use of the equipment and renovation.

Certainly at the current stage of economic, scientific and technical progress in the production of capital investment goods without the presence of organized technical servicing, there is no place for the dynamic development of international trade exchange. Thus, the problems of technical servicing of machinery and equipment delivered to Poland are the center of attention on the part of Soviet foreign trade enterprises and producers. This servicing has been implemented by taking advantage of the newest, worldwide experiences in the field and through close cooperation with Polish foreign trade enterprises and consignees.

To the end of 1980, over 30 agreements dealing with the organization of technical servicing of Soviet machinery as well as with price reductions for equipment guaranteed by exporters were concluded between Soviet foreign trade associations and various Polish enterprises. Agreements also were concluded, for example, with METALEXPORT for servicing machine tools, UNITRA for televisions, UNIVERSAL for refrigerators and so on. Within the framework of these, the necessary replacement parts for making repairs are guaranteed to the consignee's service area; many service areas possess consignment storage for replacement parts.

Each Soviet foreign trade enterprise exporting goods produced by the machinery industry has full-time specialists from the producers of these goods working either in the USSR's trade mission in Poland or in technical centers. Their primary task is constant cooperation with Polish service staffs by granting technical assistance to buyers, checking out complaints and eliminating discovered flaws, showing the newest service methods in areas of use and training Polish specialists. Each year, Soviet specialists teach up to 8,000 Polish experts in technical centers through various courses, seminars and practical training. For example, training centers for operators and mechanics of tractors and road-building equipment exist in the Polish enterprises AGROMA and ZREMB, while specialists from the technical center AWTOEXPORT organize each month in Warsaw and Opole meetings and consultations with automobile owners.

From 1976 to 1980, deliveries to Poland of replacement parts for Soviet equipment more than doubled compared to the period 1971-1975, while in 1980 they reached 234 million rubles (i.e., 25 percent of the value of deliveries of all types of equipment). Of this amount, deliveries of replacement parts (implemented through the intervention of the All-Union Federation ZAPCZAST-EXPORT) for automobiles, tractors and agricultural machinery increased 25 times during the last 5-year period and reached around 30 percent of their delivery value.

The basic form of technical service for Soviet machinery in Poland is the organization of technical centers. There are six centers for technical assistance operated through cooperation between the USSR's trade mission in Poland and the seat in Warsaw. These are technical centers for servicing machinery and equipment exported by the following enterprises: AWTOEXPORT (automobiles and trucks of all brand names; Polish import of "Pol-Mot"), STANKOIMPORT (machine tools for forging metal, imported by METALEXPORT), TRACTOREXPORT-MACHINEXPORT (tractors, agricultural machinery, cranes, shovels, road-building equipment, imported by AGROMET-MOTOIMPORT and BUMAR), ENERGOMACHEXPORT (locomotives; electric locomotives; energy, electrotechnical and welding equipment imported by KOLMEX and ELECTRIM), ELECTRONORGTECHNIKA (calculating equipment imported by METRONEX and UNITRA), TECHNOINTORG (radios, televisions, watches, refrigerators and other products for home use purchased by VARIMEX, UNITRA, TORIMPEX and UNIVERSAL).

Moreover, the Soviet-Polish center TEXTILSERVICE in Lodz deals with technical servicing of equipment for the textile industry.

The export of Soviet machinery and equipment implemented through the intervention of these technical centers has reached around 75 percent of total deliveries of these goods from the USSR to Poland.

The creation of these technical centers has raised considerably the level of service on machinery and equipment obtained from the USSR, thanks primarily to the tightening of bonds between Polish and Soviet economic organizations, and above all between Polish users and Soviet procucers. Also influencing improvement in service activity has been the growth in the number of full-time specialists in the Soviet centers, which represent the principal producers, and the creation of guaranteed storage areas for replacement parts, which has contributed to a more rapid elimination of flaws and thus to the realization of guaranteed repairs. For example, the newly opened (May 1980) technical center ELECTRONORGTECHNIKA in Warsaw has diagnostic instrumentation for block renovation of calculating equipment, as well as other laboratories and workshops for renovating individual blocks and groups of equipment. These facilitate the elimination of discovered flaws within only a few hours.

It is estimated that the current needs of Polish clients for reserve parts for the postguaranteed period are almost completely satisfied as a result of the participation of Soviet specialists in dispensing those parts ordered by Polish centralized service enterprises and individual users. At the same time, the number of Polish stations and shops servicing Soviet technical equipment and the number of centralized service enterprises, with which the technical centers are closely involved in renovation and service, have increased.

For example, the technical center AWTOEXPORT and the Federation of Motoring Subsidiaries have authorized over 140 automotive enterprises and shops, organized 3 central storage areas for replacement parts and 4 research centers for servicing Soviet trucks and, together with the enterprise POLMOZBYT, created 172 stations for guaranteed and postguaranteed service, 42 storage areas for replacement parts, 1 central storage area for replacement parts in Bialystok and storage areas in 101 automotive service stations. The technical centers AWTOEXPORT and POLMOZBYT have organized presale service on Soviet cars and trucks. With the aid of the technical center ENERGOMACHEXPORT, storage areas for guaranteed replacement parts and 10 central storage areas for replacement parts in the postguaranteed period for Soviet electric locomotives have been organized in 11 large roundhouses. All of this influences the results of training of Polish specialists in the area of servicing and using equipment delivered from the USSR. Moreover, thanks to organized seminars and symposia and through the active participation of Polish enterprises, work toward the perfection of quality in equipment delivered from the USSR, in support of experiences gained from their work in Poland, has been introduced.

Acting through the USSR's trade mission in Poland, the technical centers, alongside technical service centers, also deal with trade service for export and import transactions, as well as with problems of operation by the Soviet All-Union Foreign Trade Federation in the Polish market. These centers are therefore fully competent representatives of their federations and, under the guidance of the USSR's trade mission can resolve a wide range of problems dealing with issues of economic and trade cooperation with Polish enterprises as regards goods--the subject of their turnover.

In Warsaw, the new production, technical and administrative installations for the technical centers STANKOIMPORT and AWTOEXPORT, will be put to use soon. At the same time in Karczew near Warsaw, construction of the technical center TRACTOREXPORT-MACHINEXPORT has begun, with completion set for 1983. Construction of these centers is implemented by specialized Polish construction enterprises, based on contracts concluded between BUDIMEX and the Foreign Trade Agency, SOJUZVNIESHSTROJIMPORT. In the equipped installations will be a mechanized storage area for guaranteed replacement parts; an exhibition hall, scientific auditoria with various pieces of equipment, models and cross-sections, their groups and details; a movie theater, a library containing technical documents and catalogues; and equipment for technical servicing of individual machinery. In Warsaw will be a building earmarked for the technical center TECHNOINTORG; it will service Soviet mechanized equipment for use in the home. Moreover, the organization of the technical center MACHPRIBORINTORG for servicing a wide assortment of radio measuring equipment and other devices and automotive equipment, as well as the broadening of activity by the center TEXTILSERVICE in Lodz, is anticipated in order to service the entire gamut of Soviet equipment and broaden the work of the guaranteed and consulting center TECHSNABEXPORT in Warsaw for servicing scientific equipment.

Despite the difficulties that the Polish economy is experiencing and the reduction of imports of capital investment equipment, the years 1981-1985 anticipate important deliveries to Poland of Soviet machinery and equipment and in particular of cars and trucks (including 50,000 Kamaz trucks), tractors, agricultural machinery, airplanes and equipment for the flying industry, equipment for light industry, freezers and mechanized equipment for use in the home and others. One can therefore anticipate that needs for Soviet machinery and equipment in Poland will grow. Toward

the aim of technical efficiency for servicing this equipment, it is necessary that Soviet and Polish enterprises work toward the maximal centralization of storage and distribution of replacement parts by creating a system of centralized storage areas and service stations primarily for tractors and locomotives. There is also a need to organize the central renovation and regeneration of parts for Kamaz trucks and tractors. In this regard, it is vital to organize technical service and supply of replacement parts for production equipment in both countries based upon agreements as to specialization and cooperation in production, and also of parts for new types of machinery. Finally, the need to create in Poland service stations specializing in the repair of other equipment not covered by centralized service (e.g., electronic calculating equipment, compressors, printing equipment, road-building machinery and so forth) stands out.

Each of these undertakings will promote the efficient utilization in Poland of Soviet machinery and equipment.

Polish-Soviet Trade Cooperation

Warsaw HANDEL ZAGRANICZNY in Polish, Special Issue pp 28-29

[Article by Ladimir Kustov, director of the Soviet exposition at the 1981 Poznan International Trade Fair]

[Text] The Soviet Union is a traditional participant at the International Trade Fair in Poznan. Each Soviet exposition is different from the previous ones. What will characterize this year's exposition?

The answer to this question is simple. This year is rich in important events for the Soviet nation. We shall attempt to show this in our pavilion. Slogans and photographs will show visitors the state of liveliness and enthusiasm at the 26th Congress of the CPSU. The work performed by the Soviet nation during the past 5-year period as enumerated at the congress. New items for the development of the country's economy not only during the next 5 years (1981-1985) but also to 1990 were presented. Visitors to the Soviet pavilion can obtain more complete information on this subject by watching films and slide shows and by becoming acquainted with literature at the booths. The exposition also presents acceptance by the 26th Congress of the CPSU of the Soviet program for peace, which is the fundamental document for the peaceful, Leninist foreign policy of the CPSU, directed primarily toward the strengthening of peace and security for nations and expanding international cooperation. International cooperation is becoming an ever more important item in the politics and economics of the world.

A large portion of the Soviet exposition is devoted to the 10-year existence of the complex program for socialist economic integration and to the subject of two-party economic and technical cooperation between the USSR and Poland.

As regards the growth of trade turnover between the USSR and Poland, the figures show it best; i.e., according to initial data for the past 5-year period, the value of trade turnover was 38.5 billion rubles, which means a growth double that for the 1971-1975 period. The Soviet Union delivers to Poland crude oil, natural gas, iron ore, asbestos, cellulose, chromium, semifinished products and market goods like Lada automobiles, television sets, photographic and film-making equipment, freezers and watches.

In mutual turnover between the USSR and Poland, the role of deliveries of goods furnished on the principles of specialization and cooperation, and implemented within the framework of 22 two-party and 60 multiparty agreements, is growing. Among them, agreements on the following should be mentioned: Kamaz trucks and Lada automobiles, machine tools, calculating equipment, construction road-building equipment, textile machinery, self-propelled cranes, tractors, equipment for nuclear power plants and equipment for the metallurgical and chemical industries. Visitors can see many of these industrial goods at the booths of 20 Soviet foreign trade enterprises.

This year, there are around 4,000 exhibitors within the Soviet exposition at the Poznan International Trade Fair. For specialists, expositions by V/O TECHMACH-EXPORT, V/O LICENSINTORG and V/O SOJUZCHIMEXPORT--which represent the Soviet Union's achievements in the area of the chemical industry, production of equipment for that industry and also participation by the State Normalization Office of the

USSR--are important. Soviet industry is influencing the development of all industrial branches in the Polish national economy. The following are presented at the exposition: electric diagrams, models of production lines for producing plastics and plastic goods, a wide range of paints and varnishes, chemical fibers, chemical reagents, monocrystals (the Soviet Union produces over 500 variations of these products), mineral fertilizers (the Soviet Union occupies first place in the world for this production) and products from the chemical industry. Within the exposition of chemical equipment, a unique apparatus for gelatination is exhibited. New variations of this machine are introduced in the Soviet Union every 3 to 5 years. Also exhibited are pumps of various kinds for the chemical industry.

The State Normalization Office of the Soviet Union is exhibiting meteorological instruments and standards models, of which the Soviet Union has 116 varieties for the needs of science and industry. Many of them (e.g., sets for measuring induction) are widely used in the socialist countries.

Cooperation between our countries in the field of chemistry is based on export from the Soviet Union to Poland of fuels and raw materials; these deliveries played an enormous role in the development of the Polish chemical industry and assisted in the creation of plants like the petrochemical works at Plock, which have refined around 13 million tons of crude oil in the course of the year. Poland is in turn an important supplier to the Soviet Union of sulfur and complete technological lines for sulfuric acid plants.

Soviet foreign trade organizations like TECHNOINTORG, RAZNOEXPORT, NOVOEXPORT and EXPORTLES exhibit a wide assortment of goods for universal use, which have become in recent years a production priority for raising Soviet society's material and cultural level. They offer television sets, tape recorders, radios, vacuum cleaners, freezers, furniture, musical instruments, sporting and hunting weapons and toys, all of which are well-known goods in various countries.

In Naramowice, Soviet agricultural machinery (e.g., tractor MTZ-82 from the factory in Minsk, tractor T-150K from the factory in Charkov, light tractor T-25A from the factory in Vlodimir and others) is shown.

Within the framework of the Soviet exposition at the Poznan International Trade Fair, the achievements of one of the member republics is shown. This year the achievements of the Tadzhik Soviet Socialist Republic will be shown. Tadzhik SSR is a land of high mountains (Pamir, the so-called "roof of the world," is located in this republic), rushing rivers (hydroelectric power here places the republic in second position behind the Russian Federated Soviet Republic) and also fertile valleys. Farmers there produce annually 1 million tons of cotton, and the Tadzhik Republic will soon become one of the largest producers of grapes.

The republic's exposition contains models of the Tadzhik aluminum smelter and the Rogun power station, mineral wealth, frontal and decorative stones, building materials, jeweler's goods and food products. Known throughout the world for high quality in tanning and sewing are Tadzhik astrakhan skins and furs from musk oxen and nutria.

Tadzhik is a country of original culture, which visitors can get to know through the writings of contemporary authors, pictures, graphics and folk art. A beautiful

example of folk art is shown at the Czajchan exposition (wood sculptures of rich ornamentation). Visitors can see the works of the painter Chamadamov, who is at the booth, in order to become acquainted with certain directions in folk art. Artists from the Tadzhik Republic will assist our Polish friends in better understanding the culture of this old country.

You are therefore invited to visit the USSR's pavilion.

Polish Trade Exhibits in USSR

Warsaw HANDEL ZAGRANICZNY in Polish, Special Issue, 1981 pp 32-34

[Article by Nina Jaworska, affiliate of the Polish Chamber of Foreign Trade (PIHZ)]

[Text] The Soviet Union is our largest trading partner and supplier of many basic raw materials, other materials and capital investment goods necessary for our economy. Approximately 30 percent of Poland's foreign trade turnover is composed of goods from the USSR. Cooperative connections among industries deepen, while much attention is paid to the issue of specialized production.

Taking into consideration important tasks with foreign trade, the Polish Chamber of Foreign Trade (PIHZ) conducts actions designed to develop and strengthen economic relations with the USSR, of which the primary promotion is creating exhibits. As evident from several years of experience, exhibits are one of the more important means by which to activate and develop mutual trade turnover and economic cooperation. This activity on the Soviet market has a particularly important meaning as regards the current and future range of our trade turnover.

At the beginning of the 1970's, the organization of annual promotional exhibitions was initiated under the title "Made in Poland." The exhibitions encompassed--through a wide range of goods--many activities addressed to various areas of Soviet society, business interests and specialists. Each display within the exposition contained complete information regarding our economy, as well as about the technological and economic level of individual industrial branches and the development of relations with the USSR. The displays from "Made in Poland" fulfilled their purposes; i.e., to create a positive impression on Soviet society as to our country's development and economic potential. Further technical progress and economic development create the necessity for a systematic demonstration of the actual trade offerings and the proposition for cooperation and specialized production.

Moreover, the Polish Chamber of Foreign Trade has organized collective exhibits by foreign trade enterprises at international, specialized expositions in the USSR. These expositions show the achievements of the most important world producers and exporters in a given area and constitute a forum for conducting trade discussions, concluding agreements and developing trade relationships.

Exhibits organized by PIHZ have enjoyed a very congenial atmosphere, through which various forms of activity have benefited. Besides the traditional organization of press conferences and the distribution of materials to journalists and the public, the following also have taken place: film demonstrations, other visual aids, fairs of selected Polish goods, performances by Polish artistic groups, television competitions, interviews and discussions.

Symposia organized at many exhibits also have a very essential meaning, as Polish specialists can discuss our newest technical achievements and production possibilities in broadening cooperative connections and deepening specialized production in specific industrial branches in Poland and the USSR.

A relatively new form of promotion on the Soviet market is the "Days of the Polish Economy and Technology." These exhibitions have a symposiac character, which sometimes come complete with displays. They allow one, with relatively small financial outlay, to reach directly specific experts, business and political interests, individual republics and industrial circles.

The plan for economic promotion in 1981 anticipates the organization in Kiev of exhibits of Polish export goods under the title "Made in Poland" and of two symposia (with small exhibits) called "Days of the Polish Economy and Technology" in Vilna and Minsk. Moreover, numerous Polish foreign trade enterprises are organizing their own exhibitions and also participate in shows organized by the Soviets.

The exhibition "Made in Poland" at Kiev will be one of the larger Polish promotional shows organized abroad this year. On the grounds of the Exhibition of the Achievements of the USSR's National Economy (covering an area of 5,500 square meters), the following foreign trade enterprises will display their wares:

AGPOL	-	advertisements
AGROMET-MOTOIMPORT	-	agricultural machinery
BEFAMA	-	worsted spinning
BUDIMEX	-	general range of goods
BUMAR	-	shovels, cranes
CENTROMOR	-	ship furnishings
CENTROZAP	-	ventilating and metallurgical equipment
ELECTRIM	-	backstage equipment, energy devices
HORTEX-POLCOOP	-	preserves, frozen foods
KOLMEX	-	models of transport trains
KOPEX	-	mining equipment and tools
METALEXPORT	-	machine tools, machine tool components, welding equipment
METRONEX	-	equipment of secondary importance, computer systems
NAVIMOR	-	floating equipment (yachts, motor boats, sail boats, and so forth)
PAGED	-	furniture
POLIMIX-CEKOP	-	models of completed installations; equipment for the sugar beet, meat and baking industries
POL-MOT	-	buses, delivery trucks, garage equipment
REMEX	-	general range of goods
TEXTILIMPEX	-	material, clothing, knitting
UNITRA	-	radio and television equipment, lights, radio-telephones
VARIMEX	-	medical equipment, laundry and pressing equipment, technical articles

WIFAMA	-	carding equipment, creamers
PKZ (Works for Preserving Relics)	-	general range of services

The location of this show was not chosen haphazardly. The Ukraine's economic potential, existing cooperation and perspectives and possibilities for its development also stand behind the organization of the exhibition in the capital of the Ukrainian SSR. Our exhibition will show the current offerings of Polish foreign trade enterprises with respect to our Soviet partner; i.e., a promotional and trade exhibition. As regards the relatively broad participation by 23 enterprises, it will present a significant portion of Polish industry's production possibilities, utilizing contemporary technology and constructive solutions. It will facilitate a closer familiarization with Polish goods and a visual appraisal of their worth by Ukrainian specialists and business interests. Our presence in the Ukrainian capital should call for broader needs for our industrial goods from the Ukraine's economic circles. Direct contacts between Polish and Soviet specialists during the symposium should contribute to developing new cooperative and specialized contacts, and also deepen cooperation in specific industrial branches. For some foreign trade enterprises, the show will be simultaneously a place for negotiating new contracts. Exhibits will demonstrate the usefulness of Polish capital investment equipment and goods for building the Ukraine's economic potential. Existing trade effects from our promotional exhibitions in the USSR confirm to us that the need exists for this kind of show. They meet with lively interest on the part of government officials, specialists and a broad spectrum of society. An exhibition organized on such a significant scale also allows for emphasizing Poland's share in widespread political and economic cooperation with the Soviet Union and other CEMA countries.

During the period of "Days of the Polish Economy and Technology" in Minsk (October) and Vilna (November), Polish specialists will present a wide range of papers to Soviet specialists. The theme of these papers will be prepared from the point of view of Soviet interests and from our own export possibilities. In Minsk, papers will be presented on the subjects of machine tools and measuring equipment. A few papers will cover machinery and equipment for agriculture and the food-processing industry. Polish specialists also will present papers on machinery and equipment for galvanizing and the wood products industry. Also discussed will be automotive service stations, as well as diagnostic and garage equipment. In accordance with our export possibilities, pharmaceutical measures and equipment for physical therapy will be presented.

The theme of the symposium in Vilna also will deal with machinery and equipment for the food-processing and wood products industries, automotive service stations, galvanizing equipment and technology for heat treatment. Moreover, the textile industry will present its export offerings. The symposium will contain a photographic display showing Polish-Soviet economic cooperation and exhibits of several foreign trade enterprises.

These shows will be preceded by press conferences for correspondents from the press, radio and television. A suitable amount of general and specialized information will be available.

As previously, international specialized exhibitions have been organized this year in the USSR. Since the scope of this year's exhibitions is very narrow (dealing with only a few industrial branches), it is anticipated that only selected foreign trade enterprises will exhibit their products. POLIMEX-CEKOP will participate at the international exhibition entitled "Canning and Storage of Fruits and Vegetables" in Leningrad, ARS POLONA at the International Book Fair in Moscow, CIECH at the international exhibition entitled "Chemistry for People" in Moscow, UNITRA at the international exhibition "Current" in Moscow, BUMAR at the International Exhibition of Road-Building and Construction Equipment in Moscow and finally IMPEXMETAL at the international exhibition "Ball-Bearing" in Moscow.

This year, several foreign trade enterprises are organizing exhibits and symposia in the USSR. Above all, these exhibits have a contractual character. Organization of this kind of exhibit for exporting enterprises is a necessity. Their fundamental task is to demonstrate the offerings of Polish light industry, choices of models and newness. The following enterprises are organizing such exhibits: UNIVERSAL, COOPEXIM, ELECTRIM, PAGED, REMEX, SKORIMPEX, TEXTILIMPEX, METRONEX, VARIMEX and LABIMEX. Moreover, ELECTRIM, CIECH, HORTEX-POLCOOP and METALEXPORT are organizing symposia.

As a result, the number of Polish exhibits and sumposia organized this year in the Soviet Union is relatively significant, although compared to previous years it has declined. The principle of achieving the maximal trade benefits with the least cost outlays has guided the promotional plan in the current situation. As a result, promotional activity was limited to only those exhibitions that offer concrete trade possibilities for 1981 and the near future and exhibit newness that can be an object for export to the USSR. In this situation, these exhibits and symposia should contribute to an increase in our export and also to the broadening and deepening of Polish-Soviet cooperative and specialized relations.

AUTONOMY OF SPECIALIZED AGRICULTURAL WORK GROUPS EXTENDED

Budapest MAGYAR KOZLONY in Hungarian No 52, 5 Sep 81 pp 719-724

[Council of Minister Decree Number 27, 1981 (5 Sep) on Specialized Agricultural Work Groups]

[Text] In order to further develop small-scale agricultural farming and auxiliary activity and promote a higher level satisfaction of producer and consumer demands, the Council of Minister decrees as follows on the modification of certain orders regarding cooperatives on the basis of authority granted in paragraph 3 of Decree Number 14 enacted in 1981. Organizational Framework of Specialized Agricultural Work Groups

Article 1

(1) Specialized agricultural work groups may be formed in the framework of an agricultural, fishing and producer cooperative, agricultural specialized cooperative, consumer, marketing and purchasing cooperative (hereinafter cooperative) and in the framework of state farms, state forests and economic associationa included in the agricultural and food industry branch and belonging to the revenue regulatory system (hereinafter state farms).

(2) The agricultural specialized work group (hereinafter specialized work group) is a self-governing organization, with a defined economic independence and independent accounting.

(3) The specialized work group is not a legal entity.

Section I

Cooperative Specialized Work Group

The Formation of the Specialized Work Group

Article 2

(1) For the formation of a specialized work group it is necessary

a) to have the prior approval of the cooperative's directorship (leadershiP) for the organization of the specialized work group;

b) to hold a constituent membership meeting;
c) to pass a resolution affirming the formation of the general assembly (delegates' assembly) of the cooperative.

(2) In justified cases the cooperative directorship (leadership) may give its prior approval for the specialized work group to conduct certain activities within the cooperative prior to the passage of the resolution affirming the formation of the general assembly (delegates' assembly).

Article 3

(1) The formation of the specialized work group may be decided on by a membership meeting held with the participation of at least five persons who have applied for admission (constituent membership meeting), assuming that the meterials necessary for the operation of the specialized work group are available, or can be provided during operation.

(2) The constitutent membership meeting decides at the same time on the acceptance of the applicants, the establishment of the operational regulations, and the election of officials.

(3) Together with the resolution affirming the formation of the specialized work group, the general assembly (delegates' assembly) also determines the basic rules regarding the relationship of the cooperative and the specialized work group.

(4) The understanding regarding the relationship of the cooperative and the specialized work group, and the operational regulations of the specialized work group make up the supplement to the organizational and operational regulations of the cooperative.

Operational Regulations

Article 4

(1) The specialized work group conducts its activities on the basis of the operational regulations.

(2) The operationa regulations must define:

a) the name of the specialized work group, its goal and the scope of its activities;
b) the name and place of the cooperative in whose framework the specialized work group operates;
c) the main rules regarding the organization of the specialized work group and the operation of its organs;
d) the number of members in the organs of the specialized work group, their sphere of authority, the time duration of their operation, and the method of carrying out and filling and terminating official positions;
e) the basic rules regarding the relationship of the specialized work group and the cooperative;
f) the main principles for the formation and development of economic activity, for the use of the managing results, and for the sharing of the results;

g) the method of representation in the affairs of the specialized work group;
h) the basic rights and obligations of the members, in particular the methods of personal and property cooperation, and finally
i) the ordering of all those things which are referred to the operational regulations by statutory provision, or which the membership meeting regards as necessary.

Article 5

(1) A two-thirds majority of the membership meeting is needed to establish and to modify the operational regulations of the specialized work group. The operational regulations become valid with the resolution of the cooperative directorship (leadership).

(2) Within 15 days following approval of the affirming resolution, the directorship (leadership) sends an information copy of the operational regulations or the modifications to the state organ exercising legal supervision.

(3) After the affirmation of the operational regulations by the directorship (leadership), the specialized work group must be registered separately in the cooperative records. The detailed registration rules are established by the finance minister.

Organs of the Specialized Work Group

Article 6

(1) The organs of the specialized work group consist of the membership meeting including all members, teh executive committee, and the control committee.

(2) The operation of an executive committee and control committee is not compulsory. The membership meeting decides whether they should be established depending on the number of members and on the activity sphere. If an executive committee is not established, its authority is exercised by the chairman of the specialized work group.

(3) The membership meeting may create standing or temporary committees for certain tasks of the executive committee.

Article 7

(1) The following belong exclusively to the membership meeting's sphere of authority:

a) establishment and modification of the operational regulations;
b) the election, release, recall and removal of officials;
c) the establishing of the plans, the balance of accounts and the demonstration of results (final accounts);
d) the determination of guidelines on the use of managing results;
e) the signing of agreements on the relationship of the cooperative and the specialized group;

f) decisions on the a[illegible]ation, division, separation, transformation and termination of [illegible]pecialized work group;
g) termination of the membership relation;
h) decisions in all questions which the statutory provision, the general assembly of the cooperative or the operational regulations grant to the membership meeting's sphere of authority.

(2) A membership meeting must be called at least one a year.

(3) A membership meeting must be called if 10 percent of the members, the control committee of the specialized group, the directorship (leadership) of the supervisory (control) committee of the cooperative, or the organization which exercises state legal control initiates the call in writing, or if property registered separately for the specialized work group does not over the long run cover the payments obligations which encumber it.

(4) A partial membership meeting may also function in a specialized work group. The cooperative must appropriately use statutory provisions regarding partial general assmeblies for the conditions of its operation, for its sphere of authority, and for its capability of passing resolutions.

(5) The membership meeting has a quorum if more than one-half of the membership is present.

(6) Unless the statutory provision or the operational regulations provide for an exception, the decisions of a membership meeting may be passed with a simple majority in an open vote.

Article 8

(1) The leading organ of the specialized work group with general authority is the executive committee consisting of 3 to 7 members, who are elected for 5-year terms by the secret vote of the membership meeting.

(2) The control of the operation and management of the specialized work group is conducted by a control committee consisting of 3 to 7 members elected for 5-year terms by a secret vote of the memberhsip meeting.

Officials, Experts

Article 9

(1) The officials of a specialized work group are the chairman, the members of the executive committee, and the chairman and members of the control committee.

(2) The chairman is elected for a 5-year term by the secret vote of the membership meeting. The chairman is also chairman of the executive committee.

(3) An expert is required for the conduct of accounts and records of the specialized work group. An expert working at the cooperative, or some other expert outside the organization, may perform these tasks, if incompatibility does not exist. The operational regulations or the membership meeting may also decide on the function of other experts.

Article 10

(1) An official must

a) be a member of the specialized group;
b) be fully capable of action;
c) not stand under penalty judgment of a disciplinary decision removing him from office or a court judgment forbidding participation in public affairs;
d) not be one who in the exercise of a state legal control or state authority task is taking action in the affairs of the specialized work group;
e) not be the chairman of the cooperative, the deputy chairman, or chairman and member of the supervisory (control) committee.

(2) Instances of incompatibility in a specialized work group must be established by the appropriate application of the provisions of Article 33 in Law III of 1971 (hereinafter Szvt).

Management of the Specialized Work Group

Article 11

(1) The specialized work group manages the properties, finances and lands transmitted to its used by the members and the cooperative.

(2) The specialized work group may perform agricultural production (crop production, fruit-grape-vegetable production, and livestock breeding), forestry and primary wood processing, the processing and marketing of agricultural produce and products, the acquisition, production, renovation and maintenance of materials, means and equipment serving the agricultural needs of small producers, and activity linked to agricultural production and processing (Article 63, paragraph 2 of Council of Ministers decree number 7/1977, 12 March).

(3) The specialized work group conducts producer activity on the farms of the members, but in the interest of joint activity, it may also establish joint farms and operations according to paragraph (2) above by observing the pertinent statutory provisions.

Article 12

(1) The specialized work group manages on the basis of an annual production and financial plan.

(2) The specialized work group must keep appropriate records of the property transferred to its use, its activities and its results. At the end of the year it must prepare a balance statement and a statement of final accounts.

(3) The specialized work group meets production costs and other expenditures from its revenues, and forms a fixed and circulating fund. Statutory provision or operational regulations may also prescribe the formation of other funds.

(4) The finance minister establishes by decree the rules for the specialized work group's tax payment.

Article 13

(1) The directorship (leadership) of the cooperative continuously follows and helps in the management of the specialized work group. In this framework

a) it assures that the cooperative provides adequate support for the activities of the specialized work group;
b) the cooperative may transfer to the use of the specialized work group land, buildings, other properties (planted areas, machinery, equipment, geat, and so forth), and money which it has in its possession, care or use;
c) it may offer subsidized services and other supports to promote the goals of the specialized work group;
d) it sets the value limit beyond which, in the name of the cooperative, obligations can be undertaken on behalf of the specialized work group only with the prior written approval of the directorship (leadership).

(2) The cooperative directorship (leadership) must once a year examine the entire management of the specialized group. The supervisory (control) committee of the cooperative regularly controls the operation of the specialized work group.

(3) The cooperative cannot prescribe production, purchasing, marketing and revenue utilization obligations for the specialized work group.

Article 14

(1) The agreement regarding the relations between the cooperative and the specialized work group must settle

a) when the specialized work group is formed, the use relations and the accounting method for the properties, finances, land and buildings which belong to the cooperative and have been transferred to the use of the specialized work group;
b) the method for accounting the increase in property created as a result of the specialized work group's activity.

(2) The specialized work group must handle the property in its use separately from other property of the cooperative, and must use it only in a way defined in the operation regulations.

(3) Fixed assets transferred to a specialized work group may also be given for the joint use of the specialized work groups, if there are more than one operating in the cooperative.

Article 15

(1) The members of a specialized work group vouch only with property contributions for debts related to specialized work group activity, the cooperative vouches first of all with property registered specifically for specialized work group goals, as well as with properties transferred to the specialized work group, and for additional debts with its entire property.

Representation

Article 16

(1) In the name of the cooperative, persons selected by the chairman or the executive committee from the specialized work group membership are entitled to represent the specialized work group, assuming that they are in a membership relation with the cooperative. The cooperative registers the persons entitled to be representatives in a separate representational book; their signatures are countersigned by the chairman of the cooperative.

(2) An agreement for an obligation that exceeds the value limit set by the cooperative can be signed only with the prior written approval of the cooperative directorship (leadership), and in the sense thereof.

(3) To undertake a written, financial obligation, it is necessary to have the signature of the two persons entitled to be representatives according to paragraph (1) above, and the countersignature of the person responsible for accounting management.

Association (amalgamation), Division, Separation, Termination

Article 17

(1) With the approval of the general assembly, specialized work groups operating within a given cooperative may decide at separately held membership meetings, with the secret vote of two-thirds of the total membership, on uniting in a new specialized work group on amalgamating one specialized work group into another. In a similar way, a specialized work group may decide to split into two or more specialized work groups.

(2) The part of specialized work group membership which is entitled to form a new specialized work group may, with the unanimous decision of all the affected members and the approval of the membership meeting, separate from the specialized work group in order to amalgamate with another specialized work group operating within the cooperative or to form a new specialized work group.

(3) In case of association or amalgamation, the property transferred to the use of the specialized work group must be transferred to the new of the receiving specialized work group. In case of division or separation, this property must be divided between the specialized work groups in proportion to the number of members and the property contributions.

Article 18

(1) The specialized work group is terminated if

a) two-thirds of the total membership decide to do so by secret ballot;
b) the cooperative is terminated;
c) the general assembly of the cooperative (the delegates' assembly) revokes it approval for the formation of the specialized work group.

(2) The general assembly (delegates' assembly) of the cooperative must revoke its approval for the formation of a specialized work group if the managing of the specialized work group is causing a loss to the cooperative.

(3) The approval for the formation of a specialized work group may be revoked if according to the findings of the organ which exercises state legal control it is illegal, or if the specialized work group is conducting activity which is causing damage to the property transferred by the cooperative.

(4) When a specialized work group is terminated and the property remaining after the settling of debts is distributed, the procedure must follow the agreement on the relationship of the specialized work group and the cooperative. Properties in the possession, care and use of the cooperative cannot be included in the property distribution.

(5) When a specialized work group is terminated, it must be removed from the cooperative registry.

Membership Relation

Article 19

(1) Any citizen who has completed his fifteenth year may be the member of a specialized work group.

(2) A minor who is under 16 year of age may be accepted into a specialized work group as a member only with the written approval of his legal respresentative.

(3) The executive committee decides on a written request for admission, and informs the person concerned of its decision, or the membership meeting informs him. The applicant may appeal a negative decision to the membership meeting.

(4) The membership relation comes into being when the decision is made on acceptance.

(5) The basic rights and obligations of the member of a specialized group, the method and extent of his property contribution are decided on in the operational regulations. The operational regulations may also bind the membership acceptance to an entry fee.

Article 20

(1) The membership relation is terminated when the member dies, he resigns from the specialized group, the specialized group is terminated, or the cooperative is terminated without a legal successor.

(2) Resignation occurs as a result of the member's voluntary decision; the intent to resign must be submitted to the executive committee in writing. The operational regulation may prescribe how much time must be given in prior motice of resignation.

(3) The membership meeting, after hearing a member, may terminate a membership relation with a decision, in writing, in the case of someone who

a) has borne witness of a seriously damaging or threatening attitude toward the specialized work group;
b) deliberately causes harm to the specialized work group;
c) for censurable reasons does not carry out the obligations of the membership relation.

(4) With the termination of a membership relation, an appropriate account must be made of the agreement between the former member (his heir) and the cooperative and the specialized work group, as well as of provisions of the operational regulations.

Work Relations

Article 21

(1) The specialized work group may hire employees in its own name to perform jobs that arise in connection with its activities. The membership relation existing with the specialized work group--excepting the chairman of the control committee and its members--does not exclude the establishment of a work relation with the specialized work group.

(2) In respect to workers employed under work contract by the specialized work group, employer rights are exercised by the executive committee of the specialized work group unless the operational regulations provide otherwise. In respect to the chairman, this right belongs to the membership meeting.

(3) For the employment of the specialized work group's employees, the provisions of the Labor Code and other statutory provisions regarding the work relation provide the rules with the differences established for a cooperative employing the specialized work group, and in their case the orders regarding cooperative employees as contained in the labor regulations (collective contract) of the cooperative in the work protection regulations must be applied.

(4) If it is not otherwise stipulated in the statutory provision, the wages of the employees of a specialized work group must be established on the basis of wage formulas standard for persons in charge, managers, and workers.

Responsibility

Article 22

(1) Culpable transgression of official obligations by an official of the specialized work group is an offense requiring disciplinary action.

(2) Disciplinary punishments are the following:

a) reprimand,
b) censure,
c) removal from office.

(3) Disciplinary procedures are the responsibility of the membership meeting; there is no appeal to its decisions.

(4) An official who is guilty of causing damage in the exercise of his office is liable for damages. In case of wilful damage, he is liable for the entire loss and for damage due to negligence he is liable up to the annual pay he received in office.

(5) Indemnity procedures are the responsibility of the membership meeting; its decisions may be appealed to a court within 30 days of the pronouncement.

Article 23

(1) The cooperative is responsible to the members of the specialized work group for damage caused illegally in the work relation, according to the rules of responsibility toward its members.

(2) A member of a specialized work group who violates his obligations relating to the membership relation is responsible to the specialized work group or to the cooperative for culpable damage, according to the rules regarding the members of the cooperative.

Article 24

The cooperative's arbitration committee acts in membership disputes among the members of the specialized work group in labor disputes of its employees.

Statutory Limitation

Article 25

A claim deriving from a membership relation is subject to the statute of limitations in 3 years. A demand for indemnity in return for damages caused by criminal action, however, is not subject to the statute of limitations before the crime itself.

Interest Representation

Article 26

The interest representation work of a specialized work group is performed by that interest representation organ of the cooperative in which the specialized work group operates.

State Legal Control

Article 27

State legal control over the specialized work group is exercised--in the framework of the cooperative's legal supervision--by the same organ which performs the legal supervision work of the cooperatives, and in the framework of which the specialized work group operates.

Section II

State Farm Specialized Work Group

Article 28

(1) The prior approval of the state farm directorship and the holding of the constituent membership assembly are necessary for the formation of a state farm specialized work group.

(2) In addition to the persons listed in Article 10, paragraph (1), points a) to c), the following cannot be officials in a state farm specialized work group: a worker who holds a higher level managerial position on the state farm, its internal controller, and a worker of the organ exercising supervision over the state farm.

(3) Instances of incompatibility in state farm specialized work groups must be established in the operational regulations with the application of Article 32 of Council of Ministers' Decree Number 48/1979 (1 December).

(4) Supervision of the state farm specialized work group must be carried out in the framework of state farm supervision.

Article 29

A person designated by the executive committee from among the members who are in work relation with the state farm is entitled to represent the specialized work group in the name of the state farm. Persons entitled to be representatives must be separately registered in the representational book. Their signatures are attested to by the state farm director.

Article 30

(1) The state farm may transfer land, for a definite period of time, which is in its care to the use of the members of the specialized work group for production purposes. The use transfer does not affect the rights of those in whose care the land is.

(2) A written agreement must be signed on the land transfer, which must also include the way in which the land is to be used. Official approval is not necessary to validate the agreement.

(3) The state farm may give immediate notice of the termination of the agreement if the member does not meet in time the obligations included in the agreement despite being called on to do so.

(4) In case of use termination, the state farm is obliged to recompense the member for useful expenditures made during the period of land use.

Article 31

(1) In disputes between the state farm and the member of a specialized work group not in work relation therewith and in disputes among the members of the specialized work group, the court proceeds with the application of the rules of civil law.

(2) In disputes between the state farm and the member of a specialized work group in work relation therewith, it is the labor arbitration committee of the state farm which takes action by applying the orders of the statutory provision regarding the carrying out of the Labor Code.

Article 32

(1) The orders of Section I must be appropriately applied for the formation and operation of the specialized work group operating in the framework of the state farm, excepting the provisions in Article 10, paragraph (1), point d) and paragraph (2), Article 16, paragraph (1), Article 17, Article 23, and Articles 26 and 27.

(2) In applying the orders included in Section I to the state farm specialized work group, by cooperative we must understand state farm, by directorship (leadership) and general assembly (delegates' assembly) the director of the state farm, by the control committee of the cooperative the internal controller of the state farm, by the organizational and operations regulations of the cooperative the corresponding regulations of the state farm, and by cooperative property the property in the care and use of the state farm.

Article 33

With the appropriate application of the order included in this Section, economic associations listed in the agricultural and food industry branches, and belonging to the agricultural revenue regulatory system may organize specialized work groups.

Coming Into Force

Article 34

This decree comes into force on 1 January 1982. At the same time, Council of Ministers' Decree Number 32/1977 (17 August) which modified the foregoing decree becomes invalid.

OPPORTUNITIES FOR SMALL ENTERPRISES SUMMARIZED

Budapest HETI VILAGGAZDASAG in Hungarian 19 Sep 81 pp 4-5

[Interview with Istvan Kollarik, deputy director of the Ministry of Finance by Ivan Gara and Mihaly Muranyi: "Creating Fields of Endeavor"]

> [Text] Through the press we are beginning to be better acquainted with the new organizational forms of small scale production--small enterprise, small cooperative, business work community and others. From the beginning of next year, we may encounter these as existing entities or simply as improvements in our supply. There will certainly be those among our readers who will be employed in one of their new forms. The legislation announced recently, and that still to appear, suggest that we should be able to exploit the creative energies of society more efficiently. In the future we shall introduce the new forms to our readers in detail in our columns. Here we are interviewing Istvan Kollarik, Deputy Director of the Ministry of Finance, about the background and chief goals of the measures.

[Question] The legislation which has appeared recently, as well as that expected in the near future, are proof that the directive organs of the national economy are supporting the propagation of the enterprising spirit. What were the goals for which the decrees stimulating small enterprise production were enacted?

[Answer] I must begin my reply somewhat from afar. From the beginning of the 1950's--even in the sphere of services--increased numbers of small and mid sized enterprises went out of business. With their disappearance gaps in supply appeared, although it is true that under the circumstances of forced industrialization the standard of living policy did not require supplying the populace with more variety and more attractive goods. From the beginning of the 1960's, consumer demands became increasingly more diversified, in parallel with the gradual rise in the standard of living. The newly structured, expanded requirements can no longer be economically satisfied through the methods of large enterprises. We have a need for small scale organizations, and perhaps even for the utilization of individual and family manpower also.

The second part of the question deals with the organizational system of the economy, the relevant statistical data for which I had occasion to peruse not long ago. From

this data it is unmistakably apparent that there has been an unbroken trend--although with greater and lesser fluctuations--toward enterprise centralization. It began with the establishment of the industrial directorate around 1948-1950, continued with the large investments of the era of industrialization and with the renewed serious merger cycle at the beginning of the 1960's. There was still an occasional intensified movement toward trust formation even in the latter half of the 1970's. This phenomenon was characteristic not only of state enterprises, but also of cooperatives; and not only of industry, but also of other branches of the national economy. The end result is well known. The national economy lacks small and medium sized enterprises and plants. Today we are characterized by having only larger than medium sized enterprises, whereas the optimum enterprise pyramid consists of many small and medium sized enterprises and only a relatively few large ones.

[Question] There is considerable discussion these days about the fact that our economy is excessively centralized, and surpasses the centralization level of considerably more developed countries. This is a matter of fact. But why is this a problem?

[Answer] Having a shortage of small and medium sized enterprises is not exactly the same as being centralized. The latter indicates that there are few independent economic organizations, and that the degree of concentration is high. The former may rather be formulated as a problem of being concentrated. If we separated the merged enterprises we would still lack genuinely small sized enterprises.

A peculiar concomitant of centralization is that because there are few independent enterprises, if any enterprise gets into economic difficulties state direction cannot take the responsibility for its bankruptcy. This is not only a policy matter, but also--perhaps primarily--an economy or supply matter. We have specialty branches which have been organized into a gigantic enterprise or trust. If these get into difficulties, then the entire production verticum, and even the related areas will be in difficulties. What I am trying to bring out is that in general state aid is not a result of human weakness or error; setting it right is virtually a matter of constraint.

[Question] Many are asking why we are taking the measures to stimulate enterprise and develop the organizational system today. Why was it not done earlier, or why not do it in the future?

[Answer] We did not arrive at this point today. Numerous studies were already preparing the ground near the end of the sixties. It should also not be forgotten that the partnership statutes were modernized prior to the current measures, that the tax system for small scale industry was made more attractive, that the contract system was introduced into retail trade and the hospitality industry and also that we had dismantled several large organizations which did not prove to be viable in that form. Now, when the increase in the performance capacity of our economy is the key problem, it is very important that the market receive a greater role, and that enterprise self reliance become more vigorous. I sincerely believe that the efficiency of central direction can increase in parallel with this. Economic processes are much more likely to be better controlled through the instruments of general regulation than otherwise. However, certain steps in the organizational structure are necessary in order for competition to evolve.

[Question] What makes an enterprise a small enterprise, and who may establish an enterprise in Hungary?

[Answer] Enterprises may be established by ministries, organizations with national jurisdiction, councils and--this is a novelty--by banks. Also a novelty is that subsidiary enterprises may be established by enterprises. A small enterprise does not have an unmistakable distinguishable characteristic which can provide identification in every case. In its economic content this enterprise form is a deviation from today's enterprise categories. The small enterprise cannot be given orders and its resources cannot be appropriated. At the same time, it cannot receive state aid and cannot be financially resurrected. Its bookkeeping and statistics keeping requirements are less complex. The status of its director is more sharply defined, because his income above the basic wage depends entirely on the income of the enterprise.

[Question] What prompted the establishment of two different kinds of regulation systems for small enterprises?

[Answer] Actually, the general profit share applies to product manufacturing small enterprises, while the gross income share applies to those who perform consumer servicing. The gross income share means that the small enterprise pays linear tax on its non wage income, that is, on its earnings and not on the differences in its non wage expenses. Since I think that the profit share is the natural form, only the gross income share needs to be explained. The small enterprises performing consumer services will presumably compete primarily with small cooperatives which are also operating under the gross income share. Thus, this form of taxation is intended to assure equivalent conditions. Whether this solution is appropriate can only be revealed in practice.

[Question] As you mentioned, it has now become possible for enterprises to establish other enterprises independently--outside of partnerships which are the province of other operating organizations--in the form of subsidiary enterprises. That is, an enterprise may internally separate a determined portion of its resources and endow it with the legal rights of a corporation. However, for years we read in the professional literature how it is growth that rather serves the interests of large enterprises.

[Answer] The large enterprise system of priorities is rather complicated. At times, the standards of prestige outside the economy probably have a large role. Bluntly, the size of an enterprise one directs is not unimportant. This is only human nature, but it obviously becomes an important factor if it has certain consequences. For example, for a long time the size of the enterprise determined the kind of automobile the director could use. I feel that this perspective is losing ground, although it is true that several measures have had an effect on it. The problem I think is this: how much does the total economic environment constrain to place profitability into the focal point of enterprise operation? If the economic environment is oriented towards the requirement of profitability, then the interest will also stimulate thinking in terms of organizational forms.

[Question] The establishment of an organization, whether a small or satellite enterprise costs money.

[Answer] According to the established order of enterprise founding, it is possible to spend for this purpose from the accumulative position of the national income. In my opinion, the credit system can also promote the establishment of small enterprises to a significant degree. The basic state benefit can also have a role in the same way.

[Question] One of the significant changes which affect the cooperative sector is the appearance of small cooperatives.

[Answer] The small enterprises is practically a return to the original concept of the cooperative--one operating more flexibly, more nimbly and with less restriction. The owners, the members of the cooperative decide on the internal income relations and the utilization of the income of the cooperative for various purposes. The role of the small cooperative in the cooperative sphere is the same as that of the small enterprise in the state sector.

[Question] We had already heard about specialized co-op groups. It appears, however, that it will be possible to establish groups on a more extensive scale. Who will be the initiators?

[Answer] I think that individuals will be the primary ones here. However, the agreement and contribution will plainly depend on the evaluation by cooperatives. While the specialized co-op group is not a legal person, it is required to prepare separate balance sheets and keep separate records. Consequently, whether its activity is profitable or not will be apparent in black and white. A new wrinkle for agricultural groups is that from now on state farms, farm associations and enterprises belonging to the agricultural income regulating system may also establish them. The incentive for the individual is clear--he can earn greater income through better performance. The incentive for the cooperative, however, lies in the fact that specialty groups can improve its general efficiency and thus can be a source of good reputation.

[Question] The business work community, which is without the legal rights of a corporation, is a completely new form of individual initiative. Ultimately, what is the difference between these two organizational forms?

[Answer] Business work communities can be established to perform supplementary activities augmenting the operations of active organizations in consumer and other services and small enterprise production. The most significant difference is that official approval is necessary to validate the agreement which establishes the business work community. The approval for a legal public partnership is not a condition for its validity. In addition, the regulations for taxation of the two organizational forms is different.

[Question] We are already accustomed to contract operations in domestic trade and in catering. The regulation has now been extended to other areas of the national economy.

[Answer] The chief goal of this organizational form is the more effective utilization of the resources of socialist property in specific situations. If an enterprise has resources which are not yielding a sufficient return, then it may be

possible to have these resources yield more income through a contractual operation. Through a contractual operation a small enterprise may acquire the use of production instruments which it is unable to purchase for its own. That is, property rights for equipment remain unchanged, but an enterprise unit may acquire the opportunity for its usage.

[Question] The appearance of new forms of enterprise naturally will be accompanied by certain mobility in the labor force. How large is this expected to be? And--this is also of no small importance--what kind of an earnings surplus is the budget expecting from the new organizations?

[Answer] As far as numbers are concerned, the probable labor force movement is very difficult to estimate today. I would rather say that as far as the new opportunities are concerned, while it is not worth nurturing illusions, there should be no belittlement either. I do not believe that in the near future the movement will be of prime importance as far as labor force management is concerned, but we should not underrate it either.

As far as earnings are concerned, as a result of the introduction of contractual business operation into domestic trade, the enterprises concerned produced rather significant surplus profits over a period of a year, strictly from the fact that the new forms made the previously losing or minimally profitable businesses profitable. The budget naturally shares in this. Of course, if something similar happens in the other areas of the national economy, and if only the existing sources of losses are eliminated, it will already be a tremendous accomplishment.

[Question] Will the new organizational forms of small enterprise partnerships have an eventual effect on large enterprises?

[Answer] That is difficult to predict. For the time being, the new organizational forms are only expected to affect the marginal portion of the economy. Thus, today's enterprise sphere will be essentially untouched. The effect of the new organizational forms on the public mentality, however, could mean the further strengthening of the performance oriented economic attitude. This process has begun. It is not impossible that there will be temporary manpower management problems of economic units generally admit--20 to 30 percent of enterprise manpower is not utilized effectively.

Wages, however, cannot be evaluated in isolation in their totality. The performance behind them must always be noted. I will not be upset if it becomes apparent that in the new organizations workers actually work 8 or, lord forbid, 10 hours out of an 8 hour day, and incomes are higher because of it. The development of excessive income is limited, of course, by the tax system. Income acquired dishonestly is restricted if necessary by administrative measures. We must also not forget that the possibilities are not only for greater income, but also for failure. It is important that the emotional debate about cooperative subsidiary enterprise branches which took place in the early seventies, and which set back their development be not repeated. In my opinion, the future of the new economic form of small enterprise depends primarily not only on the tax system, but also on the public attitude surrounding these forms.

Form of initiative	Who may institute	Some characteristics
Small enterprise	Organizations with enterprise founding rights	Simpler income regulations. There are two models, depending upon whether the small enterprise is a producer or provides consumer service.
Small cooperative	Can be established on individual initiative	Members provide the resources necessary for starting it up.
Specialized industrial production or consumer service co-op group	Within the province of cooperatives and AFESZ [General Consumer and Marketing Cooperatives]	The agreement with the cooperative regulates the self reliance of the group.
Specialized agricultural co-op group	Agricultural cooperatives, AFESZ, state farms, other agricultural enterprises and partnerships	The large enterprise pays the taxes on the joint activities with the group. The group pays general wage tax on the individual activities within its framework.
Business work partnership	Can be established by individuals through a contract	A civil legal body which operates primarily with the resources of its members, but may rent instruments which are state or cooperative property.
Enterprise business work community	Employees of enterprises and budgetary organs	Their work primarily puts enterprise resources to good use. Its monetary responsibilities are less than that of other business work community.
Units of industry and service operating under contract	Comes into existence competitively, through a contract between an enterprise and the unit director	The unit may employ 15 persons at most. Its director pays general wage tax similar to that paid by tradesmen.
Lump sum accounting units in industry and services	The province of cooperatives or other operating units	Unit may employ 15 persons at most. The agreement determines the details of work performance and accounting.
Industry or service units rented to tradesmen or work teams	Established by a rental contract through competitive negotiations	Conditions are specified in the rental agreement. The winner of the competitive bidding is the one who agrees to pay the highest rental fee.

HOUSING CONSTRUCTION PROBLEMS ASSESSED

Warsaw BANK I KREDYT in Polish No 5, May 81 pp 121-124

[Article by Eugeniusz Trajer: "Housing Construction Problems"]

[Text] State of the Industry and Future Program of Housing Construction

The long-range housing construction program, as passed by the Polish Sejm, envisaged construction of 6.6 to 7.3 million dwellings from 1971 to 1990. This program would make it possible to realize the basic goal of guaranteeing a single dwelling of acceptable standards to every Polish family. The achievement of this goal was to be in stages: from 1971 to 1975, 1,080,000 dwellings were to be constructed; from 1976 to 1980, 1,575,000 dwellings; and from 1981 to 1990, 4.0 to 5.3 million dwellings.

These assumptions were not realized from 1971 to 1980, so that the housing situation has not improved. The number of dwellings handed over during that period amounted to 2.4 million; that is, 140,000 dwellings short of the lower limit of the long-range program and almost 290,000 short of the upper limit. During the initial period (1971 to 1975) construction met the program goals; there was even a slight overage (57,000 dwellings more than planned). With the beginning of 1976, the annual quotas were not met. The beginning of that year also observed the phenomenon of falsification of reporting activity of actual housing construction. The extent of this phenomenon increased in the following years; this led to a virtual failure to achieve housing construction goals during those particular years.

Only in 1980, were credible data presented relating to the execution of housing construction plans. The socialized housing construction for agricultural and nonagricultural population reached 59.6 percent in the number of dwellings and 60.7 percent in the area of floor space. This included a correction factor for the computation period from 16 January to 31 December for the entire country [except for the Warsaw capital city and Katowice voivodships, where the period was 1 March to 31 December]. Thus, during the period 1 to 15 January [in Warsaw and Katowice, 1 January to 31 March], 45,000 dwellings were turned over for occupancy, with a total floor space of 2.4 million square meters (m^2), which were (on paper) credited to the 1979 period. An audit by the Central Office of Statistics (GUS) and the Central Housing Construction Cooperative Union (CZ SBM)

in December 1980 had shown that among the buildings credited as constructed from 1978 to 1979, 127 buildings were still under construction in 1980; of this, 13 buildings were credited to 1978 and 104 to 1979 (of which 96 were in the Katowice voivodship). Corresponding errors have been included in the already published statistical data.

Therefore, from the 1,575,000 dwellings planned for 1976 to 1980, only about 1,300,000 were actually turned over. This shortage also pertains to associated construction and to single-family dwellings; from the 380,000 single-family dwellings planned, only about 330,000 have been built. Among the fundamental factors influencing the low level of housing construction are:

--Growing shortage of developed land and a general unpreparedness of cities to achieve housing construction on such a large scale. In 1975, only 11 percent of the buildings were being constructed simultaneously with engineering works; in 1979 this figure grew to 53 percent (over 80 percent in many cities). The basic reason for this situation is failure to fulfill municipal plans, attributed in part to a limited capability of engineering firms.

--In the disarray of the housing construction industry: During the last period, in particular, it was common practice to depart from the principles of consolidation in housing construction. This resulted in completion of only about half of the service projects. The deficit in this area (1.4 million m^2) amounts to actual programmed construction for the past 3 years.

--A low, and still worsening, quality of construction work. This above all results from the quality of many construction materials and elements (modules) delivered to the construction site, inadequacy of work organization at the site, defective functioning of the economic-financial system in housing construction and the accepted technological policies that led to the domination of the large-panel method. The estimated economic factors attributed to this cause,[1] in the form of additional costs (about 1 billion zlotys per year), have been (artificially) lowered. Bank analysis had indicated that in cooperative housing construction three-quarters of the dwellings handed over for occupancy by the members of the cooperative, required completion or repairs, not counting faults and shortages that emerged during the warranty period.

--A raise in prices and investment costs resulting from price changes of construction materials, improvements in standards of execution and dwelling furnishing and location of housing complexes on peripheral, undeveloped lands. Unit cost per m^2 in socialized housing construction has increased from 3,780 zlotys in 1979 to 8,500 zlotys in 1980.

The unsatisfactory situation in housing construction and also the difficult economic situation of the country will not foster, during the 1980's, quantitative changes that could markedly influence any improvement in satisfying

---

[1] W. Dabrowski, "Actual Goals of Housing Construction," NOWE DROGI No 4, 1979.

the housing needs. The team formed by the government, which included a representative of the Polish National Bank (NBP), taking into account the prevailing conditions, drafted two versions of the housing construction program for 1981 to 1985:

Type of Construction:	Version I	Version II
	in thousands of dwellings	
Cooperative construction	700	700
Plant-sponsored construction	200	150
Municipal construction	100	40
Single-family house construction	500	400
Totals	1,500	1,300

Although the team favors version I, even its realization will not shorten the waiting time for housing. The National General Census (1978) disclosed a deficit of about 1.3 million dwellings. This has grown to about 1.6 million dwellings. However, a statistical housing shortage does not render the full extent of housing needs; for one, it does not reflect the results of the formation of new households, improvement of housing conditions, dwelling exchanges, etc. Included in the statistics of needs is a population of cooperative members exceeding 1 million people--657,000 active cooperative members and 843,000 fully paid-up and eligible candidate members--who, as of 1979, had a full deposit on account. Based on this, the Institute for the Formation of Habitat defines housing needs to 1985 as 3.2 million dwellings. This number of dwellings would shorten the waiting time to 5 years. However, such a program is not realistic; even disregarding such factors as manufacturing potential, production of construction materials or land development, a realization of this program would require the commitment of about 60 percent of investment outlays in the 1981 national economy; housing construction receives one-third of general investment outlays.

Costs of Socialized Housing Construction

Formulation of costs in housing construction may be presented in two formats:

--As investor costs: those costs that burden the investor. In this case cooperative housing construction was accepted as representative because it represents a major (80 percent) portion of the socialized housing construction effort.

--As costs incurred by the construction-assembly enterprises.

Both the investor and the construction-assembly enterprise indicators show a systematic growth of housing construction costs. Formation of unit costs (zloty per m^2) in cooperative housing construction is presented in table 1.

Table 1.

3. Accompanying expenses
4. Total price
5. Zloty per square meter
6. Previous year = 100
7. (__ _ _ _year prices)

Formation of the price and costs increase indicators and the size of losses suffered by the construction-assembly industry from 1970 to 1979 are presented in table 2.

As a result of the progressive, official price changes in 1978, the amount of losses was reduced; however, losses still amount to about 200 zlotys for each square meter of dwelling surface.

Which principal factors decide the growth of price increases in housing construction? It would be impossible to describe them all; however, it is worthwhile to underline some of them.

--Changes in technological structure and a growing share in construction participation by small construction-assembly enterprises. In 1980, about 85 percent of usable floor space in multifamily residential housing was constructed by large-panel technology (a product of the industrialized housing--component or module--production). Within the large-panel systems the percentage share of specific systems is as follows: W-70, 23 percent; Wk70, 28 percent; OWT, 22 percent; and Szczecin, 13.5 percent. More than half of housing construction built with the large-panel method included the use of W-70 and Wk-70 systems, which from the point of view of material intensiveness and costs are less advantageous than the OWT system. Actual consumption indicators and costs[2] are presented in table 3.

5. in tons
6. in percentage
7. Note: consumption quantity per 1,000 square meters of usable floorspace

The cost of 1 square meter of usable floor space ($1m^2$p.u.], based on 1978 prices, by application of different large-panel systems is shown in table 4.

--Changes of materials and products used in finishing and furnishing of dwellings. Cost increases per lm2p.u. in this respect, during the past 3 years have climbed to about 100 zloty and particularly affected carpentry, reinforced and single-frame woodwork, flooring materials, bathtubs, sinks or wash basins, plumbing fixtures, etc.

--An increase in the extent and cost of work connected with internal community land development as well as construction of service facilities. This resulted in part from an increased construction of large developments located on the outer edges of cities, far from main power lines, sources of heat and urban communications lines. In the construction of commerce-service pavilions the application of the ZLS steel system (priced at 8,000 to 9,000 zloty/m^2) has caused a violent price increase in this type of construction. Another, equally real, cause is burdening residential housing construction with the unjustified achievement of construction jobs that rightfully should have been completed by the development plan (community investments) or by the appropriate ministry (commercial facilities). From a 1979 survey conducted by NBP departments, about 300 different construction jobs, within the framework of residential construction, have been unwarrantedly built at the cost of several hundred million zlotys. Such practices influence housing construction costs.

6. in percentage

Problems of housing construction costs and the apparent trends and causes of unit, price increases must remain the province of the bank, which generates activities aimed at their solution. While basically many of these construction cost factors have a structural character--one can't, for example, tear down the existing house components factories and introduce more economical systems--nevertheless, there is a place for NBP activity. This is supported in part by the results of some bank surveys and other activities of interested parties. For example, a documentation project cost-analysis survey conducted by the bank in 1980, relevant to seven investment enterprises that work in construction of new housing developments (already planned and scheduled to begin construction), has resulted in lowering the planned investment costs (3.8 million zlotys) by over 100 million zlotys from corrections in programs (exceeding norms, changes in height of buildings, changes in pavilion construction technology) and a correction of planned costs. A NBP presentation of an analysis of unit costs in socialized housing construction resulted in a decision to verify the extent and costs already accepted for 28 tasks scheduled to start in 1980. As a result of this verification, the planned costs were lowered by about 300 million zlotys,

in part on the basis of cancellation of projects with a general-urban character, unwarranted additional payments to direct costs and excessive surcharges. Other influencing factors were a decision not to construction temporary steam generators (boiler houses), lowering the reserve for contingencies and halting production of two buildings with high unit costs.

The bank surveys and controls of investment costs for housing construction will be continued in 1981. Some changes are anticipated in the control of unit costs in connection with the (legislated) changes to alter the planning and management system (Council of Ministers Resolution No 118/80). Also, an extension for the current 5-year plan period of the decisions resulting from Council of Ministers' Resolution No 106/78, dated 4 August 1978, pertaining to increasing the discipline in observing the investor costs [limits] in housing construction, has been rescinded. Thus, for the current and future years directive-type unit costs for the particular voivodships will not be determined.

The proposed system solutions to improve the economics of multifamily housing construction for the nonagricultura population from 1981 to 1985, forsee a needed bank-conducted cost analysis of respective costs formulation procedures. This new situation will demand that the NBP central office prepare guidelines for NBP branch offices for this type of analysis. The extent of these analyses cannot be limited to a strictly arithmetical compilation, they must also include a bank branch's appraisal of such questions as causes of unit cost increases, correctness of project-investment solutions, pricing of accepted cost values, justification of the extent of associated investments, etc.

3. Some Elements of Housing Policies for 1981 to 1985.

The principles of the housing policies must be subordinated to the national developmental goals and must stimulate their development. Draft postulates of such principles have been prepared; they differ, in many solutions, from those previously binding. Many of them will influence the tasks of the bank in financing housing construction. These changes are based on a series of projects prepared in February 1981; further discussion and final decisions may change these projects.

A widespread critique of existing principles of housing allocations is the basis for introducing fundamental changes. It was an accepted principle that all dwellings built by cooperatives were to be placed at the direct disposal of the cooperatives. Basic cooperatives would have the rights of direct investors. Of the 1.3 million cooperative dwellings constructed from 1971 to 1980, the cooperatives received, at their direct disposal, barely 550,000 dwellings; the remainder were turned over to plants and state administration territorial organs. In 1981 this principle will no longer be maintained. In accordance with a 1981 resolution of the Council of Ministers, pertaining to the national cooperative economic plan, the cooperatives will receive 70 to 80 percent of the constructed dwellings; the remainder will be turned over to plants and factors to fulfill their most urgent needs connected with production tasks including out-of-town workers or to territorial administration organs in connection with (old house) demolitions. The proposed principles of housing policies remain unequivocal in

that the basic criterion for housing assignment will be the length of time on the waiting list; in criteria for accepting candidates for cooperative membership (i.e., waiting) list and in determining placement within the housing assignment waiting list, the first consideration will be the existing dwelling's occupancy conditions.

In addition to the cooperative system, a return to municipal construction is planned; this would be financed from territorial housing funds. Also plant-sponsored construction would be maintained. The municipally constructed dwellings would be earmarked for resettlement of persons affectedy by demolitions, for disaster emergency needs and for the (material) hardship cases.

In financing cooperative housing construction, previously binding principles have been retained with the following changes:

--Implementation of limits in lump sump personal deposit rates. Prepared proposals provide for a rate of 900 zlotys per square meter (zl/m^2) in tenant apartment dwellings and 1,800 al/m^2 in owner-occupied dwellings (previous rates, fixed in 1973, were respectively 680 and 1,150 zl/m^2). The validating lump sum amount will be about 13 percent of cooperative member cost for tenant apartments and about 26 percent for owner-residents.

--An increase to one-half, in cooperative tenant apartments, of the amount of amortization of bank credit by maintaining a 60-year mortgage (it was one-third). In cooperative owner-occupied dwellings, to lengthen the time of credit repayment from 30 to 40 years while maintaining the same 1 percent interest rate and discounting part of the debt in case of prepayment.

--Broadening the extent of write-offs and reliefs for housing construction cooperatives toward covering additional costs incurred with housing investments on terrain affected by mining damages. Actual remission of the debt will remain on the basis of:

a) credits for investments used in construction of facilities that do not remain on the accounts of the cooperative but are transferred to utilization by state organs;

b) use of credits for financing or participation in common investments; for example, boiler houses;

c) credit for investments used in construction of local water supply--sewage facilities, in territories not equipped with such facilties, where such arrangements should be made with financial regulation of a state organ;

--Exclusion of ZFM [expansion unknown--possibly "Zakladowy Fundusz Mieszkaniowy" i.e., Plant Housing Fund] funds from financing multifamily housing projects, with the exception of plant-sponsored housing realized through an economic system. ZMF funds will be primarily earmarked for construction purposes for the workers in the make-up of own funds, assistance in repair or modernization of dwellings, construction of single-family housing, social assistance, etc.

A relatively high burden on the cooperative members (young marrieds, families with lowest income) creates a need--in addition to a subsidy of part of cooperative counstruction--for a system of individual assistance from ZFM and from territorial housing funds. Therefore, it is being stipulated that;

--The income limit be raised, in order to take advantage of loans to make individual deposits for a tenant apartment;

--The amount of the loan be raised for families with lowest incomes, young marrieds, recipients of pensions and annuities;

--Individual assistance be introduced, with a social character, toward a reduction of expenses caused by repayment of bank loans. Moneys for this purpose would come from ZFM or from territorial housing funds.

It is impossible to discuss in a short article all the changes intended to be introduced in regulations for achieving and financing housing construction. However, these are fundamental changes and they will be the deciding factor in their incorporation in the regulations of banking services for housing construction. Preparatory work in this area has already begun at the NBP central offices. This work should be completed in time to prevent disturbances in current banking services for financing housing counstruction. The revision of Instruction A-10 is intended not only to reflect the changes but above all to simplify its application.

INCREASE IN FARMERS' PENSIONS DISCUSSED

Sofia IKONOMICHESKI ZHIVOT in Bulgarian 30 Sep 81 p 2

[Article by Nikola Trichkov, chief expert in the Ministry of Finance: "A New Increase in Farmers' Pensions"]

> "Periodically we will allocate funds for pension adjustments in relation to the changes which take place in the income of the active population. During this five-year plan the lowest pensions will be raised to half the amount of the minimal salary."
>
> Todor Zhivkov
>
> (From the Report before the 12th BCP Congress)

[Text] Our society takes special care of farmer pensions, whose numbers until several years ago predominated in the total number of pensioners in the country. The conditions for allocating these pensions were greatly eased, but at the same time their amounts were considerably lower than those of the pensions of workers and employees. Since 1 July 1975, the allotment conditions for pensions of farmers in cooperative farms were made equal to those of the other categories of working people. However, many pensions which had been allotted before continued to be paid to cooperative farmers and their amounts continued to be lower. By 31 December 1980, there were 736,491 farmers' pensions being paid, 36.1 percent of the total number of pensions.

The 12th BCP Congress set a completely new task before the pension insurance, mainly in respect to minimal and low pensions. In connection with Decree No 30 of 27 August 1981 of the BCP Central Committee and the Council of Ministers, it was decided that as of 1 January 1982, old-age pensions for cooperative farmers over 70 years old will be increased, as will the disability pensions allocated by the repealed law for cooperative farmers' pensions.

Updating of Pensions

It was quite correct to begin with the farmers' disability pensions and old-age pensions of cooperative farmers over 70 years old. In the first place, most pensioners in the above-mentioned category receive comparatively the lowest pensions. The decree provides for an increase of their pensions by about 32 percent, or in reality, every individual pensioner will receive an increase of at least 14 leva monthly. The main motives for that are that most of these pensioners are unable

to work and cannot participate with their individual labor in the cooperative or private farm and in this way increase their incomes. They are the pioneers of building the socialist cooperative system, they worked in TKZS (Labor cooperative farms) in the most difficult years, when the income from their labor in the cooperative farm was the lowest.

The method adopted in the decree for an increase of the old-age pensions is apparently the most appropriate. The amounts of all old-age farmers' pensions for people over 70 are increased, and the lowest amount is fixed at 50 leva monthly. Besides this, all increases which have been paid until now will continue, such as the 1.50 leva monthly for every year of participation in TKZS up to 1 January 1957, together with the 10 percent of the personal contribution to the pension insurance plan up to 1 July 1975, etc. In this way these pensions will be differentiated according to the personal participation of the cooperative farmers in the building of the cooperatives and their contribution to the collective production.

Diagram

Key:
1. Average annual amount of a pension in leva
2. Number of people receiving pensions

This means that the cooperative farmers who, for example, had joined the TKZS in 1945 now receive and will continue to receive a monthly addition to their pensions of 18 leva, and those who joined TKZS in 1955 will receive respectively, for the 2 years, 3 leva monthly. It is obvious that in this way the pioneers of the socialist cooperative system will be getting greater recognition and material incentives. Of course the decision does not mean at all that the cooperative farms and APK (Agroindustrial complexes) will not be able to take additional steps to give due respect, honor and material rewards to the persons who founded the socialist cooperative system in agriculture, whose numbers are continuously diminishing due to natural causes.

Care for the Disabled

The decree solves in a favorable way the question of disability pensions. The increase of disability pensions is on the average 32 percent, or in absolute amount, 14 leva monthly. The disability pensions for general disease will increase on the average by 38 percent as the absolute amount of the allocated money for

group I disability pensions increases by 19 leva, and these for group II and III by 14 leva monthly. In this way, the farmers' disability pensions become equal to the minimal disability pension granted to workers and employees by the Pension Law.

The considerable increase of the disability pensions for cooperative farmers is a new expression of the concern of the people's government for the income increase of this group of pensioners. On the other hand, this is a contribution to the number of measures carried out during 1981, which was declared International Year for the Disabled.

Together with this, the monthly amounts of hereditary farmers' pensions were equalized with those of the workers and employees--30 leva monthly for each heir, irrespective of their number. So that if there are more heirs, the total amount of their pensions can exceed the amount of the personal pension of the legator on which they were based.

The new decree of the BCP Central Committee and the Council of Ministers for increases in farmers' pensions is the first step to the realization of the adopted policy for increases in the minimal amounts of pensions in order to create conditions for a peaceful and meaningful life for people who have reached pension age. There is no doubt that the decree is greeted with gratitude, not only by the pensioners, but also by all working people because it manifests the consistent implementation of the resolutions of the 12th BCP Congress.

LAGS IN INDUSTRIAL COUNTERPLANNING CRITICIZED

Bratislava PRAVDA in Slovak 6 Oct 81 p 1

[Editorial: "Implementation of New Approaches"]

[Text] When we made an attempt at implementation of counter-planning in our economy last year, the results were less than overwhelming. To tell the truth, it was anything but counter-planning. Economists in their embarassment gesticulated with their hands, claiming that all the Set of Measures says about the implementation counter plan are more or less general allusions, that there are no specific guidelines to dealing with the task, as to what to focus attention on, how meeting of the plan will become reflected in the enterprise's "bottom line," or in the system of incentives for workers. What was called for was simply, so to say, setting up the rules of the game, some sort of instructions for how to proceed.

This was no sooner said than done. Toward the end of last year the federal government adopted the Policy of the CSSR government and of the Central Council of Trade Unions in Regards to Participation of Workers in Formulation, Implementation and Control of the Progress in Meeting the Plan Quotas for the Years 1981-1985. The document stresses a more active participation by workers, particularly in preparation and formulation of plan proposals by the method of implementation counter-planning as a qualitatively higher form of the workers' creative initiative. To that end the State Planning Commission (the planning commissions of both republics), the Federal Ministry of Finance and the Federal Ministry of Labor and Social Affairs, after consultations with the Central Council of Trade Unions, worked out procedures for implementation of counter-planning.

The basic problems have been ironed out. Now, how did this become reflected in preparations of the plan for the coming year, meaning in the quality of implementation counter-planning?

According to the findings of personnel of the Slovak Planning Commission, organization of implementation counter-planning did meet with a certain amount of progress. For the first time it was implemented on a wider scale, most counter-planning agencies did issue their own departmental regulations in regard to its

implementation and even made provisions for its detailing and specification at lower levels of management. It can be said that VHJ [Economic Production Units] and enterprises proceeded along similar lines. A positive feature, without a doubt, was also the fact that personnel in individual enterprises were more familiar than they may have been last year with the tasks of the directive for the coming year and with the possibilities and advantages offered to every given enterprise by adopting more effective tasks in the sense of enhancing societal interests. Enterprises oriented their efforts toward the qualitative aspects of further development within the framework of allocated resources--savings of energy, materials, manpower, improving the level and quality of production and effectiveness of exports as well as production of needed products that are in short supply. In the key industrial branches under the jurisdiction of the SSR government, approximately 70 percent of all enterprises did meet the qualitative tasks tied to the system of incentives. True, these are but partially positive aspects, but assessment of the contributions provided by implementation counter-planning must be based on the overall implementation of the directive in the entire economy of the SSR. This comparison is not exactly propitious--the overall proposals made by VHJ do not meet the basic goals of the directive. This applies to qualitative as well as quantitative aspects of continued development which, it stands to reason, does not promote balanced relations in the national economy.

We cannot take solace even in the fact that deviations from the objectives of the directive are smaller in comparison with previous years and that they were caused by fewer enterprises than was the case in the past. For example, in the construction industry the directive for 1982 failed to be met by 20 enterprises, in the wood-working industry by 11 enterprises, in the chemical industry this applies to the plants Slovnaft Bratislava and Chemka Strazske. In the case of the latter two, the culprit is mainly shortage of raw materials, but partially also imbalance in full utilization of some production capacities. When problem solving is out of the hands of an enterprise it is understandable that its implementation counterplan cannot meet all the requirements. It turns out, however, that we could have gained more by implementation counter-planning if more managerial personnel would approach its implementation in the spirit of intensive and not extensive development, if they would not close themselves off in the cocoon of their own plant but took societal interests increasingly and consistently into consideration. Thus, for example, in upgrading the tasks of the directive, enterprises oriented themselves more toward indicators tied in with individual wage incentives--by modifications of value added and return on investment in production assets. They paid less attention to motivational stimulation that could be provided by the enterprise, namely through the development fund and the cultural and social services fund, since the extent of allocations to the latter two funds depends on profits, exports, sustenance of the structure of production and productivity of labor. The consequences of such and other narrow-minded approaches in formulation of the plan bring undesirable results.

Upgrading of adjusted value added deserves recognition, but only with the stipulation that enterprises also meet deliveries for the national economy, that the upgrading be attained by improved economy. Regrettably, that is not always the case, as is borne out by a number of facts. For example, the pledged adjusted value added is met by almost all enterprises of Slovakia's light industry. However, in the last two years this was primarily due to average price increases and more units produced, less due to materiel and raw material savings.

This is also confirmed by verification check-ups in production sectors. Contemplated relative savings of materials do not become reflected in tightened norms for consumption. The latter remain at the same level and, what is more, in the case of fuels and metals, even the savings envisioned in the state goal-oriented programs fail to be met in their full extent.

It stands to reason that these and other maladies have the same common denominator--wide sections of the working public, but primarily key management personnel, still fail to realize that an expedient transition to intensive development of the economy is the main prerequisite for invigorating every enterprise, every VHJ, the economy as a whole, the decisive factor for maintaining and improving our standard of living. It is obvious that such a transition cannot be accomplished from one day to another, that we find ourselves in a challenging period which will put everyone of us to the test. Still, there are some problems we should not have to cope with, if only managerial personnel would approach new conditions in a more responsible and adequate manner, choosing a new and creative approach, having more confidence in the personnel of individual plants, factories and workshops. These requirements never loose their validity; alas, they still have not been met by specific actions, a fact which came to the fore during implementation counter-planning. In many a case there persisted among economists distrust, fear of eventual increases in task allocation, etc. Many of them did not see matters all the way through, failed to include all individual work stations of their enterprises in the progress of implementation counter-planning, failed to sufficiently familiarize people with the new rules of the game, failed to discuss with them the tasks of the coming year, or failed to make adequate use of their suggestions.

As is stated in the Key Directions for Economic and Social Development of the CSSR in the Years 1981-1985, successful accomplishment of the tasks of the Seventh Five-Year Plan calls for improving the level of management in all state and economic organizations, primarily a more systematic orientation toward improving efficiency and quality of all labor, creation of prerequisites for an increasing export capability and lowering the demands of Czechoslovak economy for imports, accelerated introduction of innovative findings of scientific and technical development and further promotion of socialist economic integration. Preparation of plan proposals for the coming year in enterprises and VHJ showed that these key goals do not get the same amount of attention everywhere.

Let us point out at least one more finding. There is no doubt that one of the positive aspects of implementation counter-planning is the fact that the coming year will show an increase in the share of new products--representing one-third of the proposed production increment. On the other hand, however, in some sectors the proposed plan is signalling a decrease in technically advanced products. In other words, enterprises and VHJ gave inadequate consideration to implementing scientific and technical advances in production, even though it is one of the key tasks promulgated by the 16th CPCZ Congress, and also emphatically underlined by the CPSL Congress.

The shortcomings which came to the fore during implementation counter-planning are known. Undoubtedly, a majority of them is of a subjective character that

can be attributed to specific people, primarily managerial personnel. Their approach to new requirements in the economy still is not such as is called for by intensive development of the economy. Practices still also persist--as became manifest during implementation counter-planning which endeavor to bring about quality improvements and production increases exclusively through higher input, meaning higher consumption of raw materials, materiel, fuels, energy, etc. Such an approach being truly impracticable, the key issue now is that enterprises, VHJ and ministries pool their efforts to complete the plan proposal for the coming year, that its compilers abstain from making any more mistakes and concentrate their thoughts and efforts on utilization of unused resources which in many a case are at their fingertips, but a skillful utilization of which so far failed to become reflected in their plan proposals.

POOR FODDER QUALITY, IMPROPER CARE CAUSE HIGH LIVESTOCK LOSS

Bratislava PRACA in Slovak 16 Oct 81 p 4

[Article: "Inspection Reveals Thousands of Tons of Meat Thrown Out"]

[Text] Socialist agriculture has achieved important successes in over 30 years of its development. Thanks to this fact the consumption of meat here during that time has increased from not quite 30 kg per capita annually to almost 86 kg at present. Similarly there has been an increase in butter from not quite 3 to almost 8 kg, vegetable oils from 6 to 9.5 kg, milk and dairy products from 173 to almost 220 kg, eggs from 114 to 308 and sugar from 22 to almost 35 kg.

Nevertheless, in spite of these successes our agriculture has still more potential, especially in reducing losses in animal production as was confirmed by inspections and checks at many enterprises.

Even last year, for example, the number of calves lost was greater than is normal. Even though it is only not quite 1 percent more, nevertheless we lost over 4,000 young animals in this way. The loss among hogs was a great deal higher, with the normal loss figure exceeded by almost 1.4 percent which represents almost 190,000 hogs born alive. In beef cattle, even though the established limit of 3 percent was not exceeded, nevertheless even this represents over 61,000 dead animals. It has been ascertained that brood cows are not given sufficient care before and after calving, that proper care is not given calves during their first hours of life, sanitation is not observed nor is disinfection of calf stalls. Veterinarians say that almost half the total number of calves are stabled in unsuitable places. Adult cattle are often fed with inadequate fodder. Neglect of responsibilities occurs especially during the night of workers' days off. Last year almost 2,500 cows perished only because veterinarians were summoned for them too late.

Poor feed results in having many calves born dead. Last year there were almost 20,000 such cases. Small wonder then that even the basic program is not fulfilled, that 100 cows produce 97 calves. Up to now the figure is 4 fewer than this. Brood sows are not fed proper nourishment so that the young are born underdeveloped and the sows do not have enough milk to feed them. The breeders' technology is not of the highest level, pigpens are crowded and proper sanitation is lacking.

In the JDR [Unified Agricultural Cooperative] in Mosovce almost 12 percent of the total number of calves born died for these reasons. Inspection revealed that milk

cows were receiving inadequate feed rations, even bad quality silage and musty and moldy hay. Over 60 percent of the preserved bulk fodder was defective. The cows were housed in a former horse stable that was improperly remodeled, lacking a ceiling, with broken, drafty windows and improper sanitation. At the JRD in Medzibrod in the center of Slovenska Lupec as much as 80 percent of suckling pigs died because the sows were penned in inadequate facilities with several sanitary and technical defects. There were similar cases in other JRDs, for example in Gemer, Prusek, Balog nad Iplom, Tekova, Kamenicna and Hranovnice.

Although there are almost 1,500 college-educated veterinary doctors working in Slovakia directly in agriculture and the associated meat-processing industry, it is essential to continue to raise the standards of work by caretakers, zootechnicians and entire collectives that are engaged in the raising of cattle and hogs. Conscientious caretaking brings positive results. In the Dola Suca JRD, for example, they reduced the death rate of calves to half the established limit, thus setting up the conditions for producing 114 calves from 100 cows. Similarly at the Kostolne JRD only somewhat under one-half percent of weaned pigs died and over 22 piglets were bred from 1 sow. In the Drazovce JRD, of 380 calves born, not a single one perished.

In Slovakia, we are lagging behind the Czech krajs in matters of taking care of young animals. Of newly born calves 0.5 percent more will die here.

We also suffer losses in interkraj movements in which many cattle and hogs perish. Even though these movements are being reduced from year to year and they vary among the individual krajs, depending on the possibilities of production, nevertheless, even here it is necessary to take better care and select only healthy animals for transportation. Last year almost 1,000 slaughter animals were lost this way.

Injuries, sickness and other problems last year alone made it necessary to haul away over 24,000 tons of meat to animal carcass disposal plants, which is over 3,000 tons more than the preceding year, certainly an undesirable development. Likewise, the veterinarian service confiscated over 7,000 beef cattle and almost 22,000 hogs. It was necessary to slaughter over 15,000 tons of beef cattle and 8,600 tons of hogs.

These are only some of the examples indicating the potential that exists in our agriculture for raising beef cattle and hogs. It shows that district agricultural administrations in particular, but also agricultural enterprises, JRDs and SMs [state properties] must increase their veterinary services, their levels of animal tending and continue improving their competence in this area.

FUEL CONSERVATION MEASURES IN ARMED FORCES DESCRIBED

Budapest NEPHADSEREG in Hungarian No 38, 19 Sep 81, pp 8-9

[Article by Gyula Cserjes: "For the Conservation of Fuel"]

[Text] A ministerial directive will soon appear that will introduce a bonus system for savings in the cost of fuel.

The working out of an incentive system for encouraging conservation of fuel--gasoline for cars and diesel fuel--actually began two years ago already. The directorate of the fuel supply service for our army began at that time a search for possibilities and methods for economic use of energy, including the working out of the methods and regulations for realizing a savings in fuel for cars and combat vehicles. Among these are some that will mobilize military personnel, that drive the vehicles, towards the important national economic goal that, while accomplishing the increasing requirements for national defense, the use of fuel shall not increase during the current and coming years even for our army; the amount of consumption shall not exceed that of the previous years. During the course of a thorough preparation, experts from the directorate of the fuel supply service studied how several of the fraternal armies are trying to keep fuel consumption within rational limits. Here at home noteworthy cooperation was achieved with representatives of the ministries and other organizations interested in the subject. As a result of this, a bonus system was started in the army and due to our interest colonel Antal Ettig, chief of the fuel-supply service, commented on it as follows:

Bored Interest

"The incentive measures for conservation will hopefully make military personnel interested in saving fuel--those that drive, use daily, and maintain the various vehicles: the career soldiers, particularly the professional and re-enlisted noncommissioned officers and the civilian employees who daily check on the operation of the vehicles and correct their defects and the rank-and-file soldiers who drive the cars and combat vehicles and on whom the trend of consumption depends most directly. The rank-and-file soldiers who use less fuel than the norm prescribed for each particular type of vehicle will receive as a bonus 70 percent of the money saved. Professional soldiers and civilian employees who drive cars and combat vehicles will receive 90 percent of the money saved as a bonus," said Ettig in a summary of the most important parts of the bonus systems. He then added:

"Certainly many people will ask why we don't pay out the full amount of the savings. The correct amoung of savings that can be attained by drivers is inconceivable without the assistance of various kinds of experts in the maintenance shops. Practice has shown that outstanding work on the part of those who tune up and otherwise repair the vehicles is necessary for a unit's vehicle fleet to operate within the norms of consumption. For this purpose the unit commanders have available 30 percent of the 100 percent savings achieved by the rank-and-file soldiers. The 10 percent remaining from the amount saved by professional soldiers and civilian employees that drive vehicles will serve to balance over-consumption of fuel by military organizations.

The chief of the fuel-supply service said further that the bonus system has been in effect since 1 July of this year, and the units have been informed about it. The next payment of bonuses will be in January, 1982, and then again in the month of July.

Twice a Year

Thus the bonuses for savings will be paid out twice each year. There are a few other important things to know. Those who compete can only receive a bonus if they do not break the important rules that are among the conditions for payment. They [must] comply with the utilization requirements, traffic regulations and certification rules in effect at the time.

The youth organizations will also have an opportunity for meaningful political work in connection with these measures. They can do much to make sure that the mostly young drivers of cars use rationally and honestly the opportunity offered by the bonus system in their own interest. This is needed also because the incentive system expects not only savings from the drivers but also precise work in keeping records of trips. They need to be informed of this because a joint measure of the military supply and finance service that is soon to appear will prescirbe a most simple and bureaucracy-free method. For example, the commander of the unit allocates the bonus. And if this is so, it would be wrong to force--as a result of abuses--the organizations that drive vehicles to tie the payment of bonuses to stricter, more complicated, even more bureaucratic regulations. It is very important that everyone in his own position help in the implementation of the system and in the realization of the basic purpose, which can be equated with the achievement of fuel conservation, which is at the same time in the interest of the national economy as well.

RULES ON SETTING UP SMALL CO-OPS PUBLISHED

Budapest MAGYAR HIRLAP in Hungarian 25, 30 Sep 81

[Article by Istvan Kalasz and Gyorgy Szepesi, National Planning Office: "Decree-Browsing Concerning Small Co-op Activities. The Forming of Small Co-ops (1)]

[25 Sep 81 p 7]

[Text] The goal of setting up and operating small co-ops is to provide a form of self-government and work organization that can better accommodate a smaller work force and in which, with the help of the personal and increasingly growing financial contributions of their members, cooperative collectives of our citizens can perform service-related, productive and other socially useful activities (Decree No 25/1981. IX, 5, Labor Code).

In general, the small co-ops may engage in any economic activity which is not specified to fall exclusively within the state economic organizations' sphere of functions by the statutory provision. Small co-ops may not engage in agricultural activities.

Small co-ops are formed on the members' own initiative. Setting one up requires at least 15 persons, and its membership must not exceed 100 persons. Establishment of a cooperative requires a resolution by its statutory membership meeting. This must also specify the bylaws of the cooperative. The bylaws must be approved by the competent regional council authorized to exercise legal control.

Making the necessary adjustments to a smaller membership and a simpler work organization, the bylaws--which serve as the constitution of the small co-op--must include all regulations, without repeating any of the statutory provisions already in force, which apply to the forming cooperative as laid down in the various law decrees on cooperative law and industrial cooperatives. The bylaws must also state the manner in which financial contributions by the members is to be made, and must also define the value limit beyond which the conclusion of contracts will require the preliminary approval of the general assembly of the cooperative.

Setting up a cooperative requires an initial capital outlay sufficient to build a financial basis upon which the activity can commence and more and more firmly assert itself during the first year. The greatest part--and in many instances the entire amount--of the initial capital outlay comes from the share and targeted share purchases of the members. (A share is a financial contribution for general purchases. Targeted shares are voluntarily purchased by the members in order to raise needed

funds for carrying out certain specific tasks.) The amount of financial contributions also has a minimum mandatory limit, which equals two months' wages of a cooperative member. Therefore, if someone wishes to join a small co-op, he must put up a sum which equals two months of his basic wage in the form of shares. In order to enhance the economic activities of the cooperative the members can, in addition--based on a separate agreement--also lend out for use, or lease to the cooperative certain capital assets (machines, tools and even buildings and workshops). In addition to the full-time members, small co-op membership is open to any person who is presently employed by some other employer (i.e. an enterprise or a cooperative) and wants to do part-time work outside the working hours of his full-time job (in which case those labor-related statutory provisions will apply which define the legal relationships involved in holding a second job, having a second occupation and doing part-time work); to pensioners, within the employment limitations specified in the statutory provision regulating social insurance, or, if pension payments are suspended, without any restrictions; as well as to day-time students attending our higher educational institutions who receive approval from their respective schools.

The small co-op's organs of self-government include a general assembly, a board of directors, a supervisory board and a cooperative arbitration committee. In those cases where the size of the membership is under 30 persons, the bylaws will determine whether or not there will be a working board of directors, a supervisory board or any other committee; cooperative arbitration committees in such cases cannot be established. In those cooperatives which have less than 30 members, the president can, by himself, fulfill the functions of the board of directors.

The duties which fall within the sphere of authority of the assembly in a small co-op include the passing and revision of self-government rules. It is this latter which contains the description of the co-op's work organization, its directors' sphere of authority and the manner in which its jurisdiction as an employer should be interpreted. In addition, it is also the final decision-maker in cases concerning the expulsion of a co-op member, the termination of work agreements with the members and the preliminary approval of contracts which exceed the value limit specified in the bylaws. In those cooperatives which operate with less than 30 members, the assembly's sphere of authority also extends to the admission of new members and to settling membership and work-related disputes.

(In our next issue we will report on the manner in which new members are admitted and on the economic and financial regulation of small co-ops.)

[30 Sep 81 p 7]

[Text] In the first part of our series we discussed the conditions which are required to establish and operate a small co-op. This is a continuation of that topic. The admission of new members is decided by the board of directors (or by the assembly, if the small co-op has less than 30 members); the president is authorized to accept membership applicants only as probationary members for a period not to exceed 3 months. During that trial period this probationary membership relationship may be terminated by either the board or the member, effective immediately, without explanation.

At the time of admission the member and the board will draw up a membership agreement specifying the manner in which the member's personal contribution is to be asserted, the specific form and extent of his financial contribution, his scope of activity, his basic wage and, if he is a part-time employee, his working hours.

In the small co-ops group property serves as a determinant of common income incentives connected with the growth of personal income and with the expansion of cooperative property. Accordingly, a cooperative collective may directly decide how large a percentage of its income in a given year it will dedicate to personal earnings, and how much of it to developments which will enhance the realization of the co-op's common goals. The basis of taxation is the gross income, which is defined as being the difference between returns from sales and non-wage type of expenditures. This assessable income is the basis of a linear tax. Overall, under general operating conditions, the small co-op's tax burdens are on the average comparable to the amount of witholdings in other areas of the economy.

Within the wage limits presently in effect, a basic wage must be established for all cooperative members and employees. In the case of members, however,--in contrast with the regulations put forth in the statutory provisions concerning other types of cooperatives and enterprises--this is not just a kind of indicative wage, but one which is ensured to be paid out up to the amount of the minimum wage guarenteed by the statutory provisions. The main function of assigned wages it to serve as the basis for determining work norms as well as for planning and price calculations. On the basis of the total amount expended in the form of personal earnings, a social insurance contribution must be paid. The directors' basic wage and share is determined by the cooperative collective.

All top ranking cooperative employees are entitled to social insurance benefits at terms that are identical to the ones offered to actively employed enterprise employees and cooperative members; the amount of the contribution they are required to pledge is to be assessed on the basis of their total personal income. Members and employees working on a part-time basis outside the working hours of their full-time jobs are only entitled to accident benefits at a reduced premium.

(In our next issue we will discuss the conditions of specialized industrial and service co-op groups.)

DEVELOPMENT OF SMALL HYDROPOWER INDUSTRY DESCRIBED

Warsaw MONITOR POLSKI in Polish No 24, 25 Sep 81 pp 209-211

[Council of Ministers Resolution No 213, dated September 7, 1981, signed by General of the Army, W. Jaruzelski, Chairman]

[Text] To ensure the broadest possible utilization of the hydropower resources of the smaller rivers and to create supplementary sources of electric energy supply, the Council of Ministers resolves as follows:

§ 1.1. The development of a small hydropower industry, composed of hydroelectric power plants up to 5 MW, should be implemented by:

1) constructing hydroelectric power plants at existing dam installations,

2) modernizing existing hydropower plants, i.e., plants in which a hydroturbine directly drives the generating equipment, by converting them into hydroelectric power plants,

3) modernizing existing small public-utility and industrial hydroelectric power plants,

4) constructing hydroelectric power plants at new water dam installations built for purposes other than energy.

2. The Minister of Mining and Energy, after consulting with the Minister of Agriculture and Food Economy, and other involved ministers, annually establishes the investment for the small hydropower industry to be implemented by units of the socialized economy.

3. The ministers concerned will ensure that the facilities referred to in par 2 are included in the modernization-renovation tasks of the appropriate socioeconomic plans.

4. The electric power plants referred to in par 1 should first satisfy the energy requirements of the investor (prospective user). Surpluses of electric energy should be allocated to the public-utility power industry network, and if this is not feasible, the investor (prospective user) has the right to sell the surplus for local electrification requirements.

§ 2.1. The investor (user) in small hydroelectric power plants may be a unit of the socialized economy or a unit of the nonsocialized economy.

2. Small hydroelectric power plants which are the property of the State may be leased to units of the nonsocialized economy.

3. Units of the socialized economy that have water-dam installations and power or hydroelectric power plants that are not being utilized may be ordered by the governor (mayor of a city of voivodship rank) to put them back into operation and also may be ordered to modernize them so that the river's energy at a given water-dam profile is being fully utilized.

4. In the regulations on delivering electric energy, the Minister of Mining and Energy will provide that the industrial power conversion plant may cancel, wholly or in part, an agreement on delivery of electric energy if the recipient has an electric power plant or a hydropower plant which is not being utilized and which can, wholly or in part, fulfill his requirements for electric energy.

§ 3.1. Users of small hydroelectric power plants who are not fully utilizing for their own needs the electric energy being produced, may conclude an agreement with a purchaser for delivery of electric energy, if these power plants cannot be linked to the public-utility power industry network.

2. If the electric power plants referred to in par 1 are not linked to the public-utility power industry network, the rights and obligations specified in the agreements on delivery of electric energy devolve to the appropriate industrial power conversion plant.

3. The Minister of Materials Management, in consultation with the Minister of Mining and Energy and the chairman of the State Price Commission, will establish the principles of accounting for energy delivered from the small hydroelectric power plants to the public-utility power industry, taking into account the cost-effectiveness of the construction of small hydroelectric power plants and the cost-effectiveness of the production and sales of surpluses of energy from these power plants.

§ 4. Investments by units of the socialized economy, referred to in § 1, par 1, points 1-3, may be made according to the rules prescribed for renovation-modernization investments in Council of Ministers Resolution No 181, dated December 9, 1977, on modernization-investment implementation (MONITOR POLSKI No 36, item 181) on condition that all of the following conditions are fulfilled:

1) the implementation cycle does not exceed 18 months,

2) the share of construction-assembly jobs (excluding the assembly of machinery and equipment) does not exceed 50 percent of the cost-estimate value of the investment task,

3) the cost-estimate value of the investment task does not exceed 50 million zlotys.

§ 5.1. Investors undertaking the construction of water-dam installations must consider the construction of small hydroelectric power plants as an integral part of the comprehensive hydro-project investment. Deviations from this rule are possible in cases justified by technical and economic considerations, after coordination with the proper local district inspectorate for the power industry.

2. Investments referred to in par 1 are included in the burden of total water investment costs from the investors' funds.

§ 6. Water structures for damming, storage, input and output of water and for protection of shores against the destructive effects of water, which are included in the investments referred to in § 1, par 1, points 1-3, may be financed from the local water management fund.

§ 7. Governors (mayors of cities of voivodship rank):

1) will ensure, based on guidelines which the Minister of Mining and Energy will furnish by December 31, 1981, that all existing hydroelectric power plants and hydropower plants up to 5 MW (except public-utility power plants) and water-dam installations on watercourses having dam water levels above 1.6 meters, will be inventoried,

2) will send to the Minister of Mining and Energy lists of dam facilities which are to be implemented, and programs for the construction of small hydroelectric power stations, indicating the major ones proposed, by March 31, 1982,

3) will provide technical and legal advice on matters related to the construction of small hydroelectric power plants and conditions for the efficient granting of water-rights and construction permits.

§ 8. The Minister of Agriculture and Food Economy, in consultation with the Minister of Mining and Energy, will ensure that a step-by-step feasibility study will be made on utilization of river energy in those sections on which no comprehensive hydraulic engineering development is planned by the year 2000.

§ 9. The Minister of Mining and Energy will ensure that the following will be prepared by June 30, 1982:

1) a list of the equipment needed for small hydroelectric power stations during 1982-1985,

2) draft designs for standard generators for heads up to 25 meters and discharges up to 25 cubic meters per second,

3) draft designs for standard generators synchronous with the turbines mentioned in point 2,

4) reproducible draft designs of small hydropower industry facilities and equipment.

§ 10.1. The Ministers of Metallurgy and Machine Engineering Industry and Mining and Energy will ensure delivery of hydroturbines, synchronous generators, and excitation, control and automation systems as agreed-upon, in the quantities and at the times that will fulfill the requirements referred to in § 9, point 1.

2. The Ministers of Construction and Construction Materials and Mining and Energy will provide conditions for execution of specialized work in the small hydropower industry which will be implemented.

§ 11. By June 30, 1982 the Minister and Mining and Energy will prepare drafts of the indispensable regulations pertaining to the operation of power equipment in the small hydroelectric power plants.

§ 12. In § 17, par 1, Council of Ministers Resolution No 196, dated December 29, 1977, on locating investments (MONITOR POLSKI, 1978, No 1, item 6, and 1981, No 9, item 73) point 7 should read as follows: "7) electric-power and heat-generating plants, and reservoirs and water levels with a dam level higher than 1.6 meters".

§ 13. Council of Ministers Resolution No 423, dated November 8, 1958, on startup and proper utilization of plants started up by water power and other industrial plants driven directly by these plants, and on proper utilization of industrial power conversion plants (MONITOR POLSKI No 87, item 489), is invalid.

§ 14. The Resolution is effective on the date that it is announced.

DEVELOPMENT OF AGRICULTURE IN 1980'S DISCUSSED

Warsaw ZAGADNIENIA EKONOMIKI ROLNEJ in Polish No 1, Jan-Feb 81 pp 29-47

[Text] The particularly unfavorable situation that developed in the second half of the 1970's both in agriculture and in the entire national economy will affect the growth of agricultural production in the 1980's, especially the first half. This period in agriculture is characterized by stagnation of crop production (table 2) from 2 years of bad grain harvests (each of the previous 5-year periods had, on the average, only 1 year with a bad harvest) and a lack of any clear-cut advance in the use of mineral fertilizing. This stagnation is reflected as well in the yields of the remaining crops, whose annual increases amounted to only 0.24 units of grain per hectare, against 0.59 units in a long period (table 1). Increased yields of nongrain crops, however, did not effect an improvement in harvests, since the area of cropland had decreased.

Admittedly, several years of stagnant yields create a likelihood for compensatory growth in the next 5 years, but the unfavorable situation in the chemical industry and the considerable delay in achieving the goal for mineral fertilizing indicate that the average yields will not meet the food program for the country until 1990 adopted by the 15th Plenum of KC PZPR [Central Committee Polish United Workers Party] since 1974.

The strategic problem of agriculture in the first half of the 1980's will be restoring the balance of production lost in the 1970's; i.e. liquidation of the disproportion in growth between animal and crop production. In the last 10 years crop production grew by only 13 percent, while animal production grew by 28 percent[1] That entire increase in crop production occurred in the first 5 years, but animal production in those same 5 years grew by 21 percent and in the last 5 years, by another 6 percent.

In the first half of the 1970's the rise in animal production reached 73 percent due to the increase in our own stocks of fodder; it reached 27 percent due to increased imports of grain and fodder. The unfavorable situation in crop production in the second half of the 1970's forced us to increase our imports of grain and fodder further, in order to prevent a drop in production and consumption of animal foodstuffs. This goal was indeed attained, but the entire increase in animal production was the result of increased imports of grain and fodder exclusively.[2]

In sum, the 47 percent increase in animal production in the entire 10-year period was attained at the expense of increasing imports of grain and fodder. The social price for the high rate of growth of animal production and per capita consumption of animal foodstuffs was an increase in the unfavorable balance of foreign trade in farm-foodstuffs, which jointly amounted to $5.5 billion. Since the unfavorable balance in food import is not compensated by an advantageous balance in the export of goods produced by the remaining sections of the national economy, the growth in animal production and consumption of animal foodstuffs is realized, to a significant degree, at the cost of an increase in the country's indebtedness. The necessity of repaying this indebtedness requires not only reaching a favorabe balance in our country's foreign trade in the 1980's, but also balancing imports and exports of farm-food products; afterward it requires attaining self-sufficiency in food production.

The unfavoable balance in foreign trade in farm-food products amounted to around $0.9 billion in 1978 and to around $1.0 billion in 1979. The import of grain and fodder, valued at approximately $1.1 and 1.2 billion respectively, had a decisive influence on this unfavorable balance in foreign trade. Balancing foreign trade is not possible by increasing exports of agriculture-related products alone but requires a decrease in the import of grain and fodder as well. It is estimated that by activating the export of farm-food products through renewed increase in the net export of meat from around 2,000 tons in the past to around 3,000 tons annually in the 1980's (we attained this kind of export of meat from 1974 to 75) a balance in foreign trade[3] could be reached by decreasing by at least one-third the import of grain and fodder; i.e., from around 9.5 million tons annually in terms of grain from 1987 to 1989 (1 million tons of high-protein fodder is worth about 1.8 million tons of grain) to around 6 million tons in the 1980's. If we take into account the necessity of increased import of high-protein fodder from 2.0 to 2.5 million tons annually, then the import of grain should be correspondingly reduced from 2.5 to 1.5 million tons.

In addition to the emergence in the 1970's of a disproportion in the growth of crop and animal production (which is of a transitory nature), a phenomenon with permanent consequences appeared; namely, the increase in the grain intensiveness of animal production. the increase in the share of grain and concentrated fodder in fodder stocks for producer livestock (from about 24 to 35 percent in the past 10 years) caused widespread use of grain-intensive technology in feeding animals in all sectors of agriculture and an increase in the consumption of concentrated fodder per unit of animal production by almost 50 percent. The process of changes in the technology of feeding animals is rather irreversible, with the possible exception of feeder process cattle on the collective farm (mainly on the state farm in which--in view of the surplus stock of cattle--concentrated fodder will be substituted for bulk fodder). However, with similar feeder technology, a reduction in the consumption of concentrated fodder per unit of animal production is possible by improving the quality of the composition of concentrated fodder as well as by changing their assortment, for example, in replacing full-proportioned compositions by protein concentrates in herd feeding on individual peasant farms, with the purpose of increasing the concentration of protein in the fodder blend, still based to a large measure on potatoes. Improvements in the quality of concentrated fodder and the production of fodder concentrates promotes a needed change in the structure of grain and protein fodder.

Apart from the reduction inunit consumption of concentrated fodder within existing animal feeder technology, the process of developing grain-intensive technology will continue, both as a result of further growth in the collective farm's share in animal production (in which the unit consumption of concentrated fodder is over 40 percent higher than on the peasant farm) and the increase in the scale of production on peasant farms. This is determined partially, by the introduction of more labor-saving, and more grain-intensive, technology in feeding animals. Changes in grain-intensive animal production will depend on which of two opposing trends will prevail. If in the first half of the 1980's the growth in unit consumption of concentrated fodder is not checked, then the increase in animal production cannot even ensure the maintenance of the existing level of consumption of animal foodstuffs per inhabitant. This results not only from the country's population growth and the necessity for increasing the export of meat, but, first of all, because of the creation of a gap in the grain balance resulting from reducing imports. This gap must be plugged by an increase in the country's production of grain and fodder. Plugging this gap requires an increase in crop production of 8.5 percent by 1985, with an increase in the grain production of 20 percent (in relation to the average annual production from 1976 to 1980). Only the increase in grain and crop production above these indicators will be allocated for increased animal production. A reduction in the consumption of fodder by horses will follow, but it will, in principle, equal the growth in the people's farm's demand for crop products.

In the second half of the 1980's the conditions for growth in animal production will be even more profitable. With a stabilized import of fodder at the 1985 level, the entire increase in crop production can be allocated as fodder for producer livestock.

The rise in animal production that ensures maintaining the consumption of animal foodstuffs per inhabitant until 1985 is determined--with the import of fodder that has been established--above all by a reduction in the existing per unit consumption of concentrated fodder in animal production and by an improvement in the effective utilization of all fodder.

II. YIELDS

The basis for an increase in all agriculture production is an increase in yields of cultivated crops. A prognosis of an increase in yields requires both a retrospective analysis of existing trends and factors that determined these trends and an analysis of their anticipated or assumed changes that will influence a trend toward an increase in yeilds. According to the data on average annual increase in yields in particular 5-year periods (table 1), the increase in grain yields in the first 5-year periods (from 1950 to 1955 and 1971 to 1975) and the increase in remaining crop yields in the first four periods have an exponential character (roughly speaking, the constant proportional increases and the rising quantitative increases). The reduction of these increases in the ensuing periods bears out the fact that the further course of the curve for yield increases takes on a character that approximates a ligistical curve; i.e., the average annual increases in yields expressed quantitatively become distinctively smaller and smaller. When average annual increases in yields are expressed proportionally, there is even more of a diminution.

In face of a deficit in the increase in grain yields and the relatively small increase in the yields of remaining crops in the 5-year period of 1976 to 1980, one can contemplate a compensatory increase in yields in the next 5-year period (the average annual yield increases of remaining crops should be somewhat higher than average increases of remaining crops should be somewhat higher than average increases over many years).

Increases in grain and remaining crop yields in the 1980's will depend not only on the absolute increase in mineral fertilizing for all of agriculture, but also on changes in ratios in the allocation of fertilizers in interim periods. From 1976 to 1979, mineral fertilizing on the collective farm was 160 kg NPK [nitrogen-phosphorous-potassium] per hectare higher than on the individual peasant farm (314 kg and 154 kg respectively), while grain yields were higher by only 5.3 q (29.5 q as opposed to 24.2 q). Thus on the collective farm there is barely a 3.3 kg increase in grain yields per 1 kg additional fertilizing. With this rather modest increase in mineral fertilizing until 1985, it would be justifiable to stop not only further increases in the use of mineral fertilizing but even to reduce the existing level of fertilizing on the collective farm and reallocate the fertilizers to the peasant farm, which is characterized by its greater effectiveness in mineral fertilizing than the collective farm. This maneuver would give all of agriculture a larger increase in yields than trying to maintain the existing allocation of fertilizers between the collective and peasant farms.

With the projected increases in mineral fertilizing of 250 NPK per hectare of arable land in 1985, it is possible to attain grain yields of 31 q and for remaining crops, about 37 grain units from a hectare (table 1). Such higher yields are the basis of grain and concentrated fodder balances presented later, and thus the probable estimates for increased animal production. If there is a reduction in mineral fertilizing, there will likewise be a corresponding reduction in yields. A reduction in yields by 1 q means that fodder stocks are reduced by about 1.9 million tons. In terms of meat, this amounts to a reduction of about 200,000 toms in the increased animal production.

III. SOWING AREA

Our country's grain balance, and thus the balance of concentrated fodder, will depend (given the import data) on both the level of increases in yields and grain-sowing areas. Looking ahead to the years 1985 and 1990, grain-sowing areas and the share in the structure of sowing will cause much controversy. Some specialists on cultivated crops affirm that the ideal solution is a sowing area of 50 percent grain crop and 25 percent root crop. Then the highest yields of grain (by dint of these well-taken points of view) and the greatest quantity of biomass from the whole sowing area are obtained. This position, perhaps, is valid from the standpoint of field-crop production, but it does not coincide with animal feeder technology. There is no return to the animal feeder technology applied as far back as the beginning of the 1970's. This kind of technology requires a greater share of grain in the sowing structure, even if it produces a certain reduction in the total amount of biomass produced. From the point of view of its final effect in the form of animal production, it is not only the sum total of biomass that is of essential importance but also its structure and its possible conversion into animal product (more will be said about this).

From 1976 to 1979 the sowing area of grain amounted to, on the average, about 7.9 million hectares (approximately 54 percent of the sowing area) and exhibited more of a falling than a rising trend, although the 5-year plan had set its growth at 8.5 million hectares. According to the estimates of IER [Institute of Agricultural Economy] in 1976,[6] the possibilities of growth in the grain sowing area in 1980 would not exceed 8.3 million hectares, under the condition that the share of grain for the state farm would not reach 50 percent. Its share in each of the 4 years of the current 5-year plan has not exceeded 43 percent, which is mainly a result, although not entirely, of the large stock of cattle (81 head per 100 hectares, against 67 on the individual peasant farm). This requires, in the first place, that we produce our own bulk fodder.

Through simultaneously increasing the cultivated area of podded grain-seed, sugar beets and rape, an increase in the sowing area of grain to 8.5 million hactares in 1985 (58 to 59 percent sowing area) could occur only at the cost of decreasing the cultivated area of fodder crops on the collective and potatoes on the individual farm.

On individual peasant farms, the process of substituting potatoes for concentrated fodder has come into use in feeding animals, but a drop in the share of their cultivated area in the structure of sowing was not accompanied by a drop in consumption of potatoes per unit of animal production (their approximate share in the 1970's amounted to 19.8 percent, with vacillations from 19.4 to 20.3 percent). The increase in animal production was higher than the increase in potato yields. Likewise, the share of grain in the structure of sowing that developed in the 1970's--despite certain vacillations--is about 57 percent. Thus, on individual peasant farms there was not even the slightest tendency toward replacing the area under cultivation of potatoes with grain. Improvement in the agrarian structure, per unit decrease in the employment of land, and the rising scale in animal production in the economy will undoubtedly favor a certain reduction in the share of potatoes in the structure of sowing. However, as the example of special farms (twice as large as the average peasant farm) shows, a drop in the area under cultivation of potatoes does not effect an increase in the area under cultivation of grain but does in the case of industrial crops, root crops and other fodder crops, especially on farms specializing in the production of ruminant animals.

Stimulating the displacement of potato cultivation by grain would be an appropriate goal at the present stage of development in agriculture. This would certainly improve our country's grain balance, but at the expense of the total balance of fodder. As it stands, significantly more units of feed and only an insignificantly less amoutn of protein are obtained from a hectare under potatoes cultivation than from a hectare under grain cultivation. From a cameral calculation, it would be possible, with the employment of potato-grain technology in herd feeding and with the present ratio of yields, to obtain from a hectare designated for production of herd fodder about 20 percent more feed than with grain feeder technology. The displacement of potatoes under cultivation by grain is only justified when grain yields are greater than 40 q per hectare.

An increase in the are under grain cultivation on state farms to 58 to 59 percent of the sowing area would require fundamental changes in the running of these farms, including, a considerable reduction in the head of cattle for the purpose of limiting

the excessively high share of bulk fodder under cultivation in the structure of sowing. Enlarging the amount of corn under cultivation for ensilage, which is determined by an increase in corresponding tools and machinery, will undoubtedly permit a certain decrease in the existing cultivated area of remaining bulk fodder. However, it will free not more than 15 to 16 percent of the arable land under grain cultivation.

A decrease in beef feeder herds on state farms would require--for the purpose of securing an increase in beef production--a corresponding increase on the individual peasant farm. Despite the lower grain-intensiveness and land-intensiveness in the production of beef slaughter animals on the peasant farm in comparison with the state, a broader expansion in this production would approximate the effects on the structure of sowing found on state farms. From IER research, it is evident that on peasant farms specializing in feeder process cattle, the share of grain in the sowing structure amounts to not quite 50 percent, and in the remaining directions of cattle production (milk or beef and milk) about 52 percent, while on state farms specializing in herd production about 57 percent.

These data bear out the fact that specialization in the production of ruminant animals including sheep is linked to a less-than-average share of grain in the sowing structure. This results not just from the proportion of demand for grain and bulk fodder, but also from the lower degree of fodder conversion, especially with feeder process cattle. For a 1 kg increase in beef, almost two times as many units of feed are used than for a 1 kg increase of pork; the utilization of protein contained in fodder runs approximately 38 percent in relation to its use in the production of slaughter pork and milk (according Woermann). If we then take into account the considerably higher biological and economic losses in bulk fodder than in seed grain, it is necessary to produce at least 2.5 times more biomass for 1 kg of beef than for 1 kg of pork. Since a hectare of bulk fodder on arable land uses several scores more of feed units and two to three times more protein than a hectare of grain (together with straw), the increase in the cultivated area of bulk fodder at the expense of grain, by taking the direction of feeder processing in animal production, is completely justified; it permits an increase in the production of beef cattle from the arable land designated for the production of fodder for feeder process cattle.

However, from the same kind of arable land designated for the cultivation of fodder for herds--despite the decreased quantity of fodder calculated in units of feed and protein--more pork is obtained from a hectare of fodder land due to the increased capacity of conversion of fodder by a head than with feeder process cattle. Thus, farms specializing in the production of beef slaughter animals, researched by IER, obtained about 550 kg of beef from a hectare consisting mainly of fodder[7] (not counting fodder from ancillary land--straw, sugar beet leaves, second crops), while farms specializing in herd production--with nearly the same level of yield of cultivated crops (about 34 q of grain and 250 q of potatoes--obtained 770 kg of pork; i.e., 40 percent more. Even if one takes into account that 26 percent of the area of fodder for cattle was made up of grassland and that its yield is one-third lower than the yield of arable land, almost 30 percent more pork than beef is obtained by potato-grain technology for feeding herds from a hectare of arable land designated for fodder.

From the data, it follows that by changing the proportions in the development of beef slaughter cattle and pork to favor the latter, we can obtain a greater increase in meat than by continuing the larger rate of growth in beef slaughter cattle.

Developing the production of beef slaughter cattle should not be based biologically on calves but rather on fodder from grasslands and those bulk fodders from arable lands whose cultivation in indispensable from the point of view of reasonable crop rotation, as well as on fodders from second yields and byproducts. Designating additional areas of arable land for production of fodder for feeder process cattle is justified only when the yield of fodder from a hectare, expressed in feed units, is at least 2.5 times higher than the grain yield (together with straw). This does not apply, obviously, to fodder from dairy cattle, where the conversion degree of fodder is like that of herds.

In summarizing changes in the structure of sowing, the real possibilities for increasing the area under cultivation of grain by 1985 do not exceed 8.3 million hectares. This requires a 58 percent increases in the share of grain in the structure of sowing on the individual peasant farm (a 1 percentage point increase in relation to the year 1979), 55 percent on the collective farm (a 10.7 percentage point increase; on PGR [state farms] a 12.6 point increase). In fact, with the change in the ratio of prices to profit of grain, one cannot count on a great increase in the area of grain sowing on the individual peasant farm, because previous ratios in grain prices in 1965 and 1976 caused an increase in the share of grain sowing of barely 1.0 to 1.5 percentage points. One might count on a larger increase in the area of grain sowing at the expense of potatoes only in the case of a rather radical improvement in the agrarian structure. The anticipated increase in the average area by 1.0 to 1.5 hectares will not have a major influence on the change in the structure of sowing.

An increase in the share of grain of up to 55 percent of the area of sowing on state farms is not possible without a considerable reduction in the number of head of feeder process cattle per 100 hectares of farmland, which will be obviously associated with the nonutilization of existing investments in the construction of farm buildings. First, it would be necessary to eliminate from farm production the least effective farms by switching them into grain production. Nonetheless, if we consider the long-standing production profile, then a 55 percent increase in the state farms' share of grain in the structure of sowing, and by the same token an increase in the area of grain sowing countrywide to 8.3 million hectares in 1985, will not be easy to attain.

In the next 5 years (1986 to 1990) there will be a decrease in the area of farmland (by about 150,000 hectares) and afterward a decrease in the area of sowing. Despite further growth in the collective farm's share, there might not be a decrease in the area of grain under cultivation on account of a greater decrease, than in the 5-year period 1981 to 1985 in the area of potatoes under cultivation on the individual peasant farm.

IV. The Balance of Fodder and the Increase in Animal Production

As the country's economy develops and farm production increases, the proportions in the control of crop production have been gradually changing.

The expenditures for the production of seed and seedlings are almost unchanged, expenditures for horse fodder with the advance of mechanization are beginning to decrease, and expenditures for the consumption of industrial processing are increasing slowly. In sum, these three penditures, after a period of growth (from 1966 to 1970), are beginning to diminish gradually. Thus, in the total number of stocks of crop products, the share of products designated for livestock production fodder in increasing. This share, from about 50 percent at the beginning of the 1950's, has increased to about 66 percent in the 1970's and will increase to over 70 percent in the 1980's (table 2). As a result, the production of fodder for producer livestock is growing at a greater rate than crop harvests and stocks of crop products; i.e., harvests augmented by the import of grain and fodder. This creates the possibility of a faster rate of growth in animal production than in crop production.

	1966--70 / 1950--55	1976--80 / 1966--70	1985 / 1976--80	1990 / 1985
Harvests	3,1	1,2	1,8	1,3
Stocks of crop products	3,2	2,2	1,0	1,2
Seeds and fodder for horses	1,7	--0,9	--2,3	--3,5
Availabe crop production	1,9	0,7	1,0	1,0
Fodder for producer livestock:				
In units of grain	4,3	3,5	1,5	1,8
In units of oats	3,7	3,1	1,4	1,6
Animal production	3,0	2,6	1,7	2,0

Existing and predicted changes for the 1980's in the average annual rate of increase in crop harvests and stocks of crop products, expenditures for these stocks[8] and for animal production are presented in the preceding tabulation (on the basis of the data in table 2).

In the past, the rate of increase in fodder stores for producer livestock was higher than the rate of increase in harvests, particularly in the last 10 years, due to the increasing import of grain and fodder and the drop in horse fodder, as well as the lowering of the rate in the increase of available crop production. The next 5-year period in this respect will be exceptional, since the rate of increase in fodder for producer livestock will be--as a result of decreasing imports--lower than the rate of increase in harvests. But, in the second half of the 1980's with a stable import of fodder, the rate of increase in fodder for producer livestock will be higher than the rate of increase in harvests, mainly as a result of the drop in the consumption of fodder by horses.

The rate of increase in fodder for producer livestock still does not make the rate of increase in animal production and open-and-shut case; it also depends on effective utilization of fodder stocks. Till now, the period of agricultural development has been characterized by a lower rate in animal production in comparision with the rate of increase in fodder stocks and by an identical drop in the effective utilization of fodder. Animal production (counted in conversion units of meat) per 100 units of oat stocks of fodder decreased from 12.4 converted kg at the beginning of the 1950's to 11.1 kg toward the end of the 1960's and to 10.5 kg toward the end of the 1970's. If one can explain the absolute and relative decrease in the quantity of uncalculated fodder that has not been counted in the balance of fodder in the first of these drops in animal production per unit of fodder stocks,

then in the second period--i.e., in the 1970's--a sharp deterioration in the utilization of fodder stocks occurred. There are several reasons, varying in scope, for this deterioration: 1) a gaster rate in the increase of beef slaughter cattle (3.7 percent on the average annually, against 2.5 percent for the rest of animal production), which is characterized by a significantly lower indicator in the conversion of fodder in comparison with other animal products; 2) nongrowth in technically equipping state farms, causing an increase in the losses of nutritive ingredients in concentrated fodder, especially in the diminishing stocks of fodder that have a working and growing potency in them; 3) a decrease in animal production on small farms, and consequently incomplete utilization of their fodder stores; 4) increasing, grossly ineffective forms of animal production on combined farms of agricultural societies and plant-operated pig farms; 5) excessive concentration of animals on state farms going hand in hand with the deterioration of animal hygiene, which causes excessive weakening in animals, sterility in cows, a decrease in the number of piglets from sows, and finally an increase in the consumption per unit of final animal product; 6) over a two-fold increase in the quantity of industrial concentrated fodder, of which a significant part of it fails to conform to qualitative norms, causing excessive consumption of fodder per unit of animal production. Gradual elimination of at least a part of these reasons for the deterioration in the effective utilization of fodder stocks should ensure a reversal of the existing falling trend. This is, however, an indispensable condition for such an increase in animal production, which would ensure a perceptible increase in the consumption of animal foodstuffs per inhabitant by 1990. If there is no improvement in the effectiveness of the feeder process (as it set forth in the prognosis in table 2) from 10.5 kg of converted animal production from 1976 to 1980 to 10.7 kg in 1985 and 10.9 in 1990, then animal production in 1990 would amount to only 7.1 million tons instead of 7.4 million tons, and there would be approximately 182 kg per inhabitant rather than 189 kg, as opposed to 174 kg per inhabitant from 1978 to 1980.

V. Stocks of Grain and the Increase in Animal Production

The increase in grain-intensive animal production--i.e., teh increase in the quantity of concentrated fodder per unit of animal production--is a natural product of agricultural development and intensification of agricultural production, and is the result of the following factors:

1) the introduction of labor-saving technology in animal production;

2) an increase in the unit output of animals and the shortening of production cycles, which is attained through more intensive feeding by using concentrated fodder.

Under conditions in Poland, the consumption of concentrated fodder per unit of animal production in the 1950's and 1960's increased at a moderate rate (2.1 percent annually). The increase in grain intensiveness was proportional to the increase in the country's production of grain, only slightly supplemented by imports. In the 1960's began an acceleration in the rate of increase in grain intensiveness to about 5 percent annually. This resulted from a rate of increase in animal production that considerably outstripped crop production, due to the initiation of grain-intensive technologies and an increase in the collective farm's share in animal production.

Comparisons with other countries indicate that in countries with high-intensity agriculture the grain intensiveness in animal production, after a period of growth and an attainment of a certain level, begins to drop off gradually. Above all, this results from perfecting the production of concentrated blends. Under our conditions in Poland, in the 1980's limiting factors will begin as well as growth factors in the grain intensiveness of animal production.

Limiting factors that affect the increase or even produce a certain reduction in the existing grain intensiveness of animal production will be:

1) a lower rate in the increase of animal production than previously, more in line with an increase in crop production;

2) an increase in the share of high-protein fodder in concentrated fodder.

On the other hand, growth factors in grain intensiveness will be a progressive intensification and concentration of animal production on the peasant farm and a further increase in the collective farm's share in animal production. For example, an increase in the collective farm's share to about 28 percent in 1985 would produce--with unchanged grain intensiveness in both sectors--an average increase in the consumption of concentrated fodder of 0.12 kg per unit of animal production; i.e., an increase of over 800,000 tons countrywide.

One of the real factors in limiting the increase in grain intensiveness of animal production will be the change in the structure of imported fodder. Purchasing high-protein fodder instead of grain, at a unit price higher by about 80 percent, should give a production effect higher by a full 150 percent (the production and economic sense of this change depends precisely on this). An increase by 1985 in the import of high-protein fodder by 1.1 million tons in comparison with 1976-78 should give a production effect equal to 2.8 million tons of grain--i.e., in sum, it should produce a savings of a full 1.7 million tons of concentrated fodder--and, by the same token, limit the increase in the grain intensiveness of animal production.

An analysis of the development of agricultural production shows that stocks of grain--i.e., the size of our production together with the import of grain and concentrated fodder--are a determinant in the level for all agricultural production. There is a relatively precise ratio between the increase in these stocks and the increase in animal production, on the one hand, and the available agricultural production[9] and final net production, on the other. This mainly resulted because the increase in production and in stocks of grain that was, in principle, intended for fodder for producer livestock actually directly increased animal production and available and final net production. The remaining expenditures for grain increased a small degree, but in the 1980's--as a result of the drop in the number of horses--they will decrease because the production of concentrated fodder for producer livestock will rise faster than grain production and stocks of grain. The past distribution of grain stores for fodder for producer livestock and for other purposes and the prognosis of this distribution in the 1980's are as follows:

Years	Stocks of grain (in million of tons)	Expenditures for fodder	For other purposes (in millions of tons)	Share of grain stocks in percentages
1950--55	12,5	4,4	8,1	32,2
1956--60	15,4	6,5	8,9	42,2
1961--65	17,2	7,7	9,5	44,8
1966--70	19,1	9,6	9,5	50,3
1971--75	24,9	14,9	10,0	59,8
1976--78	28,1	18,3	9,8	65,1
1985	29,9	21,1	8,8	70,6
1990	32,4	24,2	8,2	74,7

The increase in the consumption of concentrated fodder by producer livestock has not only an absolute but a relative character--i.e.their share in the total quantity of cattle fodder in increasing--namely, from about 20 percent in 1950-1955 to about 35 percent in 1976-1978 and to about 38 percent in 1990.

An analysis of the data in table 3 shows that, despite a constant increase in the consumption of concentrated fodder per converted unit of animal production and available agricultural production and final net production were formed before the end of the 1960's on an approximate level. For 1 million tons of stocks of grain and concentrated fodder, there were 240,000 tons of meat (in terms of conversion), about 15 billion zlotys of available agricultural production and 14.5 billion zlotys of final net production. In the 1970's, and especially in the second half of this decade (1976-1978), previous ratios were subjected to considerable reduction as a result of the disproportion between the increase in stocks of grain and concentrated fodder (owing to increasing imports) and the increase in the production of remaining cattle fodder for producer livestock. These ratios are illustrated in the following data relative to their increases in particular periods:

Annual rate of increase in percentages	1966--70 / 1950--55	1971--75 / 1966-70	1976--78 / 1971--75
Stocks of grain	2,9	5,4	3,1
Concentrated fodder	5,2	9,2	4,2
Remaining fodder	4,1	3,4	0,0

A result of the constant disproportion in the 1970's among the increase in stocks of grain, concentrated fodder and remaining fodder was a decrease in the previous ratios between stocks of grain and the dimensions of animal production; the increase in concentrated fodder was substantially substituted for non crop fodder in the first half of this period, and in the second half of this period it was totally substituted for non crop fodder. This is expressed in the almost violent fluctuations in the increase in the grain intensiveness of animal production.

Liquidation in the 1980's of the present disproportions among grain stocks, concentrated fodder and remaining fodder should cause the ratios between the volume of animal production, available agricultural production and final net production, on the one hand, and grain stocks and concentrated fodder, on the other hand, to be on a higher level in the 1980's than in the second half of the 1970's. There is no chance of an increase in non crop fodder production out-stripping an increase in grain fodder. If we take into account previous production effects of increased import of high-protein fodder (equivalent to the effects of about 2 million tons of grain) and the decrease in expenditures for grain for non fodder purposes, then the ratios of these categories of production for grain stocks in 1985 and 1990 should be those in table 3.

Improving the ratio between the volume of animal production and grain stocks, namely, from 208,000 tons per 1 million tons of stocks in 1976-1978 to 225,000 tons in 1985 and 228,000 tons in 1990, will ensure an increase in animal production corresponding to 6.7 and 7.5 million tons; i.e., to a level previously calculated (table 2) on the basis of the total balance of fodder stocks. This increase in unit consumption of concentrated fodder. This consumption in 1976-1978 amounted to an average of 3.14 kg per 1 kg of converted animal production (in 1978 the average was 3.24 kg),[10] whereas in 1985 it should not exceed 3.5 kg and in 1990, 3.27 kg. A greater increase in the consumption of concentrated fodder per unit of animal production would require either an increase in the import of fodder above what has been assumed (4.2 million tons)--lacking such a possibility--a limitation in the increase of animal production.

Given these assumptions, the value of particular categories in agricultural production in the 1980's will be, in comparison with the value from 1976-1978, the following (in billions of zlotys):

	1976--78	1985	1990
Final net production	308,4	375	415
animal net production	238,1	280	315
crop net production	70,3	95	100
Import of grain and fodder	41,2	29	29
Available crop production	111,5	124	129
Available agricultural production	342,5	404	444

In the period from 1950-1955 to 1976-1978 the average rate of increase in final net production amounted to 1.9 per annually, against an annual increase of 2.3 percent in available agricultural production. The difference of 0.4 percent between the rate of increase in both of these categories is the result of increasing imports of grain and fodder. In the 1980's this situation will be reversed. Owning to the decreasing imports of grain and fodder, the rate of increase in availabe agricultural production will be lower; it will then amount to 1.9 percent annually, while the final net production will be higher--namely, 2.3 percent annually (2.5 percent in the first half of the 1980's and 2.0 percent in the second half). The rate of growth in final net production in the 1980's, and especially in the first half, will be of a compensatory character in relation to the minimal rate of growth in the second half of the 1970's (barely 0.3 percent annually). But even in the second half of the 1980's it will be somewhat higher than the present rate of growth covering a multiyear period, both because of the drop in fodder for feeding horses and the improvement in the effective utilization of fodder

Thus, despite a drop in the rate of growth in crop production from the present 2.4 percent to 1.6 percent annually in the 1980's and a corresponding drop in animal production from 2.9 percent to 1.8 percent, the rate of growth of final net production, as an expression of the total production of agriculture, will not be weakened but will experience a certain acceleration. On the other hand, the rate of growth of available agricultural production expressed in converted animal production, will drop from the present 2.3 percent to 1.9 percent annually in the 1980's, resulting from a change over from increased to decreased importation of grain and fodder.

VI. Possibilities of an Increase in the Consumption of Animal Foodstuffs

An increase in the consumption of animal foodstuffs per inhabitant depends not only on the growth in animal production and in a country's population, but also on the control of production. The previous volume (table 3) of animal production takes in all production, together with the increase in herds, milk expended for fodder, and eggs hatched, as well as wool sheared. The increase in herds in particular years is positive or negative; the consumption of animal foodstuffs (milk, eggs) shows a systematic drop--from about 220,000 tons from 1971 to 1975, to about 160,000 tons in the remaining years. Likewise the net export of animal products and the quantity of animal fat intended for non food purposes have been changing. In connection with this, the share in the total animal production of animal products intended for consumption in our country has shown quite a bit of vacillation (in extreme cases from 81.5 percent in 1974 to 97.8 in 1976, due to the large drop in the value of herds). The difference between the volume of total production and consumption has correspondingly vacillated (in these same extreme years) from 1.1 million tons to 150,000 tons; in the remaing years it amounted to about 650,000 tons converted for meat.

Exactly such a difference started in 1978, which we took as our datum in the distribution of generated animal production in 1985 and 1990. If we assume an increase in net export of meat from 170,000 tons in 1978 to 300,000 tons in the 1980's and a certain increase in wool production, as well as in the export of milk products and eggs, then the difference between generated volume and the volume intended for the consumption of animal production should be less than 800,000 tons converted for meat.

The possibilities for an increase in the consumption of animal products per inhabitant in the 1980's in comparison with 1978 are as follows:

	1978	1985	1990
Animal production in thousands of tons	6126	6700	7400
Consumption in thousands of tons	5474	5900	6600
Remaining expenditures in thousands of tons	652	800	800
Population in million of persons	35,0	37,7	39,1
Consumption per inhabitant	In converted kg		
Total	156,4	156,5	168,8
Including			
meat	70,6	71,8	79,0
animal fat	8,1	7,0	7,0
lk products	65,5	65,5	69,5
s	12,2	12,2	13,3
	In natural units		
Milk and milk products in liters	438	438	463
Eggs in numbers	219	219	238

Checking the increase in the consumption of animal foodstuffs by 1985 is a direct consequence of its dynamic acceleration from 1971 to 1975. Significant in this regard is the comparison of increases in consumption in different periods. In 1950, the consumption of animal foodstuffs per inhabitant amounted to 89.9 converted kg: in 1970, 128.8 kg; in 1975, 151.8 kg; and--according to our prognosis--in 1990, 168.8 kg. In the first 20 years, it increased to about 40 kg; i.e., it will likewise increase by 2 kg annually. It must be understood, however, that over one-half of this increase--namely 23 kg--was realized not in the course of 11 to 12 years but in the course of 5 years (1971 to 1975).

A lead time of 6 to 7 years (in relation to the trend) in the increase in the production and consumption of animal foodstuffs in the first half of the 1970's, due to the dynamic surge in grain harvest and the increase in the import of grain and fodder, had already created much difficulty for further growth in animal production in the ensuing years, in which an increase in production was attained purely at the cost of import fodder. Imported fodder made up about 40 percent of the concentrated fodder feed for producer livestock in the second half of the 1970's. As a result, a kind of acceleration began in the changes in animal feeder technology, which considerably outstripped the stage of development in crop production as well as in grain production. Consequently, there are fewer possibilities for further growth in animal production, especially until 1985, than if this growth in the 1970's had adjusted to the increase in our fodder stocks that had been perfected only by a gradual increase in the importation of grain and fodder. Already in the second half of the 1970's the grain intensiveness in animal production grew to a level that, given the equivalent rate of growth in animal and crop production, would be attained only toward the end of the 1980's.

Thus, the accelerating trend toward an increase in animal production and the consumption of animal foodstuffs in the 1970's (although we paid a very high price for them in the form of our country's indebtedness) was only a passing phenomenon. A future deacceleration in the growth of animal production signifies a gradual return to the original trend. Preserving this acceleration and further increasing production at an already advanced level of this trend was, however, too much to ask of our national economy. This would be possible only with a level of development that would, on the one hand, ensure an adequate and constant increase in the means of production for agriculture, and, on the other hand, finance the import of fodder through earnings from export, as in some highly-developed countries of Western Europe.

From these considerations of the possibilities and conditions for further growth in agricultural production, the 5-year period of 1981 to 1985 will be one of the most difficult periods in the development of our agriculture. We made some rather optimistic assumptions; namely, that mineral fertilizing in 1985 will increase to 250 NPK per hectare; that the import of grain and fodder will decrease by only one-third in 1978 through 1979; that the consumption of concentrated fodder per 1 kg of converted animal production will not exceed the average level of past years (3.15 kg); that there will be a reversal in the present trend of a systematic drop in the growth of effective utilization of fodder stocks (the increase in animal production by 1985 can ensure only maintaining the present level of consumption of animal foodstuffs per inhabitant; i.e., practically the level since 1975). If these assumptions are not realized (especially in the area of fertilizing, and therefore yields and harvests), there is a possibility of a drop in the consumption of animal foodstuffs.

FOOTNOTES

1. This comparison refers to average annual data from the 5 years between 1976 and 1980 and between 1966 and 1970. Likewise, other comparisons in this paper refer to--if not otherwise specified--to averages from individual 5-year periods.

2. The increase in fodder for producer livestock in this period amounted to 4.0 million tons of grain units; thus, it was equal to the rise in imports of grain and fodder.

3. According to the ratio of prices, since 1979, prices are gradually worsening for grain importers.

4. In the economic year 1978-1979 the consumption of concentrated fodder per 1 kg of increase in beef slaughter animals amounted to 4.57 kg (according to CZ PPGR's reports), while in research done by IER [Institute of Agricultural Economy], of 635 individual peasant farms specializing in the production of beef slaughter animals, there was only an increase of 1.64 kg.

5. On Western European herd and broiler farms using a monodiet, the consumption of concentrated fodder per unit of increase in live weight is 25 to 30 percent lower than on our farms, which is due mainly to the excellent quality of our fodder.

6. "Polish Agriculture in 1971-1975 and Perspectives for its Development," PWRiL [State Agriculture and Forestry Publishing House] Warsaw, 1976.

7. For purchased concentrated fodder, one calculates the fodder area according to the average net yield of grain on the farm.

8. For the purpose of maintaining comparability in particular periods, harvests of cultivated crops and their control have been computed in units of grain, and fodder for producer livestock in units of oats. Because of the somewhat different ratios in units of grain and units of oats for different kinds of agricultural products, as well as the allowance made in the GUS [Central Office of Statistics] balances of fodder for fodder of animal origin and by products of the food industry, whose share in the total quantity of fodder is growing relatively smaller, the rate of increase in fodder expressed in units of oats is slower than in units of grain.

9. The value of available agriculutral production is the sum of the value of final net production and the value of imported fodder; this is a value of the final agricultural product, which is for the national economy the available product, either in the form of a prepared food product, or raw food material for production (together with raw materials for light industry, such as wool, plant fiber).

10. In the entire 5-year period 1976 to 1980, the consumption of concentrated fodder per 1 kg of converted meat production amounted to--according to preliminary estimates--about 3.10 kg.

Table 1. Level and Average Annual Increase in Yields of Grain and Remaining Crops (in Units of Grain)

Year	Yields per hectare			Average annual increase in yields		
	Yields of grain	Yields of remaining crops	Total	Yields of grain	Yields of remaining crops	Total
1950-55	12,6	17,5	16,9	—	--	--
1956-60	15,0	20,5	19,9	0,44	0,54	0,54
1961-65	17,3	24,5	23,2	0,46	0,80	0,66
1966-70	20,1	29,5	27,6	0,56	1,00	0,88
1971-75	25,4	31,4	31,4	1,06	0,38	0,76

DELAYS IN HOUSING CONSTRUCTION, INVESTMENT PLANS REVEALED

Bucharest ROMANIA LIBERA in Romanian 13 Oct 81 pp 1, 5

[Article by Cornelia Preda: "Priorities for the People's Councils"]

[Text] The majority of the people in our country live in new housing, but the need for housing has not yet been fully met and naturally constitutes a main investment objective. This fact has its explanation in the radical transformations occurring in a series of locations from an economic point of view, as also reflected in the level of their social and urban development.

One of the great battles being fought by our national economy for efficiency is, for example, the one for more coal and for the active involvement of this resource in ensuring Romania's energy independence. As a result, certain towns, like Turceni, Rovinari or Matasari, become stars of the first order in the Oltenia coal basin, exchange their rural conditions for those of industrial centers and have urgent need for housing units. The construction of housing developments in such locations, which is closely blended with the efforts to obtain more coal, must have the same intensity and be carried out in the same rhythm.

The largest number of housing units are being built this year in Iasi County, 6,186 apartments, a number that must also be considered with the necessary number of personnel of one of the largest heavy equipment combines in the country, now in the final stages of construction. The need for housing is also felt in a series of counties which, differing from Iasi, have had an intensive development over a relatively short period of time, since the last five year plan, such as: Bistrita-Nasaud, Covasna, Harghita, Salaj and so forth. For all of the approximately 180,000 apartments scheduled to be completed this year there are strong reasons for their inclusion in the investments plan and a direct relationship to the start-up times of certain important economic projects and to the requirements for a judicious correlation between economic development and social development in the localities.

In proposing to complete 180,000 new apartments in the first year of the current five year plan, Romania maintains housing construction at a high rate, with the space thus created corresponding to a population of over 500,000 persons. At the same time, the established investment program can be evaluated as a balanced one

in the sense that it is more closely correlated with the technical base and workforce in the construction sector, a premise for fulfilling the planned tasks under good conditions. It should be pointed out that in the field of housing construction we currently have approximately one-fourth of the manpower in the construction sector, that the extension of the use of prefabrications and the start-up of certain housing factories in all the counties has simplified the work site activities permitting the attainment of certain levels of increased productivity, and that the option for buildings with five floors - the ground floor and four above - provides advantages not only with regards to the living comfort, savings in materials and favorable consequences for costs, but also reduces the necessary amount of heavy equipment, such as high-powered cranes that were sufficiently difficult for the construction enterprises and trusts to obtain. Therefore, this year the builders have begun to complete the planned apartments under more advantageous preparation and execution conditions. What are the results that have been obtained?

We should specify that the principal "builders" are the units of the people's councils, whose task it is to build 152,000 of the 180,000 planned apartments. Despite the meritorious achievements of some of the construction enterprises and trusts, such as those in Iasi, Timisoara, Constanta, Buzau, Caras-Severin and Dolj, the average results for the whole country has barely passed 50 percent of the planned value for the whole year. There are counties where half of the total number of planned apartments, and sometimes even more than half, have to be completed and turned over to the people in just a single quarter, the last one of the year. In such a situation, for example, are the housing builders in Gorj County where the needs for housing, especially in the mining basin, were not met with a concern equal to the significant investments allocated by the state to complete this housing. Despite the fact that a commendable initiative brought builders from other counties to the plains of Gorj (as well as specialized units of the Ministry of Forestry Economy and Construction Materials and the Ministry of Industrial Construction), as we were told by engineer Alexandru Cocias, a director for local economy problems at the Investment Bank: "The desired cooperation between these builders was hampered by the paperwork of bureaucracy and by the sterile discussions about dividing certain tasks, using figures instead of beginning with reality and the required cooperation for an effective situation at the worksites." And, for the workers at Rovinari or Matasari it cannot be the same if they get housing in the summer or in the middle of winter. With good reason, our interlocutor stressed that the delays increase the costs of the construction, without this fact being reflected in an increase in comfort. Along this line of thought, it should be noted that at the worksite of a model complex in Bucharest, organized at the initiative of the municipal people's council and where the costs were followed by using a special accounting document, it was found, for example, that a day lost because of a lack of building supplies, resulting in the non-use of two cranes, cost 4,000 lei in rent, overhead costs and so forth. In other words, 4,000 extra lei and what additional comfort was gained? And, as the delay goes on, a construction project costs more and more.

In Gorj County and in other areas, we know that the carrying out of construction projects is not going smoothly. On the contrary, all kinds of large and small problems must be resolved, from the finalizing of certain systematization details and sketches to the provision of supplies which involve, in addition to prefabricated items, hundreds and hundreds of items. Precisely for that reason, time has become too precious to continue to be lost. Time is being lost at the construction sites? So show the results of certain builders that are below the national average (who are, we must say, precisely the ones who have brought that average down), such as the following counties: Bihor, Covasna, Harghita, Galati, Giurgiu, Hunedoara, Ialomita, Tulcea and Vilcea.

The national importance of putting planned housing into use makes the concerns for achieving these investment objectives one of the central tasks for the people's councils. If time is precious, then we must take actions at all the construction sites so that the daylight hours are well used and that during the night on the second shift preparations are made and the assembly of prefabs and the pouring of concrete continue. Where time is lost and where time is made up can be seen in thorough analyses conducted at the site: even here we must also establish the necessary measures. We are not saying something new here, but pointing out that within the framework of certain people's councils the main investment objectives are identified within the tasks of certain leadership cadre in the executive committee of the people's council, that many mayors have made it a rule to have discussions about the construction sites after a visit to them during the peak activity hours and that in this way decisions are made not according to the desires of the builders, but according to their real possibilities and needs.

A series of other investments are to be made in localities that stem right from the requirements for building housing units or from the exigencies imposed by the concern to carry out certain public services activities with greater efficiency. It has been frequently proven that the tactic of concentrating first on more important things while the rest fall behind, is damaging and contradictory to the planning spirit and discipline in construction. That which has been planned must be achieved within the set timeframes. What use is it for certain complexes to be ready, but the residents cannot move in because the heating system is not ready? Or, the building is ready and beautiful, but from top to bottom there has been flooding because the water pipes used for supply and sewage were completed at the last moment and their connections that should have been tested during construction, during each phase were not fully checked and the results ruined the finishing work in the buildings... It is in line with the concepts for organizing investment project activities that things are carried out in a logical and managed manner.

The range of investments that directly interest the local economy in the most appropriate and profitable sense is very broad, showing the varied development of the localities involved in the investment program. To admit shortfalls means

bringing into question possible development and militating for recouping these shortfalls and for properly using the time remaining until the end of the year, and would represent an important contribution to the achievement of the proposed goals. In this direction, the people's councils, the first managers of the towns and counties and the authors of the policies for achieving the national plan have a decisive word to say.

ACHIEVEMENTS, GOALS OF CHEMICAL FERTILIZER INDUSTRY VIEWED

Bucharest REVISTA DE CHIMIE in Romanian No 8, 8 Aug 81 pp 737-742

[Article by Iustin Rogoz, deputy minister of the chemical industry]

[Text] The chemical fertilizer industry has seen powerful development in Romania in the last 15 years as a result of the priority attention given this sector of activity, whose purpose is to provide the necessary chemical fertilizer for our socialist agriculture as well as large reserves for export.

The increase in agricultural and zootechnical production under the conditions in Romania, with a limited agricultural area and one that is being cultivated in its entirety, cannot be conceived of without application of intensive technologies through administration of chemical fertilizer primarily as well as other chemical products such as pesticides, herbicides, fungicides, veterinary drugs, growth biostimulators and so forth. It has been known and checked at the world level that chemification within the technologies applied in agriculture is making more than a 50-percent contribution to obtaining an increase in production per hectare.

Chemical fertilizers provide the basic nutritional elements which plants need; that is, nitrogen, phosphorous and potassium. Under Romania's conditions, the specific nature of the agricultural land and crops requires a balanced supply of the basic nutritional elements in a certain ratio, which for the country on the average is $N:P_2O_5:K_2O=1.9:1:0.4$.

The basic raw materials for obtaining chemical fertilizer are methane gas for the ones with nitrogen, phosphate rock and potassium ores for the other two nutritional elements. Romania, having available the necessary resources of methane gas, has developed a powerful industry of nitrogen fertilizers, beyond the needs of domestic consumption, thus creating important reserves for export which would compensate for the importing of raw materials for the fertilizers with phosphorous and potassium.

The levels of production achieved, the distribution of production and the high rate of development of the chemical fertilizer industry are illustrated with figures in Table 1 and the graph in Figure 1, which, along with the chemical fertilizers, also show the development of ammonia production, the basic raw material for manufacturing nitrogen fertilizers.

Directly connected with the chemical fertilizer production there also has been corresponding development of the production of sulphuric acid, phosphoric acid and nitric acid, products which in the great majority are intermediaries in obtaining fertilizers.

In a simplified block outline, we see the technological flow of the production of chemical fertilizer in Romania which shows the area of activity, scope and complexity of the chemical fertilizer industry as well as the basic varieties placed at the disposal of agriculture and for export.

From outside the chemical fertilizer sector created especially for this purpose, we also see the chemical fertilizers from other manufactures as secondary products,too. To be mentioned along this line is ammonium sulphate resulting from the manufacture of caprolactum and methylpolymethacrylate as well as from carbonization.

The chemical fertilizer industry, which in 1948 was represented by a single factory (the Valea Calugareasca chemical plant) with an annual capacity of 1,100 tons of simple superphosphate currently has reached the number of 10 large chemical combines which are true industrial complexes built at the world technical level with regard to technologies, capacity of the production lines, degree of mechanization and automation. These chemical combines are distributed as reasonably as possible on the territory of the country (Craiova, Turnu Magurele, Arad, Slobozia, Fagaras, Tirgu Mures, Piatra Neamt, Bacau, Valea Calugareasca, Navodari) both from the viewpoint of the possibilities for supplying raw materials, utilities and personnel as well as from the viewpoint of economic distribution of products to the consumers.

In the 1976-1980 five-year plan, large funds were allocated for investments in the chemical fertilizer sector. Large new production capacities were placed into operation in this period, among which we mention the following: the Arad chemical fertilizer combine with installations for ammonia, nitrogen acid, NPK complex fertilizers and ammonium nitrate, the Bacau chemical fertilizer combine with installations for ammonia, carbamide, sulphuric acid, phosphoric acid and diammonium phosphate as well as new installations for ammonia, NPK fertilizer, ammonium nitrate, simple superphosphate, sulphuric acid, nitric acid and so forth at the existing combines in Fagaras, Craiova, Tirgu Mures, Tirgu Magurele and Valea Calugareasca.

New installations for ammonia and carbamide are in an advanced stage of construction at the chemical fertilizer combines in Arad and Slobozia.

Table 2 presents the production capacity for chemical fertilizer in Romania.

The 100-percent active substance chemical fertilizer production rose more than 1.4 times in 1980 compared with the 1975 level and more than 8.3 times compared with the 1965 level.

The average annual quantity of chemical fertilizer administered per hectare of arable land was 112 kg, compared with 77 kg in the previous five-year plan.

The quantitative increase was accompanied by an important qualitative leap both with regard to diversification of varieties as well as in the area of concentration of active substance. For example, in 1980 more than 20 types of chemical fertilizer were produced, while another 30 varieties,simple and complex, with and without microelements, in solid or liquid form, were being researched and in the homologation phase.

The share of complex fertilizers in total chemical fertilizer production in 1980 reached 36 percent, while the average concentration of active substance rose continually, reaching 37.3 percent in 1980. Particular priority was given in the fertilizers with simple nitrogen to the manufacture of carbamide, which is the fertilizer with

the greatest concentration in active substance and the best physical-chemical properties. The increase in concentration in nutritional elements of the chemical fertilizers as well as in the percentage of complex fertilizers has created for agriculture important technical-economic advantages: reduction in the volume of work and expenses for packaging, handling, transport, storage and administration, together with increase in their efficiency.

In order to achieve the chemical fertilizer industry in Romania with a view to satisfying the requirements for a modern agriculture, there has been gradual creation of our own base for research, design, machine, equipment construction, specialized construction and assembly enterPrises and qualified operating personnel.

On the basis of the experience gained, there then was a gradual move to reducing the volume of imports, to assimilating more and more machinery and equipment in Romania, to taking over some important design activities. Ammonia production is being carried out for the most part in modern, large-capacity installations.

Carbamide production is being achieved in installations of 900 and 1,300 tons/day through the stripping procedure, which provides clear energy and economic advantagaes in relationship with the classic procedure applied on the first installations.

In order to obtain nitric acid and ammonium nitrate, our own technologies have been developed and they are superior to the ones previously imported from the viewpoint of technical-economic indicators.

What also has developed on our own technologies is the manufacturing of sulphuric, phosphoric acid and simple and triple superphosphate.

The recent development of NPK complex fertilizer production has taken place along the line of the nitric attack of the phosphate rocks according to the Norsk Hydro license, thus rejecting the consumption of sulphate for sulphuric acid used previously in the attack of phosphate rocks. Four production units have been built on this technology, each with a capacity of production expressed in P_2O_5 of 100,000 tons/year, with the last three being reproduced in Romania according to an imported model. Three of these units became integrated among the existing installations for nitric acid and ammonium nitrate, thus also achieving large savings in investments.

The Romanian research carried out in the Craiova Center for Chemical Fertilizer Research and in research groups at the chemical fertilizer combines under the coordination of the Central Institute for Chemical Research, has been based on the following important directions:

Creation of our own manufacturing technologies, our own fertilizers and catalyzers;

Diversification of the varieties manufactured on existing installations;

Improvement in the quality of products;

Recovery and utilization of waste and manufacturing subproducts;

Reduction in fuel and energy consumption;

Reduction in environmental pollution in the chemical fertilizer industry.

Table 1: Rise in Production of Chemical Fertilizers and Ammonia

	1965	1970	1975	1976	1977	1978	1979	1980

General total:	2,997,000	989,000	161,000	4,147,000	100.0	10,452,000

The technologies researched in the laboratory and piloted in industry then were transposed to the industrial scale through the contribution of the powerful detachment of designers in the Institute for Technological Engineering and Design for the Chemical Industry, which has made a basic contribution of its own engineering concept.

Chairs in higher education also have participated in creating our industry of chemical fertilizers, actually achieving a creative integration of research, education, design and production.

Our own technologies or licences have been researched and conceived, on whose base installations have been built without imports of licenses and engineering. Along this line we mention our own technologies and licenses created for installations of sulphuric acid from sulphur and gases from nonferrous metallurgy, phosphoric acid, nitric acid, granulated triple superphosphate, diammonium phosphate and complex fertilizers on this base, ammonium nitrate and nitrocalcite, fodder dicalcic phosphate and so forth. A number of patents for inventions have been obtained and recorded in the country and abroad for special technologies and equipment.

Along the line of diversifying production, new varieties have been created as follows: liquid fertilizer with nitrogen for big crops, foliar fertilizer for vegetables, carbamide with microelements (borine, zinc, molybdenum), carbamide covered with sulphur, potassium sulphate, complex fertilizers with potassium sulphate, ammonium and carbamide phosphate, ammonium sulphate, ammonium phosphates, ammonium sulphate, nitrophosphates with microelements, activated phosphorite. The production of these new varieties, checked in experimental lots, may be extended depending on the needs of agriculture and requests of the foreign clients.

The products' quality has improved, achieving the conditioning of complex fertilizers through sprinkling with Deroplast (alkyl-aryl-sodium sulphonates) and powdering with diatomite or vicamite and conditioning the carbamides by sprinkling with formaldehyde. The recovery and utilization of fluoride in the form of cryolite and calcium fluoride.

Special ammonizators are being experimented with during the manufacture of complex fertilizers and they simplify technology and equipment, at the same time reducing energy consumption.

Special attention in achieving the chemical fertilizer industry has been given to the problems of environmental protection, with measures being taken to avoid pollution of water, air and ground beyond admissible limits as well as to avoid sound pollution. Along this line, on the basis of our own research and our own design concepts, technologies, installations and special apparatuses have been created as the following, for example:

A nitric acid installation which eliminates under 100 ppm the NO_x in the final gases;

A sulphuric acid installations with double absorbtion which increases the conversion output to 99.5-99.7 percent.

Improved solutions for washing the gases, new scrubber types with high efficiency, which increase the productivity of trapping the fluoride and powders;

A procedure of biological cleansing of residual waters developed at the Fagaras Chemical Combine and applied to waters with carbamide, nitric ion and ammonia content;

Technical solutions for recirculating impure waters in the installations of nitrophosphates, sulphuric acid, diammonium phosphate, triple superphosphate and so forth, in this way reducing the impure water sent into the sewer or to the cleansing installations and, on the other hand, reducing the consumption of fresh cooling water accordingly.

On the basis of experience accumulated in the design, building and operation of chemical fertilizer installations, our own research and patents, this sector of activity has succeeded in moving from the complex importing to complex exporting of technologies and installations to the developing countries, thus participating in the transfer of technologies in this area. Along this line we mention the installations delivered and placed into operation abroad until now in the area of fertilizers:

Sulphuric acid to Samsun, Turkey and Abu-Zaabal, Egypt;

Granulated simple superphosphate to Elazig, Turkey;

Fertilizer complexes (sulphuric acid, phosphoric acid and triple superphosphate) to Homs, Syria.

Romanian specialists in the fertilizer industry, in research, design and production have made their important contribution to international collaboration, in this area cooperating with prestigious international institutions: UNIDO, BIRD, FAO, TVA, the Arab Federation for Chemical Fertilizer Producers and so forth.

If one bears in mind the scope and complexity of the installations specific to the chemical fertilizer industry, especially the sharp rate at which this industry has developed, one may state that the achievements in this area in the last 15 years have been particularly noteworthy and at the level of world technology.

In the new 1981-1985 five-year plan the tasks facing the chemical fertilizer industry are particularly mobilizing, at the level of the technical-production potential created and of the wisdom and opportunities accumulated by tens of thousands of workers in this area.

The directives of the 12th party congress provide that by 1985 a level of production should be reached in the chemical fertilizer area which provides the demands of agriculture in a proportion corresponding to the specific conditions in our country regarding basic nutritional elements: nitrogen, phosphorous, potassium and other elements such as sulphur, borine and manganese.

Specific tasks for development of the chemical fertilizer sectors also are included in the Program-Directive adopted by the 12th party congress for scientific research, technological development and the introduction of technical progress and in the energy area in the 1981-1990 period and the main directions up to the year 2000, as well as in the single national plan for Romania's social-economic development and the plan for development of agriculture in the 1981-1985 period in modernizing technologies and reducing energy and fuel consumption.

At the 1985 level, chemical fertilizer production should reach 4.05 million tons of active substance, should provide the requirements for agriculture in a proportion which corresponds to the specific ground and crop conditions as well as reserves for export. This level of production represents more than 1.65 times the production achieved in 1980. The growth rate for production is exceeding that achieved in the preceding five-year plan, which was 1.41.

In the 1981-1985 five-year plan, 11.64 million tons of chemical fertilizer of 100-percent active substance (nitrogen, phosphorous and potassium) are to be delivered to agriculture.

The increase in production will have to be achieved for the most part at the existing installations by better usage of the production capacities.

We see that special attention must be directed in this five-year plan to consolidating the installations placed into operation with a view to providing for their operation at the level of the capacities and indicators forecast.

Fertilizers with nitrogen, through the manufacture of ammonia, represent the biggest consumer of natural gas in the chemical industry and a large consumer of electric energy. In the current circumstances of the world energy crisis, a special emphasis must be placed on reducing the consumption of natural gas and electric energy. The following measures are unfolding for this purpose, aimed at:

Modernizing installations for the purpose of reducing energy consumption, primarily natural gas, fuel and electric energy. Absolute priority must be given, along this line, to the ammonia installations, by far the biggest energy consumers;

Recovering all the inventoried secondary energy resources which under the new circumstances justify being recovered from the economic viewpoint;

Providing continuity of manufacture through improvement in the system for the operation, maintenance and repair of equipment. We know that large quantities of natural gas and electric energy are consumed in the stops and starts, quantities which do not turn up in production and which lead to exceeding the specific consumption.

We mention that a collective of specialists in research-design-production has been established to reduce energy consumption in the manufacture of ammonia and their task is to initiate the necessary research and studies.

For the manufactures which utilize imported raw materials, phosphate rock and potassium salts, for example, attention must be directed to reducing specific consumption, increasing the installations' output as well as recovering the subproducts resulting from the manufacture and so forth.

Continuing, measures are being taken to increase the efficiency of manufacture by the recovery and utilization of subproducts and emissions which pollute the environment.

In this direction programs as follows arebeing worked out:

Recovery of the polluting fluoride released in the manufacture of fertilizers with phosphorous, in the form of useful products (cryolite, calcium fluoride);

Utilization of carbon dioxide,a subproduct in the manufacture of ammonia, phosphogypsum, a subproduct in the manufacture of phosphoric acid, calcium carbonate, a subproduct in the manufacture of nitrophosphates and pyrite ash, a subproduct in the manufacture of sulphuric acid;

The recovery and utilization of products which currently are being lost with the residiual water or with emissions into the atmosphere, also posing problems of expenses for depolluting (for example, sulphur dioxide, nitrogen oxides, ammonia, powders of products, valuable ions dissolved in the residual waters and so forth);

The recovery of useful elements from the catalysts used.

Greater attention continues to be given to diversifying and improving the quality of the fertilizers (improving the granulometry, more efficient conditioning in order to reduce the tendency toward concentration and so forth) with a view to raising their efficiency.

In order to increase the outputs of reaction, reduce the pressure losses in the catalytic reactors and reduce working pressures with a view to finally reducing energy consumption, special attention is to be given to research to improve the performances of the current catalysts and to create new catalysts with superior activity, ones which are less sensitive to poisoning, with mechanical properties and superior working life.

Aware that the five-year plan we have passed is an important qualitative leap in our work and in order to cope with our tasks, we will have to take action with much more initiative, courage and responsibility, each one at his place of work.

The achievements of the chemical fertilizer industry are included in the line of the grand successes obtained in development of industry, agriculture, science and culture, being a wonderful demonstration of the creative force of all the people and their unshakable determination to implement the grand goals of the Romanian Communist Party's scientific policy.

Special merit in guiding the development of our national economy and all of society under the complex conditions of current international life goes to the party's secretary general and president of the republic, Comrade Nicolae Ceausescu, who has made and is making a basic contribution to working out our programs, economic policy and the entire policy for building socialism.

DATA ON MEAT EXPORTS, FIRST HALF OF 1981

Belgrade GLASNIK POLJOPRIVREDNE PROIZVODNJE, PRERADE I PLASMANA in Serbo-Croatian No 10, Oct 81 pp 28-29

[Article by Milenko Nikitovic]

[Text] Exports of livestock products over the first 6 months of this year amounted to $147 million, which was 27.3 percent less than in the same period of last year ($202 million), and by the same amount short of the 1981 plan (Table 1). First there was a drastic drop in exports of young beef (two-ninths as much was exported), and then there was a drop in the exports of canned meat products to the United States (11 percent) and in exports of horses to Italy (12 percent). It is understandable that when there is a decline in exports under the three most important export classifications, the entire export program for 1981 is in jeopardy and must be rebalanced and brought within a realistic framework.

Table 1. Survey of Exports of Livestock Products, in thousands of dollars and tons

Livestock Products	1980 t	1980 $	1981 t	1981 $	81/80
Young beef cattle	9,002	16,476	10,189	18,689	113.0
Beef of young animals	34,786	81,789	7,578	26,869	32.8
Lamb	2,925	10,910	2,511	12,096	110.2
Horses	21,875	36,814	14,739	32,415	88.3
Pork	12,561	34,326	12,142	36,243	195.1
Canned beef products	1,705	3,092	2,238	4,379	141.0
	82,854	183,407	49,397	130,691	71.2 (value) 59.6 (amount)
Miscellaneous		18,836		16,509	
Total		202,243		147,200	72.7
Breakdown:					
Convertible area		181,912		123,624	67.9
Bilateral payments area		20,331		23,576	115.9

Exports of young beef cattle were up 13 percent, and there was a possibility of a further increase thanks to the rise of the EEC quota to 60,000 head. Sizable exports to the Emirates were contracted for, so that favorable results can be expected for the export of live animals this year. This will improve only in part the foreign exchange balance, since the drop in exports of young beef is considerable. Though slightly smaller in physical volume, exports of lamb for the first time reached a figure of $12 million, which mainly goes to Italy. In the second half of the year there is the possibility of marketing lamb and live lambs in the Near East. However, our prices are considerably higher than those of New Zealand and Australia, so that it is difficult to count on larger exports to those countries.

Exports of canned meat products have been showing a rising trend since the beginning of the year. It is disturbing, however, that exports to the United States have continued to drop. This negative trend, which began in early 1980, is continuing. Why is there a decline in exports of canned meat products to the United States? The reasons are exclusively those of the market. The drop in the prices of live hogs in the United States caused a drop in the prices of pork and canned meat products, imported goods above all. The price of live hogs in March was $1 per kilogram (48 cents per pound), which amounts to about 35 dinars per kilogram. Yet our price for hogs today is 60 dinars per kilogram. Then in the second quarter, the price of hogs rose, and that brought about a rise in the prices of canned meat products. Our failure is especially striking if it is compared with previous years, as can be seen from Table 2.

Table 2. Exports of Canned Meat Products to the United States

Year	Tons	Six months, in millions of dollars
1979	9,439	31.0
1980	4,800	13.0
1981	4,270	12.3

It is certain that we are greatly disturbed by the decline of exports, since we believe that by 1985 we would succeed in bringing exports of canned meat products to that country up to $100 million.

However, there has been an increase in exports of canned pork products to the bilateral payments area, and the transactions concluded so far guarantee exports amounting to more than $50 million. If we then add to that exports to other markets, the annual export plan will certainly be exceeded.

It is an unfavorable fact that exports of canned beef products are small in volume, though considerably higher in percentages than last year. Exports amounting to $5-6 million annually do not come close to representing our capabilities, which are about tenfold greater than that. As to markets for canned beef products, they do exist: Sweden, West Germany (canned beef stew, corned beef, stewed beef), which is not even to mention the countries in the Near East and Africa. Here again we come up against prices, since the price of our beef is far higher than the price of Argentina, Uruguay and the EEC.

We also have the common problem of the marketing of baby beef, and that problem is that we should undertake cheaper production of beef and not to continue our exclusive offering of expensive baby beef.

The export of horses in the first half of the year showed a considerable growth over 1980, at least in terms of foreign exchange, if not with respect to quantity. That is, an inflow of foreign exchange amounting to $32 million was achieved, so that after the 1-year lull there are prospects that this year we will again go higher than $50 million, which was in the past our "standard."

Exports of Young Beef

Exports of young beef were two-ninths of what they were over the same period last year. Thanks to that fact, exports of the products of animal husbandry this year fell short of the plan, since last year young beef represented almost 40 percent ($142 million) of total exports of livestock products. Exports amounted to 7,578 tons, as compared to 34,786 tons in the first half of 1980. If we take our annual export program at 60,000 tons of young beef, it might be said that this year we will export one-third, or 20,000 tons, unless some exceptional circumstance emerges in the meantime to enlarge and step up exports.

The situation with the EEC is well known. In 7 months four meetings of the council of ministers have been held with the Yugoslav question on the agenda, but the Yugoslav demand for free export of young beef to Greece was not issued a "visa."

From approval of the "mandate for negotiations" and then the opposition of France and Ireland, we have today arrived at the so-called "legal hiatus." That is, it is not clear whether the status quo has been extended to the second half of the year or not, that is, whether Greece can conclude a bilateral agreement with Yugoslavia. Seven months have already passed, and the bureaucratic machinery in Brussels has so far not shown a desire to resolve the problems of third countries with any more urgency. Finally, September was to come without a true picture of the outcome and fate of our demand for export of young beef to Greece. There is just one thing we should say here: at this point it is not another 15,000 tons we need, which was the subject of discussion by the council of ministers, nor the 40,000 tons we requested for Greece. This year we would be satisfied even by the amount under Article 11 of the Yugoslavia--EEC Agreement, which is 34,000 tons, of which 5,500 tons were exported to Italy in the first half of the year, but with the proviso that Yugoslavia's variable levy be reduced in the case of Greece, so that up to the end of the year it could export under normal conditions 25,000 tons of young beef to Greece.

In connection with the marketing of young beef Greece's entry into the EEC seems to have caught us unprepared and to have surprised the network of importers and exporters, representatives of government ministries for the areas involved, and also producers. Presumably people were convinced that nothing was going to change for us and that we would probably "work it out easily." But since 1 January not a single kilogram of young beef from our country has crossed the Greek border, and we have not sold a single kilogram in advance on the other side.

The first sales came for the Near East only in June and July. Has our network of export-import firms, consisting of 1,235 organizations registered for foreign trade transactions (not all, of course, for exports of food) and 1,059 business units abroad, been up to its task? In SR [Socialist Republic] Serbia alone there are 18 organizations registered for the export of products of animal husbandry, though the exports of this republic amount to about $90 million annually, which is approximately the turnover of one organization of moderate size.

The question is whether negotiations with the EEC on the question of our exports of young beef to Greece should begin only after Greece's entry into EEC, that is, after we see whether there actually is an embargo on our exports, and that an embargo in the sense that our goods cannot support charges exceeding 70 percent, which de facto signifies a prohibition. Or, for example, is it truly impossible to sell any amount of young beef at all on the market of Iran, Iraq, Kuwait, the Emirates, Lebanon and Jordan? Of all the many organizations, one and only one succeeded in June and July in selling certain amounts of meat and livestock to the Near East. What are they doing, those who have been designated by the Livestock-Raising Fund to research the market of the various countries?

These are all questions which should be critically analyzed and subjected to detailed analysis, all in the interest of our present and future exports.

DATA ON YUGOSLAV RAILROAD CAPACITIES, OPERATION

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 24-26 Oct 81 p 15

[Article by Djordje Vasic, M.A.]

[Excerpt] It can be seen from the table that the density of Yugoslavia's rail network is very low compared to those other countries and stands only between Turkey and Greece. The density of the network on the area served by the Beograd Railroad Transportation SOUR [Complex Organization of Associated Labor] is lower than the density of Yugoslavia's network. Second, there is the favorable proportion of electrified rail line in Yugoslavia and the Beograd Railroad Transportation SOUR: that is, only Italy, Austria and West Germany have a higher degree of electrification. The number and carrying capacity of freight cars per kilometer of line in Yugoslavia and for the Beograd Railroad Transportation SOUR is also lagging behind the countries with which the comparison is made, except for Turkey and Greece. Conversely, utilization of freight cars, measured in net ton-kilometers per kilometer of line, is highest in Yugoslavia and on the network of the Beograd Railroad Transportation SOUR.

Status and Utilization of Railroad Capacity in Various Countries

Country--Railroad	Line Length, km	Line Length, km/1,000 m^2	% of Electrified Line	No of Freight Cars/Km of Line: No	No of Freight Cars/Km of Line: Capacity, t	Actual Net Ton-Km/Km of Line
West Germany	28,565	114.9	38.0	11.3	373.1	588
Austria	5,854	99.8	50.6	6.5	188.5	767
France	34,444	62.9	28.6	6.9	275.8	808
Turkey	8,132	10.4	2.5	2.7	81.1	682
Greece	2,461	18.6	--	4.5	108.0	207
Italy	16,072	53.3	53.7	7.4	215.3	406
Poland	24,415	78.1	27.3	--	--	--
Yugoslavia	9,381	36.6	31.6	4.8	184.7	1,569
Beograd Railroad Transportation SOUR	1,889	33.7	47.6	4.4	165.0	1,685

Within the framework of the Yugoslav Railroads the status and utilization of various aspects of capacity are to be seen from the following table:

Status and Utilization of Capacity of the Yugoslav Railroads by Railroad Transportation Organizations

Railroad Transportation Organizations	Line Length, km	Status of Freight Cars: On Books (IKP*)	Status of Freight Cars: In Joint Use on Network of Yugoslav Railroads (OKP**)	No of Cars/Km of Line: IKP*	No of Cars/Km of Line: OKP**	Actual Net Ton-Km/Car
Ljubljana	1,228	7,880	5,690	6.4	4.6	1,198
Zagreb	2,423	12,952	9,001	5.3	3.7	1,261
Sarajevo	1,030	7,670	5,670	7.4	5.5	1,414
Novi Sad	1,579	5,570	3,833	3.5	2.4	900
Beograd	1,889	8,006	5,430	4.2	2.8	1,285
Pristina	333	1,337	983	4.0	2.9	501
Titograd	227	833	518	3.6	2.2	675
Skoplje	672	2,238	1,421	3.3	2.1	719
Yugoslav Railroads network	9,381	46,486	32,546	5.0	3.5	1,169

* Rolling stock of individual organizations.
** Common pool of freight cars.

As we see, rail facilities are variously distributed over the regional network of the Yugoslav Railroads, and there is also variation in the level of utilization viewed in terms of transport work per car. In that respect the Beograd Railroad Transportation SOUR is below the average for the availability of freight cars, but in utilization of cars it takes second place in the network of the Yugoslav Railroads, immediately after the Sarajevo Railroad Transportation Organization.

More Optimum Utilization of Cars

The shortage of cars is the first and principal reason why the Beograd Railroad Transportation Organization has the highest expenses for operating cars of foreign railroad administrations and other railroad transportation organizations within the Yugoslav Railroads. The Beograd Railroad Transportation SOUR paid in the first 6 months of this year $120 million of foreign exchange to foreign railroad administrations for car use and 266 million dinars for use of the cars of other railroad transportation organizations within the Yugoslav Railroads.

The problem of the railroad car shortage on the network of the Yugoslav Railroads, and on the Beograd Railroad Transportation SOUR in particular, can be resolved first of all by purchasing a large number of up-to-date freight cars, especially since the present fleet is 54 percent written off. This problem can be resolved successfully by better pooling of resources by those who use and those who render transportation services and by ensuring more favorable credit terms and conditions for the production of freight cars in our own country.

The shortage of freight cars can also be appreciably mitigated by more rational use of the available cars in view of the considerable reserves. After all, during one circuit (the time from loading to loading) the car spends 32 percent of its time during loading and unloading at the user's premises, 37.5 percent in railroad yards for making up and disassembling trains, 17.7 percent during operations in other stations, and only 12.8 percent in trains. That accounts for the desire to make better use of cars by reducing the time they spend in loading and unloading (a contribution that should be made primarily by the users of transportation) and to reduce the time they spend in stations, which is after all the railroad's responsibility.

A second area in which there are common and broad social interests in higher utilization of rail transportation, above all by reduction of the share of transportation between one production unit and another in the shipping of goods, is concerned with the use of energy, especially imported liquid fuels. This would mean a contribution to reduction of the outflow of foreign exchange and to improvement of our country's exchange balance.

REPORT ON FULFILLMENT OF 9-MONTH ECONOMIC PLAN

Sofia RABOTNICHESKO DELO in Bulgarian 30 Oct 81 pp 1, 2

[Report by Committee for Integrated Social Information System, Sofia, 20 October 1981: "Results of Fulfillment of Integrated Plan for Socioeconomic Development of Bulgarian People's Republic during First 9 Months of 1981"]

[Text] Transforming the decisions of the Twelfth Congress of the Bulgarian Communist Party into deeds, the working people of the Bulgarian People's Republic launched broadscale socialist competition, made new labor advances, and discovered additional potential reserves for raising efficiency in all spheres and activities of the national economy. The plan for the social productivity of labor was overfulfilled, as were the plans for net output, aggregate profit, and the adoption in production of scientific and technical achievements; average wages increased.

Industry

Fulfillment of the plan for commodity output disposed of and the rate of production growth, broken down by ministries, was as follows:

Ministries	Commodity output produced	
	Percent fulfillment of 9-month plan for sale of commodity output	1st 9 months of 1981 as percent of 1st 9 months of 1980
Ministry of Power Supply	102.4	108.2
Ministry of Chemical Industry	100.6	107.9
Ministry of Machine Building and Electronics	100.1	108.2
Ministry of Light Industry	100.8	105.9
National Agroindustrial Union	102.0	103.6
Ministry of Construction and Architecture	97.7	106.4
Ministry of Metallurgy and Mineral Resources	98.3	111.8
Ministry of Transportation	100.7	105.1
Ministry of Forests and Forest Industry	101.4	106.1

Ministries (continued)	Commodity output produced	
	Percent fulfillment of 9-month plan for sale of commodity output	1st 9 months of 1981 as percent of 1st 9 months of 1980
Ministry of Internal Trade and Public Services	102.0	107.9

Production of basic industrial products was as follows:

Product	Output produced in 1st 9 months of 1981	1st 9 months of 1981 as percent of 1st 9 months of 1980
Electric energy, 000,000 kwhr	26,721	106.0
Coal, 000 tons	22,860	98.5
Rolled ferrous metals, 000 tons	2,495	106.2
Electrotelphers, 000 units	95	101.1
Motor trucks, 000 units	15	95.3
Power transformers, 000 units	6	109.4
Soda ash (base 98%), 000 tons	1,092	98.4
Nitrogen fertilizers (base 100% including carbamide), 000 tons	560	101.5
Synthetic fibers and silks, 000 tons	75	105.0
Paper, 000 tons	256	109.5
Paper pulp, 000 tons	167	107.1
Cement, 000 tons	4,073	103.4
Cotton fabrics, 000,000 meters	264	102.8
Woolen fabrics, 000,000 meters	28	97.2
Silk fabrics, 000,000 meters	26	105.6
Shoes (excluding houseslippers and rubbers), 000,000 pairs	14	102.3
Meat, 000 tons	342	101.8
Meat products, 000 tons	69	105.1
Butter, 000 tons	16	96.5

Contracts for the delivery of commodities for the internal market were fulfilled 97.7 percent. Larger quantities of the following were provided: kashkaval [yellow cheese], edible vegetable oils, rice, canned meat and vegetables, sugar, nonalcoholic beverages, television receivers, radio receivers, passenger cars, motor vehicle gasoline, household refrigerators, bicycles, cast-iron radiators, motor-vehicle storage batteries, asbestos cement slabs etc.

Some economic organizations and units of industry did not fulfill their plan for the production and sale of products of importance to the national economy.

The plan for domestic services to the population was fulfilled 103.7 percent. Despite this, the growing needs of the population were increasingly unmet, especially in respect of radio and television sets, dry cleaning, and construction and repair services.

As compared with the first 9 months of 1980, net output per 100 leva of fixed production assets increased 0.5 percent. The plan for the social productivity of labor was overfulfilled.

II. Agriculture

During the 9-month period agricultural organizations and units of the National Agro-industrial Union fulfilled the plan for plant-growing and animal-husbandry commodity output. The wheat production plan was fulfilled and a larger amount was produced than last year. The barley production plan was not fulfilled.

Some okrugs were seriously affected by drought. Despite the intensive irrigation measures that were taken the yields of basic crops in individual rayons were lower than planned, which had an adverse impact on plan fulfillment for the entire country, particularly in respect of corn, sugar-beet and other production.

The number of head of agricultural animals and poultry on communal farms was:

(000 head)

Animals and poultry	1 Oct 1981	1 Oct 1981 as percent of 1 Oct 1980
Cattle	1,443	99.7
including: cows	490	101.2
Sheep	6,643	99.5
Swine	2,946	98.5
Poultry	27,664	99.7

In comparison with the 1980 9-month period, more cattle and poultry in slaughtered weight and more milk, but fewer eggs were purchased from all categories of farm. Nonfulfillment of plan for all animal products occurred in the following okrugs: city of Sofia, Burgas, Varna, Veliko Turnovo, Vratsa, Pazardzhik, Pernik, Pleven, Turgovishte and Khaskovo.

III. Construction

Construction organizations fulfilled the plan for construction and installation work for the 9-month period 100.1 percent, or 74.3 percent of the annual goal. Fixed assets worth 2,741,500,000 leva were put into operation; much existing production capacity was modernized and reconstructed. The following came into operation: polypropylene plant at the Burgas Petrochemical Combine, new sulfuric acid system at the Georgi Damyanov copper-producing combine, modernization and reconstruction of the "Madara" Truck Combine in Shumen etc.

Housing units completed and handed over to the population: 33,107, or 45.3 percent of the annual goal.

New kindergartens with accommodations for 2,957 were put into operation.

Fulfillment of the annual plan for taking down capital investment lagged behind in the following ministries: chemical industry, machine building and electronics, metallurgy and mineral resources, light industry, internal trade and public services, communications, Committee for Culture etc.

IV. Transportation and Communications

The basic freight to be carried under contract by rail, motor and water transport and the plan for passenger carriage were fulfilled. A number of technical and economic indices pertaining to the use of transportation facilities were improved. The plan for aggregate profit and that for net output and for the social productivity of labor were fulfilled.

Also fulfilled was the plan for revenues realized from services performed in communications. The postal system was expanded by 23 PTT [posts, telegraphs and telephones] stations; 96,000 new telephone sets were installed.

V. Internal Trade

The retail goods-turnover plan was fulfilled, and as compared with the 1980 9-months period, volume increased 4.6 percent.

Sales of certain basic food and nonfood items during the 9-month period as compared with the corresponding 1980 period were as follows.

Food and Nonfood Items	1st 9 months of 1981 as percent of 1st 9 months of 1980
Meat	108.5
Meat products and canned meats	105.4
Rice	95.1
Edible vegetable oils	99.6
Milk	99.2
Brynza [sheep's milk cheese]	101.7
Kashkaval	107.1
Butter	103.3
Eggs	103.7
Sugar	108.8
Fresh vegetables	99.9
Fresh fruits	120.3
Sewn goods	103.0
Furniture	107.2
Cotton fabrics	100.3
Woolen fabrics	97.2

Food and Nonfood Items (continued)	1st 9 months of 1981 as percent of 1st 9 months of 1980
Silk fabrics	101.1
Shoes	106.4
Household refrigerators	114.3
Household electric washing machines	160.2
Electric cook stoves	140.3
Vacuum cleaners	110.0

On the basis of the results achieved during the 9-month period, effective measures must be taken by managements and by labor collectives of enterprises, economic organizations, ministries and people's councils for a successful windup of the fourth quarter that will ensure comprehensive fulfillment, in respect of all indices, of the 1981 integrated plan for the socioeconomic development of the country.

EDITORIAL TAKES CRITICAL VIEW OF 1981 AGRICULTURAL ACTIVITIES

Sofia KOOPERATIVNO SELO in Bulgarian 6 Oct 81 p 1

[Text] Only three months separate us from the year's end--the first year of the Eighth Five-Year Plan. The analysis of the past eight months shows that agriculture can expect better economic and productive results compared to that of last year. The record wheat and barley harvest is an important condition for the grain problem solution in our country. Compared to last year, better results are also being reported by enterprises of the food industry, agricultural machine building, and construction, as well as the auxiliary organizations for marketing and supplies, including VTO (Foreign Trade Organizations) and scientific ones.

The commodity production plan of NAPS (National Agroindustrial Union) has been fulfilled by 102 percent for the last eight months, and the plan for realized production by 99.7 percent. The quality indices plan has been fulfilled even higher.

At the same time, however, in some NAPS subbranches and activities, the expected results are far below the requirements of this year's plan. It is expected that some okrugs and agricultural organizations will not fulfill their plans and obligations for sales of grain, sugar beets, tobacco, beans, potatoes, meat, milk, etc. The food industry lags behind in fulfilling the plan for manipulated fermented tobacco, fodder yeast, sugar and sugar products, spirits, canned vegetables, frozen and sterilized fruit and vegetables.

There is no doubt that the unfavourable trends in the plan's fulfillment were definitely affected by drought and by untimely providing of machinery and raw materials to some economic organizations. However, thorough analysis of the economic results shows that drought and some problems in material and technical supplies are not the main causes. There have been droughts in the past, and there will be droughts in the future. And a perfect technical and material supply, as some economic activists understand it, will never be achieved. It is quite logical to inquire why, under comparatively similar climatic conditions and technical and material supplies, the results in different okrugs and economic organizations differ significantly. The average yield from fall crops as well as the expected average yield from spring crops in the okrugs and agroindustrial combines vary from 250 to 800 kg per decare. Thus weeds, not the drought, are the main enemy of our agriculture. That is why the expenses for chemical preparations

are increasing, and this year they reached the impressive amount of 75 million leva.

Recently, by decree of the Executive Committee of NAPS's Central Committee, comprehensive inspections of animal farming conditions were conducted in the okrugs of Veliko Turnovo, Varna, Vidin, Vratza, Mikhailovgrad, Lovetch, Stara Zagora, and Yambol. Irrespective of measures taken during the last months, inspections revealed that the same regrettable mistakes are still being made and the order and discipline in feeding and caring for animals are still being violated, resulting in deceleration of production and the buying off of animal produce. These alarming facts cannot be accounted for solely by fodder shortages, because during recent years the situation in okrugs like Razgrad, Silistra and Ruse, which experience no special difficulties in concentrated forage, fares no better than in the other okrugs in the country.

There are serious weaknesses in the food industry too. We can hardly accept as normal the fact that every failure to fulfill the plan is accounted for by shortages of raw materials and accompanied by urgent pleas for reducing the plan. Simultaneously, such a major resource as full and nonwasteful use of the raw materials remains unsolved and at many places is still at the conversation and general consideration stage. And how many other programs without real importance were developed?

All these weaknesses and unfavourable trends in the plan's fulfillment are reflected in the final economic and financial results of NAPS, OAPS (Okrug Agro-industrial Unions) and other economic organizations.

Where should the efforts be directed in order to ensure successful fulfillment of the 1981 economic plan?

Administration of the agro-economical organizations should concentrate its attention on the main resource that will help to overcome the plan's lagging fulfillment, namely to harvest crops promptly and without losses, to preserve well the agricultural production and utilize it completely. Observations of many years show that every year 40 to 50 kg corn per decare are lost in harvesting, and in harvesting sugar beets, losses range from 350 to 500 kg per decare. Nor are the losses in gathering apples, grapes and vegetables any less.

This year we should create a better organization for gathering and utilizing all the vegetative mass, especially that of the maize, sunflower, soy straw, and others. All possibilities for a complete solution of the silage problem are present. This can be done by preparing 1,500,000 tons of silage (by means of separate harvesting of the maize) more than the projection in the plan, and henceforth create a good basis for a year-round typified feeding of the ruminant animals.

The administration of the purchasing and processing enterprises has rich experience in produce utilization. This obligates them to take additional measures to organize round-the-clock work for creating high labor discipline and good order at the purchase stations, in order to avoid the waste or the inadequate use of a single kilo of agricultural produce.

Immediate measures leading to the greatest economy of materials, labor and money should be taken. Even though the basic produce expenses have already been made, we must organize a careful review and by the end of the year cut the unproductive expenses by at least 30 percent. Great possibilities for cutting the material expenses exist in feeding the animals. If the feeding and caring technology is strictly observed, no less than 50,000 tons of high-quality combined forage at the total price of 8 million leva can be saved by the end of the year.

Last but not least, the expenses of the "Work Salary" fund should be adjusted according to the expected real profits from the agricultural activity. For it is well known that without strict economic measures, the economic approach principles cannot be applied completely. The economic problems cannot and should not be resolved through feelings and emotions, but mainly through economic stimuli and sanctions.

Regardless of the difficulties and the complex problems, it is genuinely possible to overcome the lagging and to fulfill successfully the plan for the first economic year of the Eighth Five-Year Plan. Everything will depend on the improvement of the work organization and on the full mobilization of the efforts in the months ahead until the year's end.

CSSR INTRODUCTION OF REMOTE CONTROLS TO HEATING SYSTEMS NOTED

Prague SVOBODNE SLOVO in Czech 16 Oct 81 p 3

[Article by kz: "Telegrams Shorten Peak-Load Periods"]

[Text] These are not ordinary telegrams. They are not sent off by the post office, but by the transmitter located in the high voltage distribution center or transformer station. They consist of a series of electric impulses which travel through the transmission system to the households. They are not received by men, but by special receivers attached to appliances--in this case to storage heaters or electric hot water storage heaters. Telegrams have a higher frequency than the standard 50 Hz in the grid and consist of a number of control commands. If the commands contained in the telegram agree with the commands set in the receiver, the appliance is switched on or off.

"We have approximately 350,000 storage heaters and approximately 800,000 electric hot water storage heaters in the CSSR today whose installed input is about 2,500 MW," said Eng F. Bizek of the general directorate of Czech Power Plants. It is enough--if we realize that the total load of the CSSR grid amounts to approximately 10,000 MW during peak periods. These appliances serve households and socialist organizations and consume electric energy during the night which is advantageous for our power sector. The switching on in the evening and switching off in the morning is achieved mostly by so-called rated circuit breakers approximately 600,000 of which are installed on the appliances in the entire grid. The timers which control them, however, do not work punctually and so it happens that the appliances remain switched on during periods of peak power consumption. For this reason, workers in the power sector must regularly adjust rated circuit breakers. This was one of the reasons for the introduction of the new system of mass remote controls--HDO. This system has many advantages. It controls thousands of appliances from a few centers so that power engineers can immediately eliminate a considerable power load. They use the present grid for switching on and off of appliances, and the HDO receivers installed on appliances work reliably and require virtually no maintenance.

The first HDO transmitter was put into operation by the power engineers at Cheb in 1981. There are already 32 of them in the CSR (the most efficient is in Prague-Malesice) and control approximately 60,000 receivers. The biggest progress in the HDO installation has been made in East Bohemia, West Bohemia and North Moravia krajs. Apart from switching on and off of storage appliances, this system is also used by the power engineers for control of public lighting, neon tubes in advertising signs, lights in store display windows, traffic lights and so on, HDO will also be used in the centrally controlled heat supply--in the regulation of operation of heat exchanger stations.

From 1 December 1980, approximately 40,000 users in East Bohemia, West Bohemia and North Moravia krajs participated in the experiment with mass remote control of storage appliances. The power engineers wanted to verify through this experiment the way in which they could best regulate electric power consumption during the day. Due to the steadily growing number of household appliances, the load in the grid increased unusually recently. This particularly applies to the beginning of their charging period--time zone--after 10 pm, when the load in the grid of certain areas almost reaches the maximum daily values. The third power consumption peak actually appears on the consumption graph at this time. The power engineers therefore tried to level the consumption graph, that is to reduce the load at the beginning of the night charging period and transfer it to the time when the grid load is lower. Electric energy consumption declines not only during the night, but also between 1 pm and 5 pm. The users were therefore divided into several groups with staggered charging periods and could take advantage of the lower afternoon rates which equal the night rates.

This experiment demonstrated that by means of mass remote controls, consumption can be transferred to periods planned in advance. When we compare the consumption graph in East Bohemia Kraj during January 1980 and January 1981, for example, we find that the power engineers succeeded through HDO in transferring approximately 65 MW to the night consumption period after 12 am and 30 MW to the afternoon. The quantity involved was somewhat smaller in May--50 MW at night and 20-25 MW in the afternoon. These values represent approximately 10 percent of the maximum grid load of the kraj. Since this experiment produced good results, the power engineers--after a detailed evaluation of the experiment--will apply these measures to standard operation.

The grid load of the storage appliances is to increase from the present 2,500 to 4,000 MW in the CSSR during the Seventh Five-Year Plan. During this period, there should be 6 big and 71 medium-sized transmitters as well as 280,000 HDO receivers in operation, in the CSR alone and HDO should cover approximately 75 percent of the CSR territory. Whether the power engineers will succeed in achieving this goal will depend not on them alone, but also on the suppliers of this progressive equipment.

CITIZENS URGED TO APPLY THEMSELVES TO PLAN FULFILLMENT

Prague RUDE PRAVO in Czech 6 Nov 81 p 1

[Editorial]

[Excerpt] With less than 40 days remaining until the end of the year, many of the planned tasks remain to be accomplished and it is a good reminder that what may seem difficult today [in terms of energy savings] will be even more complicated the next year.

In most cases, enterprises are looking only for solutions at the prescribed levels of conservation and in many places not even that much. The latter will find it difficult indeed to find a way out--to fulfill the plan and use less fuels and energy in the process.

The fulfillment of the tasks is more successful in places where a counterplan has been prepared for this year, where the tasks were actually discussed with the workers, where they did not resign themselves to accepting the counterplan from "above," (which cannot even be considered a counterplan) but used the initiative of the entire employee collective. Unfortunately, there are only a few enterprises with good counterplans. Many an organization and enterprise management are blissfully assuming, and using it as an excuse, that as long as they do not have the exact and entire five-year plan, there is nothing they can do.

Is there really nothing they can do? Are they not aware of the dynamics of growth in the succeeding years of a five-year plan? Are they not aware of the continuous requirements for raw and processed material and energy conservation? Can anyone really be so naive and not assume that the Seventh Five-Year Plan, which is to be submitted in the second quarter of the next year will tighten the requirements, especially in the areas of energy and material consumption conservation? It makes it that much more inevitable, that the enterprises should use the counterplan methods and prepare themselves for the even more difficult conditions in the next year; that the management even now consult the workers on ways and methods for actions to be taken and how to accomplish the increasingly difficult future tasks more effectively.

We cannot continue only talking about the participation of the workers in management but must make it a part and parcel of an actual work method. The employee participation in management cannot be understood only in the bureaucratic sense as a mere formality but as a serious and basic component of the management of

the socialist society. It is an expression of trust toward the working collectives while at the same time it increases their responsibility for the joint results.

One of the conspicuous shortcomings of industrial management is the incorrect approach to the implementation of the Set of Measures. It is an extensive system of rules placing higher demands on a days work. Why is it then that so few places are actually discussing the implementation of the Set of Measures with all those involved in it? Is it an exclusive management problem? But that is not so! The entire working collective has the right to know what the new rules require of them and who is complying with them and who is not. That is because the consequences go either to the credit of the entire collective or they all are penalized for noncompliance.

Fulfillment of the Plan and the Set of Measures are not two independent measures isolated from each other. They mutually interact while many people are not being aware of this connection. They look for causes for unsatisfactory plan fulfillment everywhere else, mainly outside of the enterprise, without admitting that they are not implementing new methods and approaches.

Plan fulfillment must be perceived as satisfying the needs of the society with an efficient and rational utilization of all possibilities and resources, while not leaving idle production which is not of interest to them. It is absolutely necessary to attain the optimum solutions in the implementation of the planned tasks and thus lay the necessary conditions for the start into the next year.

TRENDS IN NUCLEAR HEATING PLANTS FORECAST

Leipzig ENERGIETECHNIK in German Vol 31 No 9, Sep 81 pp 321-329 manuscript received 25 Mar 81

[Paper presented at Dresden Technical University's 12th Colloquium on Power Plant Engineering, 25-26 November 1980, by Prof Dr Herbert Munser; Dr Beate Reetz, lecturer; Dr Guenter Glaeser and Dr Gerhard Schmidt, all with the university's Energy Conversion Section, Working Group on Energy Systems: "On the System Design of Nuclear Heat Supply Facilities"]

[Text] 1. Objectives

The primary energy situation in the GDR requires increased application of nuclear energy for the production of sources of consumer energy. Since about 50 percent of the need for usable energy occurs as demand for heat in the intermediate and low temperature range, a considerably greater reduction of the pressure on the supply of fossil fuels may be achieved through the production of heat from nuclear energy plants than can be expected with exclusive use of nuclear fuel for the production of electrical energy. The two basic possibilities for using nuclear energy to supply heat,

1. construction of nuclear heating plants,

2. implementation of power-heat-coupling in the nuclear power plants,

are tied to various boundary conditions of a territorial nature and in general present no alternative solutions through restrictions in the common electrical energy grid, nuclear power plant construction and coolant supply as well as the characteristics of the demand for heat in existing district heat supply systems and in those to be built.

In the following considerations for the optimal design of district heating systems based on nuclear heat sources, primarily system solutions for the second possibility will be discussed.

The coupling of electrical energy and heat production in power plants based on fossil and nuclear fuels assures high primary energy utilization and thereby constitutes an opportunity to control the primary energy situation with the production of high-quality sources of consumer energy. The optimal design of the heat transportation system based on hot water decides whether this kind of heat supply to principal consumer areas can be implemented.

Starting from the territorial boundary conditions of the heat supply areas, their heat requirement density, the maximum heat requirement, their time dependence characteristics and the distance over which heat must be transported, optimal design and operational conceptions as well as design and operational parameters are reported on.

2. Switching of Base and Peak Load Equipment

The large proportion of the capital expenditures on the total investment for the heat transfer systems basically speaks for their being used to meet base-load demand for heating. The nature of their combination and connection to the peak load equipment within the primary heat distribution networks in the areas of greatest demand influences the heat transport parameters and the volume flow in the transport systems. The efficiency of the power-heat-coupling in the power plants is highly dependent on the values of the flow and return temperatures of the hot water. With parallel coupling of heat transport systems as base load equipment with the peak load equipment in the heat transport system according to Figure 1, the advantages of the cogeneration of electrical energy and heat are fewer in comparison with series-coupled systems, since the inlet temperature of the hot water in the transport system as a rule is below that of the primary system. However, the greater heat transportation density results in a lower design and load-dependent mass flow in the transport line. For a base load fraction of $\alpha G_1 = 0.6$ in the design case, the relationship of the mass flow in the transport system to the design mass flow in the primary grid $\mathscr{G}$ for various methods of operation of the transport system is shown in Figure 2 as a function of the load characteristic $\beta(T)$.

Figure 1. Parallel coupling of the transport system as a base load facility and the heat source in the primary grid as a peak load facility.

The flow and return temperature courses (t_{VTr}, t_{RTr}) were coordinated with the mass flow relationship for a given return temperature in the primary grid (t_{RP}) [1].

The functions designated as (1) and (2) are characteristic of variants of temperature-variable operation; (3) and (4) stand for two possibilities of quantitatively variable operation. In contrast, a series coupling of transport systems and peak load facilities according to Figure 3 ensures a heat supply in the nuclear power plant with lower flow temperatures than the ones produced in the

Figure 2. Course of temperature and volume flow in the transport system as a function of load in parallel coupling of base and peak load facilities.

Figure 3. Series coupling of base and peak load facilities.

primary network. The proportion of this heat supply is determined by the base load ratio in the transport system. Figure 4 shows the course of the flow and return temperatures and of the mass flow ratios as functions of the load $\varkappa$. The assumption has been made that the mass flow ratio in the district heat line relevant to the one in the primary grid in the design case $\beta = 1$ is independent of the base load ratio αG_1. The base load ratio determines the projected flow temperature (in the example $t_{VTro} = 128°C$). (1) and (2) represent two variants of temperature-variable operational methods, and (3) represents a variant of the quantitatively variable operational methods of the transport system. Figure 5 explains once more the disadvantage of series coupling of base load and peak load facilities with respect to the design of the transport systems with a base load fraction $\alpha G_1 = 0.6$. In comparison with parallel coupling (P2) considerably greater diameters are optimal, dependent on the maximum design capacity of the primary system $\dot{Q}_{PO}$, although as a result of the hydraulic optimization in the linear-coupled transport line slightly higher velocities occur in the hot water.

Figure 4. Course of temperature and volume flow in the transport system as a function of base and peak load facilities.

Figure 5. Optimal diameters and speeds as a function of the design capacity with parallel coupling (P2) and series coupling (R2) for $\alpha GL = 0.6$.

This different dimensioning of the district heat lines causes greater investment costs for linear coupling.

Furthermore, the output area in consideration can be accomplished by parallel-coupled systems with two-conductor lines, but not by series-coupled ones--assuming a maximal nominal diameter of the pipelines of NW 1,400. The opposite character of the social expenditure for heat production in the nuclear power plant and for the heat transport system for both forms of coupling leads to a

preferred region for series-coupled facilities, which remains limited to line lengths shorter than 10 kilometers and to a maximum heat output on the supply area of between 500 and 1,000 MW.

For the transportation of heat across greater distances, however, parallel coupling of the transport systems as a base load heat source, with the peak load facilities at the points of heaviest consumption, is in general to be preferred. The considerations for the optimal structure of the transport systems further presume this coupling.

3. Modeling and Balancing of the Component Systems

For the purpose of economic evaluations of district heat systems in the framework of trend studies, a model for district heat distribution facilities is shown. It is based on statistically reported figures for existing primary and secondary hot water grids in the GDR and permits various influential factors to be considered, such as the increasing share of hot water heating and different methods of operation of the systems (Figures 6 and 7).

Figure 6. Models for a symmetry series of five system sizes for hot water-district heat networks.

Figure 7. Model of a district heat-distribution system based on existing district heat systems.

Key:
(1) Production facility
(2) Primary grid of a district heat-supply system
(3) District heat line
(4) Area of main consumption
(5) Secondary district heat grid i
(6) Indices for the primary district heat network
(7) Indices for the secondary district heat network

The primary grid of the inner cities can be represented as an ellipse, which includes the circular secondary grids [2].

A district heat line of variable length (ℓ_{Tr}) leads from a base load production facility to a peak load heating plant in the center of the consumption area. This model is also sufficient for planning purposes for other objectives, but cannot, however, replace the special study of a distribution system with discrete pipeline diameters for a specific location.

The basis for evaluating heat production in the nuclear heating plant is a method which is founded on the analysis of factors which influence social expenditure in the electrical energy production system. The additional social expenditure in the electrical energy grid system, which is dependent upon the coupled heat production, serves as an evaluation criterion. Investment costs are considered for "replacement" power plant capacity to be installed, which is in proportion to the maximum occurring output shortfall for electrical energy through heat production by the nuclear power plant and the fuel cost components of the electrical energy production costs of this "balancing" power plant, which is affected by design and operational criteria such as the base load fraction and the method of operation of the heat transport system [3].

The specific output shortfall by the power plant as a result of the heat production constitutes a characteristic quantity, which encompasses both the quality features of the steam power process and the heat extraction. Its dependence on the thermal efficiency of the water steam circulation process, the number of preheating levels, but above all on the flow and return temperatures of the heat carrier, was demonstrated by thermodynamic balancing, as well as by circuit diagram calculations [4]. Figure 8 shows the course of the specific output shortfall for electrical energy through the heat emission dependent on the flow temperature for various return temperatures, which is typical of the heat loss from a 500 MW saturated steam turbine block in a nuclear power plant with 1,000 MW pressurized water reactors. Preheating of the hot water is presumed in three stages with the aid of bleeder-type steam from the medium and high pressure portion of the saturated steam turbine. One should note the influence of partial load operation on the shortfall of electrical energy output, which brings about an improvement in the efficiency of the power-heat coupling with nearly all methods of operation.

Figure 8. Electrical output shortfall ΔP through the heat transfer $\dot{Q}$ as a function of the flow temperature t_V and the return temperature t_R of the hot water.

Key: (1) Design capacity

Taking into consideration an annual load factor typical of the district heat supply systems of the GDR, the expenditure for heat production may be quantified, depending on the criteria of design flow and return temperatures, the base load ratio of the nuclear power plant and thus of the transport system to the maximum heat output in the supply area, as well as the methods of operation and the control regime of the transport line. Figure 9 shows the annual heat supply cost for the base load facility based on a design capacity of the supply area dependent on the base load ratio. The higher variable heat cost proportions connected to the volume control with the same design flow and return temperatures as compared to temperature regulation and the unfavorable effect of the higher design flow temperatures t_{VO} on the power-heat coupling process became evident.

Figure 9. Annual heat production cost for the base load facility $k\dot{Q}_{GL} = k_{QCL}$ (I_{KW}) relating to the output capacity of the primary network.

According to the design output and annual operation of the nuclear power plant's heat production, which grows proportionally with the base load ratio, an increase in expenditure with the base load ratio can generally be recorded. However, if it is taken into account that with a decreasing base load proportion in the transport system the design and operation of the peak load facilities or heating plants in the peak demand area must, to an increasing extent, take over heat production, the dependence of the entire heat production cost shown in Figure 10 results. In accordance with the production program for power plant construction and the primary energy situation of the GDR, component solutions for steam generators based on raw brown coal were included in the considerations for the heating plants.

It is evident from Figure 10 that in the entire field of possible heat output, design parameters and methods of operation the need for heat can be more favorably met by the condenser power plant exclusively than by a combination of

Figure 10. Cost of heat production from base and peak load facilities as a function of the design capacity of the system.

heating plants. This statement presumes an equivalent location of the base and peak load facilities. It shows that essentially the possibility and profitability of the heat transportation decides the utilization of the advantages of power-heat-coupling.

The use of hot water-displacement accumulators was studied with the objective of broadening the area of profitability of the transport systems through reduction of the heat production and the design capacity of the peak load facilities. Depending on the peak load components of the transport system and varied accumulator capacities, a reduction in heat production costs in base and peak load facilities can be demonstrated allowing for the cost of the short-time accumulator [5]. In particular in the area of higher base load ratios the incorporation of heat accumulators in the transport system at the location of the heat transfer station promises advantages both for the design and method of operation of the heat production and for the transport system (Figure 11).

The annual expenditure for the transport line relative to the maximum demand of heat of the supply region grows in step with the design capacity of the transport system (Figure 12). It thereby counteracts the dependence of the heat production cost in the base and peak load facilities of the base load component. With growing district heat line length the variation in the design flow temperature and in the control regime for large base load fractions almost leads to such an expenditure area, which is caused by a district heat line differential of 20 kilometers.

These two parameters in the design or operation have an opposite effect on the profitability of the heat transportation systems in comparison with the power-heat-coupling process and thus on the heat production.

Figure 11. Heat production cost in base and peak load facilities.

——— with heat accumulator for various accumulator sizes

- - - - without heat accumulator

Figure 12. Annual transport cost K_T as a function of the design capacity of the primary system Q_{PO} = 500 MW as a function of the base load ratio α_{GL}.

Key:

(1) Volumetrically controlled

(2) Temperature-controlled

The dependence of the cost of the district heat line on the maximum heat demand in the supply area will be explained by comparing the outputs

$$Q_{PO} = 250;\ 500;\ 1{,}000\ \text{MW}$$

for the transportation distances of 10, 30 and 50 kilometers in Figure 13. For the design flow and return temperatures of 180/70°C the specific cost in volumetrically and temperature-controlled systems is shown as boundaries for an area which includes the design and methods of operation of mixed-regulated systems.

Figure 13. Annual transport cost k_T in relation to the design capacity of the primary system Q_{PO} for t_{VO} = 180°C, t_{RO} = 70°C.

Key: (1) Volumetrically controlled
(2) Temperature-controlled

A comparison of heat transportation costs for various design capacities in the primary system shows the influence of the transportation capacity on the transportability. When the system is designed for large heat capacity the specific transport costs for a district heat line length of 50 kilometers are only a little higher than the costs which occur in a system with smaller capacity for transportation over 30 kilometers. This statement is valid for the entire area of the base load components.

The cost development for the discussed capacities and district heat line lengths demonstrates the effect of the relative transportation distance $\ell_{Tr}/\sqrt{Q_{PO}}$ as a criterion for the profitability of heat transportation. However, the validity of this criterion becomes restricted when the design capacity of the transport system requires transition to multiconductor lines.

Figure 14 shows the specific transport expenditure for volumetrically regulated systems with a design flow temperature of t_{VO} = 180°C dependent on the maximum heat requirement of the supply area. The regions are delimited by the base load components α_{G1} = 0.6 and α_{G1} = 1.0.

Figure 14. Specific transport cost as a function of maximum heat demand in the supply area for volume-regulated systems with t_{VO} = 180°C, t_{RO} = 70°C.

Key:

(1) 4 L = Four-conductor line

In designing the district heat lines for a base load component $\alpha_{G1} \leq 0.6$ a two-conductor line in the area of $\dot{Q}_{PO} \leq 2{,}000$ MW is sufficient. Dimensioning for the total heat demand requires a transition to four-conductor lines beyond $\dot{Q}_{PO}$ = 1,500 MW. The feasibility of producing pipelines of up to NW 1,400 is presumed. The abrupt development of the specific transport cost, dependent on the transition to multiple-conductor lines, becomes evident in Figure 15. Shown are the dependencies of the transport cost on the base load component for a maximum demand of heat in the supply area of

$$\dot{Q}_{PO} = 1{,}500;\ 2{,}000;\ 3{,}000;\ 5{,}000 \text{ MW}$$

The influence of the design flow temperatures on the transport cost is then relatively small in this high capacity region, when the number of parallel conductors in the variants do not differ. The reason for this is the choice of discrete nominal widths, which partially correspond despite different design flow temperatures. The difference in expenditure thus results only from the different delivery expenses. More serious is the effect of the control regime.

The hot water velocities in the systems designed for volumetric regulation are a maximum of 2.7 m/s, and in the systems designed for temperature regulation they are below 2 m/s. The number of pressure-boosting stations in the lines for all variants remains limited to two for district heat line lengths of 30 kilometers and three for 50 kilometers. The variants conceived through the design calculation thus take the demand for high reliability of supply into account. The deviation from optimum in the direction of greater nominal widths which is associated with this is connected with greater capital expenditure and reduces the favorable effect of the higher flow temperature.

Figure 15. Annual transportation cost k_T relative to the design capacity of the primary system $\dot{Q}_{PO}$ as a function of the base load component α_{GL}.

- - - Volumetrically-controlled
——— Temperature-controlled

In these cost calculations it became evident that a heat demand in the supply system of $\dot{Q}_{PO} \leq 500$ MW cannot be met by a 50 kilometer district heat line. A decision about the profitability limits of the heat transport must take the cost of heat production in base and peak load facilities into account.

4. Optimal Design and Profitability Limits in Systems With a Closed Heat Carrier Circuit

As a criterion for the profitability of heat transportation, that is to say the possible implementation of transport systems, the cost of meeting the need for heat exclusively from heating plants fueled by raw brown coal in the peak demand area should be brought up.

The total expenditure for heat production by means of a hot water transport system and heating plants in the supply area will be discussed for a broad spectrum of maximum heat demand and transport conduit lengths depending on the base load component.

In Figure 16 the output region is shown, in which every design variant for the district heat line including total coverage of demand can be implemented by means of a transport system with two-conductor lines. The profitability limit for the district heat transportation--the heating plant input alone--was marked on the ordinate. It becomes clear that a transportation distance of up to 30 kilometers in the output region over 250 MW can be implemented. However, heat transportation in the area up to 50 kilometers presumes a heat output in the supply region of

Figure 16. Total cost of heat production in relation to the maximum heat demand in the supply area in the output region of $250 \leq \dot{Q}_{PO}$ in MW $\leq 1{,}000$.
t_{VO} design-flow temperature of the transport system
M volumetric control
T temperature control
$t_{RO} = 70°C$

over 500 MW. For short line lengths of 10 kilometers a heat supply using the transport system with a combination of heating plants in the supply system is to be preferred. The consideration of the use of accumulators corroborates this statement. The flat behavior of the cost function in the region of optimal base load component of $\alpha_{G1} = 0.8$ for larger distances and greater capacities also favors renunciation of peak load facilities in the supply area while taking the use of accumulators into consideration.

The heat demand region of the supply areas between $1{,}500 \leq \dot{Q}_{PO}$ in MW $\leq 5{,}000$ MW was shown in Figure 17. Analysis of the formation of district heat lines showed that in this output region one must switch to multiple-conductor lines.

A comparison of cost in this region as opposed to the heat output $\dot{Q}_{PO} \leq 1{,}000$ MW (Figure 16) explains once more the superiority of large design capacities of the district heat lines, which results in an increase in the transportability of the heat.

The specific cost for all variants represented in the design of the transport system lies below the limit of profitability set by the sole coverage of the demand for heat by means of heating plants in the supply area.

Figure 17. Total cost of heat production in relation to the maximum heat demand in the supply area in the output region of $1{,}500 \leq \dot{Q}_{PO}$ in MW $\leq 5{,}000$.

Conditioned by the necessary switch to multiple-conductor lines, the trend toward smaller expenditure with increasing capacity can no longer be proved, however.

For the discrete requirements of the supply of heat, minima occur in the cost functions, which become more pronounced with growing line length and as a rule run in the direction of lower base load fractions. For heat transportation over short distances the statements already made are valid. Meeting the total heat demand by means of the district heat lines is to be preferred over variants with

peak load facilities in the supply area. Heat capacities of 1,500 MW can be economically achieved through district heat lines of 30 kilometers' length with a base load fraction of 0.6 to 0.8--here as well the use of accumulators may contribute to possible coverage of the total demand for heat via a two-conductor line.

With this demand for heat, however, transportation distances of 50 kilometers may be more favorably implemented by district heat lines designed for a base load fraction of $\alpha_{G1} = 0.6$. The same statement is valid for heat outputs of 2,000 MW for both indicated transportation distances.

The requirement for a large number of conductors in the district heat lines for high transportation capacities results in optimal base load ratios of $\alpha_{G1} = 0.4$ for heat demand values in supply areas in the region of 3,000 MW [6].

5. Extension of Economic Transportation Radii in Systems With Direct Consumer Hot Water Withdrawal

The open hot water-district heat system constitutes a method of combined heating and hot water supply. If differs from the well-known closed systems by the fact that the additional water prepared in the heat production facilities is directly drawn off as hot water in the consumer installations. The economic effects result from the greater temperature spread in the medium, the reduction or elimination of the hot water return flow in the transport and distribution system and from the solution of the corrosion problem for centralized hot water heating and distribution. In the case of cogeneration of electrical energy and heat in withdrawal-condensation plants, condenser waste heat can furthermore be utilized and thereby primary energy and cooling water be saved and the burden on the waste heat reduced. The additionally required water heating capacity is reduced according to the condition of the intake water in the region of profitability of this method. Although considerable experience with the construction and operation of open systems is already available in the USSR, at the present time the problems have only been partially solved which result from the interrelations between the nature and capacity of processing, fluctuations in withdrawal and volume storage on the one hand, and corrosion in the district heat network and the quality of the consumer hot water on the other.

A necessary study of the suitability of district heat-circulation water as consumer hot water is based in particular on an evaluation of special literature to limit substances occurring in the water as well as a quantification of the impurities in existing closed district heat networks and in hot water distribution facilities [7]. It was demonstrated that soft hot water from open systems with respect to

a) the lower content of the water contaminants Cd, Pb, Zn and
b) the higher utility value of softened water for cleaning purposes

has a higher quality than hot water heated in recuperators and transported through galvanized steel pipelines. It may further be estimated that by using filters on the consumer side the iron content permitted for drinking water can be reduced

and the standards with respect to the degree of color and turbidity can be met. The flat taste which can be determined in softened or partially desalinated utility hot water may perhaps inhibit enjoyment. However, for health reasons total desalination of the additional water is not feasible for open systems.

Studies on the technological implementation also form a basis for an economic evaluation.

Figure 18 shows the principle of a coupling of the base load-heat production for an open system in the third loop of a nuclear power plant. Insofar as softening with the neutral exchange method is not sufficient because of an increased chloride content in the intake water, a two-stage partial flow desalination facility will in most cases be sufficient. This is connected in parallel with the softening installation and assures that the allowable limit is adhered to during operation.

(C) Base load heat production in the nuclear power plant or nuclear heating plant with pressurized water reactor, supplied by a flow transport line

(D) First (second, third) loop

(E) Closed when

Thermal degassing, which simultaneously eliminates germs by sterilization, constitutes the third of four heating stages in Figure 18. The steam is created through hot water expansion. The hot steam condenser of the first heating stage is coupled in parallel with the turbine condenser and thereby utilizes a part of the waste heat in the cyclic process during condensation operation.

A circuit recommended for the consumer area is pictured in Figure 19. Characteristic of the proposed concept are the flow mixing conduit to the return water for the purpose of keeping the hot utility water at a constant temperature, the filter installation, here shown only schematically, for reduction of the trivalent iron compounds, the utility water volume accumulator in a standing open construction and the indirect connection for tapping residential heat.

Figure 19. Circuit diagram of a receiving station for an open district heat system with indirect connection for heat withdrawal.

For the economic evaluation, which takes place according to the criteria of the social, capital and energy expenditures, a model system based on the preliminary studies is used. Figure 20 shows the compatible models for open and closed district heat systems.

The open system, shown to the left of Figure 20, is characterized by a base load-heat production plant with a free-lying flow line to the area of main consumption, a peak heating plant installed there, a two-conductor network in the inner city, as well as by a number of equally sized receiving stations with secondary-side-connected two-conductor heating network and utility hot water facilities.

The base load fraction is thereby subject to the restriction, that only the amount of consumer hot water tapped in the middle of the day can be transferred through the flow line.

Key: (1) Open system (2) Closed system

The discussion about the savings resulting from the above-mentioned component systems yields the following recommended application areas for open systems:

1. The greatest possible savings in social and capital expenditure can be achieved with base load-heat production in withdrawal-condensation operation with heat transportation over greater distances. The method of chemical processing of the added water is hereby of minor importance.

An aspect worth noting for the area of application for the supply concept is the possibility of decisive expansion of economic supply radii. In Figure 21 the transport line lengths of closed systems for three different intake water qualities have been coordinated on the abscissas with line lengths of equal cost for open systems on the ordinates. The transport distances of 15 to 30 kilometers for closed systems can thus, according to the respective maximum load, be equated with distances of about 60 kilometers for open systems. Hence, the supply of heat to the city of Magdeburg, for example, becomes part of the economic supply area for the Stendal nuclear power plant.

2. For base load-heat production in nuclear heating plants or in thermal power plants with withdrawal-counterpressure operation an economic area of utilization is also given when heat transportation must likewise take place over greater distances. However, with a high processing cost profitability limits amounting to ℓ_{Tr} = 8 kilometers will occur as a function of the maximum heat load.

Figure 21. Transport line lengths with the same social expenditure for open and comparable closed systems for thermal power plant operation.
($\alpha_K = 1$, $t_{VP}0 = 180°C$, $kE = 50$ M/MWh, $v_Q = 7$)

3. Another recommended field of implementation for open systems is heat supply to new, delimited urban areas, by the use of condenser waste heat to preheat water, and by laying two-conductor lines to convey the entire heat supply. Consequently, implementation is practical for the expansion of existing systems as well. The demonstrated savings in social expenditure are in the magnitude of 5 to 20 x 10^3M/MWa as opposed to a comparable closed system.

PROSPECTS FOR USE OF HEAT PUMPS OUTLINED

Leipzig ENERGIEANWENDUNG in German Vol 30 No 4, Jul-Aug 81 pp 118-120 manuscript received 21 Apr 81

[Article by Lothar Heinrich, engineer, Institute for Energetics/Central Office for Efficient Energy Use (IfE/ZRE), Leipzig, Dresden field office; and Leo Neumann, engineer, VEB Machine Factory, Halle: "Heat Pump Technology and Possible Uses in the GDR"]

[Text] Several facts--the visible end of fossil fuels; the increasing cost of their production; their increasing price in the world market and the consequent development of an energy consciousness--have resulted in a worldwide reconsideration of the heat-pump principle which has been known for over 100 years.

The use of heat pumps for heating or for combined heating and cooling makes possible significant savings in valuable primary energy. Heat pumps have become an important component of efficient energy use.

Thus, in recent years increasing numbers of heating units with heat pumps have been installed and put into operation in the GDR.

The intent of this paper is to present an overview of the most appropriate areas of application and the available technology.

As is known, a heat pump is an installation which gathers low-temperature environmental heat or waste heat from technological processes and gives it off at a higher temperature for heating purposes. This process, which operates against the natural temperature gradient, requires motive power to drive the cycle (a counterclockwise process).

Figure 1 shows a diagram of the workings of a heat pump. In a heat exchanger (evaporator), a working medium (ammonia, Freon, etc) with a low boiling point evaporates by absorbing environmental or waste heat. In the process, the heat (Q_o--heat of evaporation of the working medium) is extracted from the heat source. The compressor draws in the resulting working medium vapor at a lower temperature (T_o) and pressure (p_o) and compresses it at a higher pressure (p_k) and higher temperature (T_k). Motive power (w) must be used in this operation. The compressed working medium vapor is liquefied by external cooling in the next stage, the condensor, and gives off useful heat (Q_k). The high pressure of the liquefied working medium is reduced again to the

original pressure of the evaporator via a pressur release mechanism, (an expansion valve, for example), thus completing the cyclic process. The energy efficiency of of this process is characterized by the power coefficient, wherein the power coefficient is defined as the ratio of the heat power (Q_k) to the consumed electrical power (P):

$$\varepsilon = \frac{Q_k}{P}$$

$$Q_k = Q_o + P$$

Such processes have technically been in use for a long time in refrigerators.

Bild 1. Schema zum Arbeitsprinzip einer Wärmepumpe

Refrigerators and heat pumps are identical machines in terms of process. They differ only in the type of technical and commercial application of the energy flows and in their internal optimization adaptations for the selected use.

While for refrigerator operation the heat occurring naturally in the condensor has in the past generally been wasted via cooling cycles as environmental energy, the purposeful use of the condensor heat energy is the goal of the heat pump configuration.

Thus the inherent, unique potential of the heat pump principle becomes obvious, namely the potential for coupling energy flows of different temperatures and the associated potential for seasonally related heating and cooling by means of one and the same machine from current production.

The heating-cooling coupling is an important, highly economical field of application for large heat pumps. Selected examples of the application of the heating-cooling coupling are presented in Table 1.

Table 1: Applications of the Heating-Cooling Coupling

Type of Installation	Heating Requirement	Cooling Requirement
Fish processing	hot water for cleaning	ice production
Meat-packing plant	hot water for cleaning	refrigeration and ice production
Dairy	hot water for cleaning	milk refrigeration and cooling of storage lockers
Slaughterhouse	hot water for cleaning	coolers and refrigerator rooms
Skating rink	room and possible hall heating	ice
Food locker	room heating and deep freezing	refrigerated lockers
Brewery	hot water	beer-cellar and wort cooling
Industrial energy centers	hot and warm water	refrigerant, ice, water
Community buildings	heating and hot water	air conditioning

The differential resulting from the coupling possibility, and also the coupling necessity, of various energy flows requires a completely different, more complex approach in planning and designing heating installations with heat pumps. For example, in comparison to heating installations with conventional heat generators, the balance loop to be considered around the heat source coupling has to be expanded. The internal process conditions of the heat pump and the parameters achievable with standard production machines make it possible to couple only in a limited temperature range, specifically the temperature range relevant for room and water heating, $\leq$ 70°C.

The greater the attention paid to specific application conditions, the better the chances for the heat pump as a pure heat machine (1), (2), (3).

The VEB Machine Factory, Halle, the manufacturer of refrigeration units and heat pumps, will produce the "KWS" model series with piston compressors and rated powers between 70 and 800 kW, in 8 power ranges.

Figure 2 [not reproduced] shows a medium-sized member of this series. Beginning after 1982, the power range of this water-water heat pump will be expanded by the "SKWS" series with screw compressors and rated powers between 785 and 2,300 kW, in 3 power ranges.

These large KWS and SKWS heat pumps are complete, factory finished, internally wired, pressure- and function-tested, largely automatic, compact units ready for use.

The heat source is water flowing through the evaporator side; water sources that can be used are ground water, surface water and low-temperature industrial waste water.

Because of condensor pressure limits, a maximum water preheating temperature of 50°C can be achieved with heat pumps of the types mentioned, using R 22 as the working medium. A summary of power values is given in Table 2.

Table 2. Power Values for Large Heat Pumps Produced in the GDR (VEB Machine Factory, Halle)

Type	Motor Power kW	Cooling Power kW	Heating Power kW	Power Coefficient HeatPwr/Drive Pwr
R 22-cold water unit with series-5 piston compressors*				
KWS 63-1h	18.9	48.1	65.5	3.42
KWS 80-1h	27.8	65.9	89.7	3.23
KWS 125-1h	34.4	92.9	129.7	3.38
KWS 200-1h	56.5	140.8	191.8	3.39
KWS 280-1h	82.9	204.1	277.6	3.39
KWS 400-1h	109.1	272.1	370.2	3.39
KWS 560-2h	164.0	408.2	555.2	3.39
KWS 800-2h	218.3	544.2	740.3	3.39
R 22--cold water unit with screw pistons				
SKWS 710	200.3	608.1	785	3.92
SKWS 1400	443.7	1269.1	1664	3.75
SKWS 2000	615.5	1747.7	2296	3.73

* Values are referred to the following parameters:

Hot water outlet temperature: 45°C

Cold water outlet temperature: 8°C

** Values are referred to the following parameters:

Hot water outlet temperature: 45°C

Cold water outlet temperature: 8°C

Modified designs of these large water-water heat pumps can also work as water-air or air-water heat pumps through combination with other sub-systems.

By using R 12, now under development as a working medium, existing machines can achieve water preheating temperatures up to 70°C.

Since the energy efficience of the heat-pump process is a function of the difference in temperature between the evaporation and condensation temperatures, it is degraded in this case so that this design will remain a special form for use with high-temperature sources. By operating several large heat pumps in parallel, the heat-power range can be correspondingly expanded.

Heat pump installations of very high power can also be assembled as individual units using component assemblies form the refrigeration industry.

The main field of application of large heat pumps reaches beyond the heating-cooling coupline to technologically related preheating and heating processes and to room and water heating for general use.

Energy-related and economic balancing studies covering the economy as a whole and the evaluation of experience with planned and existing heat pump installations show the potential for satisfactory application of this technology in both the industrial and consumer economies.

The first step will be to relieve the direct and night-storage electrical heating load demanded by residential neighborhoods and individual buildings served by single-wire electricity. Subsequently, high-priced fuels such as heating oil, natural and city gas and coke can be released to the benefit of the overall economy.

Electrically driven heat pumps can also be a suitable alternative for supplying heat to locations and buildings which are difficult to supply with solid fuels or which operate under severe environmental protection restrictions.

Because of differences in the overall problem, decisions regarding the use of heat pumps always presuppose a project-related comparative analysis with other conventional variants for supplying heat.

The energy-related rationalization of heat generation for the many and varied consumers of small quantities of power requires the increasing use of small heat pumps. Small heat pumps are complete, automatic, compact devices with integrated regulation and control boxes, ready to be plugged in and used. These are also manufactured by the VEB Machine Factory, Halle.

Beginning after 1982, the small LW 1.2 heat pump, which was specially designed to reduce electric power demand for water heating, will go into mass production.

This unit designed for interior--cellar, equipment or storage room--installation uses ambient air as a heat source and delivers 1.5 kW of heat power at a water temperature of 55°C while consuming .55 kW of electrical power. Combined with a 300-liter storage unit, the hot water demand for corresponding buildings can be covered very effectively. The small water-water WW 12 heat pump is currently available.

It uses water-connected heat flows--for example, ground water or any available low-temperature energy flows--as a heat source and ensures hot water temperatures up to 55°C at a rated heat power of 12 kW. Combined with a 2 to 4 m^3 hot water storage unit, it likewise offers the potential for effective hot water service. It is also suitable for heating spaces of corresponding heat demand, for instance restaurants, doctors' offices and, in some cases, individual dwellings.

Basically, the small heat pumps will have the same overall economic effect as the large heat pumps in releasing expensive fuels.

For consumers who find it difficult or impossible to gain access to water-connected heat sources, the small air-water LW 18 heat pump is now being developed.

Outside air, down to a limiting temperature of 3°C, is used as a heat source. It has a rated power of 18 kW and also produces hot water temperatures up to 55°C. Designed as a basic module for laternative bivalent heating units, the LW 18 can cover up to 70 percent of a year's heating requirement for consumers who use it.

Conceived for the future is a smaller, manevalent air-air heat pump to replace electrical resistance heating in small spaces; for example, newspaper stands, mobile construction buildings, railway engine cabs, crane cabs, etc. These will use the heat content of ambient air over the total heating period as a heat source and either blow heat directly into the space to be heated--similar to a resistance-type of electric heater--or couple into a central air heating system.

WEST GERMAN STUDY EVALUATES GDR ELECTRONICS INDUSTRY

West Berlin DIW-WOCHENBERICHT in German Vol 48 No 42, 15 Oct 81 pp 475-480

[Article by Cord Schwartau: "The Electronics Industry in the GDR--Lag in the Application of Modern Technologies"]

> [Text] For the past 20 years, the electrotechnical industry has been a leader in industrial growth in the GDR. Of course, output growth during the 1976-1980 five-year plan declined from an annual 10.2 percent (1971-1975) to 8.7 percent. The attainment of the generally ambitious growth targets of GDR industry during 1981-1985 will also depend on whether they can raise the annual growth in this industry sector to 9.3-9.6 percent. This is so not only because electrotechnology and electronics--accounting for a good one-tenth of industrial output and 14 percent of industrial workers--carries great weight but also because it was assigned a key role in the plan concerning the modernization of other industry sectors, the rationalization of administration, better supply for the population with durable consumer goods and, last but not least, the attainment of export goals[1].

Electrotechnology and Electronics at the Center of Combine Reform

Since 1980, the electrotechnology, electronics, and equipment construction industry sector has consisted of 17 combines, eight engineering schools and five foreign-trade enterprises. In the course of combine reform, the industry sector was enlarged due to reorganization and the establishment of new units. The number of employees rose from 400,000 in 1972 via 430,000 early in 1977 to 460,000 at the end of 1980; it reached 470,000 already in 1981. A comparison to the electrotechnical industry in the FRG (barely 1 million employees) is impossible because of the different ways in which the lines of demarcation are drawn. The Ministry of Electrotechnology and Electronics in the GDR also has under it the optical and precision mechanics industry, the watch and office machines industry, as well as locomotive construction but not the production of important electrical household appliances such as refrigerators and washers. They are under the Karl-Marx-Stadt household appliances combine which is under the Ministery of General Machine and Vehicle Building.

Even before the combine reform, there were more than 20 combines in the electrotechnology and electronics sector; they were partly under the former VVB and partly directly under the ministry. The VVB were dissolved in 1978-1979, new combines were formed, and existing combines were merged. This led to the establishment of Robotron--which today, with 70,000 personnel is the biggest combine in the GDR in terms of employees--as a result of the merger of a combine by that same name (25,000 employees in 1977) with the (larger) office machine manufacturing outfit Zentronik. The Teltow electronic components combine (founded on 1 January 1971) was merged on 1 January 1978 with the Gera Electronics Combine; the Hermsdorf Ceramics Works (founded 1 January 1969) were expanded in 1979 through the addition of the electrical wiring combine; the communications electronics combine since 1 January 1979 has been consisting of three formerly independent combines. Erfurt became the center of microelectronics among other things due to the merger of the watch combine in Ruhla (in which case there was a ministry switch) with the Erfurt Radio Plant and the Frankfurt/Oder Semiconductor Plant combines.

Many present-day combines or their most important enterprises have a tradition which can be traced back to the turn of the century and even before although this can be recognized by the name only in the case of Carl Zeiss Jena. Here we might mention for example, the "Rosa Luxemburg" NARVA Combine in Berlin, formerly called OSRAM; the Oberspree Cable Works and the electrical apparatus works, both in Berlin, formerly called AEG [General Electric Company]; the Sachsenwerk in Dresden (parent enterprise of the electrical machine-building combine), formerly called Siemens; and the "Hans Beimler" LEW [Locomotive Construction and Electrotechnical Plant] in Hennigsdorf, formerly AEG-Borsig-Lokomotivwerke.

The number of employees per combine in the sector of the Ministry of Electrotechnology and Electronics averages 270,500. Even the biggest combines (Robotron with 70,000, Mikroelektronik with 52,000, and Carl Zeiss Jena with 46,000) are not as big as the three leading concerns in the FRG (Siemens with 344,000 employees, AEG with 145,000, Bosch with 120,000); but in terms of the number of employees they exceed enterprises such as IBM-Deutschland (26,000), Deutsche Philips (28,000), Grundig (36,000), SEL (33,000), and the Carl-Zeiss Foundation (30,000).

Of course, the personnel effort connected with the management and administration of the electrotechnical industry in the GDR is very high (in 1979, 23.6 percent of all blue-collar workers and white-collar employees)[2]. The economic management has for years been trying to reduce the surplus personnel force and to increase the number of persons employed in production. But even in the production process itself, the share of administrative, work-preparing and supervisory work is very large. There is one general phenomenon in the GDR and that is that manual labor prevails whereas medium-scale and small-scale series production efforts are still the rule; the flow of materials as well as the stockpiling and transportation system are behind the times both in organizational and in technical terms. Only 2 percent of the assembly processes have so far been automated in the electrotechnical industry.

The export share of the GDR electrotechnical industry, that is to say, the share of exports out of the output volume, exceeds 50 percent and thus is higher than in the FRG. In the case of the Pentacon and Robotron combines, the export shares are more than 70 percent and in Carl-Zeiss-Jena they are as high as 80 percent. These

combines mainly turn out finished products. If we also take into consideration the indirect exports which are quite considerable in the electrotechnical industry, in other words, shipments for the export of other industrial sectors, then we find that far less than half of the total output of electrotechnical products in the GDR are available for domestic use.

In the sector of the Ministry of Electrotechnology and Electronics, 125,000-150,000 employees produced directly for the consumer. To this we must add workers in numerous smaller production and repair enterprises in the bezirk-managed industry, for example, the Rema Radio Factory in Stollberg, the VEB Elektromechanik Coffee-Maker Manufacturing Plant in Kaulsdorf, and the employees in the more than 1,300 enterprises which handle repairs of radios, phonograph equipment, and TV sets.

On the Key Role of the Electrotechnology and Electronics Sector

All of the primary goals of the five-year plan running until 1985 require considerable output increases in the electrotechnical industry.

Annual real growth rates of more than 9 percent and the goal of reducing the specific utilization of material, energy, and personnel presuppose modernization and specialization of many production enterprises in the electrical industry. The tight investment fund supply situation calls for increased shift utilization in the available capacities. The contribution which the electrical industry must make to the modernization of the other industrial sectors and in connection with energy savings measures, signifies, more EDP, more microelectronics, better control equipment, more engineering consultation and software, but also the use of motors, lamps, and systems with higher energy efficiencies. The foreign trade goals call for output increases in exportable products; the replacement of imports will necessitate the expansion of production to commodities hitherto imported, especially capital goods.

In spite of all efforts, the shift utilization factor in the GDR electrotechnical industry if anything deteriorated in recent years[3]. In 1979, the share of production workers assigned to the second and third shifts in industry as a whole came to 26 percent while it was 18 percent in electrotechnology and electronics. In many electrical industry sectors, the share of women workers is great, especially in assembly and inspection processes. Because many women are doubly burdened by household chores and jobs, the material incentives obviously are not enough to bring about a major increase in the readiness of these workers to go in for shift work.

Microelectronics has steadily been gaining significance since 1976. The production structure in electrotechnology was altered as a result of comprehensive investments. Today, 36 percent of the investments in the sector of the Ministry of Electrotechnology and Electronics go into the production enterprises for microelectronic components[4]. In 1980, there were 100,000 persons working in this sector (or they were counted as belonging to it). The directive for the 1976-1980 five-year plan did not devote any special attention to that and its key role in industry as a whole was stressed only in the middle of 1977. In the meantime, many enterprises were built up or expanded or modernized and partly also changed their production program. The research facilities were centralized in the newly-established combines. A center for microelectronics research and technology with more

than 7,000 employees was founded in Dresden and placed under the microelectronics combine in Erfurt. By 1985, the GDR wants to be one of the few countries that have a microelectronic basis of their own for the modernization of industry.

GDR-made microprocessors have been available only since 1978. The output of efficient small computers in the Robotron combine so far has been started up only in small series; the assortment of electronic components is still rather small in terms of range and quantity, compared to international standards. The use of microelectronic solutions however even today lags behind the modest technical possibilities and the actual use of microelectronics is confined in connection with series-scale employment only to very few products. Regarding the use of modern technologies, the GDR is considerably further behind than one might assume, looking at the level of its research results and the technical development of prototypes. As evidence in support of the contention that the GDR supposedly has caught up with the FRG in technological development, they are citing individual achievements, newly-developed microprocessors, process control systems, robots, EDP systems, glass-fiber cables, numerical control systems, etc.[5]. Series production of course can be started often only years later and frequently only on a relatively modest scale. Contrary to the view prevailing in Western technical circles--to the effect that the GDR electronics industry has caught up and is only a few years behind--the gap between first-use and series-scale dissemination has if anything become wider. According to GDR data, the EC-1055 medium-level data system, which went into series production in the GDR only in 1980, is supposed to be superior to comparable IBM systems in some technical parameters; but the use of EDP in the GDR is still of comparatively minor significance. The lag compared to the FRG if anything has grown bigger over the past 5 years. Because Robotron is only producer of EDP systems in the GDR and exports more than 70 percent of its products and because GDR import possibilities remain limited, this lag will probably grow bigger in spite of all efforts by 1985.

In 1971-1975, the number of EDP systems still doubled to about 500 units; in 1980, in other words, 5 years later, only 600 systems were in use, including at least 200 which would still be classified under the so-called second equipment generation. In the FRG, as a rule, one generation relieves the next one whereas in the GDR, the plants remain in operation, next to each other. Apart from that, the number of EDP systems in the FRG more than doubled from 1975 until 1979 although the starting level here was incomparably higher (20,860 systems installed in 1975)[6].

The demanding goals of the current five-year plan must also be judged with some skepticism. Here we find that 40,000-50,000 robots and automats are supposed to automate the prevailing system of small-scale and medium-scale series production in the GDR industry; new machine tools are supposed to get mostly numerical controls; EDP systems and office computers are supposed to reduce the excessively high administrative expenditure. On the other hand, the question as to how modern technology is to be introduced technically and organizationally into the production process is as yet mostly unresolved. There is also a lack of sufficiently trained technical personnel. The number of persons employed in electronic data processing increased only from 10,000 to 70,000 between 1974 and 1980. All these systems however demand multishift utilization if they are to be profitable. So far it has been possible to meet this requirement only inadequately.

Electrotechnology plays a key role in the energy savings program. Microelectronics is to be used in order to increase the efficiency of old machines and systems, and to regulate and control them better. But higher energy and material savings can be achieved only if the new equipment units are not only "tied in" with existing systems but if microelectronics and machine output are coordinated with each other in an optimum fashion already during the design of the machine.

The efficiency of electrotechnical products is to be increased considerably. Today, even the light yield from such simple products as fluorescent tubes is one-fourth below Western standards. Washing machines and electric kitchen ranges consume 20-30 percent more energy[7]. The Electrical Machine-Building Combine of course even today produces more than 8 million electric motors per year, partly at the newly-built or modernized production facilities (new plants in Dresden, Heidenau, Thurm, and Wernigerode). More than half of the output of the electric machine-building industry however is earmarked for export. The requirements of the GDR national economy, for example, for DC motors, cannot be met. Almost all electric motors (according to GDR statistics, currently a total of almost 200 million), which mostly have a relatively poor energy efficiency, must thus continue to be used for the foreseeable future. The idea is to improve the efficiency through the installation of microelectronic rheostat resistances. This of course certainly is also only the second-best solution. Something similar applies to numerically-controlled machine tools. To be sure the GDR produced more than 5,000 of these machines but most of them were exported. In 1981, only 2,000 numerically controlled machine tools were in use in the GDR itself whereas the figure in the FRG was more than 25,000.

The GDR is behind even in the utilization of known technologies in terms of production engineering. In 1980 alone, 47,000 energy-savings heat pumps were installed in the FRG; in 1981, the GDR had a prototype of a small utility water heat pump (1 kw) of which 500 are to be built this year and 1,500 in 1982[8].

By 1985, the GDR will have to export even urgently needed electrotechnical producer goods to pay for raw material imports from the Soviet Union and that includes automatic telephone exchanges, EDP systems, and electronic computers worth R 1.2 billion. We can therefore anticipate that growth in the electrotechnology and electronics sector will be too small to be able to make sufficient equipment available for the modernization of domestic production. This is why the electrotechnical industry is to produce not only modern automation and rationalization equipment but must offer "sample solutions" on a larger scale which are then to be copied in combines outside the branch in the context of the so-called system of "in-house construction of rationalization equipment." The electrotechnical industry will then only supply electronic components which, for example, will be assembled into control systems in machine-building; but it so happens that the necessary specialized knowledge is virtually not available here.

Microelectronics in automobiles, in washing machines, and in entertainment electronics have become something quite natural in Western industrial countries. Simpler, traditional products in Western Europe encounter mostly saturated markets. The production of new, qualitatively particularly high-grade electrotechnical consumer goods therefore is a priority goal of GDR industry during the current five-year plan. For that purpose of course it would be necessary to expand the

production capacities quite considerably[9]. So far it has not been possible to accomodate the wishes of the GDR population. By 1985, the domestic demand for color TV sets, pocket computers, and do-it-yourself appliances will certainly be met in a better fashion. But until then, the demand will again be guided by higher standards and new requirements at first will be capable of being covered again only with imports from Western industrial countries. For video recorders, driers, and dishwashers, the GDR will want to make available and will be able to make available adequate capacities just as little as for the urgently necessary renewal and expansion of the telephone network and the introduction of modern communications systems.

Outlook

Since the sixth meeting of the SED Central Committee in June 1977, the number of employees in the enterprises under the Ministry of Electrotechnology and Electronics went up by almost 40,000 persons (status as of the middle of 1981). In view of the continuing manpower shortage in the GDR, this growth factor will no longer be available to the same extent during the current five-year plan. Because only few additional funds can be made available for investments, it is realized also in the GDR that the growth targets are very ambitious[10]. It nevertheless remains to be doubted that the lag in the use of modern technologies will be reduced if those targets are attained. In addition to the considerable output of the electrotechnology and electronics industry sector we simultaneously also need increased acceptance of new technologies in the other economy sectors. Complaints are being voiced again and again to the effect that too many enterprises adopt an excessively hesitant attitude and wait until new solutions are just about forced upon them through central planning. The reluctance to take risks on the part of many combine managements would seem to be one of the causes here. Although microelectronics has been pushed increasingly in financial and personnel terms in recent years through government contracts for research and development, the combines which are involved in practical application activities continued to stick to a rather conservative assortment policy.

NEW GOALS FOR AGRICULTURAL PRODUCTION SYSTEMS URGED

Budapest KOZGAZDASAGI SZEMLE in Hungarian No 10, 1981 pp 1240-1250

[Article by Dr Laszlo Gasdag and Peter Csingear, economic analysts of the crop production system of the Szekszard State Farm]

[Excerpt] The first decade of the production systems was the era of search for the right direction, and of developing and solidifying the organizational forms. If we look at the type of research, innovation and adaptation work, that is, the innovative activity in the stricter sense of the word, and of the operative problem solving and gap-filling activity, [we see that] the latter were definitive during the 1970's. But the solution of these very tasks such innovative driving forces into the Hungarian agriculture through which or agricultural production came to be among the world leaders. The concrete innovation was limited mainly to adaptation. The closed system chicken factories and hog raising plants and the industrial-type plowland crop production technologies started to become popular in this country by adapting the western, mainly American examples. Modern, high performance machinery was needed for the industry-type technologies. The production systems also imported large numbers of these. The new technology, the use of high dosage chemical fertilizers, and the modern machinery even by themselves resulted in a wave of innovations, and revolutionized agricultural production. The way the nationwide production averages of the two main grain types developed, well illustrates the result. (See Tables No 1 and No 2.) Our grain production has doubled in 12 years. Not only the amount of gross production increased rapidly in the plowfield branches, but so did also the per hectare income--even though the specific income per ton decreased.

Today our grain production is among the world leaders not only with respect to production technology but also as far as its profitability is concerned. The degree of utilization of high performance and expensive machinery operated in the production systems is four or five times as high as these indices of the western farms.

In livestock raising the production systems revolutionized mainly the production of meat and eggs by introducing the closed system technologies. Unfortunately, these are energy demanding technologies, and thus the profitability of this branch gradually deteriorated while gross production increased impressively. For example, we were first in the world for years in per capita egg production, but production had to be cut back because export produced losses.

Our per capita meat production was also first in the world in 1979, but it is difficult for us to remain competitive with the western exporters who enjoy large state subsidies, especially in the UK, where the most varied tools are used to hinder agricultural imports from other countries.

On the other hand, our grain export is profitable without any subsidies, and there are no special obstacles to our exports.

Economic Evaluation of Corn Production, KSZE publication, 1980.

The innovative role of the production systems was, for the most part, limited to accepting the new technologies, and this was so successful because it created the appropriate framework for implementation. The operative tasks of the adaptation process were solved well. Thus the decisive factor was not the research and development activity but development of a new organizational and problem solving structure.

The Ways and Opportunities of Further Progress

The driving forces behind the great innovative surge initiated by the systems were exhausted by the early 1980's, and thus we must find new driving forces. Transferring the emphasis from the operative problem solving work of the past to research and development in the system organizing activity may just be the thing that represents further progress. To this day most of the system headquarters have been unable to attract the most outstanding exports with their special knowledge. The present wage regulation system also hinders this. The number of those specialists is small whose main job is to search for new things, to continuously follow with attention the world's agricultural literature, etc. We are not referring to taking over the work and the role of the research institutions, but rather, to even faster and further developed adaptation of the results born there. The production systems have become comfortable, and there is a danger of stiffening the developed methods. The structure of interests also tends to favo this. During the stage when the systems were growing, this fulfilled its role well; but now it may become an obstacle to further progress. In the plowfield crop production systems this structure of interests developed mostly spontaneously by the end of the 1970's. The main goal was rapid increase of the production averages, and this desire was mostly fulfilled from year to year. The increasing production resulted in increasing gross incomes, even though the specific costs were also rising. The good crop yeilds solved the problem of grain fodder for the farms.

The introduction of more reliable spare parts and service supply, and of the new, industry-type technologies provided the farms with advantages which made it their interest to remain in the systems. The system headquarters were interested in extensive growth because the larger number of partner farms and the increase of acreage even in themselves increased profits at acceptable rates.

Today, however, the production systems are faced with a different era. Their activities must be renewed, if they wish to remain the main driving forces in the agricultural sector. And this also assumes the right changes in the interest structure. Now it is necessary to work out concrete, personal and direct interest systems for the workers of the system headquarters. Attempts have already been made to do this, but the task is far from being solved.

The system centers carry very little risks nowadays, thus neither the innovative driving forces nor the conclusion to innovate have sufficient influence on them. Even though accepting risks is an important characteristic of all healthy economic organizations, the multifaceted aspect of the present organizational forms is worthwhile maintaining also in the future. Joint enterprises, economic associations or simple economic cooperation all have certain advantages and disadvantages when compared with the others. It is a fortunate thing that no geographic limitations were assigned administratively when the systems were developing. A healthy competitive spirit has thus developed between the systems, and this alone is a significant compelling force for them to innovate. We wish to note here that in our opinion the state qualification of production systems is nothing else than a covert form of administrative interference. The

Economic Evaluation of Wheat Production, KSZE publication, 1980.

members themselves who participate in it, evaluate the operation of a cooperative organization. A farm also qualified a production system by resigning from it, or by becoming a member. Many people were worried in the 1970's about the "wild growth" of systems, and urged administrative interference. In our opinion this is a completely erroneous view. Administrative means may be used to interfer in the economic processes only if the national economic interests are violated.

The independence of production systems must be increased even if the systen in question is not an independent enterprise, a legal entity, but a part of a guest farming system. Even in this case it would be necessary to make the wage management of the system centers independent of the hosts, since highly qualified experts with broad vision can only be attracted to these centers if the wage levels there are not simply adjusted to the wage levels of an agricultural enterprise. For example, the KSZE Crop Production System which operates at maximum independence, is also struggling with the very

qualified experts with broad vision can only be attracted to these centers if the wage levels there are not simply adjusted to the wage levels of an agricultural enterprise. For example, the KSZE Crop Production System which operates at maximum independence, is also struggling with the very problems described above as a self-accounting unit of the Szekszard State Farm, and if this question is not solvable it may find itself in a difficult situation in the 1980's. In the final analysis, only that production system can remain competitive over the long range which will be able to ensure the appropriate staff of experts for itself.

The most modern technology was solidified during the 1970's, and world-class techniques became popular. Now follows the era of implementing minor perfections on the daily basis, and the speed of our future progress will depend on the coming decade on the frequency of these small steps in terms of time.

And all this will decisively depend on the human factors, since the tools and the economic foundation for it already exist.

The Szekszard KSZE Crop Production System

The KSZE was established in 1972 with the participation of 12 farms on 14,000 hectares, for the purpose of organizing intensive, industry-type corn production. In 1981 the system had 236 member partners, and the size of its integrated acreage exceeded half a million hectares. Unitl 1975 it grew only corn, but the need to utilize the expensive machinery park and the favorable experience of industry-type corn production urged the system's member farms and experts to add other crops. At the present time they supply professional advice for 13 plant crops.

The system kept the initials of its original name (Socialist Cooperation in Corn Production), since the KSZE emblem is a well known, sort of a trade name today in professional circles in this country as well as abroad.

The KSZE is not an independent enterprise but a simple economic cooperation, legally one of the self-accounting units of the Szekszard State Farm. The member farms enter into a bilateral contract with the system headquarters, and fix in this the size of the basic fee for services and the fee for incremental production.

Basicaly the KSZE operates in Transdanubia, with also a few member farms between the Danube and Tisza [rivers].

The oerational tasks are directed by six production organization units headquartered in Szekszard, Budapest, Szekesfehervar, Gyor, Kaposvar and Mohacs. In addition to these an office operates also in Vep. There are member farms in 10 of the country's megyes. Currently more than 50 services are provided, and they wish to further expand the circle of these.

In 1981 the KSZE is the country's second largest production system with respect to contracted acreage and the number of partners. It integrated 66.6 of the total plowfield acreage of the farms belonging to it in 1980. The degree of integration was 100 percent in the wheat branch, 91 percent in the corn branch, and 87.5 percent in the sunflower branch. In the corn branch KSZE's average production between 1972 and 1980 exceeded the nationwide production per hectare by an average of 1,270 kg per year, or 27.5 percent (see Table No 1.)

The system has been involved in autumn wheat and sunflower production since 1975. Today it produces wheat on more acres than Denmark. DSZE's wheat production per hectare between 1975 and 1980 exceeded the nationwide average by 581 kg, or by 15 percent (see Table No 2). For sunflower during this same time period the system's average was 368 kg, or 24 percent higher than the national average (see Table No 3).

Table No 3 Development of Sunflower Production Averages (1975-1980)

Year Designation	1975	1976	1977	1978	1979	1980
KSZE production average (kg per ha)	1307	1610	2083	2046	2126	2040
Nationwide average (kg/ha)	1190	1360	1530	1470	1830	1660
KSZE average as percentage of the nationwide average	109.8	118.4	136.1	139.2	116.2	122.9

Source: Agricultural Statistical Reference Book KSH, 1981.

The growth of agricultural production, 1975-1980. MEM-STAGEK [Ministry of Agriculture and Food Industry, Statistical and Economic Analysis Center], December 1980.

Economic Analysis of the Sunflower Production of our Member Farms. KSZE publication, 1980.

In 1980 for the fourth year in a row we succeeded in surpassing two tons per hectare in this crop. KSZE integrated in 1980, 12 percent of the country's corn production acreage and also 12 percent of its wheat area, and 13.6 percent of its sunflower area. This year 938,000 tons of grain product was produced on 148,000 hectares of corn growing area, with a world market value of about $150 million.

The size of the harvested wheat area was 156,000 ha [hectares], which produced 850,000 t [tons] of wheat valued at $170 million. All these illustrate the orders of magnitude which characterize the KSZE. In 1980 it was awarded the qualification "state-recognized production system", and its director, Csaba Lakatos was awarded the State Prize.

Characterization of KSZE's Activity

The first 8 years were a perid of seeking the right direction, extensive growth, and trying out new methods. The KSZE based its technology mainly on western technologies. The introduction of modern machinery and industry-type production procedures which represented the worldwide standards, even in themselves guarnateed the results. Besides farms with strong capital, even from the beginning there were also "poorer" partners in the system with unfavorable natural conditions, who thus received the opportunity to improve their technological levles faster than before, and to introduce the most modern technology which until then had been the privilege of only the best farms.

The farms received the machinery on credit and apliedfor it from their increased production. The system supplied the services for the modern machines, trained the technical workers of the farms, took in hand the supply of replacement spare parts, and provided

agronomical advice. Thus the difference between farms with poorer natural conditios and the bette developed ones significantly diminished as far as growth opportunities were concerned. Since the KSZE is not an independent enterprise the modern, high value machinery will remain the property of the member farms and they can do with them as they please. The system promotes introduction fo the new techniques and of the new technologies, new plant types and procedures into production, while operative direction of production and econimc operation continue to belong withing the spheres [of authority] of the oeprations and enterprises.

The success fo the branch association activity which began in 1975 contradicts those who expected the profile of the system to fade, and the advantages derived from specialization to be lost because of this. Janos Marton in his book "The Integrating Agriculture" (Agricultural Book Publishers, 1977) considered the efforts for association to be healthy only at the enterprise level, and opposed it for the systems. In his opinion, the system center, by doing this, also takes over one of the tasks of managing the enterprise, that of determining the production structure.

The experience of KSZE--in contrast with these worries--proved that interbranch integration is the only passable path to profitable production increase. The system center's advantages derived from specialization suffered no harm since the individual branches continue to be managed by independent experts who are dealing only with their own profiles. The system also did not take over from the enterprise the job of determining the production profile. The farm managers continue to make the decisions related to this question. As an end result, there has been a fortunate amalgamation of the machinery-centered and product-centered activities. The branch agronomists direct the dispensing of professional advice on the basis of the latter view, while the experts of technical productionimprovement are characterized by technology-centered thinking. The two do not contradict but complement each other.

This is a much better solution than if the farms belonged to different systems with each crop. Since the system not just simply dispenses professional advice but also performs a very complex activity, which exceeds the needs of the independent branches and crops.

Organizing the general technical-technological growth, the sale of chemical fertilizers and seeds, giving professional advice for plant protection and soil strength management, the supply of spare parts and service, and arranging credit, etc. cannot be tied to one specific branch.

In the KSZE, like in the other systems, during the first years the agronomic and technical views governed, and the economic viewpoints did not play any special roles. The goal was rapid increase of the production averages, and this even by itself insured the increase of per hectare income. But the price explosion on the world market occurred just at the same time the systems were becoming popular, and because of this a race began between yields and costs. Agriculture is a raw material producing branch, but at the same time it is also a significant consumer of raw materials. Thus the price explosion affected it in two ways: Its products became more expensive, but so did the raw materials it uses, even more so.

The increase in production averages could counterbalance only a part of the increased costs, thus the wholesale purchase prices also had to be raised.

Development of the cost saving technological processes (corn preservation without drying, soil preparation without plowing, dispersal of chemical fertilizers through slots, etc.) began in the late 1970's. The economic analytical work also developed, and was aided for the first time in 1980 by compute rtechnology.

During the 1970's the operative problem solving character was still definitive, but innovative activity was also very significant. The latter was mostly limited to introducing movelties into production (which was extremely successful), and there was very little self-development.

The KSZE is definitely amont the "inexpensive" systems. The amount of the basic fee and the share for increased production gradually decreased during the last 4 years on the per hectare basis.

In 1980 the pro-rated fee was 1.86 forints per 100 kg of corn. The KSZE earns a significant portion of its income not from payments collected from the partners but from other activities. It is engaged in selling chemical fertilizers, seeds and spare parts, organizing product storage and sales, sells technical equipment developed by itself, and in other marketing activities.

Innovative Activity

The KSZE obtains the world's leading techniques and technologies, the best types and the most modern orgnizing procedures, tries out the novelties of research institutions, and shortens the path of introducing them into production. It also constantly follows the agricultural literature.

The system's managers and experts were not afraid that excessively broad activity may lower the standards. The watchword is: All new things must be tried out! The KSZE does not consider the unsuccessful experiments and the failures to be wasted energy, or money thrown out. If we can erect a sign warning of a dead end street, which cautions us not to go that way again, that is also a result! The more novelties we try out, the higher the probability that we will find one which will repay also the money spent on the others.

The KSZE is constantly expanding the sphere of its services, and does so while raising their standards. It takes on all activities for which the members farms indicate a need, while also taking strict care to take on only those new services for which it has alrady crated the personnel and technical requirements.

With respect to services the KSZE does not have any kind of a monopolistic position, since the partner may resign from it at any time (he is not restricted by a financial deposit or legal dependence), or may transfer into another system. Thus it must constantly prove itself. This is also a large advantage incomparison with the traditional service organizations.

One of the most favorable effects of the production systems is the ending of the monopoly position of the old sales, service, etc., organs in agriculture.

It is worthwhile to mention the most important ones of KSZE's broad sphere of activities. Each year it tries out 300-400 corn types, and it developes and popularizes the technologies of storing corn without drying it. (For example, conservation by carbon dioxide, or fermentation by propionic acid.) In the wheat branch it is working on the research of type-specific crop protection. It has introduced the dispensing of professional advice on nutrient management based on soil evaluation, and established

the country's first agrochemical center for the application of liquid chemical fertilizer (in Aba). Based on its own patent, it tried out the application of gibberellins (vegetable hormones). It has developed mobile diagnostic equipment for plant protection machinery. It introduced the manufacture of a hand held protable calibrating instrument to set the plant protection machinery. It developed a new plow-tiller which saves work and expenses. It is experimenting with agrotechnology for soil protection to stop erosion of land areas around Dombovar. It is working on the technology of softening spraying water. It organizes the domestic manufacture of spare parts for imported machinery.

For example, the KVB-5 corrosion protection equipment is a product developed by the KSZE.

Experiments are currently in progress to rationalize the supply of spare parts on the basis of a computer program. The system maintains its own spare parts warehouses in Szekszard, Gyor and Mohacs.

The KSZE's service vehicles are familiar all over Transdanubia.

Working out the technology of harvesting straw in giant bales for industrial purposes was an important element of the development activity. This was done jointly with the Dunaujvaros Paper Plant.

Educating and advanced training of the technicians of the partners is also a significant activity. The opportunity opens up to gain knowledge by this means which could not be obtained within the framework of officially organized education by the state.

By means of its own publications the KSZE publishes the results of its agronomic and economic evaluations for its partners.

Working out experimentally the process of dry technology corn production in Algeria under large scale operating conditions was an international success worth mentioning. Negotiations are currently in progress to expand this.

The Path and Expected Problems of Future Growth

The ratio of innovative activity will have to be further increased in the future, in contrast with the operative problem solving functions. And, within the innovative work, the role of their own research and development must be increased instead of simple adaptation.

Besides the efforts to reach agronomic results, the profitability and economic viewpoints will have to be given more and more emphasis. The basis for starting out can only be profitability now. The KSZE--together with the other production systems--must play an outstanding role in implementing the national grain program and in successfully carrying out the entire 5-year plan of agricultural production.

In spite of the results mentioned and the intensive innovative activity shown, we must say that this activity will not be enough in the decade of the 1980's.

The KSZE an internal rejuvenationin order to remain competitive. Stagnationof the corn production averages (even though the acreage is increasing) is already a warning sign.

The main key to further progress is creating the personnel conditions. The best experts must be asembled in every branch, talents must be found and brought into the system from all parts of the country. but this is an extremely difficult task under the present general wage regulation mechanism.

It is also not a fortunate aspect that the KSZE's average wage level is limited by the wage level of the Szekszard State Farm. The production system should by all means be granted independence in the area of wage development opportunities, without it becoming an independent enterprise. Belonging to the host farm provides it with the security which makes it possible to remain a relatively inexpensive production system and have more courage to take chances. But at the same time this also limits its wage levels.

It would also be necessary to receive the same treatment in the areas of machinery supply, obtaining credit, etc. as the other two major plowfield systems. Unfortunately we cannot say this yet today.

And finally, it may cause serious problems if, because of poorly interpreted frugality, we do not import those modern macines which, considering our present production averages, are right for the expectations for today's Hungarian agriculture, and which the domestic agricultural machine industry is not yet ready to produce.

The foreign currency needed for the machines will be produced anyway by the increased products of agricultural production. But if the machinery supply turns out to have a narrow cross section from the qualitative or quantitative viewpoints, this may slow down the growth of our entire crop production on the plowfields, and we may be paying a heavy price for the erroneously interpreted frugality. Nevertheless the majority of the machines imported in the early 1970's will now reach the end of their amortization periods. The KSZE gets four or five times as much use out of the mahines each year which it has been using for 7 or 8 years, and which are operated for 3 or 4 years on western farms.

We hope that in the area of purchasing imported machinery as well as in the area of wage regulation, those decisions will be born in time which will again create favorable conditions for the growth of KSZE and of the other production systems, and thereby also for the growth of the agricultural enterprises.

CODIFICATION OF AGRICULTURAL LAW NECESSARY

Warsaw ZIELONY SZTANDAR in Polish 2 Sep 81 pp 1, 4

[Interview with Prof Dr Hab Jozef Paliwoda by Adam Sar, ZIELONY SZTANDAR: "Agricultural Law - What It Is, What It Should Be"; date and place not specified]

[Text] Prof Dr Hab Jozef Paliwoda is vice chairman of the Agricultural Law Commission, Main Board, Association of Polish Lawyers. He works at the Polish Academy of Sciences Institute of State and Law and is a member of the Scientific-Engineering Council, CSKiOR [Central Union of Agricultural Circles and Organizations].

[Question] How do you assess the current state of agricultural law?

[Answer] It should be considered unsatisfactory, but not just today. As early as 1958, after matters relating to farm reform and settlement on the western lands were completed, and we began to use civil-legal forms of action on a broad scale in agriculture, it became necessary to systematize agricultural law into a single, unified collection. However, to this day the idea of codifying agricultural law was not implemented, despite attempts made to do so. For example, during 1972-1975 even several draft versions of agricultural law were prepared, but the draft was not submitted to the Sejm [parliament].

[Question] In connection with this... How many acts of agricultural law are there--binding acts?

[Answer] The set of legal regulations called agricultural law is comprised at present of several dozen different laws or decrees, hundreds of executive orders and independent resolutions of the Council of Ministers, also orders and instructions from ministers, including 524 instructions from the Minister of Agriculture. In addition, there are several hundred resolutions of the Central Union of Agricultural Production Cooperatives and the Central Union of Agricultural Circles. For example, the operations of the agricultural circles alone are regulated by about 500 different types of legal acts. Under these circumstances, not only the organs of the agricultural production cooperatives and the agricultural circles, but also the workers of the local organs of state administration at the basic level frequently in their work are uncertain as to how to proceeed when they must independently determine, and sometimes even guess, whether they can or cannot perform specific functions.

[Question] Meaning codification is necessary. For years you have been an advocate of such codification. How do you now assess the needs and the potential for conducting this codification?

[Answer] If there were a codified, unified agricultural law, forming an internally coordinated system of standards, this would eliminate the minute regulation of problems and giving different meanings to the same concepts, principally by the chief organs of the individual sectors in agriculture. In the absence of such a unified agricultural law, each of these organs--the Minister of Agriculture, the Central Union of Labor Cooperatives and the Central Union of Agricultural Circles and Organizations --independently regulated the activities of the economic organizational units under him. The Council of Ministers, however, by means of self-contained resolutions, regulated matters which for many reasons had not yet reached the point that they could be covered by a law and pertained to the activities of several ministers.

The codification of agricultural law is a broad problem. Of necessity, I am restricting myself here to indispensable comments. I have expressed myself in greater detail on this subject in the legal journals and in my works, published in recent years.

Agricultural law at present is the only significant and yet uncodified branch in the Polish legal system. Nevertheless, its codification would have to take several years. That is more or less how much time the commission appointed to prepare it would require. Such a codification would have to be based on scientific forecasts of Polish agriculture, and it would also have to consider the development trends in this sector of the national economy for the next 10 to 15, or even 20 years.

[Question] Meanwhile it is now necessary to issue new or amended regulations...

[Answer] The guidelines of the Political Bureau and Presidium of the United Peasant Party Chief Committee, dated January 20, 1981, on the crucial problems of farm policy, agriculture and the food economy, and the Rzeszow, Ustrzyki and Bydgoszcz agreements, stressed the urgent need to adapt agricultural law to the state's current agricultural policy. The government promised to send to the Sejm, at designated times, the drafts of several laws--with specific texts--pertaining to agriculture.

All of this, of course, meant that the implementation of the idea of codifying agricultural law had to be postponed to a later and indefinite date. The regulation of the most critical agricultural problems became a matter or first priority. It should be said here that this process began much earlier than the signing of the abovementioned agreements, and that in its first stage its goal was to improve the management of farm lands and to ensure the inviolability of private-farm ownership and development stability in agriculture.

[Question] What is being done in this field, and what, in your opinion, should be done?

[Answer] Agricultural law will again increase by many new standard acts, and a number of acts now in effect will be amended. Many Council of Ministers resolutions in this field have already been issued. Other regulations have been amended. A change has been made, for example, in the Council of Ministers decree on transferring ownership of farm real estate, abolishing co-ownership of such property, and farm inheritance.

This considerably eased the requirements on qualifications for farming by the purchaser or heir.

It is expected that the Council of Ministers will soon repeal most of the decisions of its previous resolution on farmer groups, specialization and coproduction in agriculture which created many material and financial preferences to owners of specialized farms and financial preferences to owners of developmental farms, and also large material and financial preferences to specialized farmer groups.

Further important changes in farm legislation, according to the guidelines of the leading PZPR and ZSL [United Peasant Party] echelons, may be expected in the near future, meaning in months, not in years. They will cover modification of regulations already in effect and new legal regulations, primarily on: land area standards, restrictions on division of agricultural real estate and farm inheritance, together with a change in the ban on disposing of a farm inheritance.

Another closely related matter is that of making real estate ledgers on agricultural property open to the public and introducing a notarial procedure for transferring property, as one of the factors in strengthening land ownership in the private sector. Subsequent changes should include a restriction on the take-over of agricultural real estate for the state, and a drastic reduction--perhaps even a total ban--on the exchange and take-over of farm lands from the private sector for units of the socialized farm economy. If the assumptions of the state's agricultural policy on the equality of all forms of property and management in agricultural are to be applied consistently, the right of the local organs of state administration to freely dispose of State Land Fund lands and other state lands within their jurisdiction, must be markedly enhanced. The only rule of conduct by the state organs in this field should be the duty to ensure the most efficient utilization of these lands. The state organ should be required only to obtain the opinion of the agricultural self-government in selling and leasing state agricultural real estate.

The problems relating to legal conservation of agricultural and forest lands, and the recultivation of these lands, call for completely new regulations. Conservation thus far has been inadequate or totally ineffective. The law on retirement pensions and other social services for farmers and their families must be completely rewritten. The three-and-a-half years that the law has been in effect have made many of its regulations out-of-date and inapplicable. On this subject I basically agree with the solution to the social matters of peasant families contained in the demands set forth by the United Peasant Party with the reservation that in view of the existing socio-economic reality, they should be regarded as goals, with implementation at least to 1990.

[Question] And what can you say about the legal superstructure for the revival and creation of self-government in the village and in agriculture?

[Answer] I regard the issuance of a law on self-governing agricultural organizations to be not only advisable but even critical. That is why I do not support the position expressed in June by the Food Economy Council that work on drafting this law should not be given priority. Foregoing the work on this law and the subsequent minutes of the decisions of the Ministery of Agriculture and Food Economy and NSZZ Rural Solidarity, dated August 17, 1981, on withdrawing the draft from the Sejm,

delays the preparation of methods and forms of action intended to create from the village meeting a forum for coordinated cooperation of all self-governing agricultural organizations, and above all, for the concerted action of private farmers' trade unions.

What matters here is the village. Stressing the important role of the village meeting and the advice of the village administrator's office in the law on self-governing agricultural organizations could significantly contribute to lessening the mutual animosities between the private farmers' unions. It would also alleviate the tendencies of some of the unions toward exclusivity or unwarranted domination, which is not in keeping with democracy and self-government. In addition, the planned law would bring out of isolation and include in the cooperation such self-governing organizations as companies for managing gmina [rural parish] property and land partnerships, water companies, forest companies and groups, joint meetings and councils of union participants, and branch unions and associations.

Neither do I support the viewpoint of the Food Economy Council on the advisability of examining the feasibility of appointing agricultural chambers as territorial units of agricultural self-government, even if only on the voivodship level.

Such chambers, which existed from 1928 to 1946, not only could not assume the tasks in the field of farm production that they had up to 1946, since they would have to have their own professional apparatus, they could not represent the interests of the farmers, since that is the present domain of the farmers' trade unions and the branch unions and associations. Furthermore, why artificially create new structures at all in the village, when there are already too many of them?

[Question] So the number of legal acts pertaining to agriculture will again increase?

[Answer] Indeed. The changes made this year in the agricultural law regulations in effect and the issuance in the near future of a series of new standardization acts increase again, step by step, the total number of legal acts forming this branch of law. And not only they are counted. I would like here to point out still another field which urgently needs systematization of legal regulations, although these regulations, according to scientific systematics, do not belong to agricultural law but financial law. However, they are directly related to agricultural law.

I am referring to the regulations on the tax system in private agriculture. There is mention of the need to modify this system in the guidelines of the PZPR Central Committee and the United Peasant Party Chief Committee. What is at issue here is not only a reformation of the law on land taxes but also on services, some of which are not in the nature of taxes but in actuality are a reimbursement stemming from state services to farms (payments into the gmina fund, premiums into the State Insurance Fund, State Land Fund fees, electrification payments, land development payments, payments for collective water-supply equipment and main sewage equipment provided by the state, contributions to the Farmers Pension Fund). All of these liabilities are covered by a single payment order and are part of the so-called monetary liabilities.

[Question] When agricultural law is mentioned the average citizen immediately thinks of land. Are there regulations, the Constitution included, that guarantee the permance of the private farm?

[Answer] The provisions of the Constitution, the laws, decrees and executive orders, guaranteed the permanence of the farm and did not create nightmares of temporariness. We should differentiate, however, between what is recorded in legal acts and what is practiced by the organs of state administration.

[Question] The last question. Could the private farmer then feel that he works in a country that is governed legally?

[Answer] Law and order is the behavior in accordance with the law of everyone in the state. And, thus, above all, the state organs, the economic organs and cooperative institutions, and all of the citizens. We have heard a great deal, and correctly so, in the last few months on practices of state organs that have not been in conformity with the law. Less, however, has been said and written about the unlawful behavior of the citizens. This pertains also to private farmers.

How many cases have there been where contractual agreements were not fulfilled because there was an opportunity to sell a contracted farm product for a price that was higher than that specified in the agreement? In the court procedures in these kinds of matters, the farmers without any objection admitted to the claim and willingly paid the contract penalty. How many agreements were made, contrary to the law, on transferring farm property? The dates on the contracts were falsified, so as to obtain a contract with a date after November 4, 1971, that is, after the law on settlement of farm properties became effective.

Those are only examples. But I repeat that in most situations that were unfavorable to the private farmer, not the law was to blame but the practice. Not the weapon, but the hand wielding it.

MACEDONIAN POWER SITUATION NEARS CRITICAL STAGE

Skopje NOVA MAKEDONIJA in Macedonian 30 Sep 81 pp 1, 3

[Article by E. P.]

[Text] The TEC [thermal-electric power plant] "Negotino" must start as quickly as possible. All those who fail to comply with the third stage in the limitations on consumer power will have their electric power cut off. The crisis situation continues in supplying crude oil and petroleum derivatives.

Nothing optimistic was to be heard at yesterday's session of the assembly of the republic self-management interest community for energy, held in Skopje. The delegates regarded the energy situation in Macedonia as extremely difficult, and it approaches the critical limit from day to day.

In considering the immediate situation for electrical energy, the delegates state that if the "Negotino" TEC does not begin producing, greater restrictions on electrical energy consumption will have to be imposed (at present a third degree restriction is in effect). Further restrictions would have long-reaching consequences for the economy. On the other hand, a serious problem has risen in providing foreign exchange for purchasing heavy oil for the needs of the Negotino thermal power plant.

Reservoirs have 40 percent less potential than the planned balance called for, and compared to the same day last year, water supplies are down by 28 percent. In practice, that means that the hydroelectric power plants cannot deliver more than 300,000 kilowatt hours per day. As, however, the general director of the Macedonian power complex Elektrostopanstvo, Mile Stojanovski stresses, there are days when the hydroelectric power stations are delivering as much as 2.5 million kwh. If they continue at that rate, there can be catastrophic consequences.

At the session, it was stressed that a large number of consumers are not observing the measures in force for the first and second degrees of restrictions on electric powers for consumers. An especially large number of violations have been noted among so-called direct consumers. There have also been shortcomings in the work of the opstina self-management interest communities, which in such situations are supposed to undertake broad actions to insure savings and rational use of electrical energy. Because of all these failures to carry out obligations, "Elektrostopanstvo" is turning to the republic energy inspector. All of those consumers who do not have the discipline in such crisis situations to uphold measures calling for restrictions will have their electrical power cut off.

The delegates devoted special attention to the course of construction of the "Bitola" REK [Mining Electric Power Combine]. There are indications that this situation would not have occurred here if the construction of that significant energy installation had not been delayed. Therefore, a resolution was adopted calling for the earliest possible start of operations at the Bitola REK. Informed sources, however, think it will be impossible for the Bitola plant to start up before the first quarter of next year.

The only bright spot in the electrical energy crisis that has gripped the republic is the "Oslomej," TEC which is operating at full capacity. This thermal-electric power plant produced 60 million kwh of electrical energy in 28 days of this month, which is the equivalent of a full month's production. This year it is anticipated that the Oslomej plant will produce 510 million kwh of electrical energy.

Supplies of crude oil and petroleum derivatives continue to be very tight, indicates the "Macpetrol" representative from Skopje. He continued to say that even if all foreign exchange resources were available at the moment, it would not be possible to supply the needed amounts of liquid fuels in less than 20 days. The situation is also negative regarding wood and coal supplies.

An appeal for saving in a situation like this, when there are shortages of essentially every kind of fuel, strikes one as somewhat absurd. Nevertheless, that does not mean that there is nothing to be saved. On the contrary, there continue to be instances of wasted electrical power, crude oil and gasoline, and of inefficient use of these fuels.

CEMA COOPERATION IN MACHINE CONSTRUCTION, FOOD INDUSTRY CITED

East Berlin AW DDR-AUSSENWIRTSCHAFT in German Vol 9 No 43, 21 Oct 81 pp 1-2

[AW Economic Policy Information' report by Information and Public Relations Department, GDR Ministry for Foreign Trade: "Purposeful Implementation of CEMA's Long-Range Target Programs"]

[Text] The CEMA countries resolved at their 35th session to implement the principles of CEMA's comprehensive program and the five specific supplementary target programs of cooperation in selected areas of material production, programs that are designed to solve vital economic problems, intensify social production, improve the structures of national economic complexes and make more efficient use of the entire economic and scientific-technical potential of the CEMA countries. One of the most important tasks of CEMA organs and CEMA countries in recent years has been that of constructing a system of multilateral and bilateral agreements to support and implement the target programs approved by the 32nd and 33rd council sessions. By 1 July 1981, 106 multilateral agreements had gone into effect.

Eighty-Nine Agreements for Implementing Machine Construction Target Program

The drafting of agreements, treaties and programs resulting from the long-range target program for cooperation in machine construction has virtually been concluded. The Commission for Machine Construction has prepared the following 89 multilateral agreements:

Fifty-one on specialization and cooperation in production, including proposals for extending existing agreements;

Seven on cooperation to develop specialized production capacities;

Thirty-one on scientific-technical cooperation to develop new machinery and equipment.

In addition, the commission prepared 9 programs of cooperation on research, development and design as well as 35 programs on standardizing machine construction products and making them uniform. Most of the agreements have already been signed.

The specialization and cooperation agreements cover production of the following items, among others:

Metallurgical equipment for ferrous and nonferrous metallurgy, including equipment for coking plants, rolling mills, foundries and agglomerating plants;

Installations for producing various chemical products;

Equipment for enriching solid fuels, ferrous and nonferrous metals as well as mineral raw materials;

Equipment for the second stage in the processing of petroleum;

Shutoff valves and gate valves for petroleum and natural gas pipelines;

Dust removal installations;

Metal-cutting machine tools, including NC [numerical control] machines and assemblies;

Forging machines and presses;

Oceangoing and inland navigation vessels and their gear;

Mechanical devices for loading, unloading and warehousing operations;

Open-pit mining equipment;

Technological gear for producing petroleum and natural gas; drilling installations;

Diesel locomotives, cars for freight and passenger trains;

Tractors and agricultural machinery;

Technological lines and equipment for the canning, meat-packing and milk industries.

The agreement on multilateral specialization and cooperation to produce equipment for the second stage of petroleum processing provides for the production of installations for 13 of the most important processes in the deep cracking of petroleum. Complete installations as well as 31 groups of gear for the completion of installations are included in the agreement on specialization and cooperation in the production of installations for the chemical industry; some of these are for the production of ammonia, methanol and caprolactam, sulfuric acid, soda ash, paints and enamels, lampblack, ethylene and isoprene rubber. Planned for the years between 1981 and 1990 is the delivery of about 160 complete installations and 275 units of completion gear. This will meet the demand by CEMA countries for this modern technology and will guarantee a significant increase in production of the most important chemical products.

In addition to satisfying CEMA's demand for modern technology, special importance was placed on putting new machinery and equipment into production as well as raising

the technical level and quality of specialized products. This also applies to the proposals to extend existing specialization and cooperation agreements, in which case the specialized production nomenclature is to be enlarged mainly via the output of new and improved products. For example, the extended treaty on specialization and cooperation in ship construction now contains 179 positions compared to 137 in the corresponding agreement dating from 1975. The number of specialized tractors and pieces of agricultural machinery has been increased from 131 to 265.

Almost every branch of machine construction is affected by the CEMA Machine Construction Commission's agreements and programs on scientific-technical cooperation in the development of new installations, equipment and instruments.

Cooperation on expanding specialized production capacities and establishing new ones is an important area. In line with the target program, the Commission for Machine Construction prepared seven corresponding agreements governing cooperation by the following countries:

People's Republic of Bulgaria, People's Republic of Poland and the USSR -- establishment of capacities for producing forging machines and presses in the People's Republic of Poland;

People's Republic of Bulgaria, People's Republic of Poland, Socialist Republic of Romania and the USSR -- establishment of capacities for producing implements made of mineral ceramics in the USSR;

Hungarian People's Republic, People's Republic of Poland and the USSR -- development of capacities for producing ball joint drives for NC machines in the People's Republic of Poland;

People's Republic of Bulgaria, People's Republic of Poland and the USSR -- development of capacities for manufacturing machine tools and automatic lines for making sets of wheels and railroad wheels in the People's Republic of Poland;

Socialist Republic of Romania and the USSR -- development of capacities for producing contact ways for metal-cutting machine tools in the Socialist Republic of Romania;

Interested countries -- expanded production of filters and filter elements in the USSR.

Participation by interested countries consists essentially in supplying equipment for the new capacities. IIB credits are also being used.

In line with the target program for cooperation in agriculture and the food industry, the food industry is facing the task of making more efficient use of agricultural raw materials in addition to improving the structure of food production; these measures are to make it possible to increase significantly the production of the most important foodstuffs, reduce labor costs and increase labor productivity and the effectiveness of production. Serving this purpose are four agreements on the development and advancement of technologies and equipment as well as their production under a division of labor for the fats, sugar, meat and canning industries;

also playing a role here is a general agreement on the development and improvement of equipment and technologies for industrialized freshwater fish hatcheries. The Standing Commission for the Food Industry prepared the agreements in close cooperation with the Commission for Machine Construction; they were signed by interested CEMA countries in 1978 and 1979. The CEMA countries and the Socialist Federative Republic of Yugoslavia have put more than 100 research institutes of the food industry and design organizations of the machine construction industry to work implementing the agreements.

The agreement covering the sugar industry (sugar production from sugar beets) includes studies on improving methods for comprehensive assessment of the quality of the raw material and on employing new chemical substances and physical/chemical methods in sugar production. Eight technological lines, 14 technological equipment packages and 18 instruments for automatic control and regulation are to be developed and tested; 5 technological lines are to undergo further development, and an automatic system for controlling production processes in sugar factories is to be developed. The new technologies and methods will make it possible to increase sugar yield from the beets by 3 percent, reduce fuel consumption by 12 percent and the consumption of auxiliary materials by 6 percent, effect a substantial reduction in labor costs and increase the stability of the technological regime and the production rhythm. The use of the new equipment and technologies can produce about 600,000 tons of extra sugar annually, and more than 59,000 tons of standard fuel can be saved.

The development of new technologies and equipment for the processing of tomatoes, cucumbers, peaches and other produce is provided for in the corresponding agreement for the canning industry. Experts have calculated an annual return of about 210 million rubles once the new equipment is in use. About 15,000 employees can be released for work elsewhere.

Implementation of the measures contained in the agreement covering the fats industry will make it possible among other things to extract from the same quantity of raw material several thousand tons of higher-quality vegetable fats as well as coarse feed containing no less than 50 percent protein and no more than 6 percent cellulose. The economic return will amount to about 250 million rubles. The annual benefit to the meat-packing industry has been estimated at 360 million rubles — just in the processing of beef cattle and hogs as well as sausage production.

Implementation of the general agreement covering freshwater fish breeding will result in a three- to fourfold increase in the yield of freshwater fish in 1990 compared to 1977, a considerable reduction in investment outlays for hatcheries, a 50- to 100-percent increase in labor productivity and substantially improved working conditions.

Together with the Commissions for the Food Industry and Agriculture, the CEMA Commission for Cooperation in the Area of Planning also prepared general agreements on comprehensive development of sugar production as well as agricultural production and industrial processing of citrus fruits in the Republic of Cuba. Both agreements were signed during the 35th CEMA Session.

REPORT ON DELIVERIES OF SOVIET-MADE VEHICLES

Sofia RABOTNICHESKO DELO in Bulgarian 27 Oct 81 p 3

[Article by Emil Nikolov: "One of the Largest Companies in the World"]

[Text] Everyone in our country is well acquainted with Soviet motor vehicles, trucks as well as passenger cars. They fill the streets of cities and villages, continually hurry up and down the roads, and take an active part in socialist construction. But very few people know that the enterprise which makes possible their import is called "Avtoeksport" [Autoexport] V/O [Foreign Trade Association]. Perhaps the car owners who have patronized the "Druzhba" [Friendship] service station in Sofia have discovered from the sign where "Avtoeksport" is headquartered. But they do not know that during the 25 years of its activity it has been the route to Bulgaria for over one million cars and trucks. During the Plovdiv fair alone a contract was signed whereby in 1982 we will import trucks, garage equipment etc. with a total value of 53 million transferable rubles.

In addition to the well-known makes of ZIL [vehicle made by Moscow Automobile Plant imeni I. A. Likhachev], MAZ [vehicle made by Minsk Automobile Plant], KrAZ [vehicle made by Kremenchug Automobile Plant], BelAZ [vehicle made by Belorussian Automobile Plant] and GAZ [vehicle made by Gor'kiy Automobile Plant], the import of dump trucks and drop-side trucks, made by the giant of Soviet truck building--the KamAZ [expansion unknown; possibly Kama Automobile Plant], is envisaged. At Shumen the assembly of GAZ-53 trucks will continue, and at Lovech the assembly of 15,000 Moskvich [Muscovite] 2140 passenger cars (with a 1500-cc engine). Eight hundred "Volga" GAZ-24's and 100 "Zaporozhets" [Dnepr Cossack] ZAZ [vehicle made by Zaporozh'ye Automobile Plant] 968 MB's specially equipped for disabled persons will be imported.

A contract was also recently signed for the import of "Lada" [Sweetheart] passenger cars. In 1982 we will receive 15,000 vehicles. Of these, 1800 will be the VAZ [expansion unknown] 2102 station wagon, 3500 the VAZ 2106 (with a 2106-cc body and a 1500-cc engine). For the first time 5500 VAZ 21013's (with a 2101-cc body and 1300-cc engine) and 4200 VAZ 2105's will be imported. This is the latest model to have gone into series production. It incorporates the modern trends in automobile making. The body is appreciably more elegant than the "Lada" cars hitherto known. It is distinguished for its clean and straight lines. The radiator grill is new and graceful. The headlights and supplementary lights are designed as a common

rectangular block. The bumper has a wide energy-absorbing rubber strip. The compartment and seats are more comfortable. The dashboard is new and modern. The engine has a 1300-cc displacement. It is equipped with a new "Ozon" [Ozone] carburetor, which sharply reduces pollution of the natural environment and ensures stable and economical operation. Fuel consumption at 90 km/hr is 7.5 liters per 100 km. The vehicle accelerates from a standstill to 100 km/hr in 18 seconds and develops a maximum speed of 145 km/hr.

The VAZ 2105 meets all safety requirements under the standards of the European Economic Commission.

The "Avtoeksport" V/O is not just an importer for Bulgaria. It buys from us a number of component parts for Soviet automobile making. Over 60 percent of the basic electric equipment of "Lada" cars (storage batteries, ac generators, starters, coils etc.) is produced in Bulgaria. We also export castings for BelAZ cylinder blocks.

The "Avtoeksport" Company is also a well-known partner in the rest of the socialist countries. Last year alone they received through it about 400,000 passenger cars and trucks and special-purpose vehicles. It also has agencies in the capitalist and the developing countries. It cooperates with 250 foreign trade organizations, companies and corporations. It exports over 450 types of transportation equipment, which can be found on every continent.

PROBLEMS CITED IN HOUSING CONSTRUCTION PROGRAMS

Hamburg DER SPIEGEL in German Vol 35 No 44, 26 Oct 81 pp 49, 52, 53

/Unattributed article: "For Me: In the GDR Housing Construction Has Highest Priority--At the Same Time Old Buildings Are Deteriorating"/

/Text/ Concrete slabs crack. Paint blisters. Balcony facings crumble. Two girls, about 10-12, on Martin Andersen Nexoe Street in Rostock's new suburb Lichtenhagen, dispute whose apartment ceiling leaks worse when it rains: "In our home it stands THAT high!"

GDR provinces 32 years after the state was established: A breath of yesteryear hovers over the country. Unlike East Berlin, the past has not yet been packaged in chromium, gilt dabbled mirrors in aluminum frames and oxydized aluminum facades. Instead neo-Gothic and neo-classic brick buildings between Wismar and Greifswald compete with the concrete bunkers of the present to see which will collapse first.

So far the historical old buildings from Hanseatic times or the early part of this century are in the lead. In Rostock alone Konrad Brauns, department manager in the city planning department, records 100-160 homes per year as "lost"--they are rotted through and inhabitable.

That happens in a country where housing enjoys the highest priority, housing units are produced on the assembly line, and government as well as party congresses have hoisted high the banner saying that "by 1990 the housing problem as a social issue" (Eighth SED Congress) will be solved. By that time every citizen is to have shelter: First just a roof over his head. Later it may perhaps become a home which is pleasing to him.

Take Rostock: The priority need is for 6,000 homes. The applicants live with relatives or in emergency accommodation, and they need to wait up to 5 years for an answer from their enterprise labor union housing commission which assigns apartments. The standard unit is supplied by flat-bed truck: Concrete slabs, 2 x 3 meters, plain, tiled or with window, which a crane piles 5 stories high in something like 38 days for 45 apartments--all inclusive.

The entire glory, some 20 square meters per room but no more than three rooms per apartment, costs the government a maximum of M60,000 (that is the legal rule). The

tenant gets by with M1.25 per square meter. He must find a few marks more to make the apartment a home: Buy such things as a chromed brass faucet which really shuts off the water and replaces the mass produced plastic faucet at M8.60--the latter one drips in real socialism.

Or he might refurbish his old building with a bathtub at the price of DM175, supplied by Genex Distributors--no bathtubs are available for Eastern money. He could paint his window frames if he were willing to stand in line for paint.

Unfortunately do-it-yourself enjoys little popularity. Initiative appears to be foreign to small town dwellers in the GDR: Not really surprising if we consider that all spontaneity has been driven out of them for years, what with five-year plans, work norms and additional obligations.

In a rare exception bricklayers and tradesmen are making an effort in Stralsund's Faerhstrasse to restore a medieval row of houses. Immediately next to it is an inhabited building which used to be the residence of a patrician family. A hole the size of a towel gapes in the roof; grass and dandelions grown in the gutter, a half-meter connecting piece is missing from the downspout. The house is molding.

Government bureaucrats claim that private owners are content to have their property deteriorate; consequently even more communal housing is said to be needed. Yet the rents, virtually unchanged since the end of the war, are sufficient neither to meet the costs nor to provide any profits. True, the government grants loans for repairs, but with the avowed aim that private owners should "incur more and more debts" (Brauns)--to the point where they are compelled to give away their semi-ruins to the people.

Something is surely wrong with the system. Of the 80,000 apartments in Rostock, 17,000 are privately owned. The city administration planned a total of M7 million for modernization in its annual budget.

Even if there were more money, manpower would be lacking: 12,000 construction workers from the province are permanently delegated to Berlin to lay bricks for show projects to beautify the future socialist paradise. And even if there were enough manpower, it would still be necessary to cope with the bureaucracy. Every demolition jobs needs the permission of the GDR minister for construction. Such permission is never granted; the rows of houses must therefore collapse on their own.

According to the national budget the GDR spends M7.7 billion on accommodation for its citizens. Three-room apartments in a new building, costing M1,000 per annum, are subsidized for the tenant so as to cost him M250. And yet the tenant is rarely grateful. Should some cement be available, he prefers to mix it for his own vacation home rather than use it to face the building. Paint, if available, he prefers to use for the hut on his allotment rather than for the common stairwell.

With all that GDR Germans excel at procuring whatever they need: For D-marks they can buy goods which are normally kept under the counter. For D-marks they can get tradesmen to come and do things in their vacation homes. At the same time the citizens lack any desire to squander inventiveness and organizing talent on rented accommodation. True, the "Join In!" instruction classes at the houses of culture

are always full, but the knowledge acquired is not visibly applied: The GDR provincial resident prefers to hide in the privacy of his home; the drill which does not even exist officially is bought on the black market--for his own amusement.

After a lapse of 30 years even the party leadership is slowly beginning to appreciate that the defect in the system might just possibly be due to the lack of incentive. "Where the interest of society calls for it," as party jargon has it, tradesmen may now commit sacrilege against communist production methods--and work for their own account.

Successfully so: Private contractors even in the socialist GDR observe the highly capitalist rule that wages (here called salary) are the best incentive.

Electrician Karl-Friedrich Meinert of Dergenthin near Perleberg, for example, expected to earn M30,000 in the first year of self-employment. When his 1980 balance sheet was drawn up last January, he had earned more than twice that amount. Meinert commented in the Rostock NORDDEUTSCHE ZEITUNG: "I really made out well."

According to official statistics the average GDR citizen earns only 20 percent of that amount: M12,960.

FEKETE INTERVIEWED ON ECONOMIC POLICY, CONVERTIBILITY

Duesseldorf WIRTSCHAFTSWOCHE in German No 38, 11 Sep 81 pp 24, 27

/Interview with Janos Fekete, vice president, Hungarian National Bank, by Ladislaus Singer, WIRTSCHAFTSWOCHE: "We Would Do Without Exports;" date and place of interview not given/

> /Text/ Janos Fekete, vice president of the Hungarian National Bank, numbers among the internationally recognized financial experts. In an interview with WIRTSCHAFTSWOCHE's staff worker Ladislaus Singer, he comments on the economic and financial problems of his country.

/Singer/ Mr Fekete, for a long time now there has been talk about the fact that the forint will be the first East bloc currency to be made convertible. How do you intend to accomplish that?

Fekete: The primary concern is not the convertibility of the forint, but the uniform exchange rate. Money should not have two rates of exchange, because then it is not a measure of value. We once had two rates of exchange: 30 forints to the dollar for tourists, 61 for trade. When we adapted our price system to world market prices, the difference sank to 9 percent. It will soon disappear completely.

/Singer/ When?

Fekete: In 2 to 3 months, when our price system reflects world market prices. That's why we had to increase prices for energy, groceries and meat.

/Singer/ What does that do for the Hungarian economy?

Fekete: If prices are realistic and the rate of exchange is genuine, then an enterprise can work independently. But to do this it must receive those pieces of information which enable it to make the right decisions; it must know the prices prevailing in the world market and currency rates. But we shall reach the ideal condition.

/Singer/ And what will that be like?

Fekete: Then the manager of a shoe factory will calculate as follows: I buy 1 kilo of leather at a cost of 80 forints; I have 3 people working on the shoes at a cost of 120 forints, or a total of 200 forints. If I can sell the shoes for 250 forints, it was a good bit of business. And the enterprise will not be interested in whether the leather was imported from Argentina or was produced domestically.

/Singer/ Are you not criticized by your CEMA partners for this practice?

Fekete: For the present, events support the fact that we are implementing this economic policy. Whether others like our practice or not is their business. But no one is hindering us. At the most they don't like us. That's logical.

/Singer/ And what will the uniform rate of exchange do for Hungary's position in the international market?

Fekete: A dollar will then cost 35 forints. And when you ask for your hotel bill in Budapest, they will say to you: "That comes to 3,500 forints or $100." And you will not have to exchange any money. If a currency has its uniform rate of exchange, one can also speak of convertibility. Actually there are two kinds of convertibility. In one kind, the public is also supplied with convertible forints; in the other, they are not.

/Singer/ And how will that be in Hungary?

Fekete: We cannot go so far as to include the public, too. We don't have the money for that. For if the Hungarian worker could sell his house in Kelenfoeld, transfer the purchase price of 3 million forints to Vienna and purchase something else there for shillings, many people would want to send their money out of the country. We can't yet afford this kind of convertibility.

/Singer/ What form will Hungarian convertibility assume?

Fekete: In trade with the West, everything that relates to exports and imports--for example, transport costs, insurance, agency commissions--can also be bought and sold for convertible forints. The forint will just be one of many currencies, like the shilling, the French franc or the mark. It's just that accounting in forints has its advantages.

/Singer/ Which ones?

Fekete: With the convertible forint, we can buy and sell the same things for which today we must pay dollars, marks or Swiss francs. And a German can open an account with us and deposit 100 million convertible forints which he acquires when he sells goods to Hungary.

/Singer/ And can he also invest this money?

Fekete: There are special rules for investment, but he can deposit it. Anyone who brings money into the country in convertible forints can take it back out at any time and can buy any foreign currency he wants for them at the day's rate.

/Singer/ How good is this forint?

Fekete: Ten Years ago a dollar cost 60 forints, today it is 35. We have raised the value of the forint by the same amount as you have the mark or the Swiss have the franc. Thus the forint is not a weak currency. Most important however, is that Hungarian economic policy does not allow an inflation rate of over 4 or 5 percent.

[Singer] It is higher now, however?

Fekete: No, this year it is only 3.9 percent and by the end of the year it will be 4 to 4.5 percent, at the most. Only last year it was 9 percent because we raised energy prices in two stages.

[Singer:] You make 5-year plans. How do you expect them to work if you don't know what will happen in the world tomorrow?

Fekete: Our plan does not hinge on details and is not keyed to business. Our plans are based on economic policies of how much we want to raise the living standard, prices, or increase foreign trade. These are coefficients, not rules. Every factor under our control, such as interest, loan policies, investment and monetary policies, serves to attain this goal.

[Singer] How do you use these economic levers?

Fekete: An example: In Hungary agricultural prices are free. Let us suppose that egg prices begin to climb because a great many eggs are being exported. Then we simply will not issue any export licenses for 2 weeks. The eggs remain with the producer and prices go down nicely.

[Singer] Then the mark has to be somewhat regulated.

Fekete: But of course. We have to influence the mark in the direction we want. We would rather do without exports, but we will not allow any domestic shortages. It will not happen in Hungary that we export meat and thus none is available domestically. Though we could get dollars or pounds for it, the domestic supply takes priority.

[Singer] Do Hungarians support this policy of the government?

Fekete: Yes. They trust that Janos Kadar will not cheat them.

CEMA ECONOMIC PROBLEMS TACKLED WELL BY HUNGARY

Duesseldorf WIRTSCHAFTSWOCHE in German No 38, 11 Sep 81 pp 22, 24

/Unattributed article: "Different From the Others"/

/Text/ Hungary has the same economic problems as other CEMA countries. But the Budapest government is showing more flexibility and intelligence in its efforts to cope with them.

"There is no social factor of consequence which could cause us to intensify our policy, and the party wants nothing of the sort." Hungarian party leader Janos Kadar gave this promise a year ago before the Budapest parliament, with a view to the unrest that had just erupted in Poland.

Kadar has kept his promise. Hungary continues to steer its own independent course in economic policy, a course which is viewed with suspicion by its CEMA partners. And Kadar knows how to proceed tactically. He explains the quasi-market economy approach to the conservative plan purists in this way: The socialist society is "a transitional system in which goods are being produced." Thus, there must also "be a market where market laws prevail and prices exist." This has nothing to do with socialism or capitalism, because "production, even in socialism, must be profitable."

To be sure, Kadar also promised the Hungarians a year ago that no new sacrifices would be demanded of them. But he was not able to keep this promise. As early as 1 January 1981, a large number of price increases went into effect, including prices for meat, flour and tobacoo.

Yet in Hungary that kind of thing is done more easily than, for example, in Poland. In the first place, the standard of living in the land of the Danube is higher than in other CEMA countries; second, the Budapest government is smarter. It knows how to explain to the citizens why they must make sacrifices. And it has also been making it quite clear that in the next few years there will be hardly any rise in the standard of living.

According to the plan, up to 1985 the national income is to grow by an average of 3 percent annually. Roughly one-third of the growth must be spent to offset the unfavorable terms of trade, another third to keep the trade balance deficit (in 1980, 18.9 billion forints) within defensible limits.

Thus, exports are also to increase each year up to 1985 by an annual average of 6.5 to 7 percent. But--and in this respect Hungary differs from its socialist bloc partners--exports to capitalist countries are to be increased by 46 percent. Istvan Toeroek, state secretary in the Ministry of Foreign Trade, announced that for this reason special support will be given to those sectors which have the greatest chances in foreign markets: machine building, agriculture and the foodstuffs industry.

Some 54 percent of Hungarian agricultural product exports went to hard-currency countries in 1980. And further proof of the intelligence of the Hungarian economists: Two-thirds of the agricultural exports are in processed form. This of course requires investment in the foodstuffs industry, but it pays off, for the domestic market as well.

The relatively great independence of the enterprises is also of value for exports, even though the price policy imposes limits. For, according to the Budapest rules, every enterprise which exports more than 5 percent of its production must sell its products domestically at a price that is based on a conversion coefficient of 34.7 forints per dollar. In practice: If an enterprise sells its goods for $100, it must sell them in Hungary for 3,740 forints.

This can cause complications, as in the cooperation between AEG-Telefunken and Hungary's Hajdusagi Ipar Muevek (HIM). The Hungarians produce 100,000 washing machines each year with the AEG license. AEG wanted to buy half of them, but it demanded a 10-percent quantity discount. HIM could not grant that because then it would also have had to reduce the domestic price, resulting in a failure to cover costs. Moreover, far more than 50,000 washing machines could be sold domestically, but that would be at the expense of exports that yield foreign currency. To be sure, this combining of export prices and domestic prices--read: orientation to the world market--has advantages, too, not only for the domestic market, for it also establishes prerequisites for the desired convertibility of the forint.

In the meantime, efforts by Budapest economists to gradually adjust producer prices to world market prices--primarily in the case of raw materials and energy sources--required an economic sacrifice: The rate of inflation rose to 9 percent in 1980, yet this year it is to be cut almost in half.

Nonetheless, the Hungarian authorities are cautious in the matter of import licenses. Trade with hard-currency countries must be balanced in the extent possible. For Hungary, too, has debts in the West: approximately $7.8 billion, requiring a debt service each year of about $1 billion. And the specter of Poland is a warning to be cautious.

To be sure, National Bank Vice President Janos Fekete, a strict defender of Hungary's own course, acts self-assured and optimistic: "What else can happen to Hungary, where there has already been a counterrevolution, there was shooting in the streets and Budapest was a battlefield. If another country had had 3 such weeks as we did in 1956, it would have required a 20-year postponement to pay off its debts. We did not demand a single day; we paid by the due date."

GUIDELINES, RESPONSIBILITIES IN INVESTMENT ACTIVITY

Bucharest ERA SOCIALISTA in Romanian No 18, 20 Sep 81 pp 4-6

/Article by Dr Alexandru Olteanu, director in the Investment Bank: "Aims and Responsibilities in the Investment Field"/

/Text/ In keeping with its policy of continuing improvement of the people's living standard through intensive development of the national economy, the RCP is specially emphasizing further implementation of extensive investment programs in this five-year plan too which will ensure expansion and modernization of the technical-material base and an increasingly pronounced gain in the national wealth. The investment program for 1981-1985 is based on the noteworthy achievements of the past, which permit allocation of more resources to development. It is sufficient to say that at the end of last year the Romanian economy was equipped with fixed capital to the value of 1.87 trillion lei, or 40 percent more than in 1975.

The investment plan is an integral part of the National Plan for Romania's Socioeconomic Development and it amounts to 1.2 trillion lei in the current five-year plan. This is a considerable investment based on allocation of about 30 percent of the national income to accumulation. It is planned to develop and modernize 1,100 existing units and to build about 1,600 large capacities in industry and agriculture, as well as other socioeconomic capacities including about 900,000 apartments.

Paradoxical as it may appear, the effectiveness of investments depends on the efficiency with which the existing fixed assets are used, because before the investments are requested the emphasis must be placed primarily upon the intensive and most productive use of the productive capacity in enterprises and at worksites, every day and on every shift. "Finish what you have started and only then undertake other investment projects!"

Investments are the material support for the party's strategic aim of Romania's transition from the stage of a developing country to that of a country with a medium economic development. They are allocated among sectors so as to help restructure the national economy and intensify the action of intensive, qualitative and effectiveness factors in all fields. The fact is especially noteworthy here that about 85 percent of the investments are in material production, lending the nation a powerful economic impetus through such high growth rates as an annual average of 6.1 percent for the social product and 7.1 percent for the national income, which correlation sums up the intensified production and the increased effectiveness.

Over 35 percent of the total investments are intended to continue the industrialization policy on a higher level as a critical factor for construction of a modern, highly efficient economy and better exploitation of the entire material and human potential of Romanian society. They will help to develop the key sectors of industry, to raise the technical standard of all industrial sectors, and to restructure industry with emphasis on sectors consuming less energy and raw materials.

In the party's order of priority, the heavy investments will be in development of the extractive industry in order to exploit the potential of the reserves, including those located at great depths or poor in useful content, and to develop the domestic resources of raw materials and accordingly reduce their importation. The investments in that sector will permit introduction of perfected technologies for extracting and preparing the mineral substances. Investments in development of the nation's energy resources will be in a very large proportion, which sector will gradually secure Romania's energy independence by the end of this decade through expanded construction of hydroelectric power stations, an extensive program to build small hydroelectric power stations, and a program to build nuclear electric power stations and other constructions to exploit new energy sources.

Of course massive expansion of Romania's extractive industry meets some of the major conditions for a healthy development of the processing industry with emphasis on modernization and intensification of production, namely an increased proportion of the sectors and products with advanced processing, assimilation of the latest scientific-technical advances, maximum use of the existing productive potential, etc. Nicolae Ceausescu stressed the consistency with which this policy is being implemented when he said at the Second Congress of Workers Councils that "In this five-year plan we shall act not so much to build new economic units as to raise the technical and qualitative standards of the existing potential by supplementing the inventories in some sectors and to use the resources we have to full capacity."

The investments in ferrous metallurgy, for example, will serve to complete the big iron and steel capacity at Galati, which will produce 10.5 million tons, and the Calarasi Iron and Steel Combine, and also to improve the technologies for considerable reduction of the energy inputs through replacement of the Martin furnaces, big consumers of energy in the steel production process, with electric converters. It is planned to build new capacities in this sector to produce materials of great technical-economic value such as tin plate, metal cloth, electrotechnical steel plates and thin steel plates.

The constantly growing role of the machine building industry in modernizing the economy and implementing the investment program itself is well known. The allocated investment funds will help to raise the technical standards of these sectors through development of electronics and microelectronics (at an average annual growth rate of 20 percent), of precision machinery, optics and hydraulic and pneumatic equipment (18 percent), and of means of automation and control of the production processes. New capacities will also be built, also for valuable outputs on a high technical level such as bearings, heavy equipment, manufacturing equipment, components, spare parts, subassemblies, hydraulic components, color TV sets, diesel engines and dock installations for shipbuilding. In this way the machine building industry will meet about 80 percent of the domestic requirement for equipment, complex installations and machinery.

The investments in the chemical and crude-oil processing industry will continue to be in large proportion. This industry is distinguished by the pronounced trend toward

construction of capacities for advanced processing of crude oil and development of fine chemistry and capacities for obtaining special materials for electronics and other highly technical fields, of capacities for producing synthetic rubber, macromolecular products, chemical threads and fibers, drugs, pharmaceuticals, detergents and cosmetics, and of highly effective varieties of pesticides.

Other industrial sectors such as construction materials, the light and food industries, small industry under the people's councils, etc. will also receive major investments based on the same priority criteria.

On its way to a new revolution, agricultural is receiving an unprecedented emphasis in this five-year plan, being regarded along with the extractive industry as a priority branch with all the consequences of that as regards allocation of resources and the way they are used. The investments in agriculture, totaling 155 billion lei (up 22.7 percent from the last five-year plan), will help to outfit it with 86,000 tractors, which will provide for renovation of about 50 percent of the energy base, an increase of about 600,000 hectares in the irrigated areas, drainage projects on an area of 900,000 hectares, and operations to control soil erosion on 950,000 hectares. The entire program to modernize and develop vineyards and orchards will be implemented, and the program to modernize and expand the zootechnical farms will be continued.

Concentration of financial and material resources on completing the investment projects under construction in order to expedite their activation is one of the major aims of the current five-year plan in the investment field. This policy is reflected in the fact that over 70 percent of the total funds to be invested in this five-year plan will be used to finish the projects whose construction has been carried over from previous years and to activate the production capacities more rapidly. Only the remainder will be used for new construction starts.

We accordingly find one of the highly effective courses of action in the investment policy of this period, namely expediting completion of the investment capacities under construction as an essential to greater economic effectiveness and rapid recovery of the invested funds. For example, it is intended to finish all investment projects under construction at the start of this five-year plan in ? years at most.

Reduction of the investment front and concentration of the economy's financial, material and manpower outlays upon prompt activation of the new capacities and those already begun can enable society to benefit sooner from the results of the new industrial, agricultural, transport, social-cultural, educational and artistic constructions.

Nor is it any exaggeration to say that this five-year plan is a period wherein any investment outlay must be considered more carefully than ever in order to make every leu most effective. We are not wealthy enough to allow ourselves to immobilize major financial and material resources for long periods of time without obtaining any economic or social effects from them. That is why the requirement is fully justified that every worker in the investment field should heed good management of the investment funds and their greater economic effectiveness, whether he is a designer, beneficiary, builder, supplier of equipment or construction materials, or an employee of the planning or finance and banking institutions.

The facts show that completion of production capacities is unjustifiably delayed for long periods at some worksites. Naturally these delays cause extra outlays and also hold up the economic and financial results awaited by the economy. This is true of

the Borsa Machine Building Enterprise, where development of the capacity for making 4,000 tons of hoisting equipment a year with an original activation deadline in 1978 is not finished even now. By 31 December 1980 this delay had cost about 35 million lei in production and 4 million lei in profits. Similarly the Zalau Tire Enterprise, which should have activated a capacity for 1 million tires a year back in December 1979, has logged a production loss of 224 million lei and a profit loss of 50 million lei.

Essentially the RCP's new investment policy is more closely related to that of faster national development and the people's greater welfare. It requires a radical change in the way we are to think about the outlay and implementation of every investment, and it is to be carried out in all activities of the entire investment process, bringing about a veritable revolution in the consciousness of every worker, whether he is at a drawing board or a worksite, who is expected to best perform the tasks and to fulfill his obligations.

Paradoxical as it may seem, the effectiveness of investments depends on the efficiency with which the existing fixed assets are used, because before the investments are requested the emphasis must be placed primarily upon the intensive and most productive use of the productive capacity in enterprises and at worksites, every day and on every shift.

It is no secret from anyone that some enterprises are still operating at low productivity and that the net income does not always grow at the potential rate required by the technical inventory and the funds invested to enhance and modernize the means of production. For example in the first quarter of 1981 the Bucharest Machine Enterprise for Chemical Equipment exceeded its production cost level by 4 percent, which meant irrational above-plan outlays and consequently a corresponding reduction in profitability. This also happended in the fodder yeast section of the Corabia Enterprise for Industrial Processing of Sugar Beets (a cost overrun of 207 percent) and in the cement factory of the Deva Binder Enterprise (an overrun of 84 percent), etc.

Obtaining a greater profitability from every leu invested is the best way to accelerate economic development and the rise of the people's living standard because the necessary funds can be formed that way to restore to society the costs of making producer goods as well as the funds needed for expanded socialist reproduction. Therefore efficient use of the existing inventories is a prerequisite for starting construction of new capacities, sections, factories and enterprises, in other words for starting to consume new sums out of the fund for socioeconomic development.

Building new production capacities while any machines, equipment or installations are not producing at the technical-economic parameters or are not intensively used means wasting funds that can prove much more profitable if invested in sectors where such a measure is economically justified. The Bucharest Construction-Installation Central requested investments of 4.5 million lei to build new capacities for storing cement at some concrete stations although it has silos that can receive additional quantities of cement if they are better used, if the regulation durations of stockpiling are observed, and if the labor is better organized.

The way to a high economic effectiveness begins in the stage of launching the investment, which is an important point in its implementation. We do not err when we say that it is critical at this point to substantiate the suitability and effectiveness of the investment properly, primarily by optimal determination and proportioning of the

production capacities and areas, by loading all installations and machines adequately, and by adjusting, reconditioning, modernizing and developing them.

But it has been found in some cases that there are capacity reserves but the investments are requested before thorough analysis of the possibilities of performing greater production tasks by making better use of the technical means in the inventory. The Bucharest Metroul Enterprise requested transport equipment and means amounting to 16 million lei although it had such equipment but was not using it at the planned use indices and shift coefficient. The quite unjustified expenditure of those funds would have created financial difficulties for the unit by increasing the amortization and the production costs.

We may conclude that proposing and granting funds for investments must be substantiated, formulated and checked with a great sense of responsibility because they are important steps in decision making and committing the state's expenditures to the success of the investment project. Performance of the production tasks without additional investments as well as implementation of valid and effective investment projects with clear advantages to the national economy are to be encouraged just as proposed investments that do not yield the expected results in practice are to be rejected, or if they have been approved the responsibilities of the respective institutions and persons must be determined. It goes without saying that lack of such substantiation and responsibility results in the undesirable situation where material and financial resources are immobilized in investments that do not produce the expected results.

Beginning with this five-year plan a number of measures were taken to considerably enhance the effectiveness of investments, which measures are also included in the new law on investments passed at the end of last year. This law stipulates regulations conducive to more thorough preparation of the new investment capacities, to curtailment of the construction time, to introduction of more strict discipline in the expenditure of the investment funds, to greater responsibility for all elements working in this field, and to obtaining the expected economic effects as soon as possible. Meanwhile standardization of investment capacities, construction materials and manufacturing technologies was started and partly completed. That measure has brought about a veritable revolution in the field of construction materials, especially by eliminating the energy-intensive materials. Such measures and programs must be continued, and they can meet the new demands for greater economic effectiveness in order to achieve a new quality in this important activity too.

One of the first requirements consists of establishing order and discipline, in the entry of investment projects in the plan, in strict accordance with the motto "Finish what you have started and only then undertake other investment projects!" But that is not all. When the workers collectives decide to build new investment capacities, the economic evaluation necessarily requires a careful analysis to see whether new investment projects can be obviated by more intensive use of the existing inventories. If this evaluation has been made, then entry of new capacities in the plan requires them to have approved technical-economic documentation and to meet the standards of high effectiveness.

In the spirit of strict observance of the principle of minimizing immobilization of the investment funds for the period of implementation of the projects, a period during which they have no economic effect, it was determined that no new project or its financing shall begin until after its beneficiaries have met all the material and financial conditions for its regular implementation in the shortest possible time. It is

a matter of providing the new projects with financial resources and contracts for purchase of the equipment to be installed, while the builders must be committed by firm contracts and must have the necessary material and manpower resources. In this way an old desideratum significantly expressed by a popular adage, "A job well organized is half done," is also applied to this boad field of activity. Many material or financial shortages will be prevented in this way that lead to delayed performance, to repeated and unwarranted extensions of the construction time and, ultimately, to bad economic and financial consequences for economic activity.

The logical consequence of such measures of great economic importance has been a reduction of the number of new projects and, ultimately, of the workload of investment projects under construction at the same time, as well as a more rational use of the production capacities of the construction organizations and suppliers of equipment and construction materials. They are essentially measures that will heighten the responsibility of all elements active in the investment field who review and approve the technical-economic documentation or indicators of the new investment projects as well as the nature and structure of the expenditures that can be made out of the investment funds.

On the basis of the first positive results of application of all these measures it may be said with certainty that they provide for more efficient use of the development funds that society makes available to the economic units in conformity with the general aims of the current five-year plan of transition from the stage of quantitative accumulations to a new quality.

ACTIVITIES OF NEW OVERSEAS CONSTRUCTION DEPARTMENT VIEWED

Bucharest SCINTEIA in Romanian 24 Oct 81 p 5

[Interview with Ion Stanescu, chief of the Department for Construction Abroad, by Cristian Antonescu; date and place not specified: "Tasks of Great Responsibility in Achieving a Broad and Efficient International Cooperation in the Construction Field"]

[Text] [Question] It is a known truth: foreign trade and international economic cooperation have become an important facet of our entire economic activity and the achievement of the tasks in this field, tasks that are much increased during the current five year plan, represent a major requirement that can be successfully fulfilled. This is a fact demonstrated by the results obtained in these fields during the previous five year plan and by the measures taken, the conditions created and the guidelines established with foresight for the 1981-1985 period. Among these measures of a broad scope there is also the creation of the Department for Construction Abroad. What is the purpose of establishing this department and what is its field of activity? -- precisely the questions that I asked at the beginning of this interview.

[Answer] The Department for Construction Abroad was established and organized at the initiative of and under the direct guidance of comrade Nicolae Ceausescu and reflects the constant concern of our party and its secretary general for the promotion of a policy of broad cooperation between countries on the basis of the principles of respect for national sovereignty, equal rights, mutual advantage and non-interference in domestic affairs. Comrade Nicolae Ceausescu's message of peace and international collaboration, the signed agreements and programs for the future and the agreed-upon understandings, following the meetings and discussions conducted with numerous chiefs of state, have created the framework for concluding certain important contracts and the conditions for a special development of activities in construction work abroad.

Clearly, the scope and complexity of the projects scheduled to be completed in different countries have brought about the need for better coordination and the establishment of unified responsibilities for the overall national economy. These are precisely the tasks of our department, which leads, coordinates and is responsible for the execution of construction projects abroad under efficient conditions using its own units, as well as the execution of construction projects in different fields

and in different countries using the specialized units of other ministries. In order to carry out these tasks under the best possible conditions, the department is entrusted with the plan for the entire national economy in the realm of construction work abroad, a position from which it draws up the draft five year plan and the annual plan and assigns the plan indicators to its subordinate units.

The fundamental objective of our activities is the sustained growth of economic efficiency concomitantly with the satisfaction of the highest exigencies of the foreign customers. For that reason, the department is organized and operates on the basis of the principle of economic-financial and hard currency self-administration. The basic criterion that governs our efforts is the achievement and overfulfillment of the plan, the adherence to concluded contracts and the rigorous fulfillment of the start-up plan.

In order to carry out these tasks of great responsibility, the department is also conceived as an operational organ or, to put it another way, as an economic unit with well-defined functions: as a general contractor, a general supplier and a specialized contractor. It has the job of ensuring the turning over of the project on-time, of adopting measures for the technical-material supply of the worksites abroad and equipping them appropriately with equipment and manpower and of establishing programs for the efficient use of the existing material and human potential.

[Question] Two months have passed since the creation of the Department. Therefore, one can give a review and even summarize the activities that have been carried out. How do you evaluate the results obtained and what measures do you feel should be taken to achieve the plan this year and to appropriately prepare for the 1983 plan?

[Answer] In a practical sense, the organization of the department has been completed. In all the functional areas specialists were assigned who had a long economic-engineering experience. Organizational structures were established and the new enterprises subordinated to the department were created. Certainly, the department was not created against an "empty" background; it is the result of certain solid traditions. In this field, Romanian science and technology have a powerful potential and long experience, and our country has a broad and recognized prestige in building construction projects abroad. Among the numerous projects completed, I can mention the refineries built at Banyas (Syria), Zarqa (Jordan) and Karachi (Pakistan), the wood processing combines in Ondo (Nigeria), Bangui (Central African Republic) and Salwa (Sri Lanka), the dam on the K'sob River (Algeria), the sulfuric acid factory at Abu Zaabal (Egypt), the cement factories in North Korea, Iraq and Turkey, the thermo-electric power stations in Czechoslovakia, Somalia and the Philipines, and the large housing complexes and social-cultural buildings in Tripoli and other cities in Libya. I left these projects to the end since nearly 8,000 Romanian workers and specialists are working on them, with Libya currently constituting one of our most important partners.

A precise statement: as a result of the organizational measures taken on multiple levels, the units of the department fulfilled their plan tasks for the month of September. For the radical improvement of the activities carried out abroad a broad program of action was adopted containing broad technical-organizational and political-educational measures for the purpose of achieving the plan provisions and the concluded contracts in an exemplary manner. On the basis of the directives received, appropriate measures were established designed to speed up the start of operations at certain important projects: Zarqa (Jordan), Banyas and Homs (Syria) and the Port of Nador (Morocco). Although we encountered some difficulties with regards to technical-material supply, approval of certain materials, delivery of certain pieces of equipment, the measures adopted ensure the carrying out of the fourth quarter plan tasks and the tasks for the entire year and the adherence to the timeframes in the concluded contracts. For 1982, an increase is foreseen in the volume of projects by approximately 200 percent compared to the achievements this year. A large portion of these projects have already been contracted and we are making sustained efforts to quickly finalize these actions. We are working on a number of levels for the regular achievement of projects and for staying within the schedules during the first days of the first quarter next year.

[Question] You mentioned in a few words the systematic concern for increasing economic efficiency in the department's activities. What are the directions of action you have in mind to this end?

[Answer] The most important of them refers to the priority promotion of Romanian technologies, designs, installations, equipment, machinery and materials. As can be seen, we are speaking about an orientation that requires essential changes of a qualitative nature in the production slated for export, expressed in an increase in those products having a higher degree of processing and incorporating a greater degree of our own work and creativity, contributing to the better use of the raw materials used in their production.

Certainly, in increasing the efficiency of construction activities abroad we will give our full attention to using improved work technologies and modern construction techniques, rationally using technical resources, continuing to decrease energy and material consumption, reducing domestic and foreign costs, obtaining advantageous prices and payment conditions and receiving payments due on-time.

[Question] We would ask you to dwell on other important problems: the cooperation with the enterprises, ministries and other economic organs in our country for the purpose of ensuring conditions for a regular and efficient activity at the worksite. What measures are necessary for strengthen this cooperation?

[Answer] Actually, a decisive factor for the fulfillment of our tasks under qualitatively superior conditions is ensuring an active and efficient cooperation with all the economic units in the country. Along this line of thinking, we

established, along with the ministries that have construction-assembly enterprises working abroad, measures regarding the thorough organization of these units and the provision of a technical-material base and the necessary workers. We asked the specialized design institutes to review construction techniques in projects, to adapt them to the requirements of the world market, to draw up standard designs and modules for all the categories of frequently desired projects for foreign customers, to plan for equipment of lesser weight and to promote advanced construction technologies. We are firmly convinced that through the measures taken we will also receive effective support filled with solicitude from the ministries. Thus, the Ministry of the Machine Building Industry, the Ministry of the Machine-Tool, Electrotechny and Electronics Industry and the Ministry of the Metallurgical Industry are called upon to deliver materials, spare parts and equipment of good quality only after they have been rigorously accepted and pre-assembled in order to increase the degree of industrializing the work at the worksite. The Ministry of Forestry Economy and Construction Materials must deliver on a priority basis those materials for the worksites abroad and quickly begin production on those items requested by the foreign partners. Certainly, there are also other units and ministries - the Ministry of the Chemical Industry, the Ministry of Industrial Construction for example - with which we directly cooperate to achieve construction projects abroad under good conditions.

We believe that the workers of our department will work with the ardor and decisiveness that characterizes them to fulfull their tasks, to honor the contracts concluded with the foreign partners in an exemplary manner and to prepare activities for next year under superior conditions.

MEASURES FOR ACHIEVING WATER CONSERVATION CONSIDERED

Bucharest SCINTEIA TINERETULUI in Romanian 28 Oct 81 pp 1, 2

[Article by engineer Constantin Radescu, director in the National Council of Water: "Water - A National Wealth That We Must Manage in the Most Judicious Manner Possible"]

[Text] In the overall economic-social activities of the country, water management represents a component part of the general policy of our party and state for our and everyone's economic development and well-being. The requirement for the rational management of surface and underground water resources and for the use of the economic potential are, as is known, the object of certain priority importance concerns. In one of its chapters, the Program of the Romanian Communist Party stresses the necessity of a unified management of this fundamental economic resource, which is water, and upon which the current technological civilization is based. The Law on Water of 1 April 1974 and the National Long-Term Program for the Management of the Hydrographic Basins in the Socialist Republic of Romania give a long-term unified view to the problem of water, one of the principal natural wealths of the country and "a problem of national interest for the economic and social development of Romania." For the 1981-1985 period, the 12th Congress of the RCP established that in this field there will continue to be the achievement of the national long-term program for the management of the hydrographic basins for the purpose of meeting the continually increasing water requirements of the populace, industry and agriculture, in accordance with the country's economic and social development.

Our country has limited water resources: in an average year approximately 37 billion cubic meters of water flow in interior rivers. Of this volume, only 5-6 billion cubic meters can be used without having accumulation lakes, since the largest portion of the flow occurs during relatively short periods of rain and melting snows while during the rest of the year the rate of flow is much smaller.

With the existing accumulation lakes we use approximately 11 billion m^3 of water per year from interior rivers. From the Danube River, a river subject to an international statute and located in an odd position with regards to the country's territory, we can use practically approximately 20-25 billion m^3 per year and from underground water approximately 4.5 billion m^3/year. These figures place us among the European countries having modest water resources.

If we consider the fact that the amount of investment funds needed to provide accumulation lakes that could yield another one m^3/second currently range from 200 to 500 million lei and the costs for gathering-piping-treating and distributing water, as well as those for processing used water for the purpose of avoiding pollution, we can realize why we must carefully and economically use each liter of water.

Water conservation implies, first of all, avoiding waste, especially in industry and agriculture. In order to evaluate the use of water in the economy, the principal instrument is the norm of water consumption per unit of product.First of all, these norms must be established for each existing production process, a legal obligation still not respected in all industrial sectors. Similarly, water consumption must constitute an evaluative element in the design and improvement of new production technologies.

The consumption levels recorded in industry are still too high in our country compared to those existing on the international level. Even when compared to existing norms or those being improved we too often find levels that are too high. Thus, for example, a recent check in Bucharest showed that at the "Grivita Rosie" Enterprise the specific level of consumption is approximately 86 m^3 per ton compared to 20 m^3/ton as recommended on the basis of the experiences of other similar units in the country and by the data in technical literature from other countries. The combed wool mill has a specific consumption level of 570 m^3 per ton of wool-type bale compared to the 180 m^3/ton recommended as a norm.

Conservation also means eliminating water loss or reducing it as much as possible. Large amounts of water are still being lost in the network of city and industrial arteries, pipes and branches, as well as in interior plumbing in industry, social-cultural buildings and housing, because of defective pipes and joints that go undiscovered or are not repaired on a timely basis and because of defective equipment (valves, faucets, floats). The volume of water lost from the potable water distribution network for the entire country totals approximately 160 million cubic meters per year, a volume comparable to one-fifth of the total amount of potable water distributed to the populace.

Irrigation systems lose large quantities of water, estimated as approximately 40 percent of the rate of flow of the captured water, losses that can be decreased by technical-construction measures, as well as by a good organization and execution of the irrigation.

Clearly, to judiciously manage water in a qualitative sense requires, first of all, measuring the rates of flow and the volumes of water collected in the use and discharge circuits.

Although the setting up of equipment to measure the rate of flow of water is a legal obligation for all those units that use water and there is a detailed program agreed upon to this end, whose implementation has produced good results, to date these units have only installed 30 percent of the necessary equipment of thsi type, a good portion of which is not appropriately maintained and used.

Water conservation must also be ensured by the recycling of water used during the production process and by reusing it in technological processes or in nearby units. If in some branches, like, for example, in the steel and iron industry, the recylcing and reuse of water has been practiced on a broad scale and expanded in recent years, in other sectors and units all the opportunities are not being used.

Therefore, conditions exist for the achievement of certain important savings of water that will permit the more efficient use of the existing capacities of primary resources (accumulated waters, branches) as well as water supply installations (connections, treatment plants, pipe networks and so forth), and will make it possible to delay certain investment projects for new installations like these.

The judicious management of water also requires avoiding the pollution of water resources. Polluted water is the same as lost water, in addition to the negative implications of a hygiene-health and technological nature that pollution can produce.

The most used means of combatting pollution is the used water purification plant that processes water after it is used in towns, industry and zootechnical units and discharged into the sewage network. The purification process, along with the supply of water and the implementation of this process by the units and housing units that use and make water dirty, constitutes a legal obligation. Each year our country allocates through the plan an ever more significant amount of investment funds, on the order of 1-1.5 billion lei per year in the most recent period. The efforts made in all the sectors of the economy to carry out research into certain efficient purification processes, as well as for the design and production of equipment and devices used to purify used water and check the quality of the water, have led to the possibility of building purification plants on the basis of technology and equipment fully designed in-country. The number of purification installations in operation has increased from several hundred in 1960 to over 3,700 at the current time. The effect of this has allowed the slowing down of pollution under a situation of a high rate of development in industry, towns and agriculture, all potential sources of pollution. The existing purification installations retain or destroy significant percentages of the pollutants discharged along with used water.

In order to check the quality of the water, Romanian specialists have completed an efficent information system for which they have designed and also produced the first automated stations to check the quality of the water and for which they are continuing to design new sensors for the purpose of increasing the variety of polluting substances that can be analyzed.

The resources that are available are not, however, satisfactorily used, as is pointed out by the fact that the planned investment funds for purifying used water were put to use at only a rate of 58 percent and over 40 percent of the existing purification facilities operated below designed parameters.

It must also be pointed out that the substances discharged with the used water from production processes basically represent a portion of raw materials, semi-finished and finished products that are lost in the water and for whose destruction or retention in purification facilities energy, materials and manpower are expended. The result is the need to review the existing technological processes and the design of new ones with special attention going towards reducing these losses and achieving savings in raw materials along with a reduction in the level of pollution at the source.

From a consideration of this overall group of problems, we clearly see that the provision of water in the necessary amounts and at an appropriate level of quality, as well as the control of the destructive force of water and the complex management of these forces, require not only a significant technical and material effort for the design, production and coordinated use of projects, but also the taking of a conscious position by all the parties, which are great in number, that can contribute to the rational use and conservation of water, to its protection against pollution and to the best possible quality and coordination of management projects in the hydrographic basins.

Water does not belong merely to the one who turns his own faucet or to the technological process where water is used. It is a valuable national asset, a type of wealth that must be carefully used and protected under any circumstance.

ELECTRIC TRANSMISSION LINE TO ITALY COMPLETED

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 3 Nov 81 p 4

[Article by R. Jovanovic: "Higher Exchange Possibilities Quintupled"]

[Text] The 380-kv Divaca--Redipulja power transmission line was recently completed; in the past few days it has linked Yugoslavia's and Italy's electric power systems and made them considerably stronger than they were before. This line has linked Yugoslavia's electric power system via Italy to western Europe's interconnection, so that the possibility of rendering aid in critical moments will be quintupled, and the possible exchange of power will then reach 1,000 MW.

Had the Divaca--Redipulja long-distance transmission line been in service last 8 December, the specialists say that the splitting of the Yugoslav electric power system, which that day threw more than half of the country into darkness, most probably would not have occurred. Or at least the country's western portion would not have been blacked out.

The Divaca--Redipulja transmission line is part of the basic 380-kv network which went under construction in 1972 according to the country's unified project. With completion of construction of the Djerdap long-distance transmission line, the preliminary phase of the future unified Yugoslav transmission system was completed that year. After all, up until that time no Yugoslav power transmission system existed, but there was a regional system at a voltage of 220 kv.

The 380-kv network, which was to cover Yugoslavia as a whole, was planned for construction in two phases. The first was completed in 1979, and the second is coming to an end and should be completed next year. The most important parts are in fact already completed. A few of the shorter lines still remain. At the moment the entire section of the Divaca--Rijeka network of the southern trunk line, which links the Slovenian and Croatian electric power industries and the Split--Mostar line with the Divaca--Redipulja link, is in trial operation. Construction is also under way on the last section of the southern trunk line from Mostar via Trebinje and Titograd to Kosovo, which is to be completed toward the end of this year. This will actually close the 380-kv ring in Yugoslavia.

In this medium-term period, because of the lack of funds, certain smaller sections which were supposed to be a kind of double security of the Yugoslav electric power system will most probably not be built.

All in all the new long-distance power transmission network will consist of 4,400 km of 380-kv transmission line and 27 380-kv substations. Their total installed capacity is 18,400 MW, which is about 4,000 MW more than the transformer substations located at all the power plants in the country. Enough conductor cable has been built in those 4,400 km of long-distance power transmission network to encircle the entire globe at the equator.

"Putting into service the long-distance transmission line to Italy brings to an end a very expensive national project in which the entire community has invested enormous resources. Reduced to the present value of the dinar, this amounts to about 40 billion. Putting into service the Divaca--Redipulja transmission line alone has considerably augmented the reliability of supply of power to consumers in the country, especially in its western portions and the coast. This has considerably increased the possibility of exchange and assistance between us and Italy in supply of power, and via Italy with all of western Europe as well, which is also at the 380-kv voltage," says Radojko Vukosavic, supervisor of the Specialized Service for Coordination of Construction of the 380-kv System in Yugoslavia, which in fact carried out this program in which all the republics and provinces participated in unity and very successfully.

EARNINGS OF PRIVATE SECTOR DISCUSSED

Zagreb VJESNIK in Serbo-Croatian 7 Nov 81 SEDAM DANA Supplement p 12

[Article by Vlado Rajic: "How Much Do Private Businessmen Earn?"]

[Text] After two articles about the salaries of officials and the personal incomes of people employed in the economy and the social services, there is good reason to continue the story about personal incomes with figures on the personal incomes of the self-employed, or, more simply, private businessmen.

First, the official data. They can be found, among other places, in the SIZ [Self-Managing Community of Interest] for Old-Age and Disability Insurance of Self-Employed Croatian Tradesmen, Hostelers and Common Carriers. This is recorded as the base of the contribution for insurance which is paid by all the 43,476 private businessmen which the republic had as of 30 September 1981. Of that number (according to the precise statistics kept in the work community of the SIZ) 51.09 percent of the independent tradesmen, hostelers and common carriers reported a monthly personal income less than 6,000 dinars. This also includes, we were told in the SIZ, tradesmen in the regions of Slavonia and the Dalmation Zagore whose pensions and insurance in case of injury resulting in disability are based on the contributions they pay in. Aside from their trades--for example, as coopers, ropemakers, potters and the like--they are also engaged in farming.

Percentages and Cases

The share of the self-employed businessmen with earnings of 17,500 or more is 17.78 percent. The remaining percentage includes those who receive between 6,000 and 17,500 dinars of personal income monthly. More accurately, they do not receive it, but earn it. Or still more accurately, that is how much they declare to tax authorities and revenue administrations, and thus the figures reach the SIZ, which then computes the pension base that corresponds to them.

According to the financial arrangements issued for this year, the table of tradesmen, hostelers and common carriers with the highest gross personal incomes (taxes and contributions have yet to be deducted from the amounts we are giving) would look like this: 5 persons in the republic with more than 3 million dinars annually, 3 with 2.5 million, and 11 with an income between 1.5 and 2 million.

Twenty-three businessmen reported an annual gross personal income between 1.5 and 2 million dinars. There are 151 private businessmen earning between 1 and 1.5 million dinars, and 253 earning between 800,000 and 1 million. It is important to say that all these figures were reported to the appropriate tax agencies and revenue administrations, which check them out if necessary. Once taxes and contributions have been deducted, it is not difficult to compute the average personal income of those who work on their own.

Second, and this simply cannot be skipped over in the case of the earnings of private businessmen, are the occasional, but spicy cases recorded by the courts, the inspectorates, and other agencies. And they cast doubt as to whether the declared personal income is correct. After all, until a case is broken, it seems that everything is alright. The tax people handle declarations, the revenue administrations as well, and the special-interest communities the same. These are all official figures, everything is in order. The cases that go too far show that this mass of official numbers is actually an illusion which cannot be broken down without arguments. But the arguments come too late, if one is counting on social prevention.

All these "cases," or however they are to be called, are far from dependable social control, and arrive at the lump-sum payment by the shortest route: "You, now, are private businessmen, it is easy for you." Nothing is achieved by comparing the figures from official sources and what is known and "known" about the earnings of private businessmen. After all, this also breaks down into individual cases; the rich individual does not represent a trend in the system. Especially in this time of stabilization when, for instance, the owners of construction machines and common carriers have no business, and up to now they have been most frequently criticized by the tax people.

We were told in the SIZ that tax policy is being differently interpreted and conducted because of the autonomy of the opstinas in this matter. There are thus cases where taxi operators in Dubrovnik are put in the group with the highest rates of contributions, and those in Zagreb among the lowest. This differentiation of tax policy, almost on an individual opstina basis, has the result that the private businessmen move to opstinas with lower rates of the contributions and taxes, which has nothing whatsoever to do with the public campaign to strengthen small business.

What we were told in the SIZ of Old-Age and Disability Insurance of Self-Employed Tradesmen, Hostelers and Common Carriers about the finger pointed at private businessmen as being extremely rich individuals was this: it is true that the percentage mentioned in the private sector does earn considerably more than workers in associated labor, and it is true that a total of 446 persons in Croatia have a gross personal income per year higher than 800,000 dinars, but work in the private sector is usually done regardless of working hours, without annual vacations, and so on. We were told that the pointing of a finger at the millions of earnings, especially when there are not many of them (we calculated that only 1.07 percent of private businessmen realize annual earnings in such amounts) is creating nervousness among the private businessmen, not uncommonly they are being portrayed as deliberate evaders of obligations to society,

practically as thieves. And they also told us that the private businessmen themselves want the offenders among them to be named.

Here the circle probably closes. It is a long distance from individual cases to a public campaign. After all, there are many issues. If things are so difficult in the private sector, why, then, are 50 percent of the restaurants and cafes in Zagreb run by private hostelers? Why is there more and more private initiative in other activities and not just in the services, the crafts and trades and similar activities? Why is it in political assessments note is not uncommonly taken of the ever greater presence of private initiative, but outside the framework of the public campaign to develop small business? Why is it that the cases are not an occasion for debate about the causes of these things, while one of the probable causes, a tax inspectorate that is understaffed and underfunded, has not been a subject of public activity?

Neglected Relationships

There is no end to the questions that might be put. The consequences of the lack of persuasive responses are being felt. From the lack of a tax policy and the downfall of certain institutions for investigation of the origin of property (the commissions have gone even through their official collapse) to a social climate in which earning money from property, playing fast and loose with the law, tax evasion, and excessive enrichment are only observations.

And finally, a question on which little or nothing has been said so far: Where, how and why has the socialized sector lost that capable individual who knows how to work, who knows how to earn income, who knows how to organize a job? Where, how and why has the private businessman slipped past the oversight of society?

Writing about personal incomes is not an occasion to discuss at length those social, sociological and political issues even if it turns out that the bare figures do not tell much about the social relationship in which they occur as a consequence. So the private businessmen, who in the method and results of their work leap out of the social limits of productivity, measurement of labor, and results achieved within the limits of some activity, represent a separate chapter in the story about personal incomes. Here again we cannot altogether believe the figures, since some cases belie them. Here again we cannot establish a criterion as to how much is much and how much is little in the pay envelope when all accounts are dealt with. After all, the socialized sector is still far from introducing a system for measuring the results of work and remuneration according to work. How far then is the private sector?

However it may be, the fact remains that expansion of the private sector (not that socially useful one, since there are still too many activities which are in short supply, but those lucrative ones) is evident. Perhaps the root of the difference between the social interest and the private interest lies in the difference between what is needed and what is lucrative. Perhaps this ought to be the starting point in discovering the reasons why the private sector has been skidding according to social criteria (when this can be proven): Who wishes the licenses for operation, for what activities, under what conditions? Perhaps if

matters were approached from that angle, high earnings would not be confused with playing fast and loose with the law, but would be associated with social benefit, with the work invested, and so on.

Certainly, there will be more said about the private sector. In the context of the debate concerning the new tax policy, formation of the new institutions for monitoring implementation of that tax policy, and the bolstering of tax authorities.... Or, perhaps, now that we have come to the very end, the problem lies in the institutionalization of the very end point of a social phenomenon--private earnings, instead of more attention being devoted to the most important relations. After all, the merry-go-round from case to case only makes one dizzy.

YUGOSLAVIA

DEVELOPMENT OF SOCIALIZED AGRICULTURAL SECTOR SURVEYED

Belgrade GLASNIK POLJOPRIVREDNE PROIZVODNJE, PRERADE I PLASMANA in Serbo-Croatian No 9, Sep 81 pp 3-7

[Article by Danilo Tomic, MA]

[Text] Introduction

After the end of the war in 1945, an agrarian reform in Yugoslavia created a land fund of 1,566,000 hectares. About 755,000 hectares of this total were distributed to poor peasants, while 791,000 hectares were transferred to state ownership and represented the basis for state agricultural land holdings. That was actually the origin of the developmental concept for Yugoslav agriculture that was adopted later. The land consisted of small, fragmented agricultural holdings and socially owned operations with small amounts of land, poor equipment resources for production, and unsufficient trained personnel. Later, through the rapid development of the country's agriculture and general economy, which were caught up in the processes of integration and internal transformation, these organizations gradually were transformed into compelxes that today are modern agroindustrial complexes. They are true giants with the most modern production equipment, and the newest scientific, technical and technological advances are applied on them. They are counted among the most modern organizations in the world. Their accelerated development represents a qualitative change in the development of Yugoslav agriculture. Agricultural organizations have had pivotal influence on the results of Yugoslav agriculture, which has reached a world level. Besides that, various forms of cooperation and association have contributed markedly to increasing goods production on private lands.

Despite a series of positive results in the development of these organizations, various weaknesses have also been revealed, meaning that all the possibilities for increasing agricultural production have not been utilized.

In this paper, an attempt will be made at analyzing these state land operations from the standpoints of their organization, equipment (primarily with agricultural mechanization), and motivation for more rapid modernization of production processes, as essential prerequisites for obtaining better results in agriculture.

The increased effects will be regarded through the average level of labor productivity (the physical volume of production and the social product per permanent farm worker), the average level of production intensity (the physical volume of

production and the social product per hectare of cultivated land), as well as the percentages of accumulation, reproduction and reinvestment.

The Results of Research and Discussion

The level of development of productive forces in Yugoslavia was very low after the war. Industrialization was the basic method for accelerated economic development. Agriculture represented a source for accumulation in that process. Therefore, in the period 1947-1956 the overall development of agriculture as a whole, and thus the socially owned sector as well, was very much neglected. The turning point in the development of Yugoslav agriculture came with the approval of the Resolution of the Federal Popular Assembly (in 1957) and of the Program of the League of Communists of Yugoslavia (in 1958). At that time, they adopted the concept of advancing agriculture on the basis of accelerated development of socially owned agricultural organizations, along with gradual collectivization of individually owned agriculture. After 1957, the process of modernization began in these organizations, which then and now represent the bearers of overall agricultural development. That was the beginning of the development of powerful, highly productive agricultural production on industrial foundations, along with a strengthening of cooperative efforts in the village. The development of these organizations show chiefly a rising trend, with occasional fluctuations.

On the basis of data in Table 1, we can perceive a decline in the number of agricultural organizations until 1970, followed by increasing numbers. That is a consequence of the concentration and centralization of Yugoslav agriculture, the

expansion and strengthening of these organizations through various integrational processes that were implemented after 1960. Beginning with 1970, actually after the approval and implementation of the Yugoslav Constitution in 1974 and the Law on Associated Labor in 1976, the former enterprises were transformed into organizations of associated labor, and their numbers grew. Other than that, the increase in cultivated surface held by these organizations has been slow. For example, in 1979 they had only 16 percent of the total cultivated surface in Yugoslav agriculture at their disposal. The number of permanent and temporary employees grew until 1965, and then began to decline. This resulted from the increasing modernization and better equipment of these organizations (see tables 2 and 3).

4. Equipment
5. Other investment
6. Percentage structure

Source: Materials of the Federal Statistical Office

Total basic capital investments in agricultural organizations show a rising trend until 1960, and then begin to decline steadily: they did not return to 1960 levels of investment again until 1978. Similar tendencies are seen in investment in construction. In equipment, however, investments showed a constant increase both in absolute and relative terms. A significant increase in investments in equipment was noted after 1965, which coincided with the beginning of the drop in employment. That confirms that assertion about rapid modernization and mechanization of agricultural organizations in the period after reform. A consequence of this investment activity can also be seen in the increasing mechanization of agricultural organizations.

On the basis of Table 3 we can perceive a growth in the number of agricultural machines, until 1965. After the economic reform, their numbers tended to decline. That can be explained by the motivational levels of organizations for acquiring more powerful machines with greater operational effectiveness. For example, in 1965 the number of tractors with more than 35.8 horsepower was 8,854, while in

1979 it totaled 18,213. That means that the number doubled in 15 years. The satisfactory level of agricultural mechanization is a qualitative change in the development of agricultural organizations. The question arises as to what motivates the agricultural organizations to make these changes.

Professor R. Stojanovic has studied the role of motivation systems in developmental policy; he stresses: "The two basic forms of motivation are developmental motivation and consumer motivation. Their interaction, the strength of each one's effect has the most direct impact on the pace and the nature of the entire society's development, it is essential that these two forms of motivation be in the optimum relationship.[1] The same author offers the following basic components of motivation for development:

a. The accumulation motivation

b. The motivation for the growth of specialized knowledge that cannot be put to direct use.

c. The motivation for integration in all spheres of economic life, seeking an integration process that will support development; and

d. The motivation for maximizing all of society's positive external factors.[2]

Stojanovic's ideas can find application in Yogoslav theory, policy and practice of agricultural development. The basic motto for the development of agricultural organizations is to increase and provide more stable growth and more favorable

structure in agricultural production to "implement the policy of more rigid growth of personal consumption and the standard of living, for more complete satisfaction of the increasing needs for agricultural raw materials in industry, and for increasing exports while gradually reducing imports of foods."[3]

The mechanization of agricultural organizations and increases in the number of specialists have significant roles in realizing these goals. Mechanization will replace human work and contribute to higher quality and more prompt preparation of the land, sowing, cultivation, and harvest of grains, more rapid transport, better storage and so forth. And precisely increasing production and yields of wheat, corn and sugar beets in agricultural organizations (see Table 4) can be explained in part by social motives, goals and tasks in food production, good supplying of mechanization, and the growing number of specialists.

An essential factor in the development of socially owned agriculture after the economic reform can be perceived in the increase in work performed by machines (greater mechanization of the production processes) and the reduction of human labor (the number of employees).

The basic motive for these changes was to increase labor productivity in agricultural organizations, as an important prerequisite for more rapid agricultural development. In the last 25 years (1955-1979), labor productivity in socially owned agriculture, measured in terms of the physical volume of production per worker, has grown nearly six-fold (see Table 5).

Measured by value indices, labor productivity in the socially owned sector of agriculture shows the same trends. Expressed in value terms, the growth is more than 4.8 times the 1955 value (see Table 6).

The growth in labor productivity is an important indicator of not only the development of agriculture to the present, but also of its likely future development. The achieved growth in labor productivity in socially owned agriculture is satisfactory and has reached the level of productivity of agriculturally advanced countries such as Denmark, Holland, and the United States.

However, for analysis and evaluation of the development of socially owned agriculture, which is the most representative indicator, there are also other important parameters. One of them is the intensity of production, which is obtained by analysis of trends in social product per hectare of cultivated land. Actually,

that is a significant indicator of the effectiveness of utilizing land capacity. The average level of intensity, expressed in physical and value terms, reveals growth trends. The intensity of production, calculated in terms of the physical volume per hectare of cultivated land, has increased five times in the past 25 years (see Table 7).

3. Intensity (social production per hectare)

Source: The Statistical Yearbook of Yugoslavia

Analysis and comparison of the data on the growth of labor productivity and intensity of production in agricultural organizations indicate that prior to the economic reform, labor productivity grew more slowly than the intensity of production. After the economic reform, the level of labor productivity grew faster than the level of production intensity. A similar conclusion results from analysis of microeconomic indicators of the operations of agricultural organizations. (According to data of the Public Accounting Office, in 1966 income per employee amounted to 32,012 dinars, while in 1979 it was 258,060 dinars. In 1966 income per hectare of cultivated land was 3,905 dinars, while in 1979 it was 22,358. All quotations are at current prices. That means that when 1979 is compared with 1966, the income per employee increased eight times, while the income per hectare of cultivated surface increased 5.7 times).

On the basis of these analyses, it can be concluded that Yugoslav agricultural organizations are better motivated to improve labor productivity, and have been less motivated to increase the intensity of production, during the postwar period. A consequence of this motivation is found in increased extensivity of production, whereby the basic feature is the high share of grain production in the crop structure of cultivated and plowed land. Grain planting involved increasing mechanization and decreasing human labor. A further feature is the very small share of total land devoted to industrial crops, vegetables, fruits and fodder. The possibilities for more rapid development of animal hunbandry, irrigation and other intensive agriculture are not being sufficiently utilized. In other words, Yugoslav agricultural organizations are giving insufficient attention to labor- and income-intensive production (see Table 9).

Table 9. The Structure of Sowing Land of Agricultural Organizations (in percentage)

Key:

1. Year
2. Planted surface
3. Grains
4. Industrial crops
5. Vegetables
6. Fodder crops

Note to 1955: The data for 1955 should be taken carefully since harvested rather than sowed land totals are given.
Source: Statistical Bulletins No 923 and 1220, and The Statistical Yearbook of Yugoslavia

The data in Table 9 confirm previous assertions. Of particular concern is the minimal amount of vegetables planted and the constant decrease in fodder crops in the sowing structure. The decrease in fodder crops planted is a consequence of fluctuations and stagnation in livestock production in agricultural organizations. For example, in 1979 only 12 percent of the country's livestock belonged to these organizations. Concentration on extensive production in these organizations can be explained by the insufficient development of processing facilities, lack of coordination of development, plans and programs between primary agricultural producers, processing facilities, consumer centers and food reserves. The overcoming of these shortcomings would hasten the development of labor- and income-intensive production in agricultural organizations, and that would contribute to better utilization of land capacity, to an increase in the average level of production intensity. Thereby, total income and income per hectare in these organizations would be increased, and this would be reflected favorably in their capital accumulation, reproductive and reinvestment capability. Additionally, their income provides funds for the development of secondary, tertiary and public activities.

Therefore, the working people in these organizations must be constantly better motivated, along with the need for increased labor productivity, to steadily raise the level of production intensity, and thereby the accumulative, reproductive and reinvestment capability of agriculture. These are also important indicators of the development of agriculture.

The accumulative, reproductive and reinvestment capability of socially owned Yugoslav agriculture is unsatisfactory; in the past 14 years it has tended to decline (see Table 10).

Table 10. Rates of Accumulation, Reproduction, and Reinvestment in Agricultural Organizations

Year	Accumulation rate (1)	Reproduction rate (2)	Reinvestment rate (3)
1966	3.8	7.0	3.8
1970	2.2	6.4	1.6
1975	2.5	6.0	3.2
1978	1.2	4.0	0.6
1979	1.4	4.1	0.4

Source: Data of the Public Accounting Office

1. $Sa = \frac{FF}{PKPA\ (Aos + Aob)}$

Sa = the accumulation rate
PF = the operations fund
PK PS = average use of operating funds (basic capital + working capital)

2. $RS = \frac{PF + AM}{PFPS\ AAos + Aob)}$

RS = reproduction rate
AM = amortization -- total funds

3. $Srs = \frac{PF + Am -- Ot}{PKPS\ (Aos + Aob)}$

Srs = reinvestment rate
Ot = total repayments received for unpaid debts based on investment credits for basic and working capital, and repayments for investment credits for basic and working capital to be received the following year.

This has resulted from the deterioration in the position of agriculture in primary and secondary capital distribution. The deterioration in the position in primary distribution is seen in the more rapid rise of prices for industrial products intended for agricultural use, compared to the rise in prices for agricultural products. In secondary distrubition, it is seen in the more rapid increase in personal, joint and general consumption (personal income, and contributions to interest communities and sociopolitical communities), compared to the increase in prices for agricultural products.

Improving the position of socially owned agriculture in primary and secondary capital distrubution is a crucial issue for the agricultural, economic and socioeconomic development of the country in the coming period.

YUGOSLAV TRADE WITH CEMA COUNTRIES SURVEYED

Belgrade PRIVREDNI PREGLED in Serbo-Croation 30 Oct 81 p 3

[Article by Vladimir Karakasevic]

[Text] The balances for the past decade do not show the cyclic fluctuations that are typical for Western markets. In the past 5 years, the trade deficit has increased by five. Market prospects are being considered in the context of long-term advantages.

Intensive economic exchanges and constant efforts for further higher and more complex forms of foreign trade and production and financial cooperation characterize Yugoslav economic relations with the European socialist countries that are members of CEMA. These countries form a significant economic region that accounts for more than 35 percent of total Yugoslav trade. In the period 1971-1980, exports grew nominally at an average annual rate of 22 percent, while imports in the same period increased 21.3 percent. In the years of the eighth decade of the century, the CEMA countries in Europe accounted for more than 39 percent of total Yugoslav exports and about 26 percent of total imports.

The European CEMA countries are traditionally regarded as a market with a high capacity for absorbing Yugoslav products, although this phenomenon has been reduced somewhat by higher criteria for quality and product mix, so that more complex forms of lasting cooperation are moving to the fore.

Balanced Plans

Trade with the CEMA countries is a dynamic component of Yugoslav foreign trade. In the period 1971-1980, exports to the European countries of this economic bloc increased from $666 million to $3.97 million, while imports grew from $775 million to $4.41 million. [Translator's note: There is obviously an error in the text here--presumably the figures should be $3.97 billion and $4.41 billion, respectively.] In the past several years, however, export growth has slowed to practically all the CEMA countries, causing a trade deficit in the Yugoslav balance of trade with this region. As a rule, trade with the CEMA countries takes place on the basis of bilateral, balanced annual and 5-year plan trade agreements, wherein multilateral forms of cooperation with regional CEMA organizations also have a certain importance. The latter are motivated by economic factors of long-term regional politics.

... And Unbalanced Balances

During periods of positive trade balances with the CEMA countries, the Yugoslav trade deficit with the developed Western countries or, more precisely, the debts and obligations in foreign exchange were larger by the sum of the surplus in clearing accounts with the European CEMA countries. The impossibility of using this surplus to cover the deficit with Western countries resulted in "tension" when regular foreign accounts were totaled. In recent years, the trade balance as a synthetic index of trade with the CEMA countries has taken on a new feature that is manifested as a more rapid growth in the trade deficit, given the difficulties that result from the lag in Yugoslav exports to this region when compared to the growth in imports. While in the 5-year period until 1975 the total Yugoslav deficit in trade with CEMA countries amounted to $511 million, something more than $100 million annually, in the 5-year period until 1980, that deficit grew five times over, to $2.52 billion or more than $500 million per year. Within this performance, the surplus in trade with the USSR in the 5 years until 1975 was transformed in the second 5-year period until 1980 into a $600 million deficit.

There are a number of causes that brought this turnabout leading to a negative net balance in trade with the countries of this economic bloc. Among foreign trade factors, in first place stands the reevaluation of the capabilities of national economies (which is particularly typical for trade with Poland and Romania). This factor relates to CEMA countries with which trade is conducted using convertible foreign exchange as the financial basis. Various restrictive measures that were approved also affected that trade while, for countries where the clearing manner of payment is used, an important factor was the increase in prices for raw materials, especially for crude oil and petroleum derivatives from the USSR.

Some Causes

Among domestic economic factors in trade with CEMA countries using the convertbile foreign exchange basis, it should be noted that the Yugoslav market had a favorable price situation and prices that diverted domestic producers from seeking exports to that region, while the growth in imports from the countries where clearing balances were used influenced restrictions of imports from Western countries. A further factor was that trade balances with these countries were calculated at the federation level.

On the opposite side of the ledger, organizations of associated labor were not sufficiently interested in exports to this group of countries for a least two key reasons. First, the domestic inflation rate fundamentally changed the competitive position of Yugoslav export products on all national markets and, second, (although not second from the aspect of exporters' interests) the exchange rate for the accounting dollar was stagnant for a long time. This was confirmed by the reactions to the devaluation of the dinar and the equalization of the exchange rate for the accounting dollar and the convertible dollar in mid-1980; for, thereafter, exports to these countries picked up markedly.

The First 7 Months of 1981

According to foreign trade statistics, in the first 7 months of 1981, Yugoslav exports to European CEMA countries totaled $4.98 billion, of which exports to the USSR alone amounted to $3.4 billion. Imports from these countries totaled $5.05 billion, of which $3.17 billion came from the USSR. The overall trade balance with the European CEMA countries in those 7 months showed a $65 million deficit, although the balance with the Soviet Union had a surplus of $238 million. Imports were covered by exports in this period by 98.7 percent, and the equalization of trade was approached.

In total Yugoslav exports, the CEMA countries in this period accounted for 50.3 percent, while providing 30.4 percent of all imports. The process of structural changes in the trade picture continued from the period of 1976-1980. On the basis of previous experience, it can be concluded that the prospects for this market should be regarded more from the standpoint of long-term, rather than short-term, advantages, and exports should be based on quality of goods that would bring a turnabout in any specific market area, rather than on practices aimed narrowly in one particular direction.

We should not forget that the market offered by the CEMA countries creates new criteria of properties and product values, quality and design, which means that, in the future, besides existing possibilities for marketing large series and quantities of various goods, Yugoslav exporters will be expected to devote markedly more attention to quality and product mix. The new decade of cooperation is a period in which we must bring a change that will enable the produce "made in Yugoslavia" to win its place in the market not through buyer inertia but because of its real quality.

TRADE WITH EAST, WEST, DEVELOPING COUNTRIES, 1980-1981

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 10 Nov 81 p 3

[Article by V. Karaksevic: "The Regional Distribution of Exports Is the Cause of the Problem"]

[Text] The change of direction in Yugoslav exports from markets with convertible payments to the markets of the bilateral payments area, along with a simultaneous augmentation of imports from the latter market, has caused the economy difficulties which are today being debated in top-level bodies. The bilateral payments area is in this case being interpreted in the broader context of all countries belonging to the CEMA organization, although there exist agreements on convertible settlement of balances with four countries (Bulgaria, Romania, Hungary and Poland), which, however, differ from the manner of payments that is customary in free trade with the industrially advanced countries of the West and with the developing countries. In short, exports are turning more to the East, the orientation toward the West is inadequate, and there has been a mild turn toward exports to the developing countries by comparison with the same period of last year.

According to the most recent data of the Foreign Trade Institute, exports and imports in the period from 1 January to 17 December of this year have been as follows (in millions of dinars):

Exports	1980	1981	Index
Advanced countries of the West	64,544	61,121	95
Developing countries	29,167	32,402	111
Socialist countries	70,655	97,087	137
Convertible	17,078	17,033	100
Bilateral payments	53,587	80,054	149
East European countries	67,481	95,577	142
Convertible	15,069	16,504	110
Bilateral payments	52,412	79,073	151
Other socialist countries	3,184	1,510	47
Convertible	2,009	529	26
Bilateral payments	1,175	981	83
Total	164,376	190,610	116

All the technical-and-economic aspects of air cargo transport, such as prices, transportation technology and the organization of transport and cargo handling will be regulated in a contract between JAT and Aeroflot, and Yugoslav export-import organizations will be informed in detail about the elements and terms and conditions of shipment contained in that contract.

It is worth mentioning that air cargo transport has a number of advantages, especially for cargo such as perishable products, medical drugs, spare parts, patterns, and in general shipments for which speed of delivery and protection against damage are important and which are shipped in small containers.

For JAT this represents a substantial and demanding business undertaking, and in order to accept it and perform it competently, it has undertaken timely preparations in both scheduled and charter traffic. Cargo planes, two B-727's and one An-12, will have a special role. Appropriate organization of this large and long-term transaction requires competence on the part of technical and ground services, close collaboration with airport organizations and other air carriers--INEX-Aria Aviopromet and Aviogenex--in order to guarantee rapid collection and shipment of goods without damage or delay.

GROWTH OF CEMA MERCHANT FLEETS OUTLINED

East Berlin AW DDR-AUSSENWIRTSCHAFT in German Vol 9 No 41, 8 Oct 81 pp 1, 15

[Report by Information and Public Relations Department, GDR Ministry for Foreign Trade: "Trends in High Seas and Inland Waterway Navigation of CEMA Countries"]

> [Text] During the past 20 years, there have been considerable quantitative and qualitative changes in high seas and inland waterway navigation for the member countries of CEMA. The tonnage of the high seas fleet of the member countries of CEMA increased from 6.2 million deadweight tons in 1960 to 29.6 million deadweight tons in 1979 and more than 30 million deadweight tons in 1980; the tonnage of the inland waterway fleet increased almost 4-fold. During the same period of time, the volume transported by the high seas fleet increased more than 7-fold, the volume transported by the inland waterway fleet increased 2.3 times. There has been an increase in the average loading capacity of ships, the energetic appointment and the degree of automation of the technical production processes on ships. The rapid growth of the merchant fleet of the CEMA countries and its qualitative changes led to an increase in investment funds for the development of high seas and inland waterway navigation as well as to new tasks for the maintenance of ships. Greater significance was accorded to questions such as longer periods of operation for ships, rational use of fuel and lubricants. Efforts by CEMA countries to use fuel more effectively were directed at lowering specific consumption, improving the structure of the fuel balance and lowering the cost of fuel.

In consideration of the growing economic significance of scientifically designed maintenance procedures for ships, CEMA countries built national maintenance systems for high seas and inland waterway ships, making use of international experiences. Increasing demands on the equipment and maintenance of ships form the basic trends for the technical development and structural perfection of the high seas and inland waterway fleet until the year 2000.

Adaption of the High Seas Fleet to Future Demands

The trends in high seas navigation are:

--increased use of specialized ships, taking into consideration the standardization of freight pieces and specific conditions for sea routes as well as the improved construction of certain types of universal bulk-loading ships that are suitable for the transportation of containers, packaged goods, bulk freight and operating technology;

--continuing unification and typification of ships and all the technical equipment on ships, taking into consideration the perspective movement of goods;

--increase in the degree of complex automation of steering processes on ships, of energetic equipment and other instruments;

--intensification of scientific research as well as projection and construction work for the development of ships with new effective principles.

According to predicted estimates, certain structural changes are expected. Although the trend is evident, according to which the average loading capacity of CEMA country tankers is continuing to increase, experiences with supertankers have shown that possibilities for their effective use are limited. Consequently it is expected that for the projected time period CEMA countries will concentrate on oil tankers of medium tonnage. At the same time it is expected that additions to the fleet of the member countries of CEMA will probably include more tankers carrying liquid gas and liquid chemicals. The loading capacity of combination ships is to rise from a current capacity of 105,000 tons to between 150,000 and 160,000 tons per unit. Simultaneously there is to be an increase in the proportion of combination freighters carrying bulk goods and packaged goods. Special container ships have been used by the fleet of CEMA countries as early as the beginning of the 1970's. Whereas the merchant fleets of the People's Republic of Bulgaria and the German Democratic Republic are using primarily semicontainer ships, the use of pure container ships is characteristic for the People's Republic of Poland and the USSR. Experiences and investigations have shown that for the projected period an additional amount of between 1,500 and 3,000 containers can be loaded on container ships than has been the case to date. The fleets of individual CEMA countries will add modern lighters with loading capacities of between 16,000 and 25,000 tons. Furthermore, new refrigerator ships with loading capacities of between 8,000 and 15,000 tons are to complete the fleet. It is assumed that the slowing trend will continue in the use of universal ships for the transport of general cargo by the fleet of the CEMA countries.

According to investigations, during the projected time period the future development of passenger ships within the high seas fleet of CEMA countries will be concentrated on the growing need for cruises as well as trips along the shore.

During the projected time period, the development of the energy supply for ships will be concentrated on the creation of uniform and highly efficient energy facilities. At the present time there is a prevelance of power plants using internal-combustion engines. At the same time, the use of diesel-electric, steam-turbine electric and gas-turbine power facilities is relatively insignificant.

Investigations and assessments of available construction and project plans show that for some time to come the completion of energetic ship docks will be determined, above all, by the continuing increase in the operational time for engines until a general overhaul is needed and the effectiveness and reliability of internal-combustion engines on ships. At the same time, investigations confirm the high efficiency of steam-turbine and gas-turbine equipment; the possibilities for their future use on large-tonnage and fast merchant ships are good because they require energy equipment with high capacities.

There are also investigations in CEMA countries that deal with the use of nuclear energy equipment of merchant-fleet ships during the projected period of time. The profitability of such installations compared to traditional energy facilities can rise substantially, since a capacity of more than 29,420 kilowatts (40,000 horsepower) as well as a speed of time than 22 knots will make nuclear energy economical and since by the end of the projected time period it can be installed on large-tonnage ships, particularly on container ships and tankers.

One of the goals for merchant ships of CEMA countries is a qualitative jump in the development of complex automation. Limited automation in individual spheres (engine rooms, transshipment, maintenance of refrigeration facilities, docking of ships, etc.) is to be replaced by complex automation, which will systematically comprise all processes, including the ship's controls of energy facilities and the safety of all elements of navigation. Moreover, this complex automation is to be a contributing factor to solving the problem of manpower on ships. A 15- to 20-man crew on large-tonnage ships appears to be a possibility.

Further Improvements in Transshipment Conditions

The automation of work in seaports will also play an important role during the projected time period. Greater rationalization of technological processes, among them qualitative elements of transport (speed, regularity, guarantee of problemfree shipment of goods), while using a minimal amount of labor is of definite significance for the perfection of the technology in high seas navigation. Greater specialization of ships, increased capacity of energy equipment of ships and the degree of automation also permit conclusions about the directions of the rationalization of technological processes in high seas navigation. During the projected period, a system of established routes is to become the primary form of high seas transportation for the fleet of CEMA countries, since it will satisfy to a high degree the demands for speed and regularity with respect to the shipment of goods. Furthermore, high seas navigation must include special routes that are to be used primarily by container ships and lighters as well as the development of ferry traffic on high seas.

Of great importance for the organizational-technological development of high seas navigation of CEMA countries is the consistent increase in the size of packaged freight, which guarantees faster loading and unloading and a decrease in necessary labor, and the combination of various forms of transportation to speed up the process of transportation and decrease the cost of labor for loading and unloading. The use of tugboats and barges by the fleets of the Peoples Republic of Bulgaria, the People's Republic of Poland and the USSR is a relatively new phenomenon in high seas navigation. The development of this principle of high seas navigation will be continued under the conditions of relatively short distances between the seaports of the European CEMA countries.

Simultaneously the following aspects are of decisive importance for the perfection of technological processes in high seas navigation:

--the continuation of the expansion of seaports, for instance, the outfitting of docks for dry freighters, among other things, for the reloading of ore, coal and other bulk goods,

--the installation of productive unloading facilities,

--the creation of suitable transfer locations and special ports for container ships and lighters or of locations with water levels that are adequate for servicing lighters as well as

--the construction of mechanized deepwater piers where large-tonnage ships can land and be serviced.

Greater Capacity and Effectiveness of Inland Waterway Fleet

For the inland waterway navigation the following basic tendencies are significant for the projected period of time:

--consistent typification and unification of merchant ships and their energy equipment,

--an increase in the number of ships by adding Ro/Ro ships,

--continued development of navigation by increasing the use of the towing method and ships with large loading capacities (the use of barges that do not need crews but are equipped with automatic couplings) as well as

--transportation using inland-high-seas ships.

In addition, the fleet of the CEMA countries operating in the Danube basin is facing the task of developing a line of ships that will guarantee the optimal use of the Danube profile when using barges. The completion of the Rhine-Main-Danube canal will also be of a decisive influence. For the projected period of time, barges with a capacity of between 1,100 and 2,940 kilowatts (between 1,500 and 4,000 horsepower) are to be used by the fleet of those CEMA countries that are in the path of the Danube. In addition, a more significant differentiation is expected of the fleet "not" equipped "with automatic controls" with respect to their loading capacity; the percentage of barges with a loading capacity of between 1,500 and 2,500 tons is supposed to increase. At the same time, it is expected that the specialization process of the fleet will be intensified, primarily through the use of container ships, freighters carrying chemicals and ships transporting coal, cement and bulk freight.

With respect to the development of the passenger fleet on inland waterways of CEMA countries, special attention was accorded to the completion and expansion of the use of hydrofoil boats and hovercraft as well as the development of comfortable ships for tourist trips and vacations on the water.

The improvement of maintenance is of essential significance for the technical improvement of the inland waterway fleet of the CEMA countries. The most important factor is the introduction of automatic control of main and auxiliary engines and systems, the automation of the loading and unloading process, including the labor-intensive work on ships (opening and closing of cargo rooms, the coupling of barges will pulling units, change of docks, etc.).

ROBOT TECHNOLOGY DEVELOPMENT, APPLICATION DISCUSSED

Cost Effectiveness Stressed

East Berlin EINHEIT in German Vol 36 No 9, Sep 81 signed to press 11 Aug 81 pp 860-865

['Man, Robot and Social Progress' feature article by Wolfgang Gress, economist, candidate member, SED Central Committee; member, GDR Council of Ministers; state secretary, State Planning Commission: "Robots in the Service of Our Social Progress"]

> [Text] Based on the explanation given by the 10th party congress for the rapid introduction and broad application of robot technology as objectively necessary for the continued shaping of the developed socialist society, questions are answered such as to the prerequisites in the economy, especially in the combines, for the development of the robots, their production and their rapid and effective application, which economic and social criteria their application must conform to, and what our ideological work should accordingly be aimed at.

The economic strategy issued by the 10th party congress aims at resolutely carrying on our main task in its unity of economic and social policy even under altered reproduction conditions throughout the 1980's. This essentially, as Comrade Erich Honecker proved in his SED Central Committee status report to the 10th congress, amounts to bringing the qualitative factors of our economic growth fully and completely into effect. "Socialist intensification is becoming more and more the critical characteristic of our planned economy. Management, planning and stimulation, each step toward shaping our production conditions, and any project in the combines, enterprises and cooperatives must conform to this main trend in our economic growth as much as the further development in our territories. That resolve alone will ensure the continued successful solution of the main task at present and in the future. The one cannot be separated from the other. In summary is means developing our production quantitatively and qualitatively. It calls for enhancing its effectiveness, comprehsnsively improving labor quality and speeding matters up in coping with all these questions."[1]

In connection with focusing on a consistent use of the qualitative economic growth factors, especially on vastly boosting our labor productivity, the 10th party congress has worked out the tasks for comprehensive socialist rationalization. The new criteria in this field mainly are that rationalization in direct connection with a fundamental elevation of our level of technology must increasingly aim at saving working hours and jobs at vastly larger dimensions than heretofore, thereby gaining manpower for a fuller use of available technology and for solving other important economic tasks, and at the same time surmounting heavy physical, monotonous and hazardous activities. It is necessary, in particular, gradually to start automating whole production complexes.

The 10th party congress has issued a clear guideline for how these tasks, important as they are for our future social development, have to be tackled: "The change must primarily be achieved through a broad application of microelectronics in production, automated control systems for these processes, and the introduction of industrial robots. To ensure the steep rise in labor productivity, it is necessary to raise the number of industrial robots to be introduced from the circa 9,000 originally planned for this five-year plan period to between 40,000 and 45,000."[2]

In assigning such an ambitious goal our party has let itself be guided by the consideration that a rapid introduction and broad application of robot technology is indispensable under our concrete conditions to meet the objective requirements for the continued shaping of the developed socialist society. A target-directed introduction of robot technology conforms with the need to combine still more effectively the advantages of socialism with the scientific-technical revolution and thereby to make sure that the objective social and economic needs of society are satisfied by ways and means that are most economical and most adequate to human development through a high technological and high qualitative level of production. Karl Marx already has written: "To the extent that big industry develops the creation of real wealth becomes less dependent on working time and the quantum of applied labor than on the strength of the agencies set in motion during labor, which in turn is wholly disporportionate with the immediate time of labor expended on its production but rather depends on the general state of science and the progress of technology or the application of that science in production."[3]

From that vantage point, the use of industrial robots at the magnitude decided on is an essential prerequisite for ensuring a rise in labor productivity that far exceeds the customary measure, which we need to continue with success our policy aimed at the welfare of the people though the conditions for it have become more difficult. At the same time, the introduction of robot technology essentially helps further improve our material-technical base in conformity with the main trends in the development of the productive forces in a qualitative respect, which takes account not only of the current but also of the future requirements. Especially when looking beyond the present day it also is important that the development, production and use of a constantly growing number of robots in our economy serve the further shaping of the creative character of labor. Coping with this task makes possible not only to eliminate more and more the contradiction existing in certain areas between the working people's constantly improving skills and the partly low-level demands of certain labor operations, and to use people in activities adequate to their abilities, but it actually forces us to make full use of the high educational level to meet the higher demands.

That is why we regard the broad introduction of robot technology as an indissoluable component of our overall strategic concept aimed at ensuring the continued successful advance of socialism under the conditions of the 1980's.

Complex Preparation for Robot Application

As in all other fields of our economic activity we must always ask for the most favorable cost/benefit ratio, this aspect also governs any decision on the use of industrial robots. The use of robots must above all help achieve the performance and efficiency objectives laid down for the years ahead by means of the funds available to us. It would be completely out of the question to make the introduction of robots dependent on "extra" investments. What is decisive, rather, is to use available funds mainly for applying the kind of modern technologies that would provide us with a genuine thrust in rationalization, while refraining from costly new construction and construction extension projects which would in part merely preserve the traditional technological level.

It also must be clear everywhere that the introduction of robot technology brooks no delay. "The main issue now is to organize the use of 40,000 to 45,000 industrial robots for 1982 and 1983 in terms of priorities. In that case the necessary effects on boosting our labor productivity will be realized still in the current five-year plan period."[4]

That requires above all aiming the working people's creative initiative at these matters in every combine and every enterprise, and using their practical experiences and wealth of ideas, in order to get proposals rapidly about the meaningful employment of robots in such production sectors, combined with a thorough analysis of the process cycles, where the most effective eocnomic results can then be obtained. Time and time again practice has shown that the introduction of robot technology advances best where the matters relevant to it are not treated as a concern of a small group of "specialists" or "experts," but where all working people are early in the game drawn into the preparation and implementation of robot employment. The formation of a party activists group has been found useful in this regard--as in the Robotron Combine. That helps mobilize and form the capacities of the collective, helps clarify ideological problems that may arise, and supports the state managers in the exercise of their responsibilities.

Already important advances have been made in this respect in conformity with the 10th party congress decisions and in the outcome of the experience exchange at the central committee seminar with the general directors of the centrally managed combines and the central committee party organizers late in April 1981 in Leipzig. That is true mainly of those combines and enterprises where, under the political leadership by the party organizations, all available capacities are concentrated on preparing and organizing the use of robots in line with preassigned targets. Most of the combines already are working intensively on solutions which will release manpower for more productive and more highly skilled activities, bringing it about that the capacities of the available machines and installations can be used more completely.

There it proves to be necessary in each case, as a precondition for an effective use of the robots, to change appropriately the technological level of the entire production sector in question. Comrades from combines affirm, from their own experience, that an attempt at "grafting" robots onto existing technological solutions does not lead to success. Maximum economic effects in line with the 10th party congress criteria can be produced only if robot technology is made a standard component of complex rationalization solutions.

That also makes necessary incorporating the use of industrial robots directly in the management, planning, preparation and implementation of investments. This means mainly that one should once again thoroughly check and review the prevailing conceptions, requirements, decisions of principle and technological projects for intended investment measures so as to set down the economically most suitable employment of industrial robots. The focal point must always be to improve the technological production level, release manpower and further improve the working people's working conditions.

In line with such requirements, and with the central state inspectorate for investments taking an active part in it, the conceptions for important investment projects have been reviewed, e.g. in the Werner Lamberz Polygraph Combine, Leipzig, and the Herbert Warnke Conversion Technology Combine, Erfurt. In the outcome, the number of industrial robots scheduled to be used was raised significantly, a great reduction was achieved in the specific expenditures per robot, and the overall efficiency of the project was improved. What matters now is to enforce everywhere, by such a method, the economic criteria for introducing robot technology. The main concern here is to have each robot release manpower, rapidly make up for the costs involved in using robots, reach a three-shift full capacity use in technological sectors using industrial robots, and eliminate as far as possible any hazardous, heavy physical and monotonous activities.

Emphasis on Producing Robot Technology Oneself

These criteria can be met only if for any given concrete case of application one plans to use the kind of robot that demands the smallest possible expense for its development and production and is in line with our real technical and economic possibilities while it will nevertheless fully meet the specific requirements placed on it. This means we are not intent on the technically most perfect and interesting solution but on the types of robots that do their job through a minimum of costs and a maximum of economic benefit.

Most of the industrial robots that are to be used have to be produced in the application sectors themselves. That is so not only because there is but a limited possibility to create a central production of flexibly useable robots or to expand the capacities available to machine building. Primarily it is necessary due to their specific character to have industrial robots by and large built in the combines and enterprises themselves. International experiences have taught us that, too. In view of that, special weight attaches to the 10th party congress demand to have the production of branch-specific means of rationalization "boosted rapidly in all economic areas; industry must in 1985 double its own means of rationalization construction in comparison with 1980."[5]

Most combines have already set down concrete measures to ensure the necessary boost in their means of rationalization construction. The combines and enterprises in the coal and energy industry, the chemical industry, electrical engineering and electronics, the light industry and transportation are setting standard examples. And it is not merely a matter of raising the volume of their own means of rationalization output. Equally important is to concentrate the production and use of branch-specific means of rationalization mainly on the modernization of the prevailing technology, a penetrating enhancement of the technological production level and thus, on complex rationalization solutions.

That producing one's industrial robots oneself understandably is a major point of emphasis. For that reason they are now intensively working on developing and streamlining appropriate capacities for the construction of means of rationalization so that all necessary prerequisites are created for ensuring the planned use of robots. Partly there are already concrete ideas about gaining the manpower required: through releasing manpower by means of industrial robots out of one's own production.

For effectively assisting the combines in producing their own industrial robots through their means of rationalization construction it is necessary to make available more standard parts and components through centralized production, especially controls, robot-specific gears, hydraulic and pneumatic products and specific motors. While the five-year plan is being worked on at present surveys are being conducted on how in the combines in machine building and in electrical engineering and electronics concerned the output of such ancillary supplies can be raised rapidly. Considering that in 1982 and 1983 many robots are to be used and thus first have to be produced, it will certainly be indispensable for the combines themselves to handle a part of the demands for robot-specific parts and components through their own production. The effectiveness of such production largely depends of course on meaningful division of labor and specialization within the ministerial areas and combines.

Scientific-technical Lead Time and Personnel Prerequisites

Solving the robot development and production tasks in the combines presupposes, together with a skillful preparation of their use, a requisite scientific-technical lead time quickly. Managers must make sure that the relevant tasks are included in the science and technology plans and that the kind of implementation schedules are established that will ensure a speed-up in the introduction of robot technology according to plan quotas. Simultaneously, research must more strongly be focused, in accordance with the 10th party congress demand, on an accelerated development and preparation of the future use of robots of the third generation. "All this amounts to a great challenge to the creative capacity of the scientists, the designers and technicians, the operations technicians, the skill and ability of our highly skilled specialists, especially also our youth."[6]

That is why every combine and enterprise must at once make proper arrangements about personnel, select and assign the most suitable specialists in solving the scientific-technical and production tasks, and introduce target-directed measures for training and advanced training. Many comrades were perfectly correct in proposing that universities, colleges and technical schools and other scientific-technical educational institutions should assist more strongly in this.

So that none of the combines and enterprises be left alone with introducing robot technology, concrete measures were taken to ensure coordinated scientific-technical efforts. Centers have been set up for input robots, process-specific robots in electrical engineering and electronics, flexible technological robots, forge and foundry robots and welding robots. Those centers have the task to assist all combines in the scientific-technical, technological and organizational efforts toward developing and producing their own industrial robots. That includes getting hold of technical and technological documentation on already developed and produced robots, making them available to be copied, and generalizing the best experiences. That furthermore includes scientific-technical consultation and assistance in exploiting available national and international information and documentation materials and patent literature and solving the tasks in standardization and type specifications. A central data bank likewise serves to provide knowledge and experiences of benefit to the development, production and use of industrial robots, facilitate flexible automation solutions and other rationalization projects and prepare management decisions.

More and more also we use in the field of robot development and production the possibilities provided by our close fraternal cooperation with the Soviet Union. At the most recent important meeting on the Crimea between the leading representatives of both parties and states, Comrades Leonid Brezhnev and Erich Honecker, it was explicitly stated that special attention was being given to the joint efforts in developing microelectronics and robot construction. With the other fraternal socialist countries we are also increasing our cooperation in this field. The 35th CEMA conference has made far-reaching agreements about it.

All told, for the scheduled use of between 40,000 and 45,000 industrial robots by 1985 we have a sound economic overall concept that once again expresses the advantage of our socialist planned economy that can mobilize all the potentials inherent in our society for solving such a gigantic task—on behalf of social progress and the welfare of the people.

Experiences in Automobile Plant

East Berlin EINHEIT in German Vol 36 No 9, Sep 81 signed to press 11 Aug 81 pp 875-881

['Man, Robot and Social Progress' feature article by Guenter Hipp, engineer, operations director, VEB Sachsenring Automobile Works, Zwickau: "Experiences in the Application of Industrial Robots"]

[Text] VEB Sachsenring Automobile Works, Zwickau, Enterprise of the VEB IFA Automobile Combine

--Largest producer in Karl-Marx-Stadt Bezirk with 10,500 working people, half of them innovators.
--Output of Trabant automobiles rose from 1,730 in 1957 to 20,050 in 1959 to circa 120,000 in 1980.
--Production costs per automobile diminished from 1970 to 1980 by 40 percent.
--Circa 32 percent of the equipment in the enterprise comes out of its own means of rationalization construction.
--Thus far, 4,050 jobs have been reorganized or newly formed, and 1,093 jobs were released between 1970 and 1980.
--The enterprise earned the Karl Marx Medal and the Banner of Labor Medal and distinguished itself as "enterprise of German-Soviet friendship" and "enterprise of socialist labor."

High expectations in terms of economic performance improvements and improved working conditions are placed on the use of industrial robots in our economy. What conceptual work is needed for the development and introduction of industrial robots? On which experiences can one rely thereby? How do we create the working crews needed for the design, construction and operation of this new technology? These are questions that are being answered with reference to the VEB Sachsenring Automobile Works, Zwickau, where the task has been solved since 1975 with political responsibility and in economic and technical effectiveness.

To achieve the economic performance increase needed in years ahead it is necessary rigorously to improve the labor productivity in all our economic fields. Science and technology especially must create the prerequisites needed for it and decisively contribute to a rapid implementation of the economically necessary thrust in rationalization.

That is a demand that is also being faced in our enterprise, the VEB Sachsenring Automobile Works, Zwickau. We plan to boost our industrial output by 9.8 percent above that of last year, and in 1982 the growth rate compared with 1981 is to amount to as much as 18.4 percent. For solving this task we can rely on good results in the past--in the end of June 1981 our enterprise had fulfilled and overfulfilled its plan tasks for 271 months in a row--and on our tapping new reserves by means of science and technology, within the framework of socialist intensification. Pursuant to the economic strategy issued by the 10th SED Congress, we intend to raise our degree of mechanization and automation up to 1985

by at least 88 percent in taking another step in our technological production level. As a good starting position for it we consider the consistent application of all experiences in the development, construction and use of industrial robots.

The First Phase of Our Work

Since 1975 already our enterprise has been engaged in the development and introduction of industrial robots aiming to attain the highest economic results this way while to improve at the same time our working people's working and living conditions. This relatively early use of robots was due to the fact that our enterprise with what was then already a comparatively high degree of mechanization and automation had reached certain technological barriers we intended to break through that way. And that we did in fact achieve in various fields. Today we already have a considerable store of experiences in the why and wherefore of the development, construction and series operation of industrial robots, being able to conclude, as it were, our first phase. In this phase we have settled the matters of training for our working people and of forming development and application collectives, and we created production capacities out of our own production of means of rationalization. The point of departure for our considerations about using robots was a process analysis through which we also have a good starting base for implementing out tasks in the current five-year plan period.

Where were we when this phase began? We had conscientiously watched the international development since 1974 and considered our operational goals, and in 1975 we decided to use our first flexible-program industrial robot. Here we were mainly concerned with gathering experiences and preparing our technologists and workers for this new technology. And we did succeed. Of course, looking back at that from today's vantage point, such solitary "beacons" no longer suffice. For the dimensions in socialist rationalization that are now on the agenda the entire production process must be rigorously analyzed if we want to make expert decisions on the selection and purpose of robot employment and the types of robots to be employed. The correct selection of the type of robot to be used, for instance, which critically affects the labor process and, hence, the working conditions for quite a few people, while it also to a large extent controls our economic expediency, is possible only through presenting objectively prepared job criteria. That is why in 1978 we elaborated a process analysis on the basis of which we can in good time settle the sequence in introducing robots and the requisite changes in technological organization. And here we, incidentally, are enforcing the principle: "not as good as possible but only as good as necessary," because anything else would just be a waste in effectiveness. Altogether, in gaining experience we have reserved an increasingly higher place value to the matter of gaining maximum effectiveness from the use of robots. For that reason we have in the development and introduction of robots focused on the possibilities of the technological process in its total breadth: welding techniques (spot and CO_2 welding), coating (base coat and spraying of protective coating and undercoating), and the loading and unloading of machine tools. We have started rationalizing all these processes with the greatest efficiency--largely by using industrial robots which we have developed and are producing ourselves.

In April this year, our enterprise had 86 robots in operation, 17 of them flexibly programmable, at a vast technological range--mainly in labor-intensive and hazardous jobs and to handle monotonous tasks. For example, since May 1976 the first two industrial robots, freely programmable in the teach-in process* have been in operation for automatically applying abrasives to the Trabant body through a pneumatic-electrostatic spraying method. In June 1977 we started two more robots for applying undercoating, with a dry coat layer of 250 micromy, through a pneumatic spraying method. In December 1977 the first welding robot developed in the GDR went into operation which has taken on the spot welding of the rear wheel basin. In April 1978 we started using two robots for the protective coating of a car body. Two other freely programmed sport-welding robots for welding the side walls of the body frame have been in operation since January 1979. A final example: after intensive preparations performed jointly between specialists of the Mittweida engineering college and of our enterprise, we were able to use under series conditions the first freely programmable technological robot in the GDR in the teach-in method. This cooperative development has proven to us that it is possible to develop and produce highly sophisticated industrial robots in our republic without any imports from nonsocialist countries. This type of equipment is to be produced here in the 5 years ahead in series for our own needs.

The broad objective for using robots was the starting point for preparing robot conceptions for our enterprise. We never thought of these conceptions as of dogmas but constantly reviewed them while our scientific-technical understanding and our own experiences advanced in conformity with most up-to-date demands. Time and time again that made possible new applications for the robots installed all around and made their use more efficient. While our first conception of 1978 still had fairly rough expectations of the years ahead, the revised version of August 1980 already anticipated a large number of robots to be used--there were to be 158 of them by 1985--and without compromise focused on our creating our own structures and capacities in the means of rationalization construction for the development and building of robots. After the 10th party congress, based on the economic strategy issued for the 1980's, we reconsidered the use of industrial robots and raised our target significantly. Accordingly, we shall have 398 robots, 97 programmable industrial robots among them, by 1985.

Our Own Strength Is What Counts

Much of that will come out of our own construction of means of rationalization. We take it for granted that with its potential of today, it will crucially codetermine our performance improvements of tomorrow. That is why for years we have deliberately developed our construction of means of rationalization at a much higher proportion than our commodity production--with annual growth rates between 15 and 20 percent. In no other way, it seems to us, can the higher speed in the development and production of industrial robots be maintained and highest standards be ensured. Right now we are getting set to build the robots we need in small series. We have assigned this task to our Adolf Hennecke youth brigade which,

---

*Teach-in method: the teach-in programming of a robot is storing the motion sequence of the robot arm through conducting the arm directly or the contacting of desired points or courses from a switchboard in the control element in the robot. While the motion sequence is reduced during programming, the speed can be varied in operations in conformity with technical and technological conditions. Program storage is possible, for example, on magnetic tape.

a pacemaking collective, is well qualified to solve it creatively. With all the care we bestow on robot construction, however, we shall in no way neglect the other fields in which comprehensive rationalization holds sway because it is a matter of using all opportunities, a goal that can only be achieved through creating adequate capacities in means of rationalization construction.

Our experiences with the development, production and use of industrial robots have reconfirmed that the level and speed of projects decisively depend on our devoting ourselves with the greatest attention, even at the start of the projects, to the selection, recruiting, training and assignment of the personnel. Our progress depends on their knowledge and skills as much as on their attitude. It has become increasingly clear in the course of time: there is only one way to success and that goes via providing our personnel with the proper skills--in consistent and comprehensive operational preparation and the technological accommodations to a robot that may possibly be purchased and, above all, in the development and production of robots in our own enterprise. When we first gropingly approached the solution of these tasks, we never even faced the question, e.g., of using suitable and skilled personnel elsewhere, but our whole concern was to get engineers and specialists who have an eye and propensity for technological virgin territory, do not mind difficulties, and are ready, in their awareness of their political responsibility, to return once again to the classroom to get their qualifications for certain fields. Today we have a staff of specialists in all technological disciplines who are in the position to select jobs for robots and shape them with supreme technological perfection, to develop and construct robots and make them operational with highest efficiency. We think such personnel can be found everywhere. The only question is how to work with the people, motivate them politically and inspire them for the tasks to be solved. The development of a capable staff of personnel is an important management task.

As so often when something completely new is started, not everyone was at once enthusiastic in our enterprise about our projects. Under the leadership by the enterprise party organization we have made great efforts to explain the need for robots and to show which new sources can be tapped for boosting our performance in that we would, e.g., cross technologically conditioned performance barriers. To demonstrate credibly that the robot through improving labor productivity makes labor easier for people and permits their taking on more interesting activities, by means of lectures, films and slides we gave them an idea of the opportunities the use of robots offers for shaping labor processes in their own enterprise and for the cooperation between man and robot. Then we found that to the extent that working with robots brought results not only skepticism and doubts disappeared with which we initially had to come to grips, but the willingness to be part of it grew, too. Especially their being drawn into the preparatory and development collectives offered many working people the opportunity to get involved in the realization of their own ideas and suggestions. A creative atmosphere like that is indispensable for solving ambitious tasks. This way we brought it about that our working people have come to identify with the tasks assigned in the introduction of robots.

To prepare the use of robots we created a comprehensive system of training and qualification measures, elaborated and enforced by our enterprise academy. The aim was to achieve the requisite open-mindedness and readiness to be part of it

through very broad training and provide the necessary knowledge and skills at the same time. While differentiating among objectives and subjects, we involved in this training and qualification system economic functionaries, party functionaries and functionaries of the social organizations, technologists, designers, work organizers, chief operators and installation mechanics as much as repair personnel, means of rationalization construction workers and production workers. That range ensured our advancing and the participation of all involved in the task on an equal level. We paid much attention to training our production workers, installation mechanics and repair personnel. It was clear to us from the outset that the success and efficacy in the use of robots--however good the technical and technological preparation may be--crucially depend on the people whose working tool of the future the robot is. In implementing the production with robots they significantly affect the safeguarding and improvement of our intended effectiveness. Such factors as material consumption, downtime and the time available for fulfilling the labor task depend on the quality of the program prepared and fed into the robot, and that in turn depends on the qualifications of the people working with the robots.

In Concert With Science

Even when we first started thinking about using robots, we were aware of the need to work together with institutes and universities. The point was to combine the capacity potential of science and industry and to organize on a contractual basis the R&D, production and production application of industrial robots. Today we know none but this cooperation has helped us to gain a lead time for using industrial robots. Our joint effort was from the outset aimed at innovative robot designs--based mainly on our own capacities in the means of rationalization construction and in production. Due to our technologically broadly pitched work referred to, it meant contractual cooperation almost simultaneously with several cooperating partners. The result brought us top achievements that have stood up well under the conditions of series production and in shift-labor. For instance, we have since 1975 beeen working together with ZIS, Halle, on the development, construction and series production of welding robots. Since late in 1976, we have been concentrating, in concert with the Mittweida engineering college, on research for our own development of electronic controls including storage for multiaxle industrial robots with track control and teach-in storage. And together with the engineering college of Zwickau we have developed, produced an applied in gear production a universally useable coating robot.

Management With a High Sense of Political Responsibility

A resume of the work behind us indicates we have done well wherever commitment and passion directed our work and technical and economic processes were directed politically. In our enterprise it has also been confirmed how very important it is to reveal always anew what socialism can do for the well-being of the people and to translate the realization of it into motivation, social activity and economic performance. That is why we always seek to have the kind of management activity that fosters initiative and performance readiness and, in particular, induces those creative processes that express themselves in new scientific-technical insights or their creative practical application. Our enterprise party organization has always taken a lead in this and has in good time created

clear positions and correct targets with respect to the development, construction and use of robots, which we then translated into our long-term conceptions. Intensification and technological conferences have also been found useful among us where--under enterprise party organization leadership--new targets are set, emphases are placed and the requisite impulses have been released for activating our labor. Likewise, regular treatment given to major scientific-technical tasks--of which our robot conception is one--in management meetings of the enterprise party organization and the party supervision over the implementation of innovative processes have been found effective and fruitful for our work.

Political leadership, socially responsible conduct, party-mindedness, and the personal commitment and passion--those are the features of management work against which the enterprise party organization measures its own political responsibility as well as that of the enterprise director, the technical directors, the main department chiefs and the department chiefs. It is necessary that each confronts the task that is to be solved and, furthermore, through the example he sets, induces the development and application collectives to assume high risks, because any revolutionizing scientific-technical achievement comes with risks. It is, of course, important not to let the risk be a factor of surprise but to include it from the outset in all considerations at a calculable magnitude. At the same time it is absolutely necessary to make clear decisions on all management levels about the projects of preparation, development and implementation, bring the collectives to act independently and creatively and--not last--promote good interhuman relations in the collectives.

For innovative processes to take a successful course, the manager's assuming his responsibility fully is imperative. Such a responsibility may at no time be "delegated." If the manager dodges decisions, tolerates mediocrity, or takes a liberal stand toward inadequate scientific-technical achievements, it means an irretrievable loss of time with all its grave economic and political consequences.

Economic Effects

Together with the insights we gained in recent years with respect to the usefulness and suitability of the use of industrial robots in various technological processes, we of course also gained experiences with regard to the economic and social effects that are obtainable. In drawing general conclusions from all the results we regard today the economic benefit as the most important criterion for deciding to introduce robots, while we fully respect the social aspect.

Let me demonstrate that benefit by a few examples. The two robots we used for spraying car bodies increased our labor productivity by 80 percent and released 2.25 manpower. While releasing manpower we can boost the labor productivity of undercoating by using two robots by 100 percent. In other cases the labor productivity boost ranges between 30 and 80 percent, results, that is, which do themselves proud. Looking at the figure of released manpower, however, it becomes clear the results achieved are still too uneven and still greater reserves have to be tapped. With the release of from 0.5 to 2 manpower per flexibly programmed robot we can by no means be satisfied because coping with the tasks assigned to us also essentially depends on our improving the management of the manpower problem.

This inadequate result is likely to have for its cause also the ways and means in which the robots are used--and not only in our own enterprise. If robots--as was customary among us in the past--are almost exclusively included in functioning operational processes, they take on only a few production functions and the production cycles themselves as a rule remain unchanged. Then labor is assigned to feed the robot itself, and that labor is then by no means always fully used because of the robot's working speed. Far better results can be achieved if whole production sectors are rationalized through the use of robots instead of individual jobs and the workpiece transport and storage are made part of it. Beneficial also are solutions that no longer tie manpower up directly with a job but where a larger number of robots and other means of rationalization is taken care of. Such solutions, which of course call for a new quality of watching out and approaching things, must become effective even during the current five-year plan period to satisfy the premises set down by the 10th party congress.

Man the Measure

Rationalization in socialism always aims at the welfare of man. Its aim always is to improve men's working and living conditions together with boosting productivity. That social maxim is decisive for our approach in our enterprise. We use robots where a person has to perform the heaviest physical, monotonous, repetitious or hazardous work. That was the case, for instance, around the solvents steam in the coating process. Today, in our place, industrial robots set circa 23,400,000 welding spots annually, circa 189,000 m of CO_2 welding seam is drawn and approximately a 3,040,000 square meter of surface is coated and approximately 285,000 square meter of surface is cleaned with solvents--and all this without any direct human involvement. The easier work resulting from the reduction in physical and psychological stress with the simultaneous improvement of labor safety and the performance boost itself impressively illuminate the enormous possibilities through this technology and also document that the social aspects in the use of technical achievements always receive attention in our society.

In our enterprise the working people have witnessed for years that the use of robots in socialism is not merely an exercise in computation because its benefit does not lie, as it does in capitalist countries, merely in dollars and cents but in that better working and living conditions go hand in hand with economic advantages and such consequences as unemployment are out of the question. But not only that is why no fear of this technical achievement and no rejection of it shows up among our working people. Most critical for their being, quite on the contrary, involved, with creativity and initiative, in the use of robots is the fact that the working people who later are meant to work with them directly are drawn into our planning even in the preparatory and production phase. This manner of inducing creative work, reflection and trying things out does a great deal for their contentment and their pleasure in their work and serves the maturation process leading to socialist personalities. Personality is also promoted by the training that became necessary because the content of the labor of the working people who henceforth are to work with and on the robot has been altered considerably. Most of the time it is the working people who took the place of the robot before it was introduced who become the "robot custodians" and who are ambitious enough to acquire the ability to program the robot and also know what is to be done in the case of a breakdown. For instance, our

former surface mechanics have trained arduously and strenuously--often sweating about it a great deal--until they knew how to manipulate the heavy lever of the robot in programming in the teach-in method sufficiently for both robots to apply the varnish optimally and in excellent quality to the car bodies. In this atmosphere their self-assurance grew and so did their skill.

In sum: socialist rationalization at new dimensions makes new and higher demands on everyone. It is wrong to wait for some enterprises to construct robots centrally for all others. Only those collectives will make headway which mainly develop their own capacity and develop, construct and use robots in their own enterprise which come out of their own resources in means of rationalization construction. All available experiences in this field--by now we have a lot of them--ought to be used. The more success we have in solving these problems, the more we will help implement the tasks assigned by the 10th party congress, which serve the welfare of our people and peace.

Science-Producer Association

East Berlin EINHEIT in German Vol 36 No 9, Sep 81 signed to press 11 Aug 81 pp 882-886

['Man, Robot and Social Progress' feature article by Dr Rudolf Winter, economist, engineer, member, SED Central Committee; general director, VEB Fritz Heckert Machine Tool Combine, Karl-Marx-Stadt: "'Industrial Robot' Science-Production Community"]

> [Text] The "Industrial Robot" Science-Production Community has been at work in Karl-Marx-Stadt since 1979. In it, combines, enterprises and science institutions--promoted and supported by the SED bezirk management--coordinate their activities regarding the development, production and use of robot technology. What considerations led to its formation? What characterizes its field of tasks and working method? Which results have been achieved, and what are the prominent questions for the future?

Robot technology indubitably is among the possibilities of the scientific-technical revolution that have become the immediate and main reserve for our economy's performance growth and efficiency.[1] It makes possible for us to boost our labor productivity and efficiency significantly and to free the working people from heavy physical, hazardous and monotonous work. These are weighty reasons for every industrial combine to contribute with initiative and energy to introducing between 40,000 and 45,000 industrial robots till 1985, in accordance with the 10th party congress resolution.[2]

Karl-Marx-Stadt Bezirk has many combines and enterprises which in introducing robot technology have identical or similar tasks to solve in scientific-technical, economic and social respects. And then there also are considerable science capacities, especially at the universities, which are also dealing with such problems--mainly with a view to the future. It is obvious that a consistent coordination of all capacities and means for the development, production and use of robot technology in this industrial sprawl, as set down by the plan, is of economic benefit and helps speed up matters in this field considerably.

Therefore, in May 1979, the Karl-Marx-Stadt SED bezirk delegates conference decided to form an "Industrial Robot" Science-Production Community (WPG) which includes combines, enterprises and science institutions. This is an affiliation of independent economic and scientific units, working under their own responsibility, which, based on the state plan, coordinate their approaches in the R&D, production and use of robot technology.

This community includes five combines (the Fritz Heckert Combine with its tool machine construction research center; the IFA Automobile Combine; the household equipment combine; Textima Combine; the ball bearing and standard parts combine); three enterprises (the Karl-Marx-Stadt industrial works; ELMO Thurm, and Karl Marx Numerik); and three collleges (Karl-Marx-Stadt technical college; Zwickau engineering college; and Mittweida engineering college).

The industrial units and colleges are represented by their heads, i.e. the general directors, enterprise directors and college rectors. On behalf of the "Industrial Robot" WPG, a team of specialists from the partner facilities is at work preparing decision proposals, supervising the terms of agreements made, and affecting the process of robot development, application preparation and production, so as to gain time and efficiency advantages.

The members of the "Industrial Robot" WPG are committed to clearly boosting their own contribution to accelerating the use of the industrial robots by using their data, experiences and insights. In particular, the WPG is working on recommendations and proposals for organizing the partners' cooperation on a contractual basis in such a way that the advantages of concentrating the industrial and science potential in the Karl-Marx-Stadt region, the advantages of the territorial sprawl altogether, be made the greatest use of. The heads of the combines, enterprises and science institutions represented in the community are responsible for the implementation of the measures jointly elaborated. The emphasis of the joint activity is placed on fulfilling and exceeding the state quotas in the field of robot technology. Therefore great efforts are being made to contribute to a still broader application of robots by discovering and exhausting more fully ever new reserves and to make sure that their use leads to a maximum increase in productivity and efficiency. One way which wholly conforms to this goal is the organization of exemplary achievements in the four assignment centers the Karl-Marx-Stadt bezirk management set aside--where circa 15 percent of the bezirk's robot technology is concentrated--and the suitable structuring and purposeful utilization of the five consultation bases in enterprises in the bezirk.

The impulses emanating from there are worth noting. For instance, at the consultation base of VEB Sachsenring Zwickau data for further use are offered that come to a value of M 2.5 million. Also the achievements of the Zwickau engineering college are exemplary. At its consultation base for preparing and planning the use of industrial robot technology, 46 enterprises were counseled and 52 lectures were given last year. These activities have turned out to be exceedingly fruitful because they vividly demonstrate the advantages of the cooperative effort initiated by bezirk management and help many working people in better understanding the use of robots and its requirements. And that precisely makes important advances possible in the development, production and application of robots.

Even so, we do not ignore that greatreserves for a broader application of industrial robots, and thus for further performance improvements, can be tapped--mainly by surmounting the still existing considerable differences in the levels of using robot technology in the various combines and enterprises. That is emphatically confirmed by the strong upsurge we achieved in this respect while getting set for the 10th SED Congress. In the first quarter of 1981 alone, 132 industrial robots went into operation, 15 of them in flexible production processes.

The results and the robot application preparation at completely new dimensions achieved in the bezirk are based on the activities in which the "Industrial Robot" WPG is decisively engaged. For instance, through socialist cooperation between the machine tool construction research center and the VEB Karl Marx Numerik the freely programmable microelectronic robot system IRS 600 has been developed which is going to be produced in series in the foreseeable future.

Even back in 1980, the Fritz Heckert Combine, 7 October Berlin and ORSTA Hydraulics produced 40 feeding-type robots of type IR 2/S II. For 1981, their joint manufacture of 90 units is planned.

Based on robot IR 2/S II, a commodity from the box of building blocks for feeding-type robots, in the VEB Fritz Heckert machine tool combine parent plant together with the machine tool construction research center, the model design for the use of industrial robots to rationalize the rotary processes of three technological units has been successfully concluded, which saves 15,000 working hours. Six more technological units are installed in the Fritz Heckert Combine in 1981.

Through close cooperation with the Mittweida engineering college, VEB Sachsenring Zwickau in only 14 months developed and produced its first flexible production robot. Its application increased labor productivity to 125 percent, released two workers, and made up for its costs within 2 years.

The Karl-Marx-Stadt technical college has come up with great scientific achievements: an assembly robot for experimentally exploring processes of motion and assembly grabs with tactile sensors were developed and used experimentally. This series of positive examples could be further extended by results from the combines as much as by activities from the science field which crystallize, e.g., in the participation by the colleges in the bezirk in the basic research conception on "operations technology."

The WPG has also made a name for itself by working out a guideline for preparing the use of industrial robots. It makes it easier for the users to carry out all the necessary technological work more purposefully and rationally. It must get the credit for the publication of the documentation, "Industrial Robots in Operation," as a part of the catalogue for rationalization solutions, by the machine tool construction research center. Thus far, 52 solutions for continuing use were made available--beyond the borders of the bezirk. In a number of combines a basic method for computing the economic benefit from the use of robots has been found expedient, which also was prepared by the research center.

Finally, it should not be forgotten that the WPG attaches great importance to training personnel in robot technology because it is being seen ever more clearly in practice how much our economic and social benefit depends on that. Specialists and economic functionaries have been trained in the field of industrial robot technology through targeted publicity work and differentiated training activities carried out jointly between the WPG and the bezirk management of the Chamber of Technology. In 1980 alone the WPG, within the scope of its training program, offered 35 advanced training seminars that were attended by 2,670 workers. As much as those efforts it has been slide shows and a film that disseminated the best experiences in the use of industrial robot technology, made on the basis of the general knowledge gained thus far. They were well received.

All these measures have paid off well meanwhile in our society. Duplication was prevented, time was gained, and another concrete proof was furnished showing us that the socialist planned economy can use efficiency reserves which are known only in a society without exploitation and capitalist property barriers, which can count on the commitment from all and employs all resources in the overall social interest.

By analyzing the 10th party congress, we in the "Industrial Robot" WPG have given an accounting for our achievements thus far and worked out ways that aim at a much higher contribution by our bezirk to the development, production and use of industrial robots. In assessing what has been achieved we could record much that has been positive and that has to be carried farther. At the same time we are concentrating on grappling with problems which have become apparent in our highly critical assessment. Mainly the following considerations have to be taken still more seriously in our continuing work:

--Thus far the use of robots--even under the aspect of pilot solutions--still is too expensive. All the more resolutely we must try therefore to reduce investment costs and engage in our engineering and technical preparation thoroughly yet with the lowest possible expenditure. It is completely unjustified, e.g., in fact, economically totally insane, to acquire universal types of robots when their intrinsic features are not made full use of because they were intended for highly specific tasks. If, however, the specific as well as the flexible robots are geared to the needs of their particular employment precisely, with all their technical data including their control variants, a great intrinsic effect is obtainable. That requires a greater variety of robots, of course, which can be built only if all combines and hundreds of enterprises contribute to it by building their own means of rationalization.

For these reasons the VEB Fritz Heckert machine tool combine will start producing in 1982, in supplementing the centrally established program of types, robots under its own development, mainly for programming machine tools making small parts, which will greatly reduce the costs needed previously. The principle will be to build as simply and reliably as possible. The time of return of the investments of no more than 3 years in any given case must be made evident by direct savings. Division of labor production in the WPG is organizing the peripheral installations and gripping devices needed for that purpose.

--Within only a few months we must supply machine tools from our production that are more properly up to robot specifications so that we do not need to make changes later becoming necessary because the robots, combined into technological units with the machine tools, have to be converted into automated operation units. For instance, for the chuck lathes many parts had to be newly built for the automatic opening and closing of the working area and for the chuck, or had to be built in, and the machine controls had to be changed. Converting machine tools already in use is a worthwhile task for the WPG.

--Even while setting requirements for robot use the highest intrinsic benefit must be ensured. If that has not been always the case the main reason has been that operations were not always based on process and workpiece analyses, which are imperative for it. To assist the combines and enterprises, therefore, the machine tool construction research center has made available extensive guidance for process and workpiece analyses. To us in the WPG this forms the basis on which to explain the rank and sequence in the application of robots, in order to get the highest benefit out of them.

Proceeding from what has been achieved and from the requirements for cutting back further jobs with little expense, the Karl-Marx-Stadt SED bezirk management secretariat has come out with a bezirk conception that assigns high goals. Through the efforts of all combines, enterprises and science institutions and the elan of youth we intend to accomplish the production of approximately 10,000 industrial robots in the 1981-1985 period, put into operation at least 7,000 of them in the combines and enterprises of the bezirk and thereby release 17,000 workers for other activities. The measures and tasks in the bezirk conception for the political leadership and organizational work are aimed at fully ensuring the fulfillment of the bezirk quotas, through the elaboration of the 1981-1985 plan, which has already been buttressed up to 70 percent by concrete measures taken in the combines and enterprises.

That calls for tapping further initiatives for the application of process-specific industrial robot technology in all enterprises in the bezirk, reducing transition periods and ensuring a rapid application as well as exhausting further reserves in the enterprises not accounted for in the analysis.

Especially machine tool and processing machine construction have a great responsibility to start using industrial robot technology and not wait for the end of the current five-year plan period but begin with it already in 1982, 1983 or 1984. Good examples have been set by the Fritz Heckert machine tool combine, where three enterprises use a total of some 1,760 robots for their end products; the Karl-Marx-Stadt tool-grinding VEB, which has equipped circa 670 grinding machines with robot technology; and the Karl-Marx-Stadt spinning and yarn VEB, which has made available approximately 375 rapid spinning machines with loading and unloading robots.

Further reserves, as far as the production and use of industrial robots are concerned, must be tapped through reducing the great differences of levels among the combines and enterprises in their construction and use of industrial robots. The "Industrial Robot" WPG has been concentrating on that even by its concrete specifications for the 1981 work plan. The members of the "Industrial Robot" WPG,

who have left no doubt about where they stand with respect to absolutely fulfilling their goals in their work thus far and in their conferring on the tasks up to 1985 as set down by the bezirk conception, now are showing the same elan in conscientiously meeting their tasks.

Introduction to Robot Technology

East Berlin EINHEIT in German Vol 36 No 9, Sep 81 signed to press 11 Aug 81 pp 887-889

['Man, Robot and Social Progress' feature article by Prof Dr Werner Gilde, engineer, director, GDR Central Institute for Welding Technology: "Robots From the Box of Building Blocks"]

> [Text] The magnitude in the introduction of robots to our economic reproduction process makes high demands on technical and technological R&D. How are research collectives motivated for demanding, creative and economically and technically rational solutions? How are the specific tasks to be found and set down? Can solutions be worked out on prevailing economic premises that will meet our future developments? The successful work of ZIS demonstrates that these matters can be resolved with great social benefit.

Early in the 1960's it dawned on us that programmable welding machines could be built in the future by means of electronic building blocks. We then got our first pocket calculators. With some imagination and technical know-how it became conceivable that their properties could be used for programmable welding machines.

It became clear to the electronics specialists in the Central Institute for Welding Technology (ZIS) that the whole development was moving fast. It also was certain that our industry would not be able at once to supply all the electronic building blocks that would conform to highest technological standards. But we considered that a technological research institute like ZIS would have to deal with matters of the future and should not wait until all problems arising in new technologies in the construction of new machines had fully been settled by ancillary industries. Larger projects require agreement on certain principles even before research gets under way as to what the researcher is to come up with and what the user of research expects of it.

What Is to Be Achieved?

ZIS has heuristic programs for making such determinations. They are prepared to make the researcher very certain that the targets are right.

The most important points are these:

The robot is to be programmable. We have refrained from using the term "freely programmable" from the start. The limits to which a robot can be used in welding techniques are set by certain physical conditions. The programming we are asking for is confined to that framework.

Electronics must be such that through supplying novel building blocks the robot can be re-equipped without any great expenditure.
This rule does away with one of the biggest headaches in research, to have to wait for more perfect ancillary parts.

The robot is to be built up out of a building block system.

A manual welder has 32 modes of motion (degrees of freedom) in his arm to lead an electrode but, as experience has shown, he only uses these motion potentials to a very small degree.

A robot from a box of building blocks makes possible building in only those motions that are needed for the purpose. Such a method also has the advantage that less technical effort will do and the user needs buy only the parts that are needed for his purpose.

The robot is to work within Cartesian coordinates. In general, one is welding straight lines or circles. Both can relatively simply be programmed and carried out through Cartesian coordinates. Spherical coordinates, that go with the human arm or hinged robots, on the other hand, call for greater mechanical and technical control efforts.

Express Targets in Terms of Measures, Figures and Weight

When one has decided what one wants to accomplish, one's data must be as much quantified as possible. In 1962, of course, you could not possibly spell out in dollars and cents how expensive a robot would be in 1980. Even so, when the work begins there must and can be agreement about certain parameters.

(1) A robot must replace at least three welders. In principle, the welding speed of a CO_2 welding machine is not greater than that of a CO_2 manual welding device. But in contrast to the manual welder the machine needs no breaks which makes possible to turn the overlapping off-times into actual welding periods. This triples the performance, it has been found.

(2) Costs must not exceed the neighborhood of M 250,000. The idea is that in principle there must be a reasonable ratio between the economic effects due to the release of three workers and the expenditure in the use of a robot.

(3) A robot must be able to handle 80 percent of all welding activities. This qualification is absolutely necessary because a robot that can do "everything" is too expensive to pay for. There is this rule in research in general that fulfilling the last 20 percent of any kind of demand usually takes more money and time than the fulfillment of the first 80. Therefore it is of benefit to set down reasonable limits for the field of application from the outset. We shall not go into other parameters such as weights, speeds etc. at this point. Important only is that the planned parameters are reasonably proportionate to each other.

Technological Preparation and Equipment Development

Most researchers have trouble planning and setting off various threads of research in juxtaposition. Most of the time so much time is used up in development because the projects are carried on "step by step" following each other instead of simultaneously as much as possible. In thinking about this one must of course once more begin with the question as to what it is one actually wants to do.

--80 percent of the welding seams are to be welded by robot. Almost all welding engineers claim special conditions for their enterprises. ZIS has carried out a representative survey in 70 enterprises with circa 600 components. The result was that long throat and blunt seams are normally welded automatically. Those we may then safely ignore in our robot development. Of the remaining seams, circa 70 percent were throat seams (a 10,000-ton ship has 150 km of them). Almost all these throat seams have stays of 4.5 and 6 mm; their length is circa 1 meter. Thus they are too short for normal automatic welding. The type and form of these seams are almost identical in all industrial branches--regardless of the products they later are turned into. One and the same robot can thus be used in automobile construction, ship building, or making cooking-pots.

--the most important is software. A widespread error is the belief that in the use of a robot, electronics is what really counts. But the most important, the most difficult and, on the long run, the most expensive is software, i.e. the development and application of the programs.

Anyone who has a high-grade pocket calculator knows that it is possible, if one gives thought to it, to cut down the number of steps within a program, whereby always new opportunities for the use of the calculator are found. The same is true for the technological use of a robot. If there are five seams to be welded in a component, the sequence in which that is done is by no means immaterial. One must give careful throught to finding the proper sequence. And then there are still additional complications because one must pay attention to certain technological conditions, e.g. contraction through heat, and because it is necessary to program the welding process too with its beginning and its end. There are hardly any barriers here to the intelligence and imagination of the user. He who simply puts his welding robot down and hopes electronics will do something with it will suffer shipwreck. Micromodel building blocks will only do as much as the operator programs into them in "intelligence."

Never Forget Training

When you buy your first automobile, you must first have gotten a driver's license, of course. But there still are directors who think as long as you buy a robot, someone will be there who will know how to operate it. That is greatly mistaken because designers must know everything about computer design; technicians must learn the proper computer technology; and workers must learn to operate the computers professionally.

That is why ZIS started years ago conducting courses for engineers and computer operators. Especially among the operators a type of welder is growing up who must have ever improving skills technological and electronic. Particularly, an operator is expected to be highly reliable. Errors he "lets pass" in the robot have far-reaching consequences in interfering with all further operations.

Thinking of the Future

Experiences in enterprises that have already installed welding robots indicate that robots require further robots. Those can and must be further welding robots as well as robots for feeding in supplies and for testing. In many cases, robots are tied up with single-purpose automation equipment. The following important tasks arise from that for our further work:

--The GDR produces various types of robots which work on different principles. How shall they all be combined with one another?

--There are a number of efficient sensors that can largely expand the fields where computers can be used. How do the various sensors fit together with all the different robots?

--Multi-shift operation is imperative for the robots today on behalf of achieving great economic effects. What socialist society expects of us for the future, however, is that we design technologies for shift-operations no longer requiring human operators.

These three examples illustrate the gigantic organizational and technical problems newly arising from the use of robots. That for the welders the introduction of circa 4,000 welding robots results from the 10th party congress requirements is only part of the work confronting us. The robots in use will confront us with still greater (and more interesting) problems which we must solve and, no doubt, will solve.

WORKERS' EDUCATION TO BE GEARED TO GROWING TECHNOLOGY DEMANDS

East Berlin EINHEIT in German Vol 36 No 9, Sep 81 signed to press 11 Aug 81 pp 911-917

[Article by Prof Dr Wolfgang Rudolph, director, and Prof Dr Gottfried Schneider, deputy director, GDR Central Institute for Vocational Training: "For More Effective Use and Systematic Expansion of Skilled Workers' Educational Potential"]

> [Text] Education and training are an important potential for implementing our economic strategy, of which a more purposeful use must still be made. What importance attaches here to the long-term planning of our vocational and qualification structure? What implications are derived for the systematic expansion of the skilled workers' educational potential from R&D and rationalization projects? Ideas about a stronger shaping of such personality characteristics as reliability, discipline, the sense of responsibility and the readiness for dedication and performance.

In implementing the economic strategy for the 1980's which was issued by the 10th SED Congress, the higher educational level of the skilled workers in the GDR is to be used so "that a measurably higher increase in labor productivity and a higher grade of production are achieved thereby."[1] The political and technical knowledge, skill and professional experience of the working people in our country amount to an enormous capacity for the economic performance improvements we need, which must be carefully employed and constantly augmented. That we must act politically most responsibly in this is obvious; after all, we are dealing with people here. This is all the more true in view of our demographic development: in 1985, no more than 75 percent of the 1978 school graduates will any longer be available for vocational training, and in 1990, even only 50 percent. After 1990 the number of apprentices will again rise steeply.

Results of a Purposeful Educational Policy

The history of our country is marked by broad learning activity and the constant improvement of teaching and study methods. Among the greatest historic achievements in our republic is that the demand by the revolutionary workers movement for high education for all members of society is being met more and more fully. The working people's skill strucuture has been decisively changed through it.

Qualification Structure of the Working People in the GDR (in percent)

	college graduates	vocational school graduates	chief operators*	skilled workers	unskilled and employees
1955	1.2	3.1	—	25.8	69.9
1960	1.9	4.9	—	33.6	59.6
1965	3.0	7.6	—	41.5	47.9
1971	4.0	6.9	4.9	50.0	34.2
1975	5.5	8.6	3.5	49.5	32.9
1979	7.2	12.8	3.5	56.2	20.3

This altered qualification structure is directly related to the redistribution and elevation of social labor. The increase of the number of people at working-age who entered the labor market by circa 2 million (from 1950 to 1978) and the sharp reduction of agricultural labor (from 27.9 percent in 1950 to 10.8 percent in 1978) for the benefit of industry (29.2 percent in 1950 to 38.2 percent in 1978) went hand in hand with massive activities toward acquiring skilled workers' qualifications, a high proportion of women being involved in it. In agriculture, the qualification improvements were most noteworthy. In 1965, only 24.5 percent of the workers had skilled workers' or chief operators' qualifications or were college or technical school graduates, but in 1970 it was 57.6 percent and in 1979, 87.9 percent.

The GDR working people's high educational level is marked above all by a comprehensive political, natural-technical, economic and intellectual-cultural knowledge provided on all levels of our unified socialist educational system for which the 10-grade general-education polytechnical secondary school lays a solid foundation. When starting their vocational training already 71 percent, in 1970, and 86 percent, in 1980, of the apprentices had graduated from 10th grade. All graduates who do not go on to college find an apprenticeship or a job in an occupation they have trained for available to them. This great social achievement of our state also was secured in the late 1970's and early 1980's under the conditions of the demographic "high" by arranging for 40,000 additional apprenticeships.

Acquiring a skilled profession is a desirable educational goal in the GDR. To be a skilled worker is an educational credential the society acknowledges and respects. Highly qualified and class-conscious skilled workers increasingly shape the looks of the working class in our republic. A fine education enables it in ever better fulfilling its function as part of the class that is in power and as the producers of our social wealth. For that reason the party and government, together with the FDGB and the FDJ, pay great attention to vocational training, given expression, for instance, in the 7 December 1976 and 6 December 1978 resolutions on vocational training and in the 21 June 1979 resolution on adult education. Those resolutions, in conformity with our party's general line, form the basic orientation for the

*The reduction of the proportion of chief operators from 1971 to 1975 is due to the fact that since 1975 this category has included only those properly qualified working people who work as chief operators. Before 1971 , neither chief operator credentials nor working people who were working as chief operators were shown separately in our statistics. 1971 includes all working as chief operators and all who have those credentials but did not work as chief operators.

development of vocational training and adult education in the continued shaping of the developed socialist society in the GDR. The focal point for it is the development or further molding of socialist personalities, which is also a decisive prerequisite for the high economic performance improvements we need, basic as they are for all our social progress.

State teaching plans keep general and vocational basic training in well-balanced proportion with specialization. They are scientifically grounded and oriented to the needs of our economy and society. Through introducing in 1970 basic social science and technical courses the general education acquired at the secondary schools is systematically being expanded. That was a decision that was oriented to the future. Within the last 11 years, circa one-third of all skilled workers working today got in their vocational training the basics in electronics, BMSR technology (industrial measuring, control and regulating technology), and data processing. These subjects are mandatory for all 225 occupations requiring the completion of 10th grade. Apprentices are familiarized with the basic working principles in these key elements of scientific-technical progress by means of modern teaching tools. Roughly M 100 million were spent for setting up appropriate showcases in all vocational schools and making available experimental sets.

Above and beyond training someone for any particular occupation as skilled worker, vocational training provides for permanent advanced vocational training. The advantage in this is the uniformity of our socialist educational system which allows all working people to go on for a higher level of qualifications where there are no blind alleys as are typical of the FRG's educational system.

Tasks and Problems in a More Effective Use of Our Educational Potential

In the working people's high educational level the GDR holds a decisive potential for further performance improvements in all domains of our society, especially in our economy. "A great task for the 1980 is to make the fullest economic use of this considerable state of education," Comrade Erich Honecker affirmed at the 10th party congress.[2] The GDR's economic successes and its place among the 10 strongest industrial nations in the world testify to the value of a fine general education and of solid occupational qualifications. Experiences have confirmed that education must be ahead in time and focus on the signs indicating the future development of the productive forces. For a socialist society it is by no means a matter of "overqualification" if the knowledge and skills acquired sometimes are higher than what the production process requires immediately. Apart from the fact that education also is a value in its own right to us, being ahead in education holds the potential for speeding up our scientific-technical progress and intensifying our social production because when qualifications rise the working people's needs are growing for substantive and interesting work which, if properly directed, becomes a source of creative initiative.

Training proper as to needs always focuses on the foreseeable future. If in training workers one were to proceed from the jobs concretely available at any given point, it would run the risk of constantly having to catch up with new developments. Moreover, developments do not all proceed at the same pace within the economy, in various branches and also in enterprises. Along with modern installations and machines, traditional and older equipment will continue to exist.

Vocational training, however, must be oriented to the modern processes and thus to the demanding content of labor. Because of it, qualifications provided by vocational training are at present not required in some jobs. This condition can only be surmounted gradually through modernizing the production processes, changing the content of labor and, mainly, by way of rationalization. The desire of the young skilled workers to show their knowledge and skill and prove their readiness for performance and achievements should however be used more productively by means of demanding tasks, e.g., from the science and technology plans. This point also was underscored at the 11th FDJ Parliament. Sometimes economic functionaries are not sufficiently familiar with the knowledge and skills the young skilled workers acquired in their training--e.g. the basics in electronics and BMSR technology--or pay too little attention to it or demand too little. Knowing what a skilled worker knows and can do in any given occupation is an essential precondition for the managers' assuming their full responsibility to assigning the working people to jobs that are properly in line with their qualifications. Not asking enough not only diminishes vocational qualifications in the long run but also has negative effects on working morale, readiness to learn and activity.

There also are still jobs in all the fields of our economy where only minor demands are made on skills. Technical innovations, mainly in the wake of automation, keep creating such jobs even while they are constantly being reduced. Their total number in certain enterprises at present exceeds the number of unskilled workers, which is bound to employ skilled workers on those jobs. This is the main reason why circa one-fourth of the skilled workers is not employed in accordance with their qualifications. The solution of that problem cannot be, for us, to reduce the proportion of skilled workers at the benefit of the unskilled. The goal of socialism is and remains the all-round developed personality with all the knowledge and skill employed for the good of the people. Thus we must shape our work in such a way that it conforms with the needs of our society while we at the same time drastically reduce unskilled jobs through rationalization and the use of industrial robots. A priority task in our scientific labor organization is to develop jobs adequate to highly skilled socialist producers. That calls for enriching the content of labor, reducing unskilled labor, expanding the tasking areas and raising the responsibility of all working people, and alteration and combination in their labor.[3] The aim must lie in improving the effectiveness of live labor as a fundamental requirement of socialist intensification.

Requirements for Expanding the Educational Potential

The GDR's social development, as charted by the 10th party congress, particularly the close combination between the advantages of socialism and the scientific-technical revolution, calls for both more efficiently using and systematically expanding the currently available educational potential. Our implementing our economic strategy for the 1980's largely depends on developing socialist skilled workers and their educational and qualification levels while perfecting the conditions for the application of such education and qualifications. The availability of skilled workers grows in importance constantly. But what counts is that this availability is correctly used, including their abilities and readiness for coping with changing labor requirements, which also creates an educational lead for future labor requirements, and for those in scientific-technical creativity and intellectual-cultural life. Which essential tasks arise from that for vocational training and vocational adult education?

For one thing, the scientific-technical revolution requires that skilled occupations are further developed in terms of content. In determining fundamental requirements for the content of skilled occupations we certainly may take for granted today that scientific-technical progress in its basic tendency leads to more demanding contents of labor. It is assuredly so that work on automated installations calls for skilled labor. The general increase in demanding labor contents is confirmed by surveys, especially by the extensive work on the further development of skilled occupations in the GDR.[4] That is all subject, among other things, to the higher requirements level and the diversity of activities, the expanded action radius, the greater responsibility for effective production processing and the quality of the products and to a favorable combination between physical and mental work. A typical example is the combination between the preparation, installing, operating and supervising and preventative repair in the use of machine tools under computer control.

A problem in determining occupational content comes from the extremely uneven development and implementation of our scientific-technical progress. While in its basic tendency labor content becomes more demanding, technical innovations also reproduce simple, and sometimes monotonous, labor. In some enterprises, fully automated installations or machine tools under computer control are being used while we know that even in highly developed industrial countries traditional machine tools will still be used in the year 2000. On the one hand a skilled worker already controls a whole production process from a central switchboard or control point, but on the other hand, close technological ties of the worker with partial operations, especially in the assembly and operational occupations, can be done away with but gradually and over a longer span. This dialectic in the development of the material-technical base of production and the labor itself requires projecting the kinds of occupational contents that allow the skilled worker to cope successfully with the tasks of today and be prepared for more advanced or future requirements. For that reason we must accurately analyze the real processes in science, technology and production, as neither excessive nor conservative reactions must gain the upper hand in educational project planning. It forces us, for instance in view of the high place value of occupations training for a rapid, well targeted and differentiated reacting to microelectronic requirements, to maintain a solid analytical determination of the concrete demands and their appropriate conversion into educational contents and measures. The GDR Central Institute for Vocational Training has endorsed particular methods for it.

Starting in September 1981, there will be introduced on this basis more advanced training documentation for electronics specialists, BMSR technicians, and mechanics and maintenance mechanics for ADP and office machinery. A "maintenance" specialization department for electronics specialists was newly developed. In practical occupational training the handling of integrated circuits is boosted in these four occupations, and measuring technology also is paid more attention to in theory and practice. We are presently engaged in revising substantively the occupations of electromechanic, electrical draftsman, watchmaker, precision mechanic, electrical machine builder, cable mechanic and specialists in installations technology. The central economic management organs and the combines are mainly responsible for that. That they still must pursue more vigorously via the competent specialized occupational commissions.

Secondly, scientific-technical progress also leads to changes in the manpower proportions in various skilled occupations and to changes in the occupational and qualification structures in combines and enterprises. Changes in the nature and functions of labor and the further development in the division and organization of labor break down traditional occupational structures. That is given much of an impulse especially by substituting electronics for mechanics and by a high degree of automation that makes use of robot technology. For that reason, e.g., the VEB Robotron Combine, in connection with the planned use of 1,300 industrial robots by 1985, prepared an analysis about the occupations and special qualifications needed for that. It contains, e.g., the proportion of skilled workers for processing material, electronics specialists, electromechanics, machining specialists and other occupations in the development, production, operation and maintenance, the overall knowledge all working people have to receive, and concrete educational measures. The conception unequivocally proves that the developer determines the educational requirements and the certifications. It is a demand which also addresses itself to the microelectronics application centers and has to be guaranteed for all developments through the commitment notebooks.

Each combine and enterprise has to determine the requisite occupational and qualification structure over long range. Manpower and educational planners have to understand that certain jobs that so far called for electromechanics will need electronics specialists in the future. From which one must not deduce that electromechanics have now generally become less significant. To carry out the future labor tasks, the adequate occupations thus have to be selected. Not always do we know enough yet however about the skilled occupations and their range. When labor functions are changed, one can often hear criticism of the occupations traditionally involved in that field of labor. For the "skilled labor" needed in our economy there are however 318 occupations available with a great number of specialized skills which--if used meaningfully--fully meet the requirements that are foreseeable today.

The need for accurate planning of our occupational and qualification structure is further corroborated by our demographic development. The number of apprentices may diminish, yet we must still train all the new manpower we need in all fields. There are reserves in our recruiting girls for technical occupations. That also gives rise to new demands on vocational counseling.

Third, social development in the GDR calls for a higher level of vocational training.[5] For the combines and enterprises and their vocational training facilities this means improving the quality of instruction in theory and, especially, that of practical occupational training, ensuring demanding production in line with the training given, effectively using and extending the material-pedagogical conditions and perfecting the management of vocational training.

Higher demands are placed on the awareness and conduct of the young skilled workers, and thus on the communist education of the apprentices. They result from the advances of our society, the sharpening of the international class struggle, and the effects of the scientific-technical revolution. Higher demands for personality characteristics arise, among other things, from the growing technological complexity of labor and the increasing dimensions of the basic assets, the more complex

and complicated installations including those of industrial robots and the increasing complexity of the tools of labor, the integration of technological processes including the reduction of production steps, the change in the generations of equipment, the new, highly efficient technologies and working principles, and the activities of the skilled workers in innovator, rationalizer and inventors' collectives. Indubitably, a worker's sense of responsibility, discipline, conscientiousness and decision-making capacity have a far greater consequence when he is working with a computer-controlled machine tool, e.g., than with a traditional lathe.

The apprentices' general basic education also has to be further developed in line with our requirements. We start from the consideration here that microelectronics is based on the same physical working principles and inevitabilities as traditional electronics. An apprentice, as an upper-grade pupil, can approach microelectronics only via semiconductor technology. That is why it is to important to lay the ground for the necessary attitudes and the understanding of the development and application of microelectronics even during basic occupational training. Accurate knowledge is needed for that of course, too. For that reason the Central Institute for Vocational Training together with partners from the practical field prepared a teaching aid, "Microelectronics in the Basic Technical Fields," and a corresponding advanced training program for instructors to be put into use in the 1981/82 school year.

Fourth, higher demands for advanced occupational training for the skilled workers also result from it. The vocational training of the apprentices only reproduces circa 3 percent of the total of our skilled workers annually. This way alone one cannot react at the required speed to the dynamics in our scientific-technical development or the great divergencies in our economy. Every occupation has to conform to both traditional and progressive requirements, that is to say, skilled occupations are today objectively more substantial, diversified, differentiated and dynamic than can be grasped in a vocational training period of, normally, 2 years. That is why it is so important to combine vocational training with occupational advanced training more systematically and effectively. In the VEB Upper Lusatia textile enterprise of the cotton combine, e.g., in conjunction with the "Lautex Jeans" rationalization project, they in good time started the advanced training of the labor to be employed in this new plant. Thereby the conversion timetable was met, plan fulfillment was raised form 100 to 150 percent, and the first choice proportion was brought to 96 percent. In the course of their advanced training these working women submitted five innovator proposals. It corroborates that advanced training must be planned and conducted together with the technical-economic processes. The combines' unified reproduction process offers favorable preconditions for it, which must still more consistently be utilized.

While in previous years acquiring skilled worker qualifications was the focal point for adult occupational training, advanced occupational training is now gaining increasing importance. Thus the ratio between advanced training and occupational training in this area rose between 1966 and 1978 from 0.86:1 to 4.63:1 in industry, in construction even from 0.91:1 to 7.69:1. And with acquiring specific qualifications, growing importance also attaches to anti-breakdown and labor methods training.

Our economic strategy greatly focuses on cutting back jobs and gaining working people for other kinds of activities. Greater importance attaches here to the planning and implementation of advanced training measures while using the already existing education and skills. One should note, however, that some skilled occupations are substantively interchangeable to varying degrees. That is to say, when training is needed because of a reassignment, learning a different trade should be the last thing to be done. The first consideration must always be to build on what is already there and replace substantive aspects of one trade by those of another trade, or enrich a skilled worker by training in it, because in his education there also are economic aspects that must not be lost sight of.

Vocational training and occupational advanced training and their organic connection and greater effectiveness and quality gain in importance in every combine and enterprise, for it is a matter, after all, of resolutely enforcing the economic strategy the 10th party congress has issued.

COMBINE DIRECTOR EXPLAINS KEYS TO PRODUCTION SUCCESS

East Berlin EINHEIT in German Vol 36 No 10, Oct 81 (Signed to press 14 Sep 81) pp 1010-1016

[Article by Dr Hans Broll, economist, general director, VEB Werner Lamberz Polygraph Combine, Leipzig: "Persistent Struggle for Top Quality Products"]

[Text] The VEB Werner Lamberz Polygraph Combine, Leipzig, has 15,400 working people. They produce top quality products for domestic printing, bookbinding and other graphics enterprises and export to 60 countries in the world. Their top quality products include
--Planeta-Super Variant sheet offset machines;
--Zirkon forta 660 and Plamag-Rondoset roll offset machines;
--Multi effect high-capacity automatic folding machines; and
--Perfecta paper cutters.

The combine includes 12 production enterprises, one engineering enterprise, one foreign trade enterprise and one design office. They are concentrated in Leipzig, Dresden and Karl-Marx-Stadt Bezirks.

More than 100 products in the world bear the "Polygraph" trade mark. All leading newspapers in the fraternal socialist parties are printed on Polygraph machines, for instance. Cuba used the machines to establish the largest printing shop for school books in Latin America.

Four combine enterprises bear the seal, "enterprise of excellent quality work." Eight are recognized as "enterprise operating with exemplary energy economy."

The Polygraph Combine, which exports a great part of its output, is making great efforts to produce more commodities achieving top standards in terms of their scientific-technical as well as economic parameters. What management documents are needed for that? And how can one make sure that--supported by political-ideological work--quality work is done on every job which is prerequisite to top quality products?

The high economic demands and objectives for the 1981-1985 five-year plan period call for ensuring far greater growth rates in the productivity and efficiency of our economy than in the last 5 years. The working people in the VEB Werner Lamberz Polygraph Combine, Leipzig, are also adapting themselves to that pace. Aware of the fact that long-term stable economic growth in our country must rely on the acceleration of our scientific-technical progress, they concentrate their capacities still more on new products and procedures, in line with international standards, which will have profound economic effects.* Mainly wanted are top achievements that profoundly improve technical and technological production levels by facilitating a still more rational use of our energy and raw material resources, a higher degree of socialist rationalization and an increasing automation of the production processes. Top quality production calls for making the most advanced scientific-technical data the immediate basis for product development.

Entirely in that sense, and led by the party organizations, capacities are mobilized in the polygraph combine, which exports a considerable proportion of the polygraphic machines, equipment and scientific accomplishments it produces, the work being organized accordingly. Our combine management considers that the exercise of its economic responsibility implies a constant and persistent struggle for making top quality products. Such products, which in their essential technical and economic parameters signify top standards, e.g. by an improved performance, an improved cost/benefit ratio, and better qualities, marked, that is, by a more favorable expense/benefit ratio, gain great benefits for the combine and for the economy at that. Ultimately a high effectiveness growth can be obtained only if products and scientific-technical achievements meet the customers' demands and stand up to hard comparisons on the markets. Especially combines that handle a lot of export are increasingly confronted with international standards and requirements in their production assortments and production level. All the greater is their obligation to conceive their own scientific-technical performances as top achievements and not to rest at a top position once achieved. That primarily is prerequisite to selling the products and bringing in good foreign exchange.

For the buyers of products and users of scientific-technical achievements (as contained in instruction, know-how and other such performances) it is of course of no interest what concrete efforts are embodied in it. All they want is the best price and maximum benefit. To ensure effective export it is thus becoming increasingly important to be as familiar as possible with the users' needs, assess their developmental trends and take account of differing sales conditions in the various countries.

In developing and implementing scientific-technical performances domestically and the export to the socialist economic region one can rely on the demand curve anticipated in the plan and establish long-range production and sales strategies on it. As to the assessment of capitalist markets, noteworthy insecurity factors are part of the bargain because of the unstable and crisis-like development in capitalist countries made up of currency fluctuations, inflation, price manipulations and so forth.

---

*Cf. Comrade Erich Honecker, "Bericht des Zentralkomitees der Sozialistischen Einheitspartei Deutschlands an den X. Parteitag der SED" (SED Central Committee Report to the 10th SED Congress), Dietz publishing house, Berlin, 1981, p 51.

Generally one must consider that through the worldwide speed-up of scientific-technical progress quality and efficiency demands for scientific-technical achievements are growing and innovations are coming in ever more rapidly. Our combine, as an export-intensive producer of polygraphic machinery and equipment, mainly must still take more into account that scientific-technical achievements are offered on the market with increasing breadth and products with a higher degree of refinement are given preference. This tendency will undoubtedly continue, in that it is emphatically being encouraged by continuing raw material price increases with all their ramifications. And finally, the growing demands for environmental protection also have to be kept in mind which--set down by law in many countries--have to be strictly observed by anyone who wishes to export with success.

Many efforts have been made and are being made in organizing the reproduction process in our combine with regard to all requirements resulting from it. Great care is used in designing, producing and selling the kind of scientific-technical achievements that at least conform with international standards. Thus the time frame for developing and applying of new or further developed products was reduced from 36 to an average of 27 months. Thus more than 75 percent of our output is now no older than 3 years. At the same time we managed to put our products more swiftly on the market. Our production assortment was organized so that it is possible to offer technological systems solutions in accordance with broad users' demands. The degree of automation was increased for our products--mainly by means of microelectronics--, and measures have been taken to implement over brief periods specific future automation solutions. A critical analysis of the volume/performance and the volume/energy ratios of our products offered important handles for new solutions through which still more favorable values are attainable. This analysis was furthermore an essential basis for working out our refinement conception, which is of great weight to our struggle for top achievements. For years we have also sought closer cooperation with the foreign trade enterprise to derive benefits from it for the marketability of our products. Now, through drawing the foreign trade enterprise into the combine's reproduction process, the conditions for it have become still more favorable so that we can meet market needs still better all the way from the conceptual work to effective production implementation.

Starting from the polygraph combine's economic responsibility, we have worked out criteria for top achievements in order to be able to derive tasks for management activity and for the collectives' requirements in accordance with objective yardsticks. Here we rely on thorough surveys of users' needs, the market strategy of capitalist competitors and international science and technology trends. In the outcome of that we also are strictly aware that we can as a combine maintain and consolidate our position only if we succeed in combining top achievements in production development with such in production techniques, methods technology and design while we also accomplish top achievements economically speaking.

The Planeta-Super-Variant sheet offset machine from the VEB Planeta Radebeul combine enterprise meets such demands, for instance, and is a recognized top achievement. In quality, energy consumption, and the volume/capacity ratio it shows values that stand up under international comparisons, is marked by a favorable cost/benefit ratio. A basic condition for a high rate of growth is that such top achievements are developed systematically and carefully planned. That concerns the time when they become available, their operational features and their production costs.

World standard comparisons form the basis for elaborating and scheduling the requisite parameters. Only products that represent top achievements in their scientific-technical and economic parameters qualify for the highest guarantee seal of ASMW (Standardization, Measurement and Commdity Testing Office), and if they satisfy their users' needs in every respect, they can count on recognition in the international market, which is most strikingly expressed in good export turnover and acceptable prices.

Systematic Organization for Top Achievements

Proceeding from economic requirements placed on the polygraph combine, management documents and conceptions were prepared on the basis of which the foundations have to be laid for the conditions and prerequisites needed for top achievements throughout the combine's entire reproduction process. With that they are the starting point for setting up the collectives and ensuring their uniform approaches. There are mainly three documents that have been found critical for a work that is steadily oriented to top achievements: The long-term strategic conception for organizing the combine's reproduction process up to 1990 and beyond; the conception for working out the five-year plan; and the conception on personnel.

These documents are based on partial conceptions for R&D, technology and rationalization, market strategy and the management and planning of social processes. As all these conceptions are largely prepared by combine management together with the competent directors and the participation of many other working people from the combine enterprises, are thoroughly aired by the combine management and only thereafter ratified by the general director, they are not the outcome of work done around the conference table. They are the genuine outcome of a broad exchange of ideas in which not only the experts were listened to but also a large circle of working people who--deeply interested in the future of their enterprise and combine--have submitted their own suggestions for shaping labor processes and working conditions. This forms a solid basis for meeting the targets assigned with commitment and in conformity with a uniform yardstick.

The fundamental task which is common to all our conceptions is ensuring the concentration of the combine's capacities and funds on the decisive projects in the various phases of its reproduction process, as economic requirements demand. To that end, clear scientific-technical and economic and social targets were set. It includes in particular:

Concentration and specialization in product development

The polygraph combine has in recent years gone into specializing in its main production lines--after accurate coordination mainly with its partners in the USSR. That was based on coordinating with the main domestic users as well as with those in the friendly socialist countries and, furthermore, on comprehensive assessments of all future demands. We also carefully analyzed the science and technology development trends in machine building and operations techniques. From this and from the foreseeable developments of the competitors, inferences were drawn for our production assortment, our specializing in main lines--and thus also our main export lines.

Organizing the production of our main production lines on a high technical, technological and organizational level also presupposes our creating our own scientific-technical lead time for product development, technology and organization. Scientific-technical and at the same time economic top achievements can be ensured only by a carefully considered concentration of our R&D potential on the development and constant improvement of our main production lines. Here especially the advantages of scientific-technical cooperation with the CEMA countries, particularly with the USSR, stand clearly revealed. Already for years have we been coordinating essential developmental trends with the USSR. Thereby we can avoid duplication and make better use of specialization and cooperation opportunities, so that higher effects are obtained for the development, production and implementation of top achievements.

Further division of labor in conformity with long-term needs for main products

The division of labor process occurring in our combine moves onto higher levels all the time. The dynamics of this process is affected by scientific-technical progress as well as by the changing needs for scientific-technical achievements. That gives rise to new requirements, tasks and labor contents. All such steps toward further streamlining and proportioning the enterprises in our combine proceed from the principle of ensuring our productivity, efficiency and qualities in accordance with economic requirements.

Specialization in accordance with main production lines has been found useful--in conformity with systematically creating the appropriate modern technologies and the proper organization from R&D all the way to product sales.

In further developing our division of labor it must be taken into account that not all various parts, components or products needed for completing an installation are made in the combine itself. This, however, must not infringe the struggle for final products on a top level in any way. When several combines are involved in the production of a commodity it cannot possibly mean that the responsibility for its qualitative level is proportionately broken down, as it were, or would be reduced for each participating combine while the degree of interlinkage increases. On the contrary! It is all the more important that each combine which, as the end producer, bears the main responsibility for product quality vis-a-vis the user arranges for the properly timed qualitative and quantitative requirements for ancillary products and sets down the binding future specifications for those ancillary supplies. Complex agreements based on properly timed understanding about the development of qualities, needs and delivery matters and serving a common benefit have in our experience proven themselves in coordinating with ancillary suppliers.

Cooperation with scientific-technical institutions

Through a purposeful approach we have achieved cooperation on a contractual basis with the Karl-Marx University, the Leipzig Technical College, the Karl-Marx-Stadt Technical College, the Dresden Technical University, the Central Institute for Socialist Economic Management, Central Committee, SED, and the Institute for Graphic Techniques, Dresden/Leipzig. This on-going contact is a significant prerequisite for setting down mandatory world standard-controlling requirements that can be argued in front of the general director.

This cooperation was of benefit to all the partners. For the polygraph combine that was shown, e.g., by 24 patents, the preparation of TGL (GDR norms), and the creation of sound scientific management instruments, some of them for the management of social processes. Many of these results led to on-the-job and graduate theses and dissertations.

Quality Work With Every Job

An essential condition for high labor efficiency in our combine is ensuring high quality work on every job constantly, i. e., attention to quality labor in its whole breadth. It is a matter of ensuring appropriate technical parameters for adequate costs as well as--at an equal measure--a high quality of spare part supply, customer service, service all-around, customer advice and the offer in know-how. For that reason one must not in the management work be oriented exclusively to the parameter, "industrial commodity production with the Q guarantee seal"--however important and revealing that may be for the quality of a product--, but ways must be found to take account of the complex character of quality labor in the sense referred to.

Thanks to our resolute orientation to quality labor, more than 90 percent of the commodity production under mandatory testing and classification regulations bears the Q guarantee seal in the polygraph combine. If we are to hold or even extend this high a proportion, all collectives in the combine enterprises must be so greatly motivated for quality labor that we manage to fulfill our qualitative requirements in all phases of the reproduction process and on every job. The first step in that direction comes already during the production preparation phase when commodity and procedural developments are argued in front of the general director, with a body of experts being present, when ensuring high-grade qualities enjoys a high place value. Through socialist competition we have been struggling for years to qualify all combine enterprises as "enterprise of excellent quality labor" and "enterprise of exemplary order, discipline, safety and cleanliness." That is prerequisite to the title, "combine of excellent quality labor," which to gain demands great efforts in management activity and everywhere in our political-ideological work. In the intensification and quality conferences of the enterprises, in quality discussions and in the party school year and the party group meetings, the questions relating to quality labor on every job are a focal point in the discussions. Right now our collectives, based on labor guidance directions developed by combine management, are working on the higher requirements for quality labor under the current conditions of our scientific-technical progress in the combine and the tasks derived from that.

It is necessary first and foremost for the engineers and technicians to project scientific-technical top achievements and for our workers to produce them because ultimately high efficiency depends on high-grade production. Still we must not ignore that the sales income, and thus our efficiency, also depends not insignificantly on the work in other areas and its own top achievement in sales, for instance. Therefore we incessantly strive for quality labor on every job, it being prerequisite to quality labor, top achievements, in the combine. The attitudes required for it depend on clear political positions, a socialist attitude toward work and good familiarity with the combine's reproduction process. To form and strengthen such attitudes we have chosen several courses in the combine. Our experiences on the way to top achievements show us we have done well doing so.

Regularly--at least once a month--members of combine management appear before production collectives to explain the combine's strategy in meeting its economic tasks. Subsequent discussions explain political contexts and economic requirements. By this procedure we help management to keep in touch with production. This close personal contact between management personnel and workers and the relationship of trust between them, strengthened by it, affects the labor results because then many questions and problems that have arisen can more rapidly and simply be settled and requirements can more persuasively be explained to individuals. Ultimately all that is also being reflected by the fact that through personal and collective commitments quotas are ensured and 90 percent of the people working in the combine is involved in competing for the title, "collective of socialist labor."

For the development and new production application of products we are setting up temporary party activists' groups. Their members come from the development collectives and are technicians and workers in those fields that by and large will then be involved later in the production of those products. Through socialist cooperative work problems of design, technology, organization and others are settled in accordance with concrete conditions. This also is a good way to challenge creative participation, use the knowledge and skill of a larger group of persons and thereby further reduce the risks.

To activate innovator activity, we pay great attention to a targeted assignment of innovator tasks. We regard them as important for having working people identify more with their labor tasks. Especially among the young people a big step ahead has been taken this way. Half of the working force in the combine is made up of innovators, which is noteworthy enough, yet that it comes to 56 percent among the young people must be seen to be a special success. That was greatly helped by the work with youth brigades and the assignment of youth projects. Selecting youth projects from critical tasks in the field of microelectronics and industrial robots strengthens the young people's sense of responsibility for producing top achievements and for quality labor. It boosts their dash and enthusiasm to discover new scientific-technical territory. The result of this work is given expression in our having registered a total of 83 copyrights in 1980, which gave us an average of 13.1 patents for every hundred university and college graduates among the labor force.

All forms of socialist competition include quality labor in their goals. Quality parameters have become a crucial criterion for rating the collectives in socialist competition. For that we work with such forms as handing out quality certificates and awarding quality workers. More than half of those who work in material production are taking part in the contest for the title "quality worker."

The work jointly done by combine management and party, trade union and FDJ management has been and is aimed at understanding the mission to do quality labor and achieve top quality products as a party mission and fulfill it as such. We concentrate all our activities on, and measure all our results against, successes in solving these tasks with their great economic range and political importance.

INITIAL USES OF SOLAR ENERGY DOCUMENTED

Magdeburg VOLKSZEITUNG in German 2 Oct 81 Supplement p 4

[Article by Hans Goedicke, engineer, technical director, VEB Light Metal Construction Enterprise, Dessau: "New Developments for Warm Water From the Roof"]

[Text] The use of solar energy is currently attracting considerable international attention. To be sure, in our country solar energy will never be able to replace brown coal as energy source; nevertheless, under certain conditions it can be used for heating water and thus make it possible to conserve other energy carriers.

The use of solar collectors which at one time was restricted exclusively to sunrich countries did not spread to Europe until 1970. Since then special collectors have been developed in several states. The first collector produced by the VEB Light Metal Construction Enterprise, Dessau, was installed in 1977 on a log cabin in Rinkemuehle in the Harz mountains to be used to heat water for utilitarian purposes (VOLKSSTIMME has already presented several reports on it).

The question concerning the possibility of developing and producing solar collectors was raised for the first time one year earlier by the Dresden Institute for Air and Refrigeration Technology in conjunction with the Economic Council of the Bezirk of Halle. The entire staff of the plant was unusually receptive to this problem. They joined the scientists of the Dresden Institute and succeeded in developing a solar collector within a short period of time. Only 6 months after beginning the research the first generation of Dessau solar collectors was delivered. In 1978 the first swimming pool in our republic was heated with solar energy. It was in Freyburg (Unstrut) and the swimming season was extended by 2 months. The romantic Unstrut Valley offers favorable conditions for such a feature.

The VEB Light Metal Construction Enterprise, Dessau, the collective of which worked hard for the title of "exemplary plant in the application of energy economics," is continuously striving to improve the life expectancy and efficiency of solar collectors, using the latest scientific-technological know-how. The use of solar energy is tied to requirements that are of an extremely varied technical-technological nature. Solar collectors must be manufactured of highly corrosion-resistant material and have a long life expectancy. They have to be adapted optimally to the structure of the roof and the building. Furthermore, the installation must be able to absorb heat well and respond to the entire range of waves emitted by the sun's rays, and it must have a high degree of efficiency. In other words, heat losses should be minimal.

In the meantime, as a result of our research and development, the third generation of solar collectors, type DS3, has already been produced. These collectors have considerable advantages when compared to the first ones. Due to improved construction methods, a savings of 50 minutes in production time and 6 kilograms has been accomplished when compared to the first model. Since connecting hoses are placed underneath the collectors, they are not exposed to any outside meteorological or atmospheric influences; consequently they also attain a higher quality of parameters and heat losses are reduced. Altogether the new collectors are able to produce annually 350 kilowatt hours of energy per square meter of area.

In comparison to conventional procedures of energy production, the economic cost for the use of solar energy is very high in spite of all accomplishments. As a rule, it amounts to between 2 and 3 times as much as piped-in heat. Consequently, costs and results must be compared in each case. Effective solutions can be provided by combining solar technology with coal-fired furnaces, which can take over the warm-water preparation during extremely low temperatures. In the future, the use of solar energy is a possible means of energetic rationalization especially for small and medium-size plants, because the need for warm water for utilitarian purposes is relatively limited.

To date, solar collectors produced by us have been tried, among other places, for single-family homes in central and southern districts of the GDR, an experimental house of the VEB Energy Combine, Berlin, an experimental facility of the VEB Air and Refrigeration Technology, Dresden, in swimming pools, a sanitation facility in the VEB Schweinezucht Losten, Kreis Wismar, and also for agricultural installations of the Hungarian People's Republic. These practical tests provide us, the producer, with ever higher standards, which serve as an incentive for new results in research and development.

HUNGARIAN-U.S. TRADE RELATIONS DESCRIBED

Budapest HETI VILAGGAZDASAG in Hungarian No 42, 17 Oct 81 pp 55-56

[Article by Pal Emod: "Hungarian-American Trade. The Unexplored West"]

[Text] Hungarian enterprises wishing to export should not be deterred by the present delay in the American economic recovery and, on the other hand, influential American businessmen should use their influence to smooth the way for Hungarian export products to the United States--this is probably the most concise way to sum up the essence of the statements made at the last session of the Hungarian-American Economic Council.

At the time it was established in 1975, the opening session of this body, which was supposed to be destined to advance the relations between Hungarian and American enterprises and the development of bilateral trade, was characterized by almost a family-type of atmosphere. There is an easy explanation for this: back in those days hardly more than a couple of dozen firms were involved in the bilateral exchange. The delegation that came to Budapest from overseas to attend the 7th session of the Hungarian-American Economic Council held last week, however, consisted of already 45 members. Present among the American businessmen were the representatives of such "big guns" as General Motors, Citibank, Corning Glass and International Harvester. (The Hungarian-American Economic Council was started by the two countries' chambers of commerce, at a time when there was still no trade agreement between Hungary and the United States.)

At the plenary sessions, as it has become customary, the trade turnover between the two countries was reviewed. Looking only at the numbers there is no cause for alarm. The reason for this is that since 1978, in other words, since the conclusion of the bilateral trade agreement which now also contains the principle of most-favored-nation status, great advances have been made in the turnover of goods between the two countries. Three years ago US exports to Hungary amounted to $149 million, while Hungarian exports to the US totalled $75 million. By 1980 these two values had developed as follows: US exports reached $240 million, Hungarian exports increased to $122 million. If, however, we also take into account that only 1.4 percent of Hungary's total exports are earmarked for the US, while American products constitute a 2.7 percent share of total Hungarian imports, than we are justified in saying that the opportunities still have not been fully exploited.

A few years ago still only a few more than ten Hungarian enterprises were marketing in the US, while today the number of Hungarian enterprises present on the American

market is close to 30. This increase in interest is also demonstrated by the fact, that there are 132 economic organizations represented in the American section of the Hungarian Chamber of Commerce.

For reasons attributable perhaps to the relatively low American tariff rates, or the peculiarities of the domestic market there, of all our exports to the capitalist countries it is our American exports that--proportionately speaking--the Hungarian export structure has been found to be the most favorable. The proportion of machines is close to 30 percent, and if we look at the machine industry products as a whole, we find that their share represents 45 percent of Hungarian exports. The articles, however, which make up the remaining 55 percent are not just any kind of products either, for the list of exports also includes large volumes of foodstuffs, ready-made clothing goods and shoes.

At the top of the hierarchy of the largest Hungarian exporters is the Raba Hungarian Railroad Car and Machine Factory; others among the leading pack are Terimpex (TERIMPEX Foreign Trade Enterprise for Livestock and Crops], United Incandescent, Mogurt [MOGURT Foreign Trade Enterprise for Motor Vehicles] and Tannimpex [TANNIMPEX Foreign Trade Enterprise for Leather and Fur]. According to Hungarian trade officials, the advantages of the American market lie not only in that its tariff levels are lower than those of the European Economic Community, but also in the fact that it has considerably less discriminatory exemptions.

Some of the Hungarian enterprises have also recognized that the most practical form of trade is the mixed enterprise. It was the United Incandescent which assumed the role of pioneer in establishing such enterprises, when it created the Action-Tungsram in New Jersey. Another venture which operates under this type of mixed enterprise format is the New York-based Tannimpex-Lattani firm, in the field of shoe and fancy leather production. Several Hungarian firms, such as Medimpex MEDIMPEX Foreign Trade Enterprise for Pharmaceutical Products, Medicor Medical X-Ray Equipment Enterprise and Hungarotex HUNGAROTEX Foreign Trade Enterprise for Textile Goods have set up an independent enterprise in the United States, while Technoimpex TECHNOIMPEX Foreign Trade Enterprise of the Machine Industry has established a business office there.

Looking at our prospective possibilities, we find that the West Coast of the American continent still remains a blank spot, for Hungarian enterprises have still only been able to tap the East Coast and the Midwest. From among our products, considerably more wine and specialty alcoholic beverages could be sold there, than what is presently being offered.

Hungarian exports also depend, to some extent, on the way the American economic situation develops. The reason we say only to some extent, is because our exports are insignificant when looked at in light of the American market's capacity to absorb goods. As a conclusion to the Budapest conference, a press conference was held at which the head of the US delegation, Zoltan Merszei, vice-president of Occidental Petroleum, stated that the end of the recession was expected to come by the end of the summer. Unfortunately, they were to be disappointed, but they hope that the recovery which have been expected for so long will finally materialize by next spring. Experience shows that business deals can be made even during times of recession--pointed out the president of the Hungarian section, Jozsef Molnar, general manager of Tannimpex. His enterprise has received orders from the US for 900 thousand pairs of shoes for 1981, and 1.6 million pairs for next year.

Finally a few words about Hungarian imports, too. Most of these consist of raw materials, and especially of chemical goods. The share of advanced technology is relatively small, due to the fact that the American authorities take a long time to approve the export of certain goods, as a result of which Hungarian enterprises are sometimes reluctant to place in orders. The demand has been voiced again during the current negotiations: influential American businessmen should "lobby" more extensively to shorten this lengthy administrative process.

What has made making a clear-cut determination of the extent of our trade turnover even more difficult, is that the American system of statistics is different from ours. This difference is evidenced by the figures presented in the former, according to which American exports to Hungary amounted to only $79 million as opposed to the $240 million figure listed in our records. The reason for this is that is an American firm names a particular European port as its product's point of destination, then the American statistics will list Hamburg, West Germany or Rijeka, Yugoslavia as the export's terminal point, even though the sending firm usually also indicates the Hungarian destination.

The current negotiations will presumably provide the American businessmen with sufficient information about the Hungarian economy. Their inquiry, however, will also be enhanced by something else. To coincide with the opening of the council's session, the Hungarian Chamber of Commerce just had a supplement published in the WALL STREET JOURNAL, a paper with a circulation of 7 million copies, under the title, "Hungary As a Trading Partner".

FURTHER DEVELOPMENT OF HUNGARIAN-USSR ECONOMIC RELATIONS DESCRIBED

Budapest FIGYELO in Hungarian No 44, 4 Nov 81 p 9

[Article by Boris A. Borisov, chairman, USSR Chamber of Commerce and Industry: "Soviet-Hungarian Economic Cooperation- The Development of Forms and Methods"]

[Text] In the 1980's we need to solve how further to develop the forms and methods of Soviet-Hungarian cooperation. This is the precondition for solving important problems both multilaterally and bilaterally.

The Soviet-Hungarian Economic and Scientific-Technical Cooperation Committee had studied those problems which require joint interest. On this basis, it has called for the preparation of 19 sub-branch programs. Broad scale specialization and cooperation is planned in branches like the electronic and electronic-technical industry, chemistry and petrol-chemistry, machine tool manufacture, vehicle manufacture, iron metallurgy, tractor and agricultural machinery manufacture, radio industry, and so forth.

Between 1971 and 1975, the reciprocal deliveries of specialized products came to 840 million rubles, and between 1976 and 1980 they reached 4.8 billion rubles.

An outstanding example of Soviet-Hungarian production cooperation is in vehicle manufacture. The Ikarus bus is well known in the USSR, the manufacture of which is Hungarian by specialization. In the past 30 years, more than 60,000 Hungarian buses have been delivered to the USSR, or about 40 percent of production. In the field of vehicle manufacture, the USSR and Hungary have signed four long-term specialization and cooperation agreements, and it is in this framework that the reciprocal deliveries in vehicle structures are being made. The Soviet LIAS factory supplies Hungarian bus manufacture with front axles, and the Hungarian side supplies the Volga Automobile Factory annually with 400,000 complete units according to 20 entries, including instruments, precision mechanical products, and electrical equipment. In exchange, Hungary receives annually 15,000 new LADA automobilies; in 30 years Hungary has been supplied with 500,000 USSR automobiles including more than 400,000 passenger cars.

Next year will be the 20th anniversary of the successfully operating Soviet-Hungarian cooperation agreement on the exchange of alumina and aluminum. On this basis, Hungary has increased to a significant degree its production of bauxite and alumina, while the USSR is working with its substantially greater energy-intensive aluminum industry capacity.

Commodity Exchange in the Value of 34 billion rubles

In the 1980's the USSR is continuing with technical assistance to the construction of the Paks Nuclear Power Plant and the Danube Iron Works. Other facilities are also being constructed in Hungary with Soviet participation; these include: cement factories, coal mines, thermal power works, water works, iron and nonferrous metallurgy enterprises, oil refineries, and paper and cellulose factories.

At the same time, Hungary has participated in the establishment of various integrational facilities on Soviet territory; these include: the SZOJUZ gas pipeline, the Vinnyica-Albertirsa electric power transmission line, the Hmelnick nuclear power works, the Usty-Ilimsk cellulose factory, the Kiyembayev enrichment asbestos combine, and iron metallurgy works. In the final analysis, all these things will make it possible that between 1981 and 1985 Soviet natural gas deliveries to Hungary will double the volume delivered in the previous five-year plan period, while electric energy deliveries will increase 1.6 times and we shall increase the sales volume of cellulose, raw materials with iron content, ferro-alloys, asbestos, and so forth. Hungary meets the greater part of its energy source, iron ore, cotton and rolled goods needs from Soviet deliveries. Hungary is delivering to the USSR an increasing volume of gas and oil pipelines, automatic equipment necessary for oil and gas industry enterprises, telemechanics and equipment, chemical industry equipment, pharmaceuticals, fresh and canned vegetables and fruit, and many other commodities.

The volume of reciprocal commodity exchanges between the two countries will exceed 34 billion rubles between 1981 and 1985, that is, it will be one and one-half times greater than the volume for the previous five-year plan period.

For Program Specialization and Cooperation

An important place is occupied by scientific-technical cooperation in the in the long-term specialization and cooperation development program. In this area there exist direct relations between 59 Soviet and 17 Hungarian ministries and national authorities. Soviet and Hungarian scientists and planners jointly planned incandescent lamp assemblies, chemical industry technological processes, machine tools, and so forth. Between 1981 and 1985 they will jointly research nearly 300 subjects. As a result, the serial manufacture will be solved of 130 new machines and pieces of equipment, more than 70 high-efficiency technological processes, 25 pieces of automated guidance equipment, 15 new materials types, and so forth. They have called for the formation of a joint collective of experts, the establishment of planning and technical offices, the exchange of scientific documentation on a commercial basis, and the exchange of licenses and know-how.

The Soviet and Hungarian social organizations are following with particular attention the fulfillment of specialization and cooperation development tasks under the present five-year plan. In this area the Soviet Chamber of Commerce and Industry and the Hungarian Chamber of Commerce have significant experiences. Their cooperation enjoys a long past.

The national sections have been operating for more than 10 years on a reciprocal basis: in the MKK [Hungarian Chamber of Commerce] the Soviet section and in the Soviet chamber the Hungarian section. In framework of the sections, they are assisting

with a systematic exchange of experience in carrying out the Complex Program, the long-term cooperation special programs, and the Soviet-Hungarian Long-term Production Specialization and Cooperation Development Program. They are undertaking measures which will promote quality improvement in export and import commodities in both countries, and so forth.

The Hungarian Chamber of Commerce and the MTESZ [Federation of Technical and Scientific Associations] and the Soviet Chamber of Commerce and Industry in cooperation with the chambers of the federated republics are regularly holding Hungarian economic and technical days in various cities of the USSR; in 1980, such days were held in Kiev, Tbiliz and Ashabad. In organizing the days, active assistance was extended by the service units of the EXPOCENTER Pan-Federation Association of the Soviet Chamber of Commerce and Industry. A large part of these programs consists of lectures on technical subjects, and these are followed by consulations. In 1980, a total of 49 lectures were presented on subjects concerning the development of the machine industry, the automobile industry, chemistry and the chemical industry, and the meat industry.

Chamber Relations

Symposiums are held in Hungary every year with the cooperation of the Soviet chamber at which the Soviet experts inform the Hungarian participants of new Soviet technical achievements. This year, for example, there were successful symposiums on Soviet electronic components manufactured within the framework of the cooperation. By year's end, a symposium will be held on Soviet pump manufacture. In this connection, it should be mentioned that in November 1980 the Hungarian experts studied projects for Soviet pumps used in sub-branches of the economy. A Hungarian delegation visited the MOLDAVHIVDROMAS production association in Kisinyov, and the Moscow research institute which studies water facilities.

A delegation of the textile industry section of the Hungarian Chamber of Commerce visited wholesale textile bases in Riga, Tallinn, and Leningrad. In talks with the Soviet experts they discussed the testing methods for textile goods, packaging problems, and so forth. This year a delegation of the chemical industry section of the Hungarian Chamber of Commerce visited the Soviet Union. The Hungarian experts visited enterprises of interest to them in Moscow, Kiev and Odessa.

REGULATIONS ON SERVICE CO-OP GROUPS HIGHLIGHTED

Budapest MAGYAR HIRLAP in Hungarian 2 Oct 81 p 7

[Article by Istvan Kalasz and Gyorgy Szepesi: "Overview of Decrees About Small-Industrial Activity. The Specialized Service Group (3.)"]

[Text] Specialized industrial and service groups can be created in the framework of industrial, agricultural, consumer, marketing, and purchasing cooperatives.

The specialized group is a self-accounting organization with specific economic and corresponding self-governing independence, operating within the framework of a cooperative and is closely tied to it. A two-sided agreement regulates this relationship. The specialized group is not a legal entity. Its cooperative nature is based on its self-governing system similar to that of the cooperative, its share system that takes into account the members' personal collaboration and financial assistance.

The economic action of the group may be primarily directed toward service for the populace (for instance, mechanical and maintenance services,) manufacturing (some limited output items, machine components,) as well as the production of goods necessary for the activity of the parent cooperative or services performed on its part. All economic activity not expressly allocated to state enterprises and not agricultural in nature may be performed by the specialized groups, similarly to the business work communities.

At least five individuals applying for membership may form a specialized industrial (construction), production, or service group. No specific regulation exists regarding the ceiling on the number of members possible; it naturally corresponds to the nature of the small-business production performed by the group. The organization of the members' statutory meeting, the requisite financial means and the approval of the cooperative's general assembly or board of delegates are necessary for the group to be formed. The members' statutory meeting accepts the operational regulations of the cooperative, elects the president, vice-president and executive committee (this last is the collective directing body of the cooperative, the president of which is essentially the president of the group), or other corporate structure, as determined in the regulations.

It is necessary to fix in the rules of operation the specialized group's name, sphere of activity, the name and headquarters of the cooperative in whose framework it operates, the more important regulations regarding the organization and operation

of the group and the role and authority of the president and the other leaders, as well as the main rules concerning the relationship of the group and cooperative. The rules of operation furthermore contain the value limit above which the group may only accept responsibility with the assistance of the cooperative management. In the rules the basic rights and responsibilities of the members must be addressed, especially the mode and degree of personal and financial assistance, and the means of representation in the specialized group's affairs must be systematized. The operational rules only become effective when approved by the management of the cooperative. The management sends the approved regulations as a report to the appropriate council exercising governmental control.

The financial means necessary for the economic activity of the specialized group are accumulated from the financial assistance of the members as well as the funds and capital equipment (building, machines, materials, automobiles, etc.) assigned by the cooperative for the use of the group. Other economic organizations (for instance, the enterprise for which the group performs background-industrial or other supplementary activity) may also assign financial assistance.

The speciflized group and the cooperative make an agreement concerning the transfer of financial assistance and its conditions. If another enterprise assigns assistance, the cooperative makes a similar agreement with the enterprise after approval by a general assembly. The financial means in use by the specialized group must be registered individually and separately from the other finances of the cooperative. In the records, assistance from the members, finances from the accumulated income of the group, and financial means assigned by the cooperative or other enterprise must be registered separately.

Anyone over 15 years of age may become a member of a specialized group. An individual employed by another agency--business or cooperative--may be a member of a specialized group, in addition to the primary-occupation members, as in the small cooperatives. Retirees and students at educational institutions are also eligible for membership. A member of the cooperative in which the specialized group operates may ask admittance to perform work outside of regularly scheduled work time.

In our next report, we will look at the rights and responsibilities of the members.

ESTIMATES FOR 1982 NATIONAL BUDGET PUBLISHED

Warsaw ZYCIE GOSPODARCZE in Polish 4 Oct 81 pp 4, 5

[Text] Parallel with work on draft targets for the 1982 economic plan, a preliminary estimate for the national budget income and expenditures was worked out for next year. The present degree of narrowing down preliminary plan targets did not allow for the working out of sufficiently precise estimates. The values presented in this estimate are, indeed, preliminary in character making it possible only to be familiar with the trends and directions of the growth rate of the national budget income and expenditures and their structure.

Conditions and General Problems

The economic plan targets for 1982 in the intermediate variant, envisage the maintenance of industrial production almost at this year's level along with a concurrent increase in production costs due to high fixed costs. Wages, which indicate only a rising trend have also become a fixed cost with respect to the "inflexibility" of employment. At the same time, these targets envisage a continued increase of outlays with the aim of increasing public consumption, particularly in the realm of social and cultural services. These sectors are under the great pressure of need. Altogether, this makes it possible to conclude that in 1982 the national budget will find itself in an even more difficult situation than during the current year. The emergence of a shortage of income to the order of over 680 million zlotys, should be expected including 490 million zlotys, on the basis of the current budgetary clearing of accounts and on the basis of the clearing of accounts for previous years--over 190 billion zlotys (not counting the eventual refunding of bank credits for the financing of the effects of procurement price increases in 1981 (approximately 126 billion zlotys)).

Among the major conditions which determine the presented form of the 1982 budget estimate, the following should be mentioned:

--in the "intermediate" targets for the 1982 economic plan--taking into account only the maintaining of the industrial production level and the decline in the national income, both of which lead to the further reduction of budgetary income;

--ensuring funds for the implementation of the signed into effect by the government, social agreements and settlements of the Ninth Congress of the KC [Central Committee] PZPR, particularly in the area of the development of social and cultural services and improvement of wages of education employees and further development of social insurance.

However, the following will be a somewhat limiting factor for the extent of the budget deficit:

--implementation of the stabilizing plan which expresses itself by applying, among other things, a series of economizing measures to certain budget expenditures;

--establishing a tax policy in the estimate towards enterprises, which envisages the taking over of a considerable portion of financial accumulation;

--the projected economic reform which should be conducive to the activation of enterprise undertakings for the reduction of costs and stimulation of production; the assessment of the effects of this improvement is, however, very difficult and any possible progress should be treated as a reserve of the presented budget estimate.

Envisaged Fulfillment for 1981

It is envisaged that in 1981, the projected income of the current national budget will be fulfilled on a total scale. The primary contributing factor for this is the formation of income from foreign loans on a higher scale than planned (by about 10.4 billion zlotys) in connection with the obtainment of additional credit from the USSR as well as over and above the planned quota of proceeds from social insurance premiums (by about 2 billion zlotys) related to a higher than planned increase of the wage fund. However, both the so-called, non-accumulation payments made by enterprises and other economic units as well as income from the clearing of accounts for financial accumulation is projected to be somewhat lower than planned.

The total amount of budgetary expenditures (together with the augmenting by national councils of budget incomes from last year's local budget surpluses) will take shape in 1981 on a level close to the plan.

The envisaged national budget shortage will come to approximately 220 billion zlotys, thus, within the range of a deficit. It should be recalled, however, that the effects of the increase of procurement prices on agricultural products were not covered by the budget but by a bank credit (about 126 billion zlotys) and, moreover, the 1981 budget was incapable of fully covering the losses and deficits of the funds of many enterprises.

The last draft plan targets indicate that in 1982, a certain decline of the current budget income (by 25 billion zlotys; i.e. by 1.7 percent) should be expected. This is substantiated, in part, by the anticipated effects of the reform of producer prices, which in fact eliminates the need for or limits the extent of necessary budget subsidies in certain areas of production while at the same time it reduces a high rate of accumulation in others. To a considerable degree, the income limiting factor would be the maintenance of a level of industrial production, which not only is not accompanied by a decline in production costs but by their increase as well. This has a vital meaning for the whole of the budget income since the payments made by enterprises and other economic units are the principal source of this income.

The clearing of accounts, on the basis of financial accumulation, has a fundamental importance for payments of enterprises and other economic units. It is envisaged that it [the clearing of accounts] will take on the following form:

Table 1

Tabela 1

	(1) Przewid. wykonania 1981 r.	(2) 1982 r. w starych warunkach cenowych	(3) 1982 r. w nowych warunkach cenowych
Dochody budżetu od przedsiębiorstw z tytułu rozliczenia akumulacji finansowej (4)	[illegible]	[illegible]	[illegible]
Wydatki budżetu na rzecz przedsiębiorstw gospodarki uspołecznionej (5)	[illegible]	[illegible]	[illegible]
Saldo rozliczeń budżetu z przedsiębiorstwami (6)	—[illegible]	—[illegible]	—[illegible]

Key:

1. Envisaged fulfillment for 1981
2. Under the old price conditions
3. Under new price conditions
4. Budget income from enterprises, on the basis of clearing of accounts for financial accumulation
5. Budget expenditures for the benefit of enterprises of the State-controlled economy
6. Balance of budget clearing of accounts with enterprises

The arrangement indicates that the maintenance of a negative balance of the clearing of accounts of enterprises with the budget should continue to be expected during the current year, on the basis of accumulation, even though financing with the budget of considerable financial deficits of enterprises amounting to over 170 million zlotys in 1981 and approximately 150 billion zlotys under the old prices and 20 billion zlotys under new prices is not envisaged.

The negative balance of this clearing of accounts is related to the fact that--as is estimated--enterprises of the State-controlled economy will show a financial deficit for 1981 (excess costs over sales proceeds with allowances made for the balance of extraordinary losses and gains) in the amount of 175 billion zlotys. This constitutes, to be sure, a certain reduction of the overall deficit in relation to the assumptions accepted at the time of revising the plan and budget by 85 billion zlotys, primarily as a result of making allowances for official and unofficial price movements in the area of end products, above all, goods and services procured by the public. However, this implies a highly unfavorable situation.

It is also envisaged for 1982 that financial accumulation under the current price conditions would be negative and would amount to 247 billion zlotys. In comparison to the envisaged fulfillment for 1981 this would indicate an increase of losses in enterprises of the State-controlled economy by 72 billion zlotys; i.e., by 41 percent. Such a substantial increase stems from the following being taken into account:

--first--economic conditions formed during the second half of the current year, decidedly worse than those of the first half-year (as a result of, among other things, the successive introduction of new procurement prices as well as the put into effect wage increases);

--secondly--a greater increase of fixed costs (especially of amortization) rather than of production.

In the above presented prognosis for financial accumulation in 1982, the effects of the increase in retail prices during 1981 have already been taken into account.

Under the new price conditions; i.e., after making allowances for changes in producer prices, enterprises of the State-controlled economy of all sectors will remain--as is estimated--on the borderline of profitability since they will achieve only 1.2 billion zlotys of accumulation.

The reform of producer prices will bring about a profit return from such sectors of the national economy as forestry, transport and telecommunications, foreign trade as well as from certain subsectors of "industry" (mining of raw materials and early phases of manufacturing). In the remaining sectors of the national economy--this will mainly concern communal and housing management--an increase in producer prices along with the unchanged reimbursement of the public will result in an increased need for budget subsidies.

The financial effects of the sale price increase on basic commodities which constitute the object of supply turnover and at the same time, the object of market sales--such as coal, crude oil proeucts, etc.--constitute a separate matter. If the current level of retail prices were to be maintained then, this production will require budget funding in the form of subsidies for the amount of approximately 230 billion zlotys.

In the sector "agriculture," the assumption has been accepted that the increase in procurement prices will be higher than the effects of the increase of producer prices and that is why losses in this sector will disappear and agriculture will remain on the borderline of profitability.

The presented prognosis for the structuring of accumulation and its clearing of accounts with the budget was elaborated on the basis of very preliminary information on the subject of the envisaged course of production processes in 1982 as well as changes in the structure of production, which is the basis for the scattering of the effects of production price changes and for the estimate of financial accumulation and its distribution under the new price conditions. The presented prognosis is highly tentative in character and only allows for the evaluation of the effects of the situation if the current trend of its development holds up.

For the time being, no future changes in retail prices have been included in the prognosis. The retail price reform may introduce very significant changes in terms of the form, which the results will assume. The dimensions and the scattering of these changes depends on the extent of the retail price increase and on the extent of compensation. In proportion to the assuming of decisions in this regard, the prognosis for the financial results of State-controlled enterprises will change and for their clearing of accounts with the national budget. Suggestions concerning this matter were presented in the final part of the particulars.

The non-accumulation income from enterprises and other economic units is projected for the amount of 152.2 billion zlotys; i.e., on a level lower by about 5.3 percent than the envisaged fulfillment for 1981, which is decided mainly, not by the projecting of income on the basis of various non-recurring payments, as it is, for example, on the basis of repricing commodities; for in general, the acceptance of the assumption is suggested, that enterprises will lead them [the commodities] not to the income of the current national budget but to a special account in the amount of from 50 percent (industry) to 70 percent (trade) of the results obtained from repricing reserves [stocks] according to the new producer prices. From this account, the zloty difference resulting from the reassessment of foreign obligations will be financially covered according to the state of affairs for 1 January 1982 in connection with the envisaged introduction of a new currency exchange rate.

The payments made by financial and insurance institutions have been projected on a scale lower by 3.1 percent than the envisaged fulfillment for 1981. This is primarily related to the increase in costs on the basis of interest on savings deposits and also as a result of a decline in income on the basis of interest from investment credits.

Income from taxes and fees of the non-socialized economy increase in proportion to the envisaged fulfillment for 1981 by 1.2 billion zlotys; i.e., by 7.9 percent.*

In the estimate, above all, an increase in returns from taxes and fees on individual service-production activity is envisaged by 13.7 percent; i.e., by 1.3 billion zlotys. This estimate is based on the assumption that:

--the turnover of individual service-production activity will rise by 22 percent.

--the use of periodical tax exemptions will expand for newly started establishments and tax relief for establishment owners who will be hiring employees transferring from units of the State-controlled economy.

--the share of turnover of establishments taxed in tabular form and of establishments completely or temporarily exempt from taxation in the total turnover of trade, commerce and services will amount to 50 percent; this share causes the rate of increase of tax proceeds to be lower than the rate of increase of turnover.

---

*Under comparable conditions; i.e., after adding to the envisaged fulfillment for 1981, the implemented land tax reliefs which are not taken into account in plans.

--a further improvement will occur in the increase of the net result from 92.2 percent in 1980 to 96 percent in 1981 as well as an increase of payments made into the arrears account.

Income from taxes and fees from individual farms and people holding real estate in rural parishes has been estimated somewhat lower (by 0.1 billion zlotys) than the level of envisaged fulfillment for 1981. This is mainly related to the decline of returns from land taxes as a result of exempting from this tax, proceeds from wagon-driving on the basis of transporting milk to State-controlled purchasing centers.

Income derived from public taxes and fees is expected to be at a level above the envisaged fulfillment for 1981 by 0.6 billion zlotys; i.e., by 3.9 percent. In the estimate plan, an increase (of 0.4 billion zlotys; i.e., by 7 percent) was particularly envisaged in proceeds from revenue fees.

The remaining national budget income decreases in proportion to the envisaged fulfillment for 1981 by 33 billion zlotys; i.e., by about 55 percent. This decline mainly concerns:

--returns from the remainder of the centralized account of reassessed reserves as well as from the clearing of accounts for eliminated investment funds and the fund for the development of unions [associations], which [returns] in 1981 will amount to 18.1 billion dollars and will not appear in 1982.

--income from foreign loans (reduced by 14.3 billion zlotys) since, for the time being, greater inflow from foreign credits is not envisaged.

Estimate of Expenditures for 1982

The general assumptions of the estimate of expenditures are represented by the following data (in billions of zlotys):

Table 2

Tabela 2

(1)	Przewid. wykonanie za 1981 r. (3)	(2) Szacunek na 1982 r. wg starych cen zaop.	(4) wg nowych cen zaop.	% 1982/1981 wg starych cen zaop.	% 1982/1981 wg nowych cen zaop.
(5) Ogółem wydatki budżetowe	1492,7	1668,5	1771,2	118,5	118,7

[Key on following page]

Key:

1. Envisaged fulfillment for 1982
2. Estimate for 1982
3. According to the old producer prices
4. According to the new producer prices
5. Total budget expenditures
6. Current expenditures
7. Clearing of accounts with banks on the basis of repayments and amortization of credit, subsidies and interest differences
8. Expenditures for investments and major repairs

It appears from the arrangement that budget expenditures for 1982 will be marked by a high growth rate computed on the basis of both the old and new prices. The high increase of current expenditures will concern mainly the financing of social and cultural services (by 41.4 billion zlotys; i.e., by 16.8 percent) and social insurance (by approximately 44 billion zlotys; i.e. by 53 percent). An additional factor which increases expenditures is the item "undistributed funds," intended primarily for the financing of the effects of the increase of producer prices within the budget range and, particularly, within the scope of social and cultural services, in communal management, etc. at a cost of over 130 billion zlotys. However, the significant increase in the clearing of accounts with banks, using the new prices, is connected to the necessity of financing investments in the non-material sphere along with the use of new prices in construction.

The structure of the total amount of expenditures for economic purposes is represented by the following data (in billions of zlotys):

Table 3

(7) pozostałe wydatki	113,3	117,5	117,5	103,7	103,7

Key:

1. Envisaged fulfillment for 1981
2. Estimate for 1982
3. According to old producer prices
4. According to new producer prices
5. Total
6. Including: clearing of accounts on the basis of financial accumulation
7. Remaining expenditures

Budget expenditures stemming from the clearing of accounts for financial accumulation were discussed in the item concerning budget income. It should be expected that the introduction of new producer prices will at the same time cause a significant increase of surcharges from the budget, particularly on communal and housing management as well as surcharges on central heating in housing cooperatives. An appropriate sum has been set aside for this purpose in the already mentioned "undistributed funds."

Outlays for research and development financed by budgetary funds increase by about 0.3 billion zlotys; i.e., by 2.0 percent in relation to the envisaged fulfillment for 1981. Moreover, in accordance with the system of financing research, these outlays will be covered--as every year--by funds of enterprises to a degree specified in the NPSG [national socioeconomic plan]. However, this matter will require separate solutions in regard to the tendency of enterprises to avoid the compulsory financing of research as part of their cost burden.

The envisaged increase of expenditures, in the preliminary estimate, for social and cultural purposes by 41.4 billion zlotys; i.e., by 16.8 percent is related to the necessity of ensuring funds for the financing of the increase of equipment, increased hiring and wages, increase in living costs, increase in flour prices and that of flour-based products as well as the financing of food to a level of the physiological norm for orphanages and health service and social welfare centers. From the sum total increase, approximately 20 billion zlotys falls to the increase of personal and derived expenditures and approximately 22 billion zlotys when taken together with compensation for the consequences of increased prices on baked goods, 4.3 billion zlotys for the increase in expenditures for medication and 15 billion zlotys for expenditures involving the purchase of other materials, services, etc. Within the range of expenditures for the purchase of materials and services, allowances were made for funds for the compensation of cost of living increases caused by the centrally non-balanced price changes and various small changes in assortments for the sum of approximately 5 billion zlotys; i.e., in the range of 12 percent.

Moreover, 0.6 billion zlotys has been envisaged for the financing of increased food expenditures as a result of increased flour prices and those of flour-based products.

In the sector estimate, the effects of the increase of producer prices have not, as yet, been formulated due to a lack, at the present time, of possibilities for making an estimate of the extent to which they will have a bearing on budget expenditures in the particular sectors of social and cultural services. For this purpose, an appropriate general reserve, as yet not divided into sectors, has been ensured.

The assumptions accepted for purposes of computing expenditures for social and cultural services, have been adapted to the resolutions of the "Government Plan for Stabilization." This is expressed, in particular, in the resignation from the improvement of budgetary norms with the exception of expenditures for food in orphanages and health protection and social welfare centers as well as expenditures for medicine.

The considerable increase of expenditures for social and cultural services in 1982 with a concurrent decline in the national income in the range of 4.5 percent makes it so that next year, the ratio of social and cultural outlays to the national income will increase significantly. This concerns, in particular, outlays for health protection and social welfare and outlays for education and upbringing.

It is obvious that progress will have a partly formal character since it is related to, among other things, the increase of prices and the decline of the national income.

Expenditures for social insurance--under comparable conditions with respect to financing--increase by about 44 billion zlotys; i.e., by 53 percent. The fundamental item of the increase is the amount of approximately 29 billion zlotys envisaged for the financing of compensation for the effects of the price increase on grain-flour products for persons receiving family and educational allowances as well as for pensioners and annuitants. The remaining part of the increase falls mainly for educational allowances--(about 11 billion zlotys) and maternity allowances (about 1 billion zlotys) as well as to subsidies for the fund of general retirement subsistence (about 1 billion zlotys) and the farmers retirement fund (about 1 billion zlotys) in connection with the increase of the smallest services from 1 July of this year.

It is suggested that expenditures for the national administration (central and local) be determined on the basis of resolutions of the Council of Ministers pertaining to additional economizing tasks for 1981. They envisage, among other things, a reduction in employment in the central administration by two thousand jobs as a result of the reorganization of ministries. Savings from this are estimated at 255 billion zlotys for next year. Furthermore, a 10 percent reduction has been established in expenditures for domestic official business travel and for the purchase of material and non-durable goods (by 47 million zlotys). Savings on foreign service expenditures have also been introduced in the amount of approximately 193 million zlotys. The proposed economizing tasks are adapted to pertinent resolutions accepted in the "Government Plan for Stabilization."

The presented economizing measures are, however, accompanied by a series of essential expenditure increases. This involves mainly the following matters:

--increasing commissions for village administrators (by about 0.3 billion zlotys) with the aim of activating their functioning in the area of tax dues collection.

--introduction of compensation on the basis of increased flour prices and those of flour-based goods (0.2 billion zlotys) and financing the increase in local administration employment by 500 jobs in personnel [employment] divisions in view of the increase of tasks dealing with the shifting of the working force.

--assuring funds for jubilee awards and bonuses for full-term employment service (125 million zlotys). In general, however, there will occur a drop in the share of administrative costs in the budget.

Subsidies for the financing of investment purchases are decreasing by about 4.8 billion zlotys; i.e. by about 30 percent and for investment building--by about 0.7 billion zlotys; i.e. by 1.5 percent. Under the new price conditions, an increase of subsidies for investment building by 38.6 billion zlotys has been planned as a result of including the 70 percent increase in the cost of construction and installation work. This estimate was established on the premise of the assumption that:

--outlays, at old prices, for the social-cultural area, for food management and development of tracts of land for housing construction will hold at the 1981 level;

--assistance from the budget will not be given for the repayment of bank credits to enterprises, which had up to now made use of this assistance.

Budget expenditures for major repairs are proposed at the level of their envisaged configuration during the current year; i.e. 28.2 billion zlotys and after including the increase in the cost of construction-installation work, this amount rose to 47.5 billion zlotys. In this amount, consideration was also given to funds indispensable for the financing of the most urgent repair needs in the province of Radom (in accordance with decision No 32/81 of the Government Presidium from 20 June of this year).

In addition to the discussed funds for major repairs, a reserve for through highways and for the reconstruction of urban transportation systems was established in the estimate in an amount analogous to that of the current year; i.e., 2.7 billion zlotys and 4.6 billion zlotys after including price increases.

Local Budgets

In the area of local budgets for 1982, a continued increase in expenditures should be expected in accordance with the already discussed assumptions in the realm of communal housing management, social and cultural services, etc. In order to cover increased expenditures, the directing of appropriate income for the disposal of national councils and the ensuring of appropriate amounts of equalizing subsidies from the central budget is envisaged.

The increased scope of the personal income of councils will expand the possibilities for the economical management of above planned income and will strengthen the councils' financial independence.

In implementing the proposed postulates which tend towards the strengthening of the financial independence of national councils, the acceptance of the assumption is, moreover, envisaged that in term of the budget, only equalizing funds allocated from the central budget will be set up as directive-type indexes for the provinces. In connection with this, the method of budgetary planning for 1982 was changed, thus limiting the reporting by provinces of their basic budget plans.

It is envisaged that national councils--similarly to this year, will have a budgetary surplus and will have the possibility of additional financing of both current expenditures and major repairs as well as of collective action--in accordance with their own, independent assessment of local needs.

The adopted assumptions tend towards the implementation of the resolution of the Ninth PZPR Congress, which deals with, among other things, increasing the authority of national councils in respect to the accumulation and exploitation of financial means for regional needs.

Variant of "Apprehension" and "Hope"

The preliminary assumptions of the central socio-economic plan for 1982 envisage the possibility of two-way changes in the situation, in relation to these assumptions: unfavorable deviations characterized as the variant of "apprehension" and favorable changes characterized as the variant of "hope."

It is estimated that in the variant of "apprehension," negative financial accumulation of enterprises will increase from 247 billion zlotys envisaged for 1982 to 365 billion zlotys. On the other hand, the budget deficit would increase from over 680 billion zlotys to about 800 billion zlotys.

As for the variant of "hope," negative financial accumulation of enterprises will decline to 180 billion zlotys while the budget deficit will decrease to about 500 zlotys.

As it appears from the discussion and attached tables, the budget estimate for next year closes with an enormous deficit to the order of 680 billion zlotys and after eliminating budget liabilities for previous years, the deficit amounts to nearly 500 billion zlotys. The issue of the economical management of funds for the improvement of the budgetary situation should be given consideration on at least this scale (500 billion zlotys).

Three courses of action aiming at the restoration of the essential budget balance, in terms of current repayments, are possible:

--increasing the volume of production including that of income

--reducing expenditures

--introducing new taxes and price increases on goods and services in an area not requiring compensation while in the remaining (compensated) area, paying off that part of compensation (for better off families), which is obligated by the stabilization loan.

In the light of "intermediate" assumptions for the 1982 economic plan, the extent of production will not permit for the elimination of the budget deficit. This source will also not ensure the elimination of the budget deficit, despite all the adequate income, even in the variant of "hope" where an increase in production is envisaged.

Realistically, the road to ensuring a quick and accordingly significant improvement in the nation's financial situation and to balancing the budget--apart from aiming for a change in the structure of production--are tax-price procedures. This is also vital for the ensuring of balance in the domestic market. From this point of view, the scope of operations should amount to approximately 500 billion zlotys on an annual scale. From the point of view of effect on the financial results of enterprises, the difference in prices of 500 billion zlotys over the compensation amounts would indicate the rebuilding of financial accumulation on a macro scale in a similar amount. The national budget could take over from this--with a strong tax policy towards enterprises--approximately 400 billion zlotys. Therefore, there would be a chance for balancing it [the budget]. However, will social conditions come about which will permit this? It is difficult to give a positive answer right at this moment.

16. Social insurance
17. Remaining current expenditures
18. Science
19. Social and cultural facilities
20. Including:
21. Education and upbringing
22. Health protection and social welfare
23. National administration
24. Administration of justice and public safety
25. National defense
26. Remaining expenditures
27. Including:
28. Servicing of foreign loans
29. Undistributed funds
30. Cabinet [Council of Ministers] reserve
31. Clearing of accounts with banks on the basis of repayments and amortization of credits as well as interest differences
32. From this:
33. Repayment of investment credits
34. Refunding of credit amortization, subsidies and interest differences in agriculture
35. Refunding of credit amortization and interest differences in housing management [economy]
36. Interest from foreign bank credits for the second half of 1979, 1980 and 1981.
37. Investment expenditures and major repairs
38. Including:
39. Investments
40. Major repairs
41. Funds for through highways and the reconstruction of transportation systems
42. Budget deficit
43. After revisions made on the basis of changes in the NPSG made by the Diet on 31 July of this year
44. Amounts and indexes in the numerator include data with allowances made for changes in retail prices; and those without changes in retail prices--in the denominator

[Key continued on following page]

45. Amounts and indexes were not given in producer prices which are supposed to be in effect from 1 January 1981 due to a lack of possibilities for assessing the effects of price changes in particular sectors. For the financing of the effects of these changes, funds presented in iten IV of the table have been ensured in total on the basis of a comprehensive estimate of price changes prepared by the Planning Commission

46. Indexes computed after eliminating the effects of price changes on baked goods and grain-flour products

47. Indexes computed after eliminating the effects of transferring the financing of sanatorium-climatic treatment from the "finances and insurance" sector to the "health protection" sector

48. Index computed after eliminating the effects of the increase in living costs as well as the price change on baked goods and grain-flour products

49. Indexes computed after excluding additional financing, from the envisaged fulfillment, from the national councils' own funds and after exclusion from the 1982 estimate of the effects of cost of living increases and price changes on baked goods and grain-flour products

50. Index computed after eliminating the effects of the cost of living increases and price changes on baked goods and grain-flour products as well as the transferring of financing of expenditures for sanatorium-climatic treatment from the "finances and insurance" sector to the "health protection" sector

51. Index computed after eliminating the effects of cost of living increases and price changes on baked goods and grain-flour products.

52. Index computed under comparable conditions; i.e., after eliminating the effects of the cost of living increase

53. Index computed after eliminating from the envisaged fulfillment of additional financing from the national councils' own funds and after eliminating from the 1982 estimate, the effects of cost of living increases, price changes on baked goods and grain-flour products as well as transferring the financing of expenditures for sanatorium-climatic treatment from the sector of "finances and insurance" to "health protection."

[Key continued on following page]

54. This amount includes the reserve for the financing of the effects of producer price changes in the non-production area (103.9 billion zlotys) and in the area of financial services implemented by budgetary units (26 billion zlotys); funds for the financing of social-cultural centers projected to be taken over from work establishments (0.6 billion zlotys); the refunding of land tax relief (0.3 billion zlotys) as well as subsidies for tourist enterprises (0.2 billion zlotys).

55. Index computed after excluding from the envisaged fulfillment of additional financing from the national councils' own funds.

PEAK-PERIOD POWER SHORTAGES DESCRIBED

Warsaw TRYBUNA LUDU in Polish 5 Nov 81 pp 1, 2

[Article signed "(wodz)"]

[Text] In November there will be a shortage of 700 megawatts. Will the light go out in residences? How should electric power plants be relieved of their load?

(TRYBUNA LUDU Reportage) Electrical energy for the autumn-winter season which has now begun is a scarce commodity. Despite the fact that in recent days major shortages have not been evidenced, energy consumption is growing. In order to meet these consumption needs, lines are being connected up with the network of successive power units in electric power plants in which repairs have been completed.

Nonetheless, in November there will be a daily shortage of about 700 megawatts of power. In the months to follow, in special instances, the shortage may even grow to 2,000 or 3,000 megawatts.

Discipline Is Essential

The amount of fuel for energy production is severely limited. For example, as a consequences of the drop in coal production this year, electric power plants will supply 10 billion kilowatt-hours less than planned. This will make necessary the strict alloting of power during the winter.

Demands are already being made by some plants for an increased allotment since their original allotment, as granted by the ministries, has already been utilized.

Such requests have been made, for example, by ELTRA in Bydogoszcz and the POLAM factories in Pabianice. Some of these plants claim that the ministries did not distribute the allotments properly; others express concern only over their own interests.

When there is a situation in which power is in short supply the choice must be made--should the current be shut off in a shoe factory or in a plant which manufactures radio receivers? Certainly, the priorities granted to households, to industries supplying the population and to key subsectors of the economy must be adhered to.

Meanwhile, data from GIGE [The Main Institute of Mining and Energy] shows that the allotments are being treated by some plants as a form of raising energy prices, since the normal price of 1 kilowatt-hour is 0.9 zlotys while the price when the allotment has been exceeded is 5 zlotys. Allotments are frequently exceeded, and energy costs are figured into production costs. As a consequence of such hasty decisionmaking, there is a shortage of energy for many consumers from the so-called residential group.

A System of Reductions

In order for the national power system to function without more substantial disruptions, there must be, above all, the exhortation of discipline in energy consumption. Without this, it will become necessary to shut off the flow of current to residences, bakeries and schools.

An important role is being played by the so-called system of planned reductions, by means of announcements on radio broadcasts of the level of current for a given day.

The meanings of some of these levels follows:

"03" --no reductions are anticipated.

"10" --at this level there begins the randomly planned shut-off of certain installations in industry.

At level "19" the planned shut-offs stop.

Level "20" means the probability of breakdown shut-offs. These will be executed among "privileged" consumers.

It is anticipated that this winter, it may be necessary more than once to shut off the power supply to residences (for 1 to 1 1/2 hours) to enable a milk plant, e.g., to process milk. This year we have already experienced shut-offs caused by the failure to adapt to the current levels. As a result of the lack of discipline of some factories, consumers from the residential group have had to suffer the consequences. And so, the reduction of current flowing to residences will depend primarily on industry, i.e., on whether it will be willing to adapt to the reductions as announced.

Whether on freezing winter days, our lights and television sets go out and elevators in skyscrapers stop will depend on the quality of the miners' work and on the conservation of power in factories.

Is Drastic Action Inevitable?

Our readers are flooding us with a stream of questions on the subject of whether, e.g., it will be made known beforehand that it is safe to use an elevator, that they will not be stuck inside for 1 1/2 hours.

From the information we have received, the matter of informing residents has not yet been discussed. The power industry does not yield to planning shut-offs in advance. It is possible only to make certain estimates based on weather conditions and

available power in electric power plants. If a sudden breakdown occurs in an electric power plant, or if there is a sharp uncontrollable increase in energy consumption, immediate decisions must be made to shut off even protected consumers.

The technical possibilities of informing residents by means of radio and television as well as by means of a so-called "blinking" light are among the matters being considered. Decisions on these matters should be made in the near future.

MINISTER INTERVIEWED ABOUT COAL CRISIS

Warsaw TRYBUNA LUDU in Polish Oct 81 pp 1,3

[Interview with Maj Gen Czeslaw Piotrowski, minister of Mining and the Power Industry by Stanislaw Reperowicz; date and place not given]

[Text] [Question] Comrade minister, coal is more and more often being compared to bread...

[Answer] A very apt comparison. Both bread and coal are indispensable to our lives. And this is not so only today. For one thing, it is due to the fact that after the war we set ourselves up on coal. As the country which suffered the most destruction throughout Europe, Poland was thus able to rise up out of its ruins and to find itself in the ranks of economically developed countries.

It is noteworthy that while in 1938 hard coal production amounted to 38.1 million tons, by 1946 it had reached 47.3 million tons, and in 1947, 59.1 million tons. Each year showed an increase in the amount of coal mined. One of the reasons this was possible was that mines, including those mines on lands which had been recovered and saved from destruction as a result of the Soviet Army operation to surround these lands in 1945, were able to resume production immediately following the liberation.

But what was needed to extract the black gold from the depths of these lands was people. And they were the decisive factor for production. Tens and even hundreds of thousands of fine, hard working people of the miner's trade. The names of the pioneers who made the greatest sacrifices: Pstrowski, Bugdol, Apryas and many other peacetime heroes have been written into the annals of our nation's history.

As we read the chronicles of those years, we take pride in the involvement of society in the coal issue. What was not done at that time to increase production? Magistrates and officials from the industrial administration, militiamen and the employees of party committees, anyone who knew how to work in the mines went down to help the miners on their day off. Without entering into judgments, let us likewise point out that for a time there was even a special military formation known as the Coal Corps. The youth organization "Service to Poland" and members of the ZMP [Polish Youth Union] were voluntarily called up to lend considerable support to the members.

The results were evident. In 1955, nearly 95 million tons were mined. It would give me tremendous satisfaction if our ministry today had the allies it had then, if people, even those who have never been in Silesia and in the Basin and who have never seen a mine understood that the living standard of each of us depends, to a significant degree, and will continue to depend for some time in the future on the results of mining.

[Question] What, then, is coal for the Poles?

[Answer] It is, above all, the major, as yet irreplaceable source of energy driving our economy; it is a basic source of foreign exchange income from export; it is an important raw material for the chemical industry, light industry and the construction industry, as well as for agriculture and processing. Moreover, despite continual electrification, gassification and the development of the heating system, the need for coal as fuel on the part of the population continues to grow. The price structure up to this time, according to which coal is very inexpensive, does not encourage broad interest in and the use of wood for heating purposes.

[Question] Without questioning the wisdom of being based on coal, I should like to ask whether the actual costs of increased mining are always considered? At some time, should the intensive rate of production increase not be slowed down?

[Answer] Without a doubt, today we must reflect upon the future so that we do not repeat earlier mistakes. However, with regard to mining, we must think in multidimensional terms. In 1979, production reached the tremendously high ceiling of 201 million tons. Poland became a world coal power. And although many fields of our economy were already at a crisis stage, coal production enabled us to compensate for inferior results in other branches, and the reduction in the living standard of society was delayed. In other words, thanks to the work of the miners, the nation did not feel the lack of various articles as severely as it does currently.

The problem of the costs of increased output must also be approached from many angles. Mining today little resembles mining from the days of Pstrowski. It is mechanized. Many modern mines have been built and many mines have been modernized, even though much remains to be done in this regard. A considerable part of the increase in production which has been achieved, however, is due to the intensification of the physical efforts of miners. Be reminded that until autumn of last year not only did they work 6 days a week, but on Sunday as well. In 1976, Sunday-holiday production amounted to 11 million tons, i.e., approximately 6 percent of the total annual yield.

Since even this was not enough, the so-called four-brigade system of work was initiated. It extended the operation of mines to a full 7-day week, while at the same time basically shortening the work time of miners. Over the course of 2 years it was introduced in nearly half of all mines. However, it did not find universal acceptance and was abandoned during the talks in Jastrzebie partly because it disrupted the traditional course of family life, since miners' days off fell on various days of the week.

Perhaps these demands concerning the shortening of work time would have been complied with more readily if, in the race to increase the tonnage yield, there had not been a certain accompanying organizational-technical carelessness in the production process itself, the lack of spare parts for mining machinery and the sometimes irrational management of the lodes acquired. Let us add that during various periods, the attitude of the administration to the miner's trade also varied. The system of remuneration was not always understood and accepted in the same way.

[Question] In September 1980, an agreement was concluded in Jastrzebie which changed the former principles of work in the mines in a fundamental way...

[Answer] As you know, in addition to many other proposals, it provides for the reduction of the work week to 5 days. This means that the mines are not operative during 2 days of the week. This has a drastic effect on production.

This year, the output up to the present time has amounted to 30 million tons of coal less than for the same period last year. Such a sharp drop in production must have a negative effect on the entire economy. Initially, the economy withstood this shock. The real tragedy, however, as a result of which the whole of society is the victim, is being played out only now.

The economic authorities have calculated the amount of coal that should be produced in order to ensure that the economy will not fail under any circumstances. Initially, the Planning Commission established the lower limit for production at 188 million tons. The Ministry of Mining showed that not more than 175 million tons could be produced. Later this goal was made more realistic and set at 168 million tons, and finally, at 164 million tons. Now even this final plan--164 million tons--is, in fact, unrealistic. No one needs to be told what the negative consequences of this will be.

It is a specific type of economy in which we live. We are not in a position to shift the economy over to a different road, nor has any country on earth up to the present time been successful in making such a shift instantly, what's more, under crisis conditions. We can consider, and we even must consider, how to bring other fields of management to begin to relieve mining, in a gradual and planned-out way, of the obligation of its primary participation in the production of the rational income. For this, however, we need both the time and the resources.

[Question] Then, is there any exit from this seemingly hopeless situation?

[Answer] I would not call it hopeless but extremely difficult. From the very beginning the government held that the agreements concluded in Jastrzebie, including the point which discussed the 5-day work week in mining, should be respected. On the other hand, the government was also aware that such a great day-to-day reducion in coal production threatens the entire country with economic and social degradation. Thus, appeals were made to miners, in the name of their civic sense, to work voluntarily on free Saturdays. These appeals had some effect. Some miners of their own volition appeared for work, even though they sometimes got into trouble because of this.

For the purpose of increaseing the numbers of such volunteers, a special system of supply privileges was introduced for those working on free Saturdays. This considerably improved the situation. For example, in January of this year, when this mobilization fund was not yet operative, scarcely 150,000 tons of coal was produced. On the other hand in March, when the program was in full force, twice as much coal was produced every Saturday, i.e., up to 300,000 tons.

This system of incentives was severely attacked by "Solidarity," which used various forms of boycott. The situation in the mines began to be very tense. Part of the work force of particular mines was in favor, part was opposed. Meanwhile, there must be a sense of calm and order in the mines, as well as friendly mutual trust. Under pressure by "Solidarity," and taking into constant consideration the maintaining of the necessary atmosphere under the earth in the mines, in the name of preserving this calm, the government signed an agreement on 7 May 1981 abandoning the mobilization fund. The consequences of this were not long in coming. In May, Saturday production fell to 127,000 tons, in June to 113,000 tons, and in July to 101,000 tons. We have calculated that up to the end of August, abandoning this fund has cost us at least 1.8 million tons of coal which could have been given over to the economy, sold abroad for medicines and the like. And perhaps it would have meant that we would not be looking so fearfully toward the approaching winter.

[Question] If I remember correctly, later there were the so-called Saturday appeals of "Solidarity."

[Answer] We were counting on them enormously and we tried to accord them as much importance as possible. I regret to say that they did not bring about the anticipated results. By comparison with July production, the output on these "appeal Saturdays" increased by barely several tens of thousands of tons. Moreover, it should be pointed out that the solution lies not in 8 such Saturdays, but in a logical system for stimulating production today, in 3 months and next year.

[Question] What further actions has the ministry taken?

[Answer] At our suggestion, the Council of Ministers, in September 1981, adopted Resolution No 199 which introduced, among other things, additional, top wages for miners taking on voluntary work on free Saturdays. In this resolution, which, among other things, imposes upon the ministry the obligation of developing a program for increasing coal production on working days, many issues which have been preying upon the mining industry up to this time, have been covered. Thus, the resolution addresses the need to increase housing construction for the mining industry, the development of a social base and the amending of the "Miner's Chapter" and the Collective Labor Agreement for the mining industry.

Like the mobilization fund, this resolution has been attacked and boycotted in various ways by "Solidarity." While they reject the government concept, "Solidarity" aktivs have not managed as yet to present any constructive proposals of their own reconciling the 5-day work week with the country's need for coal.

At the Fourth Plenum of the PZPR KC/Central Committee/, the thesis was likewise adopted that an increase in coal production is one of the conditions for rapidly extricating the country from the crisis. We continue to try to engage in talks with "Solidarity." We continue to be determined to find a way out of this difficult situation, because the truth is that without a basic increase in coal production we will go nowhere. For many, many years we have been constrained by a system of the country's dependence on coal; thus, every drop in coal production has a tremendous effect on our economy. We see this in the difficulties the power industry is now experiencing. Add to this the halted production in cement plants for lack of coal, the reduction in deliveries for metallurgy and the like.

[Question] The prevailing opinion is that an increase in coal production lies, among other things, in improving the supply of spare parts for mining machinery and equipment.

[Answer] That is true. It is to that very end that the production structure of factories manufacturing mining machinery has been changed. Owing to this, mines have received a considerable number of these spare parts, more than 50 percent over last year's deliveries. Moreover, despite a very difficult foreign-exchange situation, we have purchased various mining parts and equipment from abroad at a cost of nearly 30 million zlotys.

[Question] And what has been done for the people?

[Answer] The above-mentioned Council of Ministers resolution from September of this year also includes important, very beneficial rights for miners, which will be found in the amended Collective Labor Agreement and in the "Miner's Charter." Currently there is in the Sejm a draft of a Law concerning special pension rights for those working under the earth.

We are also trying to gain new cadres for mining. By the end of this year we will have increased employment in mining by approximately 20,000 persons. To this end there is, among other things, a decree of the MON [National Defense Ministry] permitting soldiers, after a year of service, to undertake work in underground mines and permitting conscripts to elect to work exclusively under the earth as their military service.

At the beginning of this article we stated that, like bread, coal is necessary for our lives. I would like everyone to understand that increasing coal production is an issue for the whole nation, an issue for us all. Mining is counting on such understanding and assistance from society.

[Question] I think that society wants to help the mining industry, but we encounter the attitude of the farmers, for example, who say "we will give the miners more meat, if we receive more coal." We thus come full circle. Where, then, does the truth lie?

[Answer] I believe that the truth lies in the middle. There is a shortage of coal, but we cannot explain away all of the shortcomings of the entire economy in terms of this shortage. For example, the implementation--over the course of

3 quarters--of coal deliveries made by the "peasant Mutual Aid" amounts to nearly 17 million tons and is only 1.6 million tons less than during the same period last year. By the end of this year, these deliveries should reach approximately 23 million tons, or approximately 8 percent less than last year. If meat deliveries were reduced over last year's deliveries by only this amount, the market situation would be radically improved and the miners would be better supplied with meat than at present. Coal deliveries for sugar factories were never so regular, and coal was never of such good quality as during this year.

On the other hand, significant curtailments in deliveries of coal have been felt by industry, in particular by cement plants and the metallurgical industry. This has had the most serious effect on export. If, for example, in 1979, we exported 41.6 million tons of coal, including 26.7 million tons to the II payments area, in 1980, we will certainly not exceed 16 million tons, including approximately 8 million tons bound for the II payments area. And the current price of 1 ton of coal runs about 80 dollars. These figures speak for themselves.

We are all feeling the current lack of coal and we will continue to feel it for a long time. This is the price we are paying for the "luxury" of a 5-day work week in the mining industry; this is the price being paid by our entire economy.

We cannot, however, dump all of the problems of our economy upon the shoulders of the miners. It is difficult, the country is undergoing a crisis, and we should all try to manage what we have as well as we can because when we will extricate ourselves from the present situation depends on us alone.

ROLE OF INDUSTRIAL DEVELOPMENT IN ECONOMIC GROWTH

Bucharest ERA SOCIALISTA in Romanian No 16, 20 Aug 81 pp 8-11

/Article by Gheorghe Cretoiu: "Industry in the Process of Intensive Growth of the National Economy"/

/Text/ The strategic goal of the Seventh Five-Year Plan as set by the 12th RCP Congress, namely Romania's transition from the stage of a developing socialist country to the higher stage of a medium developed country, calls for rapid progress in all activities, in industry and agriculture and in the other economic sectors, science, education and culture, as well as improved management and planning of all socioeconomic activity, intensified socialist democracy, and participation of the masses and the entire people in social management. By virtue of social determinism, attainment of the goal in its entirety depends completely, critically and primarily upon construction of a strong and modern economy dynamic in the intensity of its development, rationally diversified and well balanced in the structure of its sectors and subsectors, efficient in its expenditures of resources, and socialist in its social-humane purpose.

In this extensive process, development and modernization of industry and steady growth of the industrial output are in a position of primary importance. Statement of this position must be based first of all upon the functions industry has to perform as a sector with a technical base that is revolutionary by its very nature, but also upon a threefold relationship to the present conditions of economic growth in Romania and throughout the world. We shall discuss these three circumstances briefly.

In the first place, Nicolae Ceausescu's statement that Romania must not be industrialized to the detriment of agricultural development and modernization has a great fundamental validity. Actually the results of socialist construction in Romania and the world indicate the great complexity of the concept of industrialization, which excludes any unilateral trends and is not identified either with mere growth of the industrial output or with restriction of industrial development to any given model or to a few industrial sectors. From the economic standpoint, industrialization ensures the transition of the national economy to machine technology by creating a series of industrial sectors and activities permitting better use of the nation's creative potential and natural resources. The current scientific-technical revolution is making major changes in this process, making it possible to shorten some stages and to combine or eliminate others while also changing the very nature of the process of industrial development. Under these circumstances one can no longer assume that one

industrial sector alone can function as a leading sector, as for example the textile industry did in the beginning period of the history of industrialization or as the steel industry did for about a century, because now the promotion of technical progress and new scientific advances depends upon a series of industrial sectors and subsectors and upon the development of the other economic sectors as well. Moreover, despite the pronounced trend today toward concentration of production we can no longer absolutize the trend toward the big enterprise at the expense of small and medium enterprises also capable of technical achievements and great efficiency, just as we cannot idealize their ability to adjust to new conditions.

In the second place, analysis of the position and role of industry in economic growth must allow for the level of economic development the country has reached, the particular needs of its socialist construction, and the accumulations from previous stages, but also for the requirements and especially the strategic goal of the new stage. Therefore it is very important to make a critical analysis of the way the industrialization process was conducted in a certain stage of Romania's socialist construction, when important and very promising industrial subsectors as well as development of Romanian scientific research were neglected. The period following the Ninth Party Congress was accompanied by a consistent policy and extensive programs that made significant changes in the model of industrial development and provided for the formation and development of peak subsectors of vital importance to better exploitation of Romania's natural resources and manpower potential and to expanded reproduction. Moreover, thanks to some extensive investment programs, industry now has a solid technical-material base wherein more than 40 percent of the existing fixed capital in the national economy is operative in effective industrial enterprises outfitted with modern machinery and equipment. All this constitutes a solid basis not only for developing industry as a main factor for economic growth but also for some extensive restructuring to meet the requirements of better use of raw materials and materials and of an output up to world technical-qualitative standards.

In the third place, industrial development in the model of economic growth is also increasingly affected today by the developments in the world economy and especially on the international market, by the developmental trends in the international division of labor, and by the effects of the crisis in energy and raw material resources. The realities of the present-day world indicate how unsound any one-sided approach is in this area too. While economic science has demonstrated, quite correctly, that development of the productive forces has made the industrialization process less dependent on local raw material resources, under the present circumstances it is becoming increasingly apparent that excessive dependence upon imports of raw materials, and especially of energy resources, can cause serious problems in economic growth requiring major reappraisals of economic policy, particularly as regards development of production and export of some energy-intensive products. Intensified efforts to expand the domestic base of raw materials and to make better use of them, as well as restriction and even elimination of energy-consuming exports, are now primary requirements for growth. Under these circumstances the direction of industrial development must be determined not only by replacement of imports and stimulation of exports but also by the immediate needs of the economy, analyzed in their evolution and in their entirety and in close correlation with the requirements for greater economic effectiveness throughout the entire course of social reproduction.

I think the foregoing points, to which still others can be added, adequately demonstrate the necessity of a new and revolutionary view of the process of economic growth

and, in that connection, of the position and role of industry in the model of economic growth and also of its relations with the other sectors of the national economy and especially with agriculture. While an opposition of industry to agriculture, the two basic sectors of the national economy, is not only unjustified but also harmful, any attempt to minimize the critical role of industry in the developmental process has proved equally so.

The realities of the world of today indicate that the evolution of the national economy and the growth of the social product and national income are directly related to the developmental level of industry and its structure, extent of technical equipment and economic effectiveness. Accordingly the discussions in various countries about ways of overcoming the present economic difficulties most often emphasize modernizing and restructuring industry and making it more adaptable to the constantly changing conditions and requirements on both the national and international levels. Japan for example intends to reach an average annual industrial growth rate of 5.3 percent (in real terms) by 1985, and even if that rate is below the level previously reached, it is above the industrialized capitalist countries' average and very close to the average growth rate expected of the gross national product (6.2 percent). Other western countries are speaking of "a new industrial revolution" or of revitalizing or restructuring industry. Whatever the planned formulas are, the policy of economic growth emphasizes industrial development and modernization, in ways that will allow, of course, for the particular conditions of time and place.

Worldwide experience tells us that the high level of any country's economy primarily depends upon development of the processing industry, which makes better use of resources and permits widespread promotion of technical progress. According to the World Bank's figures, the per capita outputs of the western capitalist countries' processing industries in 1976 were between $2,000 and $3,000 (1970 U.S. dollars) except for Italy and Great Britain, where they were $1,578 and $1,640 respectively. In the underdeveloped countries they were only a few tens of dollars per capita and in the developing countries a few hundred dollars. It is important to point out that the outputs of the processing industries in those countries account for 40-50 percent of their gross national products in terms of constant prices. Let us also note that according to the same source the per capita value of exported manufactured products in 1977 varied from $915 in France, $1,096 in Denmark and Austria and $1,755 in the FRG to $2,499 in Switzerland.

The foregoing figures, correlated with those for Romania, indicate how necessary it is for Romania to continue the process of industrial development and modernization in order to maintain steady gains in national income and national wealth as a basis for joining the ranks of the countries with medium economic development. The results of socialist construction in Romania justify this policy because promotion of industrialization is the factor that enabled Romania to reduce the inherited lags behind the developed countries. The comparative figures prove that the lags in industrial output were reduced more rapidly and intensively than the differences that separate us from the developed countries with high indicators. Industry's contribution in support of Romania's economic dynamism is illustrated by the fact that about 75 percent of the gain in national income in the last five-year plan came from industry, and every 1 percent of the population employed in that sector contributed about 1.7 percent of the created national income, compared with 1.1 percent in construction, transportation and telecommunications and 0.47 percent in agriculture.

In view of the conditions and requirements of the present period, the RCP Program and the documents of the 12th RCP Congress assigned the task of intensive and concurrent development of both industry (and especially production of raw and energy-bearing materials) and agriculture. In reference to the 1981-1985 Five-Year Plan, Nicolae Ceausescu pointed out that "The plan emphasizes more intensive development of the raw material base and domestic energy resources as well as more effective development of agriculture because those sectors are critical to Romania's socioeconomic development and to improvement of the people's material and cultural living standard." To this end the net industrial output will be increased at an average annual rate of 8.8 percent, the gross industrial output will be up 7.6 percent, and the gross agricultural output will be up 4.5-5 percent in the years of the current five-year plan.

Under the present conditions the intensive development accentuates the interdependence between industry and agriculture, necessitating closer coordination of the growth rates and factors of both economic sectors. The new agrarian revolution and intensive agricultural development depend on widespread introduction and efficient use of science and technology and on revolutionizing the technical-material base of that sector. Meanwhile the progress of some major industrial sectors (light industry and the food industry) critically depends upon the extent of agricultural development and modernization. Whereas in the past the economic literature discussed reducing industry's dependence on raw materials of vegetal origin, in the present energy and raw material crisis agricultural is playing a greater part in reducing industry's dependence on some scarce raw materials and generally in raising the output and economic effectiveness of industry. It is important to point out here, for example, that in the present period the degree of domestic coverage of light industry's requirements for textile raw materials is to be raised from 55 percent in 1980 to more than 70 percent in 1985.

The main feature of industrial development in the present stage is its intensive and all-around involvement in the general transition to a new quality and in satisfaction of the characteristic requirement of the five-year plan, namely the transition from extensive to intensive development. This feature affects the whole system of proportions and objectives of industrial development and depends on the more comprehensive role and functions of industry as they follow from the internal mechanism of expanded socialist reproduction.

Viewed in that light, industry's contribution to intensive development involves many considerations. For instance, modernization of the technical-material base and intensified growth of labor productivity entail an increased and diversified demand for means of labor on a high technical level as well as raw materials of industrial origin. Of course those needs can be met from different sources, from domestic production and (or) from imports. As we know, Romanian industry is now meeting about 80 percent of the nation's requirements for machinery and equipment. Compared with the prewar situation, when over 90 percent of the requirement for machinery and equipment was imported, this is a great gain of socialism with major favorable economic and social-political effects.

Industry's function of technical equipment of the whole national economy and supply of basic raw materials is increasing particularly in the present period because of the following circumstances at least: (a) In the current five-year plan Romanian industry is to supply over 85 percent of the equipment and installations needed for the investment program, with increased requirements and those for developing the two sectors of

the national economy, for purposes of extensive promotion of technical progress and intensified growth of social labor productivity. (b) The new five-year plan provides a greater contribution from industry to meet the domestic requirement for raw materials and energy, in order to curtail dependence upon the contradictory developments on the world market in this field. (c) In order to procure foreign exchange resources and to enhance the economic effectiveness of Romania's participation in the world economic cycle, the proportion of products of the machine building and chemical industries in the total volume of exports is to be raised to about 60 percent. These aspects of industry's contribution to socioeconomic development are too obvious to discuss.

Here is another aspect. Industry supports economic dynamism by a greater gain in productivity and national income than other sectors and especially in comparison with agriculture. It is sometimes maintained in discussions that this situation is characteristic of the developing countries or that it could only be due to neglect of agriculture in favor of industry. For a better evaluation of the situation, the example of some industrially developed countries is illustrative, which also have intensive agricultures that not only supply the demand of the domestic market but also provide major surpluses for export. For instance in 1978 every 1 percent of the French population employed in industry contributed 1.06 percent of the created national income, while in agriculture the proportion was two times less (0.55 percent). In Canada every 1 percent of the employed population contributed 1.12 percent of the national income created in industry and 0.70 percent of that created in agriculture (In Romania in the same year those figures were 1.73 and 0.47 percent respectively). The considerable difference in labor productivity (even though it increased more rapidly in agriculture in the postwar period in the industrialized countries) favors strengthening industry's role in securing a steady economic growth.

The facts also favor a more general idea, namely that absolutizing or one-sidedness are both useless and harmful. The comparisons only underscore the interdependence of the two economic sectors and their different and particular contributions to economic growth, at least for certain stages. Major changes in the correlations between these sectors can occur, under well-determined conditions, at any given level of socioeconomic development and in any given stage of industrialization.

Transforming the social production structure, placing the economy on an industrial basis, and creating the industrial sectors that make the main producer goods are the essentials for reaching a high level of effectiveness. But those sectors can be implemented in different ways, since it is possible to shorten some histotical stages and to choose either a wider range of products and subsectors or a selective policy based on more intensive specialization. It is well known, for example, that modern industry is inconceivable without a strong machine building industry and without chemistry. Industry's ability to assimilate the latest advances of modern science and technology and also to generate such advances directly and primarily depends on the technical levels and structures of those two industrial sectors, on how modern the production equipment of the whole industry is, on the quality of the labor force, and on the ways research and production are correlated. Those sectors,including their most modern subsectors, can be created at the start of industrialization withouth going through all the traditional stages. This is illustrated by the example of Japan's industrial development in the postwar period.

The countries with more limited raw material bases have emphasized specialization. When we consider the machine tool industry we find that in a number of countries like Switzerland, Austria and Belgium for example production is highly specialized, while

on the other hand the FRG and Great Britain are making a wide assortment of machine tools (Great Britain for example produces over 3,000 types of lathes). In Japan this subsector of the machine building industry has logged high growth rates (the output increased by more than 6 times in 1965-1980) and it is also characterized by a high added value (It is estimated that the machine tool industry has outstripped the processing industry as a whole by 9 times in this indicator). Such gems of advanced technology are characterized by heavy consumption of research and design work and in production by consumption of highly skilled labor.

Creation of such a critical sector as the machine building industry heavily depends on metallurgy. But creation and development of the latter entails increased energy consumption, especially when production of higher quality metal is begun. But as long as metallurgy is developed in connection with the requirements of the national economy and emphasis is placed on exploitation of the metal by machine building on a high technical level, dependence on ore imports is compensated for by metallurgy's contribution to economic growth and social development. But experience shows that growth of metal production is gradually moderated and the value of the output of this sector is increased primarily by intensified processing and increasing the proportion of high quality products in the sector (the well-known example of Sweden is the most graphic one in this respect).

In many highly industrialized countries the total output of steel and even the per capita output (having reached a high level) increase very slowly or remain relatively constant (except for the last decade, when it declined in some countries because of the economic crisis). But by developing production of special steels and by intensifying exploitation in the machine building industry a great effect of economic growth and social development is obtained, so that increasing production in the processing sectors is obtained per unit of output of the metallurgical industry.

The studies show (as a correlation especially important in the present stage) that as processing and exploitation of the material resources are intensified the index of advance of the processing sectors over the sectors producing basic raw materials is higher. We note for example that in 1976-1979 the index of advance of the growth rate of production in the machine building and metal processing industries over the growth rate of iron and steel production was 1.7 in the GDR, 2.4 in Czechoslovakia and 3 in the USSR. And the coefficients of advance were high even for longer periods. For example they were 1.5, 1.6 and 1.9 in the said countries in 1960-1979. Over the same period the coefficients reached 2.1 in the FRG, 3.2 in France and 1.3 in Japan.

As for production and consumption of electric power, the experience of the developed countries and Romania's as well shows that their evolutions change once the developmental level rises and the type of economic growth is changed. In the U.S. economy for example electric power consumption per unit of national income peaked in the 1970's, after which it began to decline. In Romania it reached 106 kilowatt-hours per 1,000 lei of national income and 64 kilowatt-hours per 1,000 lei of industrial output in 1970, after which it logged a decline (more pronounced in the last five-year plan), reaching 95 and 46 kilowatt-hours respectively in 1979.

And so there is a point where industrial development contributes to intensive economic growth not only through increased live labor productivity but also through greater conservation of material and energy resources and their intensified exploitation. At this point the activity becomes very important of planning and managing the process of modeling the economic structure by moderating the growth rates of the energy-consuming industries and intensifying the rates of expansion of the sectors with

advanced technology that incorporate a great deal of highly skilled planning and design work. Industry's contribution to economic growth is greater if those sectors deliver some of their products to the international market, where the demand for products on a high technical level is expanding and the terms of sale are more favorable.

The Seventh Five-Year Plan for Romania's Socioeconomic Development is making major changes in the basic correlations of economic growth. While according to the provisions the per capita national income is to be up 6 percent on the annual average in 1981-1985, per capita fuel consumption will only be up over 2 percent on the annual average. It should be noted that the total national income as well as the gross industrial output will be up 41 and 44 percent respectively, while the quantities of crude oil processed will be less than in 1980, being limited to 25 million tons a year. We mention that in the industrialized western countries a 1 percent increase in the gross national product corresponded to a crude oil consumption of 1 percent at the start of the last decade and one of 0.2 percent in 1973-1975, only to rise again to 0.8 percent at the end of the 1970's.

As another aspect of intensified production, in the years to come Romania will emphasize more rapid growth of the net industrial output than that of the gross output, increasing the coefficient of advance from 1.06 in the last five-year plan to 1.15 in the period of the new five-year plan. For an average annual gain in the gross industrial output of 7.6 percent, electric power production will be increased by only 4.1 percent on the annual average, while the average annual growth rate of production in the machine building industry will be 1.14 times higher than that in the metallurgical industry.

These important qualitative correlations reflect once again the contribution of industry to intensified processing of raw materials and materials and to their better exploitation in all sectors. They are supported by the considerable changes to be made in the internal structures of the main industrial branches through more intensive growth of the subsectors and groups of products that contribute heavily to greater labor productivity and more intensive exploitation of the raw materials.

For instance the main production increase (in terms of value) in metallurgy will come from intensified processing, while steel production will be increased by about 1.4 times, production of sheet iron and cold-rolled strips will be increased by 1.9 times (That for the electrotechnical industry will be increased by 2.7 times), and the outputs of rustproof sheet iron and refractory products will be increased by more than 3 times. In the machine building industry, it is planned to make more pronounced increases (by means of the 47 special programs for products) in the products that meet the needs of the national economy and provide valuable surpluses for export, such as systems of highly productive complex equipment for mines, power units for inferior coals and bituminous shales, equipment for hydroelectric power stations and small power plants and for unconventional energy sources, drilling equipment, modern automotive combines, etc. In the chemical and petrochemical industry special emphasis is placed upon intensified processing of petroleum and methane gas, upon manufacture of new, higher quality products of plastics and chemical fibers and threads, and upon development of fine chemistry and manufacture of special materials for electronics. The food industry will show a growth rate higher than that specified for all industry, and the average annual increase in light industry will be very close to that in the gross industrial output.

The plan provisions as well as the general aims of the economic policy indicate that in the current five-year plan industry is to make an essential contribution to the pronounced intensive development of Romania's national economy and to the steady growth of the national income as a major prerequisite for Romania's entry into the ranks of the countries with medium economic development and for the rise of the public's material and cultural living standard.

INCREASE IN MERCHANT FLEET SIZE, PORT CAPACITY CONTINUES

Bucharest LUPTA CFR in Romanian 25 Jul 81 pp 1, 2

[Article by Rear Admiral Nicolae Hirjen, Deputy Minister of Transportation and Telecommunications, Chief of the Department of Merchant Marine Transportation]

[Text] Merchant Marine Day is, indeed, a proper time to sum up the successes attained in the steadfast application of the Party's program for the development and modernization of the various sectors of our merchant marine. These sectors include ship building, port construction, oceanic and riverine fishery, marine research and exploration, and shipping. Together they represent a significant part of our national economy.

In celebration of this event all labor collectives in our merchant marine have strived for and achieved considerable results in exceeding shipping production plans, increasing the safety of navigation and attaining significant savings.

In his address to the Second Congress of Workers Councils Comrade Nicolae Ceausescu delineated the objectives for the shipping sector. They include giving priority to the optimization of shipments, the elimination of shipping crossovers and unneeded shipments, the intensive development of riverine shipping and the increased outfitting of maritime vessels in order that by 1985 a minimum of 70 percent of all maritime shipping will be accomplished with Romanian ships.

The efforts to fulfill these objectives represent a continuation of the significant achievements made in the past 16 years. These years have been the brightest and most productive in the country's entire history and truely bear the mark of the Romanian people's wisest and most beloved son, the inspired patriot and kindhearted communist, Comrade Nicolae Ceausescu.

During this period socialist Romania has distinguished itself before the contemporary world with its impressive pace of economic development. Our country has, in this respect, taken a foremost position in the ranks of nations.

This phenomenon is also quite vividly displayed in the domain of the merchant marine. During these last five year plan the capacity of our maritime fleet grew from 116 vessels totalling 1,560,000 tdw. In 1976 to 181 vessels with a total of 2,600,000 tdw. in 1980. And the current five year plan foresees the nearly doubling of total capacity. During this same period the volume of cargo shipped by sea by our fleet increased by 122 percent, that is, from 7,300,000 metric ton in 1976 to

16,200,000 ton in 1980. Plans for 1985 call for 40,500,000 ton with a fleet capacity of approximately 5.5 million tdw. This will constitute approximately seventy percent of our country's maritime shipping requirement.

River shipping also developed at a high pace. In 1980 a total volume of 12,300,000 tons shipped was recorded. This compares to only 6,700,000 tons in 1976. The current 5 year plan provides for the further outfitting of our riverine fleet and the attainment of 30,000,000 tons shipped in 1985. This will mean an increase of almost 2.5 times.

Along with the development of our maritime and riverine fleets has gone the increase in capacity of our country's ports. In 1980 a volume of maritime traffic of almost 33 million ton of dry cargo and a total riverine traffic of 17 million ton were achieved. This compares to only 18 million ton of maritime traffic and ten million ton of riverine traffic in 1976.

Our Party's program provides for further considerable increases in port capacities. This will be achieved by expanding the port of Constanta southward to Agigea, constructing the new maritime ports of Mangalia and Midia and developing, according to the demands of our economy, the Danube River ports.

Appropriately, the necessary degree of accessibility of our country's navigable routes will be constantly maintained. Of particular concern are the navigable channels of the Danube River and the Sulina Bar, the inadequate maintenance of which could lead to serious reductions in traffic, especially during periods of reduced water level. Consequently, the regularization of the water channels achieved by the construction of hydroelectric power installations and navigation systems such as the Iron Gates project are of considerable importance for riverine shipping. Other such projects are Iron Gates II, Turnu Magurele--Nicopol, and especially the Danube--Black Sea Canal.

Planned to enter use in 1983, the Danube--Black Sea Canal will be 64 kilometers long and will have two sets of locks, one at each end, to permit access for up to 3000 ton barges and of up to 18,000 ton convoys. There will be an outer harbour facility at Constanta for transloading between riverine and maritime vessels. Additionally, the ports of Basarabi and Medgidia will be developed along the canal route.

Thus, cargo headed for or coming from above Cernavoda will be able to avoid a detour of almost 400 kilometers. Major savings in time, fuel and even shipping capacity will result.

Occupying fifteen place in the world in ship building, socialist Romania has greatly developed all aspects of technical supervision in the areas of ship construction and utilization. One result is the attainment of the highest standards of operational safety.

Mobilized and spurred on by the decisions of the 12th Congress of the RCP and the 2nd Congress of Councils of Workers, by the invaluable guidance of the Party General Secretary and President of the Country, Comrade Nicolae Ceausescu, proud of their rich traditions and grateful for the working and living conditions created for them, the sailors, port workers and all personnel of the merchant marine are determined to work enthusiastically and decisively toward giving even more lustre to the colors of the Romanian merchant marine. All thereby make the greatest contribution toward raising Romania in the ranks of the world's semideveloped countries.

VOLUME, STRUCTURE OF INVESTMENTS, FIRST HALF 1981

Belgrade EKONOMSKA POLITIKA in Serbo-Croatian 19 Oct 81 pp 19-20

[Text] Success of the policy of economic stabilization is usually set in a direct dependence on the results achieved in reducing the volume of investments. The interdependence is beyond dispute--investments have a share between 30 and 40 percent in the social product, and this high level of investment is in part achieved through foreign indebtedness and domestic credits whose quality is such that they directly lead to note issue and inflation. The interdependence is all the greater because the economic benefit of these investments is on the whole unsatisfactory. This assessment is also confirmed by figures on production, employment, labor productivity, exports and imports, the ability to form capital and the profitability of business operation of organizations of associated labor in the economy.

The social product has been growing in recent years at a rate of about 4 percent, which is approximately the rate of increase of employment in the economy. It follows that labor productivity has been staying at the same level. The stagnation of labor productivity at a high volume of investment (new investment projects and projects for reconstruction and modernization of existing facilities) signifies a drop in the level of utilization of capacity and a drop in the effective hours of work by the labor force. Investment projects are also increasing the country's dependence upon imports, which is confirmed by figures on import and export trends over the last 10 years. That period is typified by a growth of imports at a rate corresponding or exceeding the growth of the social product of the socialized sector of the economy, accompanied by a growth of exports at a rate that lags behind the real growth of the social product. Augmentation of the trade deficit is a consequence. No essential change is taking place in the ability of OUR's [organization of associated labor] in the economy to form capital or in the profitability of their business operation. On the average capital formation does not exceed 20 percent of the economy's income, and relative to the business assets employed, it is even dropping as a practical matter. On the average it amounts to about 5 percent, and it moreover is lagging considerably precisely in those sectors of the economy where the investments are greatest.

In the period January-July of this year payments for investments in fixed capital in the economy and noneconomic activities increased 9 percent in nominal terms, which indicates a real reduction of payments for investments of about 10 percent. Figures on the trend of the physical volume of production do not confirm these relationships. For example, production of the means of labor rose 5 percent, and at the same time there was no essential increase in either inventories of these products or in exports. We can conclude from this that investments in domestic equipment increased in real terms over this period. There was, however, a reduction in imports of equipment, which could have contributed to a certain reduction in total investments in equipment. Since construction work represents more than 50 percent of total payments for investments in fixed capital, it follows that the volume of construction work is the dominant factor in the total volume of investments. According to the statistical data, the volume of construction work in the period January-July of this year dropped between 1 and 2 percent (on the basis of the number of workers on construction sites and the number of effective hours of work). Nor does this datum support the observation that there has been a real drop in the volume of investment of about 10 percent in real terms.

Perhaps the reduced payments for investments (in real terms) are in part a consequence of the increased illiquidity of OUR's in the economy and of the banks, and in part also of an intentional holding back on making payments for investments under the influence of the political climate concerning the need to reduce the volume of investments. There is an indicative datum in this respect to the effect that the volume of uncollected accounts receivable has increased; on 30 June it was more than 70 percent larger than on the same day of last year.

The Size of Investments

Yet the measures taken to reduce investment spending are not yielding any very evident results. Incidentally, it is probable that measures were not taken which could yield benefits in this sense. If investment projects are unprofitable in their majority, if the profitability of investment is not the motivation that determines adoption of the investment decision, making investments more extensive (through a tax on investment) is not likely to help to reduce investment spending. Nor can we expect any significant benefits either from a review of lists of investment projects when the review is conducted by the same people, under the same conditions, and guided by the same motives who for all practical purposes made the investment decisions in the first place. Even the tried and true conventional measures of economic policy cannot yield results in either reducing investments or with respect to selection of investments because the motivations involved and operative are not even approximately the same as those in countries with a so-called market economy. It seems that there are two possible solutions--either to apply the methods characteristic of the countries with a planned economy, or radical changes in the motivation behind investment projects, which presupposes more far-reaching practical changes in almost all domains of the functioning of the economic system.

In the period January-July of this year total payments for investments amounted to about 280 billion dinars, which is 19 percent more than in the same period of

last year. Payments for investments in fixed capital increased the most in hostelry and tourism (61 percent), the crafts and trades (35 percent), agriculture and mining (28 percent) and housing and utilities and municipal services (27 percent).

Table 1. Volume and Distribution of Investments

Activity	Amount, millions of dinars	Index	Distribution, %
Total investments	279,293	119	100.0
Industry and mining	102,708	118	36.8
Agriculture and fishing	10,506	128	3.8
Construction	9,096	102	3.3
Transportation and communications	23,729	112	8.5
Trade	11,193	114	4.0
Hostelry and tourism	9,558	161	3.4
Crafts and trades	1,987	135	0.7
Housing, utilities and municipal services	75,271	127	27.0
Financial and other services	5,399	90	1.9
Education and culture	10,585	120	3.8
Health care	7,985	122	2.9
Sociopolitical communities	7,355	83	2.6

In the distribution of investments those in industry and housing, utilities and municipal services are dominant (64 percent of total investments). Investments in noneconomic activities, with the exception of sociopolitical communities and organizations, have been increasing faster than investments in the economy. Though payments for investments of sociopolitical communities and organizations have diminished, they still considerably exceed the budgeted funds of sociopolitical communities which were spent for investment projects (payments for investments amount to 7.4 billion, but the funds of sociopolitical communities used to pay for investment projects amount to 3.4 billion dinars).

Sources of Capital

Reality has been persistently discrediting sociopolitical commitments to a radical change in sources of capital for investment projects. The capital of OUR's in the economy has not assumed the dominant place in the financing of investment projects, nor has the pooled capital of OUR's in the economy been playing any significant role at all in financing investment projects. Bank credits and lendings through the banks continue to occupy the dominant place (more than 50 percent of total capital comes from these sources).

The resources of sociopolitical communities have a share of only 1.3 percent in total payments for investments. This percentage does not correspond even approximately to the extent of their influence on the taking of decisions concerning specific investment projects. When major investments are being made (slightly more than 300 of the large investment projects under construction account for more than 50 percent of the value of all investment projects, or about

700 billion dinars) the decisions are not made without agencies of sociopolitical communities being involved. Nor is their influence restricted solely to bank resources. They also have a direct influence on the assignment of resources of organizations of associated labor in the economy through decisions on personnel in large OUR's in the economy, through decisions on the pooling of capital, and so on.

Table 2. Distribution of Capital for Investments by Sources

Source	In Millions of Dinars	In Percentage
Total	279,293	100.0
OUR's in the economy	94,949	34.0
Giro accounts	42,390	15.2
Funds for social services	2,732	1.0
Other funds	49,827	17.8
OUR's in noneconomic activities	27,293	9.8
SIZ's [self-managing community of interest] in the social services, housing SIZ's, and local communities	12,217	4.4
Banking organizations	123,957	44.4
Dinar funds for investment	74,797	26.8
For housing construction	38,521	13.8
Credits extended from foreign exchange resources	10,639	3.8
Lendings through banks	17,286	6.2
Opstina resources	2,097	0.8
Republics and provinces	1,129	0.4
Federal budget	365	0.1

The distribution of investments by sources is considerably less favorable in the underdeveloped republics and Kosovo. The share of capital of OUR's in the economy themselves is considerably smaller than in the more advanced regions (Bosnia-Hercegovina, where the share of capital of OUR's in the economy is approximately the same as the national average, is an exception).

In the underdeveloped republics and Province of Kosovo bank resources and lendings through the bank have a share of 60 percent in total payments for investments, while the share of the capital of OUR's in the economy, including resources of communities of interest in the economy and the resources of joint reserves, is only 23 percent. This distribution of capital for investment by sources shows that the influence of agencies of sociopolitical communities on the making of specific investment decisions is greater in the less-developed opstinas, and it is not precluded that this also is contributing to the lower benefits from investment being achieved by the less-developed economies.

Change of Motivation

It is not in conformity with the system for the agencies of sociopolitical communities and organizations, either independently or in a tieup with the banks, economic chambers, and the like, to make decisions on specific investment

projects. This right probably derives from the fact that the agencies of sociopolitical communities make decisions on all specific conditions for the realization and distribution of income and the fact that they make decisions directly concerning personnel policy in OUR's in the economy and the banks. The consequences of this manner of decisionmaking on investment projects and this manner of furnishing funds are manifested in the low efficiency of investments and the ever diminishing feeling of responsibility on the part of personnel in OUR's for the economic results of their business operation. The possible consequences are not without significance. It is not just a question of unoptimal use of capital and reduction of future growth of the social product and income. It is a question of shaping a set of instruments in the economic system which is reproducing economic inefficiency. Every new investment project also signifies a corresponding number of newly employed workers. Production under unfavorable conditions is automatically an expensive operation, and high prices are inevitable. Since for all practical purposes liquidation is not possible, it is indispensable to have excessive protection, prohibition of imports, and even regional exclusiveness.

Table 3. Regional Distribution of Investments

Source	More Advanced Regions		Less-Developed Regions	
	Amount, millions	%	Amount, millions	%
Total	200,097	100.0	79,196	100.0
OUR's in the economy	76,717	38.3	18,232	23.0
OUR's in noneconomic activities	19,122	9.6	8,171	10.3
SIZ's in the social services	8,929	4.5	3,288	4.2
Banking organizations	83,468	41.7	40,489	51.1
Lendings through the banks	9,463	4.7	7,823	9.9
Opstinas	1,514	0.8	583	0.7
Republics and provinces	521	0.3	608	0.8
Federation	363	0.2	2	0.0

All of this urges the conclusion that a change in the motives and criteria for investment projects is indispensable. This does not mean, of course, that society must always be guided by maximization of income and maximization of the profitability of assets as the principal motivation in establishing a development conception. The truth is, however, that these motives must be involved. Certain other motives may indeed have a certain priority, for example: raising employment, greater utilization of domestic sources of energy and raw materials, the country's independence with respect to certain products of strategic importance, faster development of the underdeveloped regions, and so on. All these motives may be basic goals in adopting the social plan for the country's economic development. However, they may not be the motives guiding the workers in organizations of associated labor as investors. They can only have one motive in making investment decisions--maximization of their own income by maximizing the rate of profit in use of their capital surplus.

There ought not to be contradictions between the social goals of development and the motives of OUR's as investors. Society possesses an appropriate set of measures of economic policy whereby it can guarantee that investors motivated by maximization of their own income will automatically contribute to achievement of the goals and tasks in the country's development.

INTEGRATION OF KARDELJEVO, METKOVIC PORTS

Sarajevo OSLOBODJENJE in Serbo-Croatian 29 Oct 81 p 3

[Article by G. Beric: "Two Ports in One"]

[Text] The seaports at Kardeljevo and Metkovic have since a few days ago been operating as a single work organization with a work force of more than 1,700. The long-prepared merger of the two neighboring ports at the mouth of the same river is unquestionably the event of the year with respect to economic integration in the Neretva Delta region. From now on "Port of Metkovic" will operate as OOUR [Basic Organization of Associated Labor] "Port of Ploce," one of the work organizations in the numerous family of the Sarajevo Railroad Transportation Organization. Thus after a number of years the mutual competition of the two ports divided by a distance of only 25 km has been superseded and replaced by a pooling of labor and capital.

Common Interest

The initiative came from both sides, and they have a common interest. This is best indicated by the datum that certain operations were planned jointly even during preparations for merger of the ports at Kardeljevo and Metkovic. It was agreed, for example, that in future slag from the Zenica Mining and Metallurgical Combine would be shipped through the Port of Metkovic, which in this way alone will augment its traffic by 100,000 tons of cargo annually.

"We are on the same river, we are connected by the same rail line and the same main highways, so that it was natural for us to enter into association," says Pero Musulin, commercial director of "Port of Ploce." "It is certain that this merger will among other things considerably help to speed up development of the 'Port of Metkovic,' since there are a number of commodities which we will be transporting through the port, which is relatively small, but is very interesting from the standpoint of the economy's needs. Metkovic, for instance, possesses a large refrigerated facility whose capacity can be used in the transportation chain of overseas cargo. It is also certain that the small distance separating the two ports offers large opportunities for better use of manpower and machinery."

The two ports are oriented toward the economy of the same hinterland area, which was one of the key reasons for their merger. The "Port of Metkovic" thereby became a part of the integrated system of the Sarajevo Railroad Transportation Organization, which has been fully affirmed by relying on ever firmer and more ramified business collaboration with the economy of Bosnia-Hercegovina. More than 10 years ago, when it merged with the railroad, the "Port of Ploce" had a traffic of about 900,000 tons of cargo annually, and this traffic has quadrupled in the meantime.

In spite of its present economic difficulties and the fact that the opening of the new Yugoslav oil pipeline in February of last year left the port in Kardeljevo without 800,000 tons of petroleum cargo, this port has so far been able to maintain a record traffic of over 3.5 million tons of cargo.

Investments Are Needed

The largest users of the port services are the Zenica Mining and Metallurgical Combine, with which the Sarajevo Railroad Transportation Organization has a contract on long-range business collaboration, and then the Boris Kidric Coke and Chemical Combine of Lukavac, the large Sarajevo collectives Energoinvest and Sipad, INCEL of Banja Luka and Elektrobosna of Jajce.

"Our development plans are linked most closely with projections for development of the Bosnia-Hercegovina economy," Musulin explains. "That accounts for the large joint investments in port facilities and equipment. During the last 5-year period an alumina silo, a timber and lumber terminal, a petroleum coke storage facility and terminal for liquid cargo which is one of the most modern of this type in Europe, were built with joint capital. About 1 billion dinars were invested in construction of these projects."

In this large port collective stabilization is not regarded as a restriction, but as an effort to raise the volume and quality of operations. Investments are necessary and worthwhile if they are the result of economic logic, we were told in Kardeljevo. That is why the "Port of Ploce" and the Sarajevo Railroad Transportation Organization, in collaboration with the economy of Bosnia-Hercegovina, will continue the construction of new port facilities. The largest such investment project in the coming 5-year period will be construction of a liquid cargo terminal with a capacity of 1 million tons. The investments will exceed exports amounting to 2 billion dinars.

In answer to the question of whether it is possible to furnish that amount of capital in a situation when the economy is fraught with great difficulties, we received the following response:

"Construction of this terminal has become a necessity. Otherwise the future development of ferrous metallurgy in Bosnia-Hercegovina, whose needs for imported raw materials are ever greater, will be in jeopardy. Work is being done right now to complete the financial package for construction of this project. The port in Kardeljevo now receives vessels up to 50,000 tons in capacity, because we have no space for storing this cargo. The imported raw materials are

unloaded directly from the ship into freight cars. If there were a terminal, we would be able to handle three times as many ships, which would reduce the shipping charges to half of what they now are. The economy would thereby save about $25 million a year on shipping alone, which is not to mention the other benefits.

CROATIAN PLANS FOR PORT, TRANSPORT DEVELOPMENT

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 6 Nov 81 p 11

[Article by V. Subic: "Speeding Up Development of Integrated Transportation"]

[Text] There is a need for more intensive mutual business linkage of rail, highway, maritime shipping, seaport, forwarding and other work organizations in the shipping of cargo in containers (primarily by the container train between Rijeka and Zagreb and by piggyback shipment on the route Ljubljana--Zagreb--Belgrade--Djevdjelija), along with greater activity to get the users of these shipping services involved in this. In addition, there is a need to speed up conclusion of agreements on construction of the planned inland container terminals, primarily in Zagreb.

This was among other things resolved in the meeting of the Executive Committee of the General Croatian Association of Transportation and Communications in debate on realizing the program of measures and actions to speed up development of integrated transportation. It was indeed emphasized that the planned development of integrated transportation was not achieved in the last medium-term period. In Croatia 7.47 billion dinars were invested for this purpose, which is 4 percent below what was planned.

Unsatisfactory Condition of Facilities

The present condition of facilities in this field is not satisfactory. A major portion of all Yugoslav containers between 20 and 40 feet are in this republic (88.7 percent), and they are mostly in maritime shipping--89 percent. Of the 7,827 Yugoslav containers in Croatia, 6,461 are in use.

Maritime shippers of SR [Socialist Republic] Croatia have 21 container carriers with modern technology maintaining lines to North America, the Great Lakes, the Middle and Near East, as well as the Mediterranean ports in North Africa. Occasionally containers are carried on lines to the Far East.

Of the seaports in Croatia the only one with up-to-date equipment is the Port of Rijeka, which possesses a container terminal and a ro-ro terminal, while the Port of Kardeljevo can be used occasionally. Last year the ports handled 16,170 containers, or 35.6 percent of total Yugoslav container traffic, because of the

shifting of traffic to the northern ports of Europe and in part to the Port of Koper.

The Zagreb ZTP [Railroad Transportation Enterprise] has in its fleet only 500 cars suitable for carrying containers, while highway carriers possess about 120 specialized semitrailers for highway container shipment. The Zagreb ZTP does not possess a single specialized car for combined truck transport, which is known as piggybacking, while of the inland terminals the only one which has been adapted is the one in Zagreb, and its capacity is small. Because of this situation there is a large disproportion between the maritime and inland portions of the integrated transportation systems, the integrated transportation chain is not homogeneous, and there is a lack of quality and safe transportation of freight from the producer's door to the consumer's door.

Obtaining More Funds To Develop This Field

All of this imposes the necessity of taking measures and actions to speed up development of this important segment of transportation, especially in the current medium-term period, it was stated at the meeting.

The medium-term plan for development of integrated transportation in Croatia, which was adopted at the assembly of the SIZ [self-managing community of interest] for integrated transportation, is based on the conception of a higher degree of development of land traffic as compared to the capacity of the fleet and also on expanding and enlarging the capacity of the terminal at Rijeka (especially for ro-ro traffic), on construction and equipment of a piggyback terminal in Zagreb, on organizing freight centers in the interior, and on purchasing the necessary freight cars and trucks. Provision is also being made for equipping major users for use of this kind of transportation and also for continuing construction of facilities for production of equipment used in integrated transportation. Plans call for spending 11.2 billion dinars for these purposes up to 1985, 7.12 billion of which will go for infrastructural projects.

Under the Self-Management Accord on the Bases of the Medium-Term Plan for Development of Integrated Transportation in Croatia up to 1985, 2.77 billion dinars are to be furnished from "own" resources, while 4.025 billion dinars would be commodity credits. The largest item is for the purchase of vessels and their equipment--3.4 billion dinars, which comprises 84.5 percent of the commodity credits, or 30.4 percent of the total investments foreseen.

Aside from the pronounced need to provide financing and various exemptions during construction of infrastructural facilities and also in the purchase of vessels and other equipment, measures will also be undertaken to speed up development of this transportation in Croatia. The executive committee and also the assembly of the general association have committed themselves to creating and carrying out a consistent plan for development of integrated transportation in Yugoslavia and, as a segment of that transportation in Croatia, to seeing to creation of the physical plant and equipment it is based on. Moreover, it was said, there is a need to speed up the taking of decisions on foreign exchange and dinar exemptions on goods being carried by integrated transport; and mention

was also made of organizing the production of the necessary equipment. In any case, it would be most worthwhile if the measures in the field of customs duties, insurance, banking policy and monetary-credit policy be implemented through linkage of all participants in integrated transportation on the basis of income sharing in conformity with the Law on Associated Labor. There is also a need to establish the status of the SIZ for integrated transportation in the framework of the solutions for the entire transportation system. Realizing these measures and actions, Josip Stefan, chairman of the Executive Committee of the General Croatian Association of Transportation and Communications, emphasized, will be very crucial concerning the degree to which integrated transportation is developed in this medium-term period. And the present economic situation is urgently pressing the need for it to be developed faster and more comprehensively.

BRIEFS

EMPLOYMENT IN BOSNIA-HERCEGOVINA--In the first 7 months of this year 18,600 persons were employed in the socialized sector. More success in employment in the small-business economy was also noted which at the end of July had employed 6.7 percent more than last year at that time. This year work organizations reported a need for 76,688 workers, but 40 percent of these jobs remained unfilled. The number of workers leaving for work abroad has been negligible this year, while an increasing number of our people have been returning from work abroad. This year about 1,600 returned, while only 290 left to work outside the country. Up to now a total of about 50,000 workers from Bosnia-Hercegovina have returned from work abroad and most of them have found work here, primarily in the socialized sector, while quite a few of them have returned to their farms or opened their own shops. Up to now 91 opstinas have established measures for the gradual return and employment of workers from abroad. In many opstinas special small-business economic development program have been established and decisions made on tax and other advantages for the opening of artisan shops, for obtaining business space, for the purchase of equipment, machinery etc. A good number of returnees have been employed also through the pooling of their funds with work organizations or through founding an OUR (organization of associated labor). [Excerpt] [Sarajevo OSLOBODJENJE in Serbo-Croatian 7 Nov 81 p 4]

CHANGE IN IFC ORIENTATION--Representatives of the 42 foreign banks and 12 banks from all our republics and provinces, i.e., the founders of the International Finance Corporation, held a meeting of the administrative and executive council of the corporation. Most of the 57 projects completed in the corporation's 11 year existence show very good results. According to the new operating concept, instead of organizing joint investments in large and medium-scale projects in new locations, the corporation will aim toward concentrating on existing Yugoslav capacities in industry, agriculture, and tourism. One hopes to find a common interest together with potential foreign investors for the purpose of eliminating bottlenecks in production so that production could be much less expensive and sales could be made, together with foreign partners, on a firm long-term basis on the world market. Foreign credits will not be used for such projects, but rather mainly investments by domestic and foreign partners without any credit components. Such an approach, it is estimated, will mean the organization of production aimed exclusively toward export which will not be temporary but contracted over the long term with specific foreign partners and for specific markets. [Text] [Belgrade PRIVREDNI PREGLED in Serbo-Croatian 11 Nov 81 p 2]

FALL PLANTING, HARVESTING--As of 9 November 86.4 percent (1,353,000 hectares) of the 1,566,000 hectares planned had been planted in wheat. At the same time 88.8 percent of the 2,059,000 hectares of corn had been harvested and 85.3 percent of the 130,560 hectares of sugar beets harvested. The best planting results have been achieved in Slovenia (with 98.1 percent sown of the 53,000 hectares planned), in Kosovo (93.3 percent of the 105,000 hectares planned), and Vojvodina (92.5 percent of the 330,000 hectares planned). Wheat planting is furthest behind in Montenegro (71.4 percent of the 3,500 hectares planned) and Bosnia-Hercegovina (76.2 percent of the 170,000 hectares planned). In regard to the corn harvest, it has been completed in Montenegro with all 8,000 hectares harvested. Similarly in Slovenia, the corn harvest is 99.1 percent completed. In all other republics and provinces the corn harvest is over 90 percent completed, except in Vojvodina where 78 percent of the crop has been harvested. The results in regard to sugar beets are entirely satisfactory. Slovenia, Macedonia, and Bosnia-Hercegovina have completed harvesting from all planted areas; but Kosovo is late with only 72.5 percent of the area harvested; the crop in the remaining areas has been almost 85 percent harvested. [Excerpt] [Belgrade PRIVREDNI PREGLED in Serbo-Croatian 12 Nov 81 p 1]

SERBIAN AID TO KOSOVO--According to the draft agreement on special measures to achieve the fastest development of Kosovo up to 1985, Serbia is to provide an additional 2.5 billion dinars in the next 5 years. The balance sheet on the sources of these funds has not yet been prepared in the [Serbian] executive council but members of the council believe that the funds should not be provided through additional burdening of the economy, but from redistributing that which is already available. The agreement should contribute toward stronger linking and coordination in developing programs and pooling labor and resources between OURs (organizations of associated labor) in Kosovo and OURs in other parts of the country. Coordinating the development of Kosovo within Serbia is one of the more important prerequisites for achieving the most rapid development of the province. The republic will also examine the possibility of transforming the obligatory payments Kosovo makes on credits from the Fund of the Federation into a pool of labor and resources which would exceed the agreed limit of 50 percent of the permanent reserves of the fund. The executive council also accepted a proposal that 5 billion dinars be provided to the Kosovo economy in durable current assets and that, in this regard, the possibility of printing money be examined. The council also supported a measure which calls for providing 450 million dinars in the federal budget to cover the differences in the interest rate on credits for current assets which basic banks provided to Kosovo in 1979. The draft agreement also calls for conditions to evaluate energy resources in Kosovo to meet Yugoslav electric energy needs. In this regard, the Yugoslav Economic Chamber will be obligated to prepare a program which would serve as a base for the long-term self-management ordering of relations in this field between organizations of associated work. BRIEFS

YUGOSLAV-USSR TRADE--"In every discussion we had in Moscow comments were made in regard to our prices," stressed Igor Ursic, president of the section for the USSR in the Yugoslav Economic Chamber [i.e. Chamber of Commerce], at a 30 October 1981 meeting in Belgrade to review the visit of the chamber's delegation [to Moscow] 20-26 October led by Jon Srbovan, president of the presidium of the chamber. The visit as a whole was considered a success but members of the delegation shared some impressions which the business people [at the meeting] listened to but did not subsequently discuss. First, the Yugoslav deficit was noted as a serious brake on goods exchange; second, in some cases the Yugoslav [trade] partners are offering goods which are considerably more expensive, and it was reported that in some cases business people begin negotiations with an increase as high as 60 percent over that of the previous period in order finally to agree on a reasonable increase of about 10 percent. In the first 8 months of this year 64 percent of the Soviet exports and 54 percent of the Yugoslav exports planned for 1981 had been made. The chamber delegation particularly discussed a number of current problems in the field of transport, shipbuilding, ferrous metallurgy, machinebuilding, agriculture, and the construction of capital investment projects. The suggested commodity lists for 1982 call for a trade value of about $7.25 billion ($3.74 billion in Yugoslav exports and $3.50 billion in Yugoslav imports). The increase of about $250 million in Yugoslav exports should reduce the above-cited deficit. A working group of Yugoslav experts left for Moscow with proposed commodity lists on 10 November, at which time negotiations are to start on 1982 economic cooperation. CSO: 2400/72

HUNGARIAN-KUWAITI TRADE RELATIONS DESCRIBED

Budapest HETI VILAGGAZDASAG in Hungarian No 41, 10 Oct 81 p 29

"Mini Country--Maxi-Money"

No sooner did the departing plane of the emeer of Kuwait disappear on the horizon than the first order for Ikarus buses arrived, most likely as the result of the negotiations held here in Hungary with that country. Our foreign trade experts, however, better be on the alert: It is easier to lose than to obtain business with Kuwait.

The economy of Kuwait, a small country on the Arabian penninsula, is widely known. Its dollar affluence is not unprecedented. The combined annual trade surplus of the countries of the Arabian penninsula is estimated at $100 billion. From this sum Kuwait's share, a country of 1.3 million people, was $16 billion, which is to say that its total income last year exceeded by this amount the $6.6 billion it paid out for foreign goods.

The abundance of money determines the foreign trade strategy of states which do business with these Arab countries: it is worthwhile to sell these countries as much foodstuffs, consumer goods and machineries as possible and to obtain from them as much capital as possible. The conceptions of Hungarian foreign trade--the traders, the financial and banking specialists--are no different and they were made known to Kuwaiti business leaders who accompanied the emeer on the latter's recent visit to Hungary.

Hungary is Kuwait's biggest trading partner among the European socialist countries and the fact that nearly one percent of Kuwait's imports are Hungarian products is of notable significance. According to the projectsions of the Hungarian foreign trade, the present annual exports to Kuwait, valued at nearly $55 million, can be increased to $70-80 million by 1985. Hungarian industry could participate to a greater extent than it has until now in the development of Kuwait's crude oil and machinery industry or, more specifically, in the exploration and opening up of Kuwait's oil and natural gas fields as well as in the development of its aluminum industry. The opportunities that exist in participating in the development of that country's water management and in the promotion of its public health, sports and tourism are better than ever. Participation may be various. The building of entire plants, the delivery of machinery is included in

the plans of Hungarian foreign trade the same as the preparation of programs of exploration and development or the employment in Kuwait of Hungarian specialists.

At the time of the emeer's visit one of the many subjects discussed was the completion of the plans for a light bulb factory which would be built in Kuwait by United Incandescent. According to preliminary plans 70-80 percent of the factory's machinery and equipment would be delivered by the United Incandescent and by assuming 20-30 percent of the investment costs the Hungarian company would become part owner of the future Kuwaiti plant. An order for 50 Hungarian buses, valued at more than $4 million, has already arrived since the emeer's visit.

It is well known that Arab businessmen are very cautious. It is difficult to gain but even easier to lose their confidence. In the past years, for example, Hungarian firms were not allowed to participate in Kuwait at competitive biddings for the sale of transformers and substations. All this "merely," as heard at the Foreign Trade Ministry, because some electrical equipment, previously delivered by the Ganz Electrical Works had minor flaws. The ban will be lifted only if the company corrects these mistakes or, more specifically, if the two new substations scheduled to be delivered and installed this year operate satisfactorily within a guaranteed period of time.

It appears to be the mutual interest of both countries that more and more Kuwaiti capital find its way to Hungary. There are encouraging signs that such working capital can participate in the establishment of Hungarian joint companies. Hungarian foreign trade is also actively counting on the participation of Kuwaiti private and public firms in the financing of industrial plants in Hungary.

CHANGES IN AGRICULTURAL REGULATORS REFLECT NATIONAL CHANGE

Budapest FIGYELO in Hungarian No 45, 11 Nov 81 pp 13-14

[Article by Rezso Kostyal: "Regulators of Agriculture"

[Text] The regulator modifications serving to improve the economic balance, increase the economicalness of export, transform the production structure and make for more thrifty cost management also affect agriculture. Thus on the large agricultural operations also the social insurance contribution has increased by 3 percentages points, generation of the obligatory reserve fund has increased by 5 percentage points and interest has increased by one percentage point while normative export supports have decreased. Freight fees have increased and a vehicle contribution is being implemented. Special transportation tools serving agricultural purposes directly--tractors, etc.--are an exception to this and a contribution need not be paid for them. There is a 50 percent rebate on the contribution for other transportation tools which are used for agricultural purposes as well.

The changes introduced this year at state enterprises, which have an advantageous effect for the workers, in the generation and use of the social and cultural fund also apply to the large agricultural operations. For example, where there is no institutional kitchen and the workers get meal tickets as a subsidy this must be calculated at the expense of the social fund and not at the expense of the shares fund.

In addition to the changes being implemented in the area of the people's economy a few modifications better encourage agricultural producers to increase production of exportable products by operations in the low income group.

Price Changes

The prices of the most important tools and materials used in agriculture have not changed. Budgetary supports neutralize the changes in producers prices or import prices for artificial fertilizers and industrial fodders. As of 1 November the prices of fuels, among the industrial materials, increased by about 10 percent but the budget will balance out 75 percent of the increases--using methods used thus far. In the future, however, there will be an end to the March budgetary balancing of energy production for the large agricultural operations.

A few price corrections of minor significance in regard to state agricultural purchasing prices will make the price system more flexible. In the future strain

improving wheat will be in the controlled price category and the "protected price" for a few products will increase; there will be modifications interdependent with quality in the prices for tobacco and red pepper. The weight limit for hogs classified as being in split condition will increase from 73-95 kilograms to 95-100 kilograms.

There are also indirect price changes in that the Grain Trust--on the basis of contract--will pay a 60 forint permium per 100 kilograms for extra production of cereal grains and corn by the large agricultural operations. Production exceeding a quantity 10 percent higher than the average annual production for the years 1976-1980 will be classified as extra production. Use can be made of this, however, only if the specific indexes for grain fodder use do not deteriorate at the farm in question. In the contrary case a quantity of grain corresponding to the specific extra use must be subtracted from the quantity for which the premium can be paid.

Taxation

The base for the income tax will be the total of the profit serving as a base for settling accounts (incentive) and labor fees and wages. Thus the tax base can continue to be reduced by the sum of the funds used to pay debts, cover losses and repay credits assumed to cover fund shortages but it will be increased by non-normative export supports.

Studies show that the differentiation of labor fee levels of producer cooperatives has moderated; the differences between the average labor fee levels of the cooperatives--going beyond the efficiency of production--derive in large part from differing work time use. Where the role of household plot farming is greater there is generally less fulfillment of the work day performance on the communal farm. This justified putting an end to that differentiation which depended on the level already achieved in increasing the tax-free wage level. The newly introduced tax-free value will be a uniform 2.5 percent according to the tax table. An increase in the labor fee level exceeding this will be burdened by a more progressive tax than heretofore of 100-500 percent. At the same time, there will continue to be labor fee tax concessions interdependent with the peculiarities of agriculture. Among these special emphasis is given to the possibility of an additional 3 percent tax-free labor fee level increase which can be made use of in the event of bulk labor fee savings. If the farms make use of this possibility then they can differentiate better according to performance.

Beginning 1 January 1982 the practice already used in state enterprises of permitting the undertaking of work not belonging to their job obligations, going beyond the work time in their own producer cooperatives, will be extended to producer cooperative members. It will be a condition of the contract that the producer cooperative member should work full time for the communal farm until he has put in 2,200 hours and then can undertake an additional job on top of the physical work of the basic activity.

The production taxation rules and a few production tax keys for industrial activity by the large agricultural operations have changed considerably--ensuring withdrawal conditions identical with those for industrial enterprises.

Experience shows that the industrial and service activity of the large agricultural operations still has a skilled labor force drawing effect in Budapest and environs. To moderate this there will continue to be an additional 10 percent production tax on price income for certain industrial activities done here. (This will not be paid in the megye cities.) The category of industrial-agricultural or agricultural-industrial cooperatives is being abolished as will the special production tax applicable to it.

The tax keys for some industrial and service activities will increase by 1-2 percent. In part this will counterbalance the concessions given for agricultural production and it will also ensure withdrawal conditions identical with those for industry. A production tax more favorable than before--which is to say, a favored production tax--will be levied on products produced from waste materials (paper, used tires, etc.)

The obligation to redeem documents accompanying animals, which are burdened with a fee, will end.

Investment Supports

Minor modifications of investment supports will serve to rationalize the present practice. For example, at present a 30-35 percent or fixed sum support can be given to create dairy facilities for milk production or for hog fattening investments. In the case of a fixed sum the upper limit which can be given for established supports will be 60 percent of the costs needed to carry it out.

The biggest problem of melioration investments is the absence or slow pace of water improvements. In the interest of having the narrow state support funds offer a possibility for melioration of larger areas of land, improving the water supply, the role of one's own resources or of credits anticipating them will be increased by about 10-15 percent. Investment support for large area melioration will be differentiated depending on the material strength of the large agricultural operations participating in them. The magnitude of their own strength will be determined by the per capita gross income. Where the per capita gross income is high the large farms will receive as support 40 percent of the costs for carrying out large area water improvements; where it is low they will receive 70 percent. Not only will this bring into harmony the magnitude of the supports and the ability of the cooperatives or enterprises to bear the burden, it will also make possible water improvements on a larger area with the same total support.

Additional melioration support cannot be given for an area which has already been treated in this way, with the exceptions of areas undergoing melioration prior to 1978 if they are included in large area melioration. In this case, if 60 percent of the area must undergo large area melioration again, the melioration maintenance fund generated but not used can be included in the totals needed without the obligation to replace them.

Encouraging Meat Production

Among the operational supports there will be modification of the support system for cattle raising. In the past five-year plan period milk production increased greatly and the profitability of milk production improved parallel with this also.

In the great majority of the agricultural operations this branch, which was a deficit one earlier, brings a significant profit. But state supports provide the larger part of the profit. The goal now is to cover the milk consumption needs of the populace by a further increase in specific milk production without increasing the number of cows.

Since the export of milk products is not advantageous, with the exception of a few products, and since there is a need for slaughter cattle supports will be regrouped between these two end products of cattle raising.

This will be served by a 20 percent reduction in the milk marketing premium (hereafter there will be only 8 fillers instead of 10 fillers per milk marketing percent) and a 45 percent reduction in the milk price supplement (one forint per liter instead of 1.80 forints per liter). The supports thus freed will increase the profitability of slaughter cattle production in that the large agricultural operations will get a 6 forint price supplement for every kilogram of beef sold. The condition for this is that the slaughter cattle sold must have been in the possession of the large farm for at least half a year. This will make every phase of beef production more favorable (raising, fattening and maintaining beef cattle).

Increasing the production and export of slaughter cattle and mutton is also served by that measure according to which the large agricultural operations with unfavorable natural conditions can cover that part of the increase in reserves deriving from increasing cattle and sheep stocks from the reserve fund instead of the development fund. In areas of weaker productivity where the obligatory reserve fund does not accumulate to a degree such as to cover the reserve due to a justified increase in cattle and sheep stocks credit must be used to finance the increase in reserves.

Price Supplements

The differentiation in the incomes of agricultural operations is basically the consequence of differing productivity of producing soils. Differences in personal incomes moderated in the past plan period but the differences between profits of farms increased.

Up to now the financial system calculated that the differing cooperative incomes were in part of a rental character. The progressive land tax and income tax drew off a part of the different incomes deriving from different land quality. But the uniform official prices do not recompense the expenditures of the weakest areas--which can still be kept in production--rather they are based on the costs of operations farming under conditions somewhat less favorable than the average.

Up to now separate supports balanced out the negative rents in areas with weak productivity (in general, plow land with cadastral net income lower than 14 gold crowns). In consideration of the fact that there are a very large number of operations between the average (21 gold crowns) and the supported areas (under 14 gold crowns), and that in many cases the official purchasing prices based on conditions around the average do not cover the costs even of them, it became necessary to improve their interest in agricultural production.

Extending the sphere of supports also encourages an increase in economical export. Special price supports for farms in unfavorable production localities have been increased from the previous 15 percent to 25 percent for the marketing of cereal grains and have been increased to 10 percent for the marketing of slaughter cattle, slaughter sheep and berries. Those large agricultural operations whose plow land cadastral net income as of 31 May 1981 does not reach 17.10 gold crowns, according to the records of the AFTH [State Bureau of Geodetics and Cartography], will also get special price supplements. The value of the price supplement will be 20 percent of the price income for cereal grain and corn, 7 percent of the price income for slaughter cattle and slaughter sheep and 8 percent for the marketing of berries.

Large operations being temporarily supported will get special price supplements of the same magnitude. But if they are removed from this category they will still get the special price supplement.

Naturally the regulator modifications being realized in the people's economy as a whole affect the farms in unfavorable producing localities also, although in general one cannot expect these farms to counterbalance these in accordance with the increased requirements. For this reason, as a partial counterbalance to the increase in the SZTK [Trade Union Social Insurance Center] contribution, the base price supplement value will increase by 1-2 percent.

One way to improve the economic and financial balance in every supported farm might be to increase industrial production. Every one of these farms can enter the competition to win supports which can be repaid from the production tax.

Experience shows that profitable agricultural production can be conducted even on areas with weaker productivity. But this requires special expertise and organizing ability. At present, since these areas cannot guarantee them a suitable income, they employ fewer than the average number of experts. This contradiction will be resolved by a new provision which entitles every supported farm to support linked to the employment of experts from a fund of the megye council set up for this purpose.

COUNCIL OF MINISTERS ANNOUNCES REGULATIONS FOR SMALL BUSINESS

Decree on Small Co-ops

Budapest MAGYAR KOZLONY in Hungarian No 52, 5 Sep 81 pp 712-715

[Decree No. 25/1981 (IX.5.) of the Council of Ministers on Small Co-ops]

[Text] By the authority invested in it by Law No. 3, 1971, Section 116, par. (3) on cooperatives (hereinafter referred to as "Szvt.") the Council of Ministers orders the following:

Section 1

(1) The goal of setting up and operating small co-ops, is to provide a simpler form of self-government that can better accommodate a smaller membership and, with the help of the personal and increasingly growing financial contributions of their members, cooperative collectives of our citizens can perform productive, service-type and other socially useful activities.

(2) A small co-op is a legal person which operates with a membership of not more than 100 persons.

Section 2

(1) With the exceptions listed under (2), small co-ops may engage in any economic activity which is not specified to fall exclusively within the state economic organizations' sphere of functions by laws, law decrees, or by decrees or resolutions of the Council of Ministers. The conditions for pursuing this type of economic activity--among them especially the obtaining of necessary permits and permissions--are regulated by the orders which apply to the cooperatives.

(2) Small co-ops may not engage in agricultural activities which fall within the sphere of activities of agricultural cooperatives and specialized agricultural groups, nor may they perform services provided by work collectives (creative collectives) operating in the cultural branch.

Section 3

In the case of small co-ops (hereinafter referred to as "co-ops"), the orders issued in the Szvt, and in Law Decree No. 32, 1971, on industrial cooperatives (hereinafter referred to as "Iszt."), shall be applied with the modifications stated herein.

Section 4

(1) Setting up a cooperative requires an initial capital outlay sufficient to build a financial basis upon which the activity defined in the bylaws can commence and more and more firmly assert itself during the first year.

(2) The bylaws must--in a simplified form reflecting the smaller membership and work organization and without repeating any of the statutory provision orders--include all of the things the Szvt. and the Iszt. have specified they should contain, which apply specifically to the given co-op. The bylaws must also include:

a) the main forms which the members' financial contributions may take within the co-op, as well as the general framework of the membership agreements pertaining to those forms [Section 11, par. (1), point c)];

b) the value limit beyond which the conclusion of contracts will require the preliminary approval of the general assembly.

(3) The name selected for the co-op must be one which unambiguously expresses its character as a co-op form and activity.

Section 5

(1) Belonging exclusively within the general assembly's sphere of authority are:

a) the right of decision-making in all matters which have been specified in the Szvt. and the Iszt. as falling within the sphere of authority of the general assembly and the assembly of delegates;

b) the right to pass and revise the rules of self-government;

c) the right to expel a member from the co-op;

d) the right to settle membership and work-related disputes in co-ops operating with less than 30 members;

e) the right to terminate work agreements with members; and

f) giving preliminary approval to contracts which exceed the value limits specified in the bylaws.

(2) The general assembly must convene at least four times a year.

Section 6

(1) Except as stated in (3), all co-ops shall be required to have a board of directors, a supervisory committee and a cooperative arbitration committee; their size shall be determined in the bylaws.

(2) The bylaws shall determine whether the co-op will hold regular work conferences.

(3) In those cases where the size of the membership is under 30,

a) the bylaws shall determine whether there will be a working board of directors, a supervisory committee or any other committee; and

b) the co-op may not establish a cooperative arbitration committee.

Members (employees) shall have the right to appeal within 30 days any of the general assembly's decisions concerning membership (work-related) disputes--except in matters listed under Section 39, par. (1)-(2) of the Iszt.--by taking their cases before the labor court.

Section 7

(1) In order to provide a replacement for the president, a vice-president must be elected. The bylaws shall determine whether the president (vice-president) will serve in his office on a full-time basis or in addition to performing some other activity in the co-op.

(2) In the case of co-ops with less than 30 members which do not have a working board of directors, the president shall fulfill the functions of the board as specified in the statutory provision.

Section 8

The orders issued in Decree No. 51/1977, (XII. 21) of the Council of Ministers on the internal supervision of co-ops shall be applied with the following changes:

a) Instead of having to maintain an independent inside inspector, the co-op may entrust this task to one of its members or employees--who has the prescribed qualifications--even in addition to that person's other functions, given that there is no conflict of interests between the two jobs.

b) It may also assign this task to the control office of its regional association or to an expert who is a registered inspector.

c) Once a year it shall be required to have the control office or the expert referred to in b) carry out a general inspection of the co-op.

Section 9

The co-op must lay down a combined set of self-government rules. In these it must specify:

a) the rules whereby the self-government organs are to operate;

b) the structure of work organization and the authority of the directors;

c) the manner in which internal supervision will be carried out;

d) the way the employer's jurisdiction will be exercised vis-a-vis the employees;

e) those rules concerning job performance and the division of divisible income among the members, which are not contained in the bylaws or the determination of which is otherwise left up to the organizational, operational or labor regulations by the statutory provisions; and

f) the way the co-op's labor safety regulations are to be implemented.

Section 10

(1) In addition to full-time members, co-op membership may also be granted to:

a) persons who are members of (employed by) industrial or agricultural cooperatives, or are employed by other employers and wish to work outside the working hours of their full-time jobs;

b) persons receiving old-age or disability pensions within the employment limitations specified in the statutory provision regulating social insurance, or--if pension payments are suspended--without any restrictions;

c) day-time students attending our higher educational institutions who receive approval from their respective schools.

(2) The orders which regulate the granting of small co-op membership to persons who are employed or whose membership involves the obligation to work, and the duty of registration connected with it, as well as the length of their working hours shall be those laid down in the separate statutory provisions.

(3) The admission of new members shall be decided by the board of directors.

(4) The president shall be authorized to accept membership applicants only as probationary members, for a period not to exceed 3 months. During that trial period this probationary membership relationship may be terminated by either the board or the member, effective immediately, without explanation. Probationary members may not be required to make a financial contribution.

Section 11

(1) At the time of admission, the member and the board shall draw up a membership agreement which must especially state

a) the manner, in which the member's personal contribution is to be asserted and the basic personal wage which is to serve as the guideline for determining the personal income due to him on the basis of his personal contribution;

b) the working hours of the member if he is only to be employed on a part-time basis; [a) and b) together constitute the membership work agreement], and

c) the specific form and extent of his financial contribution.

(2) Membership agreements must also be drawn up with probationary members.

Section 12

(1) The member's financial contribution may be in the form of

a) share- or targeted share purchases; or

b) transferring ownership of capital equipment, buildings, workshops and motor vehicles (hereinafter referred to as "capital assets") to the co-op.

(2) In order to enhance the economic activities of the co-op, the members may--on the basis of a separate agreement--lend out for use, or lease to the co-op certain capital assets.

(3) The bylaws may also establish other forms of financial contribution.

Section 13

(1) The minimum mandatory limit for making a financial contribution shall be the amount of shares purchased by a member which is the equivalent of two months of his basic personal wage. [Section 11, par. (1), point c)]. The bylaws may also establish higher limits for mandatory financial contributions and state whether other forms of contributions will also be allowed.

(2) Unless otherwise ordered in the bylaws or by the general assembly, the mandatory financial contribution must be made upon acceptance into the membership.

(3) Share purchases and other financial contributions over and beyond the minimum mandatory limit shall be based on the member's voluntary decision.

(4) Upon transferring ownership of capital assets to the co-op, the contributing member shall be entitled to compensation, the amount of which shall be negotiated between the member and the co-op. Compensation may not be paid to the debit of the initial capital outlay.

Section 14

(1) Targeted shares for development purposes determined by the general assembly shall be purchased by members on a voluntary basis.

(2) The lowest and highest amount of targeted shares that can be subscribed to, the manner in which they are to be purchased, terminated, repaid and utilized, and the conditions necessary for these actions, shall be determined--within the limits stated in the statutory provision--by the general assembly.

(3) Otherwise, targeted shares shall be regulated by the same orders that apply to shares.

Section 15

(1) On the basis of their financial contribution made in the form of personal participation and share purchases, members shall be entitled to a part of the co-op's divisible revenues in the form of a personal income.

(2) Members shall be entitled to a personal income based on their financial contribution even if, for reasons not attributable to them, they are prevented from personal participation.

Section 16

If the co-op is operating at a loss, or is lacking special purpose funds, its members shall receive a reduced personal income which will be determined in accordance with the special statutory provision. In such cases, they shall be liable to repay the appropriate portion of any personal income already received.

Section 17

(1) If the co-op is unable to provide a member with permanent employment either in the field specified in the membership work agreement or in another field that is acceptable to both the member and the co-op, or if the member becomes eligible for retirement, the general assembly may unilaterally terminate the membership work agreement. Termination of the agreement shall be forbidden in those cases where labor law regulations prohibit the termination of employment.

(2) The co-op must, upon request, return to the member his entire contribution, cash or otherwise, at the time his membership work agreement is terminated.

Section 18

(1) Upon the ending of the membership relationship, repayment of the member's financial contribution shall be due to be completed within 30 days after the year-end balance has been approved. The board--or in the case of co-ops operating with less than 30 members, the general assembly--may postpone the repayment of this financial contribution for a year if such action is absolutely necessary to ensure the continued undisturbed production of the co-op.

(2) Upon the ending of the membership relationship or the termination of the membership work agreement, the member may come to an agreement with the board to leave behind his financial contribution which he had made in cash, for a period not to exceed two years, as well as those capital assets which he had made available for use (leased) to the co-op. This shall not affect the member's right to receive a personal income on the basis of his financial contribution.

Section 19

The rules regulating the disciplinary and financial responsibilities of co-op members are the appropriate provisions of the Iszt. and of Decree No. 40/1971

(XI. 30.) by the Cabinet concerning their implementation (hereinafter referred to as "Iszt. R"), with the difference that

-instead of average monthly wage they should be understood to mean personal income based on personal participation, and furthermore that

-in case of damages suffered by the co-op through the member's negligence, the bylaws may increase his liability to the average amount of one month of his personal income.

Section 20

(1) If on a year's average, and for a continued period of time the size of the membership increases to over 30 or 100, then, starting 1 January of the year following this increase, the self-government organization of the co-op must be amended in accordance with this decree, and in the case of memberships over 100, the orders regulating the co-op's organization and operation shall be those issued in the Szvt. and the Iszt., replacing the ones contained herein.

(2) Any increases in the size of the membership which exceed the limits specified in par. (1) must be promptly reported to the state organs in charge of exercising legal control.

(3) The authority of state legal control shall also include the responsibility of making certain that necessary changes in the bylaws are made in time.

Section 21

The representation of co-op interests shall be handled in accordance with the regulations stated in the Szvt., with the addition that the representation of interests will be exercised by regional and national corporate organs set up according to main activities.

Section 22

(1) The rules regulating state activities regarding the co-ops are the appropriate provisions of the Szvt. and of Decree No. 30/1971 (X. 2.) by the Cabinet concerning their implementation (hereinafter referred to as "Szvt. R."), which are to be applied with the changes contained in par. (2)-(4).

(2) Only on the basis of reports received, alleging violations of statutory provisions, bylaws or self-government regulations shall the state organ exercising legal control be required to carry out an investigation of the given co-op.

(3) Except for having to provide advance information concerning the date and the agenda of upcoming general assembly sessions, the co-op shall not be required to disclose any other information or decision in writing to the state organ exercising legal control.

(4) Branch-professional control of the co-op shall be exercised by the branch minister who, depending on the co-op's main location, shall act through the

specialized local administrative agencies of the competent capital city, megye or municipal council's executive committee, which has jurisdiction over the co-op's activities.

Section 23

Par. 25, 30, 36-42 and 42/B of the Szvt. R., and par. 9, 17, 44, and 45/B of the Iszt. R. must also be applied to the small co-ops as prescribed.

Section 24

If the co-op fails to remedy its losses and special purpose fund deficits in accordance with the regulations stated in the special statutory provision, it shall not be bailed out under any circumstances; instead, it is to be dissolved by the state organ exercising legal control.

Section 25

(1) This decree will enter into force on 1 January 1982

(2) Co-ops operating with less than 100 or less than 30 members on the day this decree is put into force, shall be required to revise their bylaws in accordance with the above decree and to submit these revised bylaws for approval to the state organs exercising legal control, within 30 days.

(3) Upon consultation with the regional association and obtaining the approval of the national corporate organ, co-ops forming or operating with not more than 100 members may commence or continue operations in accordance with general co-op regulations.

Section 26

In the case of small co-ops,

-the wages referred to in the statutory provisions should be understood to mean personal income based on personal participation; and

-year-end shares (profit shares) should be interpreted as personal income based on personal participation received in addition to the amount paid during the year.

Council of Ministers

Decree on Industrial, Service Co-op Groups

Budapest MAGYAR KOZLONY in Hungarian No. 52, 5 Sep 81 pp 715-719

[Decree No. 26/1981 (IX. 5.) of the Council of Ministers on Specialized Industrial and Service Co-ops]

Text] By the authority invested in it by Law No. 3, 1971, Section 116, par. (3), the Council of Ministers orders the following:

Section 1

(1) Specialized industrial (construction industry) production and service co-op groups (hereinafter referred to as "specialized groups") are independent economic accounting organizations run by citizens, which operate within the cooperative framework and which enjoy a certain degree of self-governing and economic independence. The specialized group is not a legal person.

(2) The economic activity of the specialized group shall be aimed primarily at providing services and producing goods for the population as well as at making products and providing services that are necessary for the activities of co-ops and other economic groups. Otherwise, the determination of its sphere of activity, and the conditions under which that activity is to be carried out, shall be regulated by the appropriate orders concerning small co-ops.

(3) Relations between the co-op and the specialized group shall be governed--within the limits of the statutory provisions and internal regulations--by way of agreements.

Section 2

(1) Specialized groups may be established by at least five persons applying to join.

(2) In order to set up a specialized group, the members must hold a statutory membership meeting, provide the necessary financial assets to ensure its undisturbed operation and obtain the approval of the co-op's general assembly and its assembly of delegates.

(3) The statutory membership meeting shall pass the operational regulations of the specialized group and elect the president and vice-president of the group as well as other corporate organs specified in the rules of operation.

Section 3

(1) Without repeating the statutory provision orders, the specialized group's rules of operation must specify:

a) the name, goal and sphere of activity of the specialized group,

b) the name and place of operation of the co-op in which the specialized group is planning to operate,

c) the most important rules regarding the organization and operation of the specialized group; the tasks and sphere of activity of the president and other board members;

d) the most important local regulations concerning relations between the specialized group and the co-op,

e) the main principles upon which the economic activity is to evolve and develop, and which will determine the way the results of production are to be utilized,

f) the value limit over and beyond which any obligations assumed by the specialized group in the name of the co-op will require the preliminary approval of the co-op's board (or management, hereinafter also referred to as "board"),

g) the basic rights and obligations of the members, including especially the manner and the extent of personal and financial contributions,

h) the manner of representation in the specialized group's affairs, as well as

i) those regulations which have been ordered to be included in the rules of operation by this decree and the membership meeting.

(2) Whether or not the specialized group will have an executive committee shall be specified in its rules of operation.

(3) The rules of operation shall become effective upon approval by the co-op board, and will be forwarded as information by the board to the state organ exercising legal control over the co-op.

Section 4

(1) Decisions concerning specialized group business shall be made by the membership meeting, with the exception of matters specified in the rules of operation to fall within the exception of matters specified in the rules of operation to fall within the authority of the executive committee, the president or some other leading member.

(2) Matters falling exclusively within the sphere of authority of the membership meeting include:

a) the passing and revising of the rules of operation,

b) the election, dismissal and impeachment of the president (vice-president),

c) the determination of the income of the full-time president due to him on the basis of his personal participation,

d) giving approval to agreements concluded with the co-op as well as to agreements between the co-op and other economic organizations entered into as stated in Section 7,

e) the drawing up of the annual plan and the decision concerning the utilization of the results of production,

f) the right to terminate membership relationships,

g) the decision to dissolve the specialized group, as well as

h) the right of decision-making in all matters specified by the rules of operation to fall exclusively within the sphere of authority of the membership meeting.

Section 5

(1) The membership meeting must be convened at the intervals specified in the rules of operation, but at least twice a year. If recommended by at least 10 percent of the membership, or initiated in writing by the state organ exercising legal control over the co-op, and furthermore, if the capital assets (Section 7) transferred to the specialized group for use do not cover the liabilities borne by those assets for an extended period of time, and extraordinary membership meeting must be called.

(2) At a membership meeting a quorum shall be more than half of the members present; its decisions--with the exception of the decision to dissolve the specialized group--shall be based on a simple majority of the votes cast by the members present by way of open ballot.

Section 6

(1) The length of the term for which the executive council and the specialized group's president (vice-president) is elected shall be specified in the rules of operation, and is not to exceed 5 years.

(2) The rules of operation shall also state whether the president will carry out his tasks on a full-time basis or in addition to his other activities within the specialized group.

(3) If the president is unable to fulfill his functions, the vice-president shall assume his role.

Section 7

(1) The financial assets needed by the specialized group to perform its activity shall come from the financial contributions of its members and from cash and other forms of capital assets (i.e. buildings and other structures, workshops, machines, materials, etc.), which have been transferred for use by the co-op or other economic organizations to the specialized group.

(2) Capital assets may be transferred for either a determined or an undetermined length of time in exchange for a user's fee, other forms of compensation, specified services or a predetermined share of the profits expected from the specialized group's activities.

(3) The transfer of capital assets and the conditions under which it is to take place shall be laid down in an agreement between the co-op and the specialized group. If the capital assets are transferred by some other economic organization then, following approval by the membership meeting, it shall be the co-op

which will conclude the agreement on the transfer and the conditions under which it is to take place, with the economic organ.

Section 8

(1) Separately listed assets coming from the members' financial contributions and from the results of production, that are put aside for the purposes of the specialized group, as well as any capital assets transferred to the specialized group by the co-op or other economic organizations, must be recorded separately, apart from the other assets of the co-op.

(2) The specialized group shall use its revenues to cover its production costs and to meet other expenses.

(3) The rules of taxation concerning the activity of the specialized group shall be laid down by the Minister of Finance.

Section 9

(1) The specialized group shall be required to employ a professional expert to be in charge of accounting and bookkeeping. Unless there is a conflict of interests, these duties may also be performed by experts working for the co-op or by other outside professionals.

(2) If the performance of an activity is made contingent upon some special skill by the statutory provision, the specialized group may only continue that activity if there is someone among its members who meets the stated qualification requirements.

Section 10

(1) The specialized group's activities shall be closely monitored and supported by the co-op board. In addition to transfers of capital assets, such support may be in the form of special services, as well as other types of assistance which will further the goals of the specialized group.

(2) Once a year the board shall, in cooperation with the supervisory (control) committee, review the entire economic activity of the specialized group.

(3) The resolutions passed by the co-op's corporate bodies are only binding on the specialized group if, and only to the extent its operation has resulted in damages to the capital assets assigned to it by the co-op, or if it interferes with the co-op's normal economic activities, and the resolution is aimed at eliminating that problem.

Section 11

(1) Members of the specialized group shall be liable for the debts connected with the group's activities only to the extent of their financial contribution.

(2) Debts connected with the activities of the specialized group shall be guaranteed by the assets that are listed separately for the purposes of the specialized group; debts over that amount shall be secured by its total assets.

Section 12

(1) The person authorized to represent the specialized group in the name of the co-op shall be the president of the group, or if he is prevented from carrying out his functions, the vice-president or some other member appointed by the membership meeting with the approval of the co-op board. The persons qualified to represent the group shall be listed separately in the co-op's register of representatives.

(2) Agreements which involve obligations over and beyond the value limit specified by the co-op may only be concluded with, and in accordance with the written preliminary approval of the co-op board.

(3) The undertaking of a written or financial obligation shall require the joint signature of the two persons authorized in par. (1) and the countersignature of either the head bookkeeper or his assistant.

Section 13

(1) The specialized group shall be dissolved,

a) if so decided by a two-thirds majority of the membership meeting, polled by secret ballot,

b) if, due to the lack of a legal successor, it ceases to operate, and

c) if the co-op's general assembly or its assembly of delegates withdraws the approval it had given to allow operation of the specialized group.

(2) The approval given to allow operation of the specialized group may be withdrawn if, in spite of resolutions by the competent co-op organ forbidding it [Section 10, par. (3)], the specialized group engages in an activity which results in damages to the capital assets assigned to it, or hinders normal co-op operations; or if the operation of the specialized group is determined to be illegal by the state organ exercising legal control over the co-op.

(3) Upon dissolution of the specialized group, the assets which had been listed separately for the group's purposes and which are left over after all outstanding debts had been settled and the capital assets transferred by the co-op or other economic organizations (Section 7) had been deducted, may be divided among the members in accordance with the extent of their personal participation and the size of their capital contribution.

Section 14

(1) All persons over 15 years of age shall be eligible to become specialized group members; persons under 16 may only be allowed to join after their legal

guardians--and in the case of students, also their respective educational institutions--have given their written approval.

(2) Specialized group membership is also open to the members of those agricultural, industrial, consumer, marketing and purchasing co-ops, in which the specialized group operates, on the condition that they work outside the working hours specified in their work schedule.

(3) The decision whether an employee or a person whose membership status involves active work should be allowed to become a full member of the specialized group, the registration requirements connected with such a change in status, and the length of his working hours shall be regulated by the orders of the special statutory provisions.

(4) Unless otherwise ordered in the rules of operation, the admission of new members shall be decided by the membership meeting.

Section 15

(1) With the exceptions listed in par. (2), the joining member shall be required to make a financial contribution. The extent and form of this contribution, as well as the deadline by which it is to be made, shall be determined--within the framework of the rules of operation--by the membership meeting.

(2) The membership meeting may waive the financial contribution requirement if the member possesses a special skill which is needed by the specialized group to fulfill its goals.

(3) Upon termination of the membership relationship, the financial contribution must be repaid, except if it had been spent to settle losses.

Section 16

(1) The share of the specialized group's production results which is to be received by a member shall be determined on the basis of his personal participation and financial contribution.

(2) The proportion of the share of profits to be received on the basis of personal participation and financial contributions shall be determined annually, within the framework of the statutory provisions and of the rules of operation.

Section 17

(1) The membership relationship shall be terminated upon withdrawal by the member, upon termination of the relationship by the specialized group or upon the dissolution of the group. The intent to withdraw must be submitted to the president in writing.

(2) The membership relationship may be terminated by the membership meeting if the member

a) causes intentional damage to the specialized group,

b) displays other forms of behavior that are seriously damaging or threatening to the group's interests, and

c) fails, for reasons attributable to him, to live up to the obligations stemming from his membership relationship for a continued period of time.

(3) The decision to terminate the membership relationship--arrived at after the member had already been allowed to speak--must be put in writing.

(4) In case of termination of a membership relationship, all outstanding accounts must be settled with the former member (or his heir). All outstanding mutual claims--with the exception of the year-end share of the profits--between the former member (or his heir) and the specialized group shall become payable upon termination of the membership relationship.

Section 18

(1) The specialized group may hire employees to represent it in performing certain jobs which may arise in connection with its activity; the number of these employees, however, may not exceed 10 percent of the size of the membership.

(2) Unless otherwise ordered by the rules of operation, the power of employer over these employees shall be exercised by the president.

(3) In other matters concerning the working conditions and wages of the specialized group employees, the applicable rules are the appropriate provisions of the general labor statutes, including the adjustments which pertain to the co-ops.

Section 19

(1) In addition to the specialized group, the co-op also will be held liable, in accordance with the regulations concerning co-op members, for any unlawful damages caused by a group member in connection with his membership relationship.

(2) The specialized group member shall be held liable, in accordance with the regulations concerning co-op members for any wrongful damages it may cause the co-op by not living up to the obligations connected with his membership.

(3) Membership-related disputes among specialized group members, or work-related disputes among specialized group employees operating within an agricultural or industrial co-op shall be acted upon by the co-op arbitration committee, by applying the appropriate procedural regulations. Membership-related disputes must undergo preliminary reconciliation at a membership meeting or before another corporate organ specified in the rules of operation.

Section 20

Membership-related claims shall become void after 3 years. Debts due to pay for criminal damages, however, shall not be forfeited until the lapsing of the criminal act itself.

Section 21

(1) The representation of the specialized group's interests shall be handled by the corporate organ of the co-op in which the group operates.

(2) The legal state control of the specialized group shall be exercised within the framework of the co-op's legal control.

Section 22

This decree will enter into force on 1 January 1982.

REGULATIONS ON ECONOMIC WORK COMMUNITIES HIGHLIGHTED

Budapest MAGYAR HIRLAP in Hungarian 23, 28 Oct 81

[Article by Istvan Kalasz and Gyorgy Szepesi of the National Planning Office: "Economic Work Communities"]

[23 Oct 81 p 7]

[Text] The economic work community, which is a civil, legal association organized by private individuals and is not endowed with a legal personality, can be established in order to perform activities supplementary to the operations of consumer and other services, small enterprise production and other organizations, and also in order to better organize and spread these (for example: for the maintenance of joint work organizations, receiving depots and service outlets; for joint acquisition of raw materials, joint stock building) (15th tvr [law decree] regulation for 1981, 28/1981, [IX,29] MT [Labor Code] regulation). It may not perform commercial activities, but may undertake to organize and promote activities of such nature (for example, for joint merchandise acquisition).

The members bring the economic work community into existence through a partnership contract in which they specify what activities they will perform. However, they may not perform activities which statutes have placed into the province of operating state organizations. Moreover, permission in advance is necessary to perform certain activities.

A work community may be established by at least 2, but not more than 30 members. One who is already a participating member in a work community, or one who may not be a tradesman because of having committed some crime may not be members of a work community. On the basis of this decree, private individuals--including tradesmen also--may draw up a partnership contract for the performance of activities for which official permission is otherwise required (trade license, operating permit, etc.). This regulation does not apply to occasional partnerships by tradesmen. A tradesman may operate as an independent tradesman in addition to his membership in a work community. Employed individuals and those required to do work as members of a cooperative may become members of a work community. A special statute (8/1981 [IX,29] MuM [Ministry of Labor] numbered regulation) provides permission, or rather, the necessary reporting requirements.

Official approval is necessary for the validation of the partnership contract. The petition for approval must be submitted to the primary work community authority concerned. The specialty regulating organ of the executive committee of the relevant area council which has authority over work community activities comprises the primary authority. Other official permits necessary for the performance of the activity must be attached to the petition. For activities requiring certification, the appropriate documents attesting to the certification of the members must also be attached, as is a doctor's certificate for a line of work (activity) requiring appropriate health. Approval of the community's agreement may be denied only if the agreement is in conflict with the law.
After the approval of the community's contract, the specialty directing organ registers the work community. The record must contain the name of the work community, its headquarters and sphere of activity, the names and addresses of its members, the name of the person authorized to represent the economic work community and the date the community's agreement was approved. The work community must also be entered into the registry of firms. The firms registry regulations pertaining to general partnerships must be appropriately utilized at registration.

The work community operates under a corporate name. The names of the founding individuals may not appear in the corporate name, but the activity the work community performs must be represented in it. The headquarters of the work community is the place where the activity specified in the associative agreement is conducted. If the work community performs an activity which cannot be specified in its locality, then the headquarters is to be the permanent residence of its appointed representative.

One or more members specified in the partnership agreement are the authorized representatives of the economic work community for the purpose of conducting the business and business related matters for the membership. If according to the partnership agreement more than one member is empowered to conduct business and only jointly, any one of them may take urgent measures which cannot be postponed in order to prevent financial losses for the work community.

The membership may protest the inappropriate or unsatisfactory conduct of business by the appointed member. The majority vote of the membership is decisive in the matter. The majority decision of the members may also revoke the representative's appointment. If it is necessary to establish another organization to conduct the business of the work community, the head of this organization shall be the representative appointed in the partnership agreement, who may, if necessary, delegate some of the rights of conducting the business and representation to employees of this business organization. As far as the membership is concerned, however, he is just as responsible in such a case as if he performed them himself. The members of the work community have the right to be personally informed of the conduct of business matters. For this purpose they may examine the books and documents of the work community and request explanations from the representatives.

[28 Oct 81 p 7]

[Text] The work community operates primarily with the joint resources, or rather, with the resources available for joint use through the financial contributions of the members. In order to perform its tasks it may rent, lease or utilize resources owned by the state or cooperatives, even those which otherwise may not be legally utilized by private individuals. The members are required to personally participate in the activities of the work community. Thus, it is not possible to become part of a work community and to acquire shares, or personal income through only monetary or other resource contribution.

The work community may employ assisting family members, employees, outside workers and skilled worker apprentices. The number of employees it may employ is as follows: for 2 to 5 members, 2; 6 to 10 members, 4; 11 to 20 members, 8; and above 20 members, 10. The work community may employ outside workers as part of the permitted number of workers.

If the work community has among its members a tradesman who also practices his trade on his own, the employees of the tradesman do not count as employees of the work community. However, the combined number of employees of the work community and employees of member tradesmen may not exceed 30. The work community representative practices the rights of employer over the work community employees. He may not delegate this right.

A work community may employee a skilled worker trainee only if there is among the members, employees or assisting family members an individual who has the appropriate training in the specialty of the skilled worker trainee. The number of skilled worker trainees per specialty may not exceed three times the number of qualified individuals in that specialty among the members, employees and assisting family members. The work community may employ assisting family members without restriction. The activity of the assisting family members is not considered to be an employment relationship. According to trade practice regulations, time spent in such a relationship needs to be accredited in order to count for professional experience.

Official supervision over the operation of economic work communities is performed by the specialty regulating organization of the council for the area concerned. The specialty regulating organ can dissolve the work community if it seriously, or despite repeated warnings violates statutory regulations, or because it receives repeated warnings for unprofessional or poor quality work during the period of a year. The work community may also be dissolved by its members. The dissolution of a work community must be reported without delay to the specialty regulating organ in charge of recording, and to the registry court.

The activities of economic work communities are considered to be activities performed within the social framework, since even the regulation of their incomes is based on this principle. The work community pays a partnership tax on its gross income. The members pay a general income tax on their personal incomes derived from the work community, according to the regulations for tradesmen. Tradesmen who are work community members pay taxes on their combined incomes from the work community and from the practice of their separate trades.

Social insurance care for economic work community members includes pension, accident insurance, maternity and burial benefits. Assisting family members of work community members have a right to maternity and burial benefits. In addition to the retention of employee status, cooperative membership, independent tradesman or pensioner status, individuals are only entitled to accident benefits on the basis of their participation in work community activities.

BACKGROUND ON BALANCE OF PAYMENTS PUBLISHED

Warsaw ZYCIE WARSZAWY in Polish 29 Oct 81 p 4

[Article by Henryk Czadynski: "What Were The Credits Spent On?--Behind the Scenes of Balance of Payments."]

[Text] (Private Information) The debt bulge, which is depressing the economy, causes painful disturbances. Many details on this subject are made available to us from press agency communiques, like for instance bargaining with the creditors regarding a postponement of repayments, nevertheless, our interest in the national balance of payments is still very deep. Despite the report on the state of our economy and the explanations contained therein the nation would still like to know precisely how much do we owe to the West and the East, on what were those credits spent, what are the consequences today of this indebtedness and what will the consequences be for the future generations.

It would be possible to get an answer to part of these questions. Some of these matters, which up till now were shrouded in secrecy, are now being made public. Never before were so many words written on this subject. At the same time, there was never such a need to explain, to the public at large, the gravity of the situation and the interdependence of our future prosperity on the amount of foreign exchange that we will be able to obtain, not only for credit repayment but also for purchases of those goods that are indispensable for us. We need this so that our industrial potential may be realized and can bring in revenue instead of remaining a burden.

During a press conference with Marian Kizak the Finance Minister, the journalists were informed that it is now intended to publish regularly all information on this subject. Central Office of Statistics [GUS] will henceforth publish a balance of payments statement [state budget report] in "Rocznik Statystyczny" and in "Rocznik Finansow." Also, the banking publications will quarterly publish specific data on balance of payments. The intention, simply stated, is that these matters should now find themselves under public scrutiny. Currently about a half of our imports is made up of food and agricultural products, particularly feeds.

On that occasion the press corps also received a publication, prepared by the Ministry of Finance and the Polish National Bank, pertaining to the balance of

payments for the decade 1971-1980. It is apparent that during that decade we imported more from the West than we exported--72 percent of import expenses were covered by exports. The unfavorable trade balance amounted to 54 billion of foreign exchange zloty [fxz]. A growth of this negative trade balance can also be seen. In 1971 we still had a favorable trade balance of 438 million fxz [foreign exchange zlotys]. Beginning with the following year the degree of our indebtedness became more and more apparent. The largest unfavorable balance amounted to 9.9 billion fxz in 1975. That year our exports covered only 59 percent of our import obligations.

Beginning in 1976, the unfavorable balance began to decrease. More efforts were undertaken from 1977 on. This led to a decrease of the unfavorable balance to a low of 2.4 billion fxz by 1980. For the entire decade this whole trade picture was characterized by a 54 billion fxz trade deficit. Although we experienced an increase in the foreign exchange influx from services and remittances, which reduced this deficit by over 9 billion fxz, the sizeable remainder had to be covered by credits. This means that the whole country lived on credit. The national income which was destined for debt repayment was more than the value of our [total] national production.

It is also worthwhile to note not only the absolute monetary worth of the credits but also their purpose. A closer look at the data indicates that as time went by, our intermediate term indebtedness was increasing and that the short term indebtedness surpassed the 5 billion fxz point beginning in 1975.

In 1974, the cost of foreign exchange credits was 975 million fxz. One year later it exceeded 1.6 billion fxz and by 1980 it grew to 7.5 billion fxz. It is important that we know not only the size of the burden on our economy but also the ratio of our income coming from exports. This influences not only the repayment capability but also the position of the country on the [world] financial market. There are countries whose debts, as compared to their national income, are markedly higher than ours, however, they also have a disproportionally higher debt repayment capability. Unfortunately, our ratios are unfavorable and this is very evident from the 1980 statistics, although the data for this year [1981] indicates a real drama. Income from our exports--we are still talking about our trade with the West--amounted to 24.3 billion fxz, however, the interest on our debt amounted to 24.6 billion fxz and the repayment of the principal came to over 17.1 billion fxz. This shows that our indebtedness was higher than the income from our exports, in practical terms the total needs of our economy necessitated an increase of credits.

What is the cause of this situation? The structure of our trade transactions indicates that during an initial period the unfavorable balance was primarily a result of excess investments and the resultant large purchases. We should add that this did not result in the intended investment returns which, if realized, could allow us to experience a different result, including repayments. This is also tied in to a defective investment structure and their drawn out implementation.

All the same, gradually, among all the factors which contributed to our ever increasing balance of payments burden, food imports assume the most prominent

place. An unfavorable balance of trade in agricultural and food products began to grow in 1975. For the decade the combined trade deficit in this sector surpassed 13 billion fxz. This was the result of faulty economic and social policies which did not permit an intensification of agricultural production and faced with poor harvests, did not stimulate the application of the necessary savings measures. Here we have the salient points of the trade deficit in specific years. The electric machinery industry achieved its peak in 1975--with over 6 billion fxz of trade deficit. In 1971 it amounted to barely 82 million fxz. Afterwards this branch gradually reduced its trade deficit to 166 million fxz in 1980 [sic]. The total trade deficit for electric machinery industry trade surpassed 29 billion fxz for the decade. Our steel industry is another branch which is gradually decreasing their debits. They achieved their peak in 1976. At that time their unfavorable trade balance in metallurgical products amounted to over 2.7 billion fxz, then began to gradually decline, so that in 1980 it actually achieved a trade profit of 631 million fxz. Total trade deficit for the decade was over 13.1 million fxz. Until 1973 trade in agricultural food products was in the black (183 million fxz). After that the deficit began to grow. The first billion fxz in the red appeared in 1976, by 1980 the deficit had surpassed 3.8 billion fxz and the total trade deficit for the decade was 13.2 billion.

In one branch a positive trade result was registered. Fuels and energy showed profit only in 1971 (924 million fxz), the greatest gains were registered in 1975 (2.8 billion fxz). In 1980 this branch earned 2.2 billion fxz and the total for the decade amounted to more than 19.2 billion fxz.

However, if we look at the total picture, the situation begins to be complicated. Export income during the first 9 months of the current year were reduced by 24 percent, as compared to a corresponding period of the last year. Expenses for imports from capitalist countries were 19 percent lower. This gradual decrease in net income makes an increasingly difficult repayments situation. In March this caused an increase in interest payments for foreign credit and made it necessary to start negotiations with the creditors on the subject of re-financing or postponing the terms of our debt repayment. The accords reached on these matters are known, however, one must not lose sight of the basic conditions. It is absolutely necessary to maintain a set level of export income and to insure a continuous control of that portion of our obligations which was not postponed. A further decline in exports--as noted in the above mentioned report made available to the press corps--may cancel the prospects to live up to the agreements which we have reached with our creditors.

To make this a complete picture, a brief note on our balance of payments with the socialist countries. This balance has also shown a gradual trade deficit increase. In 1980, the expenditures for imports from these countries exceeded our exports by 3.7 billion fxz. This was the direct consequence of shipments made of goods destined to aid Poland in overcoming the economic difficulties by socialist countries and principally the USSR. During the first 9 months of 1980, our export income was about 10 percent less than for the respective period of the previous year. At the same time our payments for imports rose by about 4 percent. Trade deficit reached a record high of 3.8 billion fxz.

To sum it all up, our indebtedness, as of 30 September 1980, amounts to 82.3 billion fxz, of that about 10 billion fxz is our debt to socialist countries.

Such picture provokes several after-thoughts, though only one conclusion: if we wish to endure, if we wish to receive additional, indispensable credits, then Poland must achieve a fundamental turn-around in export situation. Otherwise the flow of imports, without which we cannot do, will be curtailed.

VARIANTS IN 1982 ECONOMIC PLAN EXPLAINED

Krakow GAZETA KRAKOWSKA in Polish 2 Nov 81 pp 3,4

[Article by Z. Madej: "On the Draft of the Central Socioeconomic Plan: The Year 1982, a Variant of Fears, Hopes, or a Real Middle?"]

[Text] Thanks to a deputy's initiative last year, government representatives are requiring a new approach to plans, beginning with the year 1982.

Back during the stage of preparing the targets for the plan, we have the obligation of sending to the Sejm the government's intentions for the next year. This is consistent with numerous postulates concerning the need for deputies to participate in the structuring of future draft plans.

The initial targets for the draft of the central socioeconomic plan for 1982 are the first official planning document presented in variant form in the history of planning in Poland. It contains three probable trends in economic development in 1982: a variant of fears, hopes, and intermediate position, which could be called the variant of a real middle.

The first variant is more or less an extension in 1982 of everything which is presently going on in Poland. To maintain these trends would lead to a further decline in production, a worsening of living conditions, to the devastation of the economy, and, as a result, to its breakdown. This is why we call it the variant of fears. We hope that it will not gain the approval of the majority of the society and that the majority will actively combat the declining trends in the economy.

The second variant, the variant of hope, anticipates an economic revitalization, production growth, a rise in national income, and an improvement in living conditions. It is based on the potential and capabilities which currently exist in our economy. Nevertheless, the most important issue is the development of the sociopolitical situation in the country. The level of production activity of the society and its approach to work will ultimately depend on it.

The third variant, the intermediate variant, falls between the variant of fears and the variant of hope. It foresees a slowing of the trends of decline in economic development and the regathering and ordering of forces, in order to prepare the ground for gradual revitalization of the economy. We find ourselves in a period of grave social conflict. The situation is exceptionally unclear, and there is great uncertainty as to the future structuring of economic and political trends. For this reason, it is difficult to make any unequivocal statement concerning the shape of the future, even the immediate future.

Coal is currently the "starter" of the Polish economy. During the first quarter of this year we extracted 41.3 million tons, but extraction fell to 40 million tons during the second quarter, and this level was maintained during the third quarter. If these trends continued into 1982, the decline in coal extraction to 155 million tons would mean a further drop in industrial production of about 10 percent and a decline in national income of about 8 percent. For decades the Polish economy has been based on coal, which provides us with 70 percent of our power, and we do not have anything to replace it with in our exports either. A decline in extraction of more than 35 million tons in 2 years and a drop in exports to capitalist countries of 18 million tons, which at today's prices would amount to more than a billion dollars, would be a terrible blow to the economy. A further decline in extraction would create the danger of the economy's falling apart and could cause effects more serious than a natural disaster. Therefore, we must do everything to avoid this pessimistic variant's coming to pass.

The variant of hope foresees the extraction of 175 million tons of coal in 1982. There are real chances for this to come true.

With 175 million tons of coal, the value of production of industry as a whole could increase by about 5 percent in relation to this year, and national income would increase by about 2 percent. Exports could be upped by nearly 10 percent. This would be a visible sign of a turnaround in the economy onto the road of growth and a chance of getting out of the crisis.

What sorts of steps are being taken to play up this opportunity? Right this year employment in mining increased by about 12,000 persons, and it is expected to increase further. The government drafted and sent to the Sejm a draft of the law on retirement benefits for miners and their families, with a provision to reduce retirement age to age 50. It also issued an ordinance permitting retired persons to continue working without losing their retirement pay and exempting earnings for holiday work from compensatory tax. A production fund for additional remuneration of miners was created. The mining industry has a foreign-exchange fund amounting to 10 percent of the value of coal exports. Justified priority is given in distributing foodstuffs to miners.

The coal difficulties must also be resolved on the level of savings. The government has drawn up a program to rationalize the consumption of fuels and power. All immediate efforts should be aimed at seeing to it that about 3 million tons of hard coal are saved in 1982.

In our country brown coal, lignite, is an important factor in the fuel and power balance. The capacity for extraction of this coal in existing mines approximates 36 million tons per year. In 1982 extraction will be increased by another 2 million tons, in the Belchatow Basin.

Agriculture is an important sector of the economy upon which the fate of the country rests. Here too we have variants in conceptualizing the development of the situation in 1982. The variant of fears assumes certain adverse weather conditions and projects that crop production may be lower than in 1981. On the other hand, livestock production should be higher, because of this year's good harvests.

All efforts should be united to proceed in the direction of the variant of hope, but today we cannot say that this can be accomplished. After all, this year we had good yields and good harvests, but procurement of grain and animals for slaughter is going very badly. In our country we need about 6 million tons of grain for consumer purposes, but we procured only about 1.3 million tons of the total 4.2 million tons planned. If this trend continues into the fourth quarter and next year, then in this sector too the economy is getting close to that impassable barrier beyond which consequences similar to the effects of a natural disaster begin to appear. There is not enough grain for bread, and foreign-exchange for additional imports just is not there. A similarly dangerous situation may also occur in the area of livestock procurement.

What measures are intended to prevent this? Introduce in the autumn a system of linking commodity to commodity in trade between town and country. Further shifting of industrial production to meet the needs of agriculture. Provide incentives for the migration of people to work in agriculture. In foreign trade we find the following: a decline in the economy's export capacity, exceptionally burdensome indebtedness in the capitalist countries, and recent improvement in indebtedness to the socialist countries.

The variant of fears foresees exports on the level of 19 billion foreign exchange zlotys to the capitalist countries, which is less than this year's; imports from this area are targeted at a level of 15 billion foreign exchange zlotys, which is 27 percent lower than in 1981. The decline in imports will have an adverse impact on the supply of raw materials and other materials for industry.

In the variant of hope exports to the capitalist countries were projected at 23 billion foreign exchange zlotys, which is 19 percent higher than this year's figure. This corresponds to the growth projected in this variant for coal extraction, industrial production, and agricultural production. Our imports from the capitalist countries in this variant are expected to be on the level of 22 billion foreign exchange zlotys. This is based on the assumption that despite everything it will be possible to obtain credit to get the economy moving.

In exchange with socialist countries, we do not foresee very great differences from one variant to another. These relations are based on the most stable and long-term foundations. It is in our most vital interest to strengthen further our economic cooperation with the Soviet Union and other socialist countries.

If the current trends continue next year, with regard to the domestic market, the population's cash income will increase by about 380 billion zlotys but market deliveries would have to decline by between 140 and 150 billion zlotys. This would cause the market to break down completely and make it necessary to introducing a universal rationing system.

There is a disparity between the population's justified aspirations and needs and the real economic situation. Social considerations have called for, and are continuing to call for, a rise in wages and income, for the development of social benefits, but this growth was carried out last year apart from, and even contrary to, the course of production processes and during a period when there was a general decline in social labor productivity. The economic bond between town and country has been broken. Procurement has slowed. These trends can and must be counteracted.

In the variant of hope it is projected that the flow of money to the market will be half and that commodity deliveries will be larger. It is also anticipated that the retail price reform will be introduced for the prices of basic foodstuffs, fuel, and power. Compensation will be introduced for part of the society, but people earning in the higher brackets will have to bear part of the costs of this operation.

Next year we can expect a greater rise in production, especially that of confectionary products, pharmaceuticals, soap and hygienic items, underwear, clothing, and footwear.

This year the budget deficit will amount to about 200 billion zlotys, and next year it may even increase to 500 billion.

It is anticipated that the draft of the plan for 1982 will consist of two parts: a forecasting and information section and a targets section. The first part is to include forecasts of socioeconomic phenomena and will serve as the informational basis for the provisions of the central plan and one of the informational foundations for drafting the plans

of the enterprises. The second section will contain general economic figures of the central plan and operating programs concerning socioeconomic goals which have priority.

A special part of the plan will consist of operating programs concerning priority areas such as food, public health, exports, fuel, power and raw materials, deliveries to meet national defense and security needs, and so on. The execution of these tasks will be obligatory in nature.

Initial targets have already been worked out for the draft of the central socioeconomic plan. The materials have been sent to the deputies and also to more than 120 enterprises and to central agencies and the ministries. Next the ministries and banks will work on the individual parts of the draft of the plan. This work will continue to the middle of this November. Then there will be the drafting of the annual central plan, and after the Council of Ministers has reviewed it, it will be sent to the Sejm at the end of November.

On behalf of the basic interests of the nation, we must put an end to the confusion. Now it is not merely the considerations of the political regime but also social and even biological considerations which make it impossible for the economy to keep testing ambitious, political games.

DISCUSSION OF PRIVATE CAPITAL IN SOCIALIST SYSTEM

Belgrade KOMUNIST in Serbo-Croatian 6 Nov 81 p 9

[Article by Esad Zgodic: "Opportunities for Self-Reproduction of Private Capital in Yugoslavia"]

[Text] It seems that neither our theoretical thought nor practical political thinking has been devotedly vigilant on the question of how great the possibility is for private capital, in spite of all the public supervision, to take on the attribute of a social force that has become independent, that is, to articulated interest, in either an organized or spontaneous way, as an autarkic factor in our political reality, a factor relevant to the system. After all, it is well known: private capital, especially in certain highly accumulative forms of its existence, once it has been created, is not scrupulous about either the methods or means of its self-reproduction. Put more simply, no social system can impose a level of taxation or other forms of restriction on private capital equal to its ability, carried forward by the logic of its nature, to reproduce itself. It is a fact that to some extent privately owned capital is socially organized in the political system of socialist self-management: it has its associations, but it is also incorporated into the delegate-political system as a whole (for example, through delegations in assemblies of sociopolitical communities). It is thereby acknowledged not only as an economic agent, but also as a political agent, an agent, of course, with a socialist orientation.

Private Capital Cannot Be Judged Solely on the Basis of Statistics

So, to whatever extent the interest of private capital has been legalized as one of the interests in the pluralism of self-management interests, and to whatever extent that interest is realized through the legal institutions of the political system of socialist self-management, which, of course, constitute both limits on development and forms of social oversight, the question still remains whether our political self-consciousness is in part making concessions to private capital, according it the honor of being if not a social force that has become independent, then at least an important social force with a cooperative function? Have we in theoretical terms, in our social science, and in practical political terms thought out the limits on and prospects for development of private capital? This demand that the social status of private capital be judged from the standpoint of its future prospects, rather than from the standpoint of the pragmatic social concerns of the moment, should not cause any bewilderment in view

of the fact that it is possible for private capital to develop on self-management foundations. Which means that this question also implies a need for thought to be given to the question: Can our experience in developing certain forms of private capital--for example, under the heading of contract organizations and the like--basing itself on manufacturing organization and the division of labor, become a relevant form of production on self-management foundations?

Caution and the fear of developing private capital beyond the limits of socialist capital are often answered in our public with the tale of how private capital is on the one hand a function of the development of socialized production (in the sense of cooperation), while on the other it can become excessively rich only through dishonest operation and unlawful speculations. That is, of course, true, but the fact that speculation is inherent in the nature of the self-generation of private capital is forgotten in such tales. There is no reason for that nature of private capital to be modified either by the logic of moralizing or by the strength of a social force. So, this question specifically implies the need to think out the manner in which we will treat the particular sectors of that capital both in the news media and also in other forms of organized political interest. It is certain that there are quite a few examples which demonstrate that this attitude ranges from dogmatic rigidity to uncritical liberal support.

We do not judge the development of our private capital solely on the basis of statistical data on the number of citizens who are, in the conventional jargon, working with the means of labor which are their own property. This development can also be monitored in terms of the kind of external manifestations and organizational forms private capital is taking on. One such manifestation is the phenomenon of the growth and organization of that capital through manufacturing organizations of a kind that are formed on a family basis. This is not a question of passing on a "trade" from father to son, but of a phenomenon in which nuclear or extended families reproduce their capital by taking over a particular sector of production after the pattern--from the needle to the thread. What is it but a small manufacturing company (with new content and relations, of course) when a family in the broad sense "produces" everything necessary for a human burial [original reads "nutrition"], from the wreath and the coffin to the death certificate. That is indeed the name of the game: it is easier to maintain a monopoly that way. And monopoly is the heart of it--the machine for self-reproduction of capital. Monopoly and other forms of threat to the interests of socialized labor are not created solely on this basis.

Perhaps even inflation has some relation to the strengthening of capital in the private sector, at least to a minor extent. That is, the question might be put: Have we, and to what extent have we thought about the degree of impact which the large power of private capital as a consumer, especially of certain of its sectors--tavernkeepers, hotel owners, dredging machine owners, private truckers, merchants, etc.--is having on creation of the fever of consumerism and on creation of the needs of the market, which are needs only in appearance, by contrast with the ordinary citizen's power as a consumer? If we add to this the power of Yugoslavs returning from employment abroad as consumers (and of those who have not yet returned, but are spending foreign currencies at New Year's and

on other occasions, when they all but empty the shops), as well as the power as consumers of other strata in society which occupy a high place in the distribution of material power, then it is understandable that the illusion of the size of our citizen's power as a consumer is growing. It is sometimes forgotten in this connection that the vigorous and advertised recent social campaign to raise the standard of living of workers with the lowest personal incomes was not only politically motivated or borne along solely by the ethics of humanistic solidarity; it was also in part an economic imperative insofar as its purpose was to guarantee adequate reproduction of creative manpower as the basic precondition of production itself.

Are We Acquainted With the Informal Social Power of Private Capital?

Certainly one of these questions is this one: To what extent have we thought out in theoretical terms the informal social power of private capital, to what extent do we have a political self-awareness in this field, and to what extent have we made a practical study of the informal social power of private capital; and then, why is it that all of a sudden private capital has become so attractive that, for example, teachers are leaving schools and opening little cafes, physicians are building restaurants, and well-known athletes are going back to the business of the private sector, and so on? These questions concerning the value aspects of the social status of our private capital also urgently require that we develop a critical awareness of a mythology which is being popularized ever more shamelessly: a myth is being created about the private sector in which there are more and better earnings. But that mythology, which links "private" and "business" into an indissoluble association, that myth of the private as being economically and socially the most productive, also makes its entry by other channels, above all via the uncritical reification of the world of private capital in the West, which is still the economic ideal for the bourgeois consciousness, but still an ideal which is always sullied to some extent with petty elements of immorality, exploitation and alienation. So, attention also deserves to be paid to this question: What are the repercussions on our value system of the success of our private capital on the one hand and on the other of idolatry of the bourgeois world (not only through fashion, taste, art, show business, life style, the sex industry, etc.) through an idealized conception of the welfare state and of that world of private capital? Of course, we do not regard the private domain as the only, nor even the essential source of elements of bourgeois restoration at the level of values, but its influence in the period of its legally restricted rehabilitation should not be overlooked. Which is why this moral dimension which it has will quite frequently be a topic of reflection for our committed theorists.

All these questions should not, of course, be taken as a demand for organizing a crackdown on the private sector. But at the same time there is both in theory and from the standpoint of our society's historical development the question of whether the time has not come (avoiding all blaring alarmism) to put the question in the focus of critical social self-consciousness, without hypostasizing this phenomenon, of limits on the development of private capital on "self-management foundations," that is, of limits this side of expropriation, i.e., of a new revolutionary act. When we speak about the development of the private sector within self-management, it is in the terms of the historical future that we

are thinking; so that it is that future which we are judging, and not merely the present or some short-term period. This question, then, does not imply insistence on any interdiction or isolated examination which would divert scientific and political consciousness from the central issues of the future development of socialist self-management. Note should also be taken that the fact that the countries of eastern socialism are opening up room for private farm plots cannot be taken as a possible contribution to our policy toward private capital either, since that is something else.

There Is a Need To Establish the Status of Private Capital and the Limits on Its Development

We feel that through its committed journalistic activity KOMUNIST could make an evident contribution not only to our theoretical thought, but also to political practice in the sense of awakening motivation and in the sense of concentrating attention. After all, the seriousness of these issues derives from the fact that the republics and provinces, except in the domain of fundamental principle, are to some extent conducting a differing policy concerning the social status and development potential of private capital (which, of course, we refer to in more carefree terms). What all this could mean is a question in and of itself: From the concentration of capital in one area to a demand for its expansion? An expansion which arises through demands for legalization of new forms of private capital: bus service, private galleries, private bookstores, private stores, medical and dental practice, and so on. And where are the limits and what are the consequences, not in the context of now, but in the context of tomorrow, in a historical perspective, from the standpoint of the goals of the revolution? In putting questions in this way, we turn aside all ominous foreboding or tendentious prophesy. This is just a question of the need for the status of private capital and the limits on its development (assuming private capital is necessary in the first place) to be defined in theory and policy on an ongoing basis within the terms of the crucial substance of our social community--socialist self-management.

PROBLEMS IN IMPLEMENTING IFC PROGRAM FOR SMALL BUSINESS

Belgrade RAD in Serbo-Croatian 13 Nov 81 p 3

[Article by V. Miljkovic: "I Want the Dollars, But Then Again Maybe I Don't"]

[Text] The IFC (International Finance Corporation) approved a loan back in mid-1980 amounting to $32 million for our small business. A contract was in fact signed, but an entire year passed before the first tranche amounting to only $1.2 million was withdrawn. It is expected that by the end of this month we will withdraw the second tranche in the same amount. All in all, in 16 months we have managed to use slightly more than $2 million, which is a negligible amount by comparison with what stands available to us from that international institution.

At the time when the contract was signed, we stressed that the line of credit from the International Finance Corporation was a good stimulus for development of our small business. We did not hold back in our assessment that these investments would speed up the involvement of small business in export transactions, import substitution, as well as greater abundance of supply on the domestic market.

One had the impression that we were well organized. The Bank of Ljubljana was acting as the agent, and every republic and province delegated to the consortium one commercial bank which would take over $4 million of the loan and assume a commitment to furnish additional dinar funds in twice that amount. We obtained the loan on favorable terms and conditions: an interest rate of 11 percent, a repayment period of 9 years, and a period of 3 years before repayment begins.

Our Desires Are To Be Carried Over Into Programs

It was expected that we would invest these funds in small projects which would be set up quickly and would become profitable in a short time. There was also good reason to suppose that we would have an abundance of opportunities to invest. It turned out the opposite--we had nowhere to put the money.

Were the slow use of this loan motivated by thrift, there would be every justification. The reason for the lateness, however, lay in the poor cooperation among the banks, the economic chambers and associated labor. The lateness was

because this effort was avoided on behalf of easier jobs, because we were not ready enough to undertake a vigorous effort to resolve a number of problems that have arisen.

The first oversight was committed when we entered into signing the contract on the loan when we did not have projects already. We did not examine precisely what projects we would invest the money in, nor what equipment we would obtain on the domestic market and what equipment we would have to import, how we would regulate import rights relative to the power system, and above all we did not consider who would be responsible for those investment projects. Since we did not have projects ready, we could not expect the commercial banks to provide the dinar funds to which they were committed. Thus we had at least two solid reasons for letting the line of credit lie idle.

Yet one would say that the role of the banks in our society cannot be reduced to the passive appropriation of funds. Our commercial banks should have been helping the economy more vigorously in selecting and developing programs. It is well known that entire teams of specialists worked on so-called "new products" in the largest banks in the world. In our own context the banks would make an essential contribution to stabilization were they to propose lucrative programs and to furnish the funds for them.

This did not, of course, diminish the responsibility of associated labor and the economic chambers, which should have cooperated better in drafting programs. We have a great number of experts, and we have also gained a great deal of experience. We are known in the World Bank--and the IFC is an affiliate of the World Bank--as a developing country which submits highly competent and extremely well documented projects, but we fell short on projects for our small business.

The Computer Is Waiting for Lists

On the whole we know what we want from small business; this we have clearly set forth in the social plan. We have agreed that we want to build new projects in small business and to expand and modernize existing ones for production in cooperation with large-scale industry, for production which will augment exports and reduce imports, and which will open up new jobs. We have agreed that large systems would be vehicles for the plans for small business and that in this way they would ensure their more profitable business operation and regular supply of small semifinished products.

Yet for something new to be planned, we should first know what we have available in the small business sector and how these plants are operating and what results they are achieving. Unfortunately, these figures do not exist. Small business is registered in the statistics lumped together with the entire economy, since the Social Accounting Service and statistical bureaus did not receive in good time the lists of those enterprises so they might put them in a separate column. The train has already been missed for last year--the pages have been removed from the computer. Hope remains that it will be possible at least for this year, on the basis of the year-end statements, for the data on small business to be given separately in statistical reports.

No one can specifically compute whether the programs for small business can survive that long and what the consequences of the delay will be. In the meantime it remains for associated labor to muddle through with the scanty information and to use it to improvise large programs for small shops.

Since the programs are late, the loan is hardly being used, and the 3-year period before repayment begins, which started at the moment when the contract was signed, is passing. That means that one advantage is losing its value: it is not a matter of indifference whether repayment of the loan begins when an operation is already running smoothly and is profitable or when it has just gone into production, or, still worse, while it is in the construction phase.

The pity is all the greater that the few programs we have managed to complete show that the effort was worth the trouble. Among other things, this can be easily seen from the example of the onyx and travertine mine in Svetozarevo, which has already been opened with funds from this line of credit, and 50 percent of the output is intended for export.

Is a New Line of Credit Justified?

In approving the first credit for our small business, the International Finance Corporation has announced its willingness to allocate new funds for this purpose at the end of this year in the amount of $65 million. How much sense would it make for us to enter into the new arrangement when we have not been quick enough in making use of the one already concluded. After this experience will the IFC be willing to undertake new negotiations? The creditor's decision must be based on the results achieved to date in discharging the provisions of the existing contract and on figures on the benefits from the investments which have been made.

As matters stand at present, we will have to wait a bit longer for the results of the investments, and it cannot be said that performance of the provisions of the contract has been going smoothly. That is, it is well known that the IFC is interested in encouraging investments in private plants, and thus it was stipulated that the loan for our small business was to set aside 20 percent of the funds for activities conducted on the basis of self-employment.

At first glance this would not seem to present any problems. Our constitution provides for self-employment as well as for establishment of associations between independent activities in the private sector and work organizations through various forms of cooperation and other types of collaboration. We have indeed sound experience in this. To be sure, the latest available figures are for 1979, but it is worth stating that even at that time Yugoslavia had 167,841 self-employed persons, otherwise referred to as private entrepreneurs. In addition, they employed 78,353 workers. A calculation was even made that this form of activity has been making quite a contribution to creation of new jobs. It was envisaged for the planning period from 1976 to 1980 that employment in activities in the private sector would increase at an average annual rate of 8.1 percent, but the actual rate was only 4.1 percent.

In view of these facts it remains explicable why a problem has arisen in using that portion of the line of credit intended for activities in the private sector. It is true that under the Law on Foreign Exchange Transactions private entrepreneurs cannot be actual recipients of a loan in foreign exchange. Moreover, they cannot be furnished foreign exchange to repay a loan, since they are not direct exporters. Another problem lies in differences in rates of exchange which occur in connection with repayment of the loan, as well as in qualifying for rights under the tariff regime to import equipment. But the problem is considerably more simple if advantage is taken of the possibility offered by the agreement on the contract organization with work organizations and trade organizations. In the case of this loan, Vojvodina quickly overcame the problem for subcontractors of Merkur of Ada. SR [Socialist Republic] Croatia also proposed a solution through the Work Organization Itas of Kocevje. There is every indication that the problem can be solved, but still the effort to solve it has been going slowly.

We do have self-managing communities of interest for cooperation with foreign countries, and we do have economic chambers and the banks. All these institutions were established to help associated labor, to become involved in establishment of links and collaboration. All of them together have the capability first to provide the programs and to find all the administrative solutions, and then to sign contracts on international loans. As it is we have built up a pile of loans; if in addition we make ineffective use of them, they will do more harm than good.

'UNCONTROLLED' LEASING OF FARMLAND IN VOJVODINA

Belgrade KOMUNIST in Serbo-Croatian 6 Nov 81 p 7

[Article by Branko Krstin: "Land Policy: The Law Is 'Turning a Blind Eye' on Offenders"]

> [Text] In the interest of stability and organization in food production the time has finally come to put a stop to the uncontrolled leasing of land, to abuse and to the bending of regulations, which have taken on large proportions in Vojvodina.

A merchant cultivates 72 acres of land--which exceeds the maximum fourfold for a farmer and more than 14.5-fold for someone who is not a farmer!

However much this datum--presented in a meeting of the regional economic chamber in Zrenjanin attended by representatives of eight Central Banat opstinas--deserves to be put in some "believe it or not" newspaper feature, it never will be. Not because there is no such feature, but primarily because there are people who believe that this case is no exception at all, nor even a record. There are no altogether precise data on this in any opstina in Vojvodina, since all this is done very cleverly on a "one-to-one" basis, and the inspectorates themselves are not effective enough. Usually the discussion concerns young farmers who are well equipped with machinery and who cultivate their own, their father's, their mother's, their brothers', their sisters' land, a few hectares of their nearest neighbor and several acres of their closest friend or of a farm belonging to elderly people. But there are also examples where agronomists, tractor drivers, or officeworkers buy or rent land and cultivate that land of theirs or someone else's with equipment that is owned by society. Many take advantage of their job to obtain supplies more quickly and sell their goods on favorable terms, bypassing even the organization of cooperators. There are similar trends in the production of fattened young beef cattle, hogs and broilers. Nor is it rare for these "agricultural specialists" to include economists, lawyers, merchants, teachers, craftsmen and tradesmen, and others for whom food production is not their official occupation and who often use even hired labor, and indeed even credits under the Green Plan.

It is very difficult to obtain data on all this from the opstinas. But here are some of the most significant figures.

A certain veterinarian manages apart from his job to fatten as many as 150 hogs at a time. In Zabalj Opstina there are 52 employed persons who are tilling more land than the maximum allowed by law. In Novi Sad there are two supervisors who are renting 10 hectares apiece. In Pecinci there are 84 employed persons cultivating more than the allowed maximum, and in Senta 3 workers at the sugar mill are renting 52 hectares of socialized land. In Kikinda a pensioner is cultivating 40 cadastre acres, a cabinetmaker 50, and a private tradesman all of 80. A kind of record is held in this group by the manager of the farm machine pool in Vrbas, who is renting between 50 and 60 acres of land, and he even has 2 combines!

How Are We Managing the Land?

Just these few figures, along with the fact that the list is not complete nor altogether precise, clearly indicates that there is quite a bit of laxity in land management. After all, it is not difficult to conclude that all those who are renting sizable areas without being hampered or are farming in their "free" time as the most progressive "pure" farmers--are committing an extremely large number of offenses. Since there are no precise data on their work, we must believe that they are not discharging their tax obligations, they are endeavoring to derive as much as possible from the land with a minimum of investment, whereby they are ruining the land, and most often they are planting their crops and selling the harvest aside from all plans and the organized market. In so doing they are disrupting the efforts which are supposed to lead us toward greater stability in production and in better supply of the market.

Someone will perhaps say that for now it is better to "look the other way" and even allow this kind of production than for large areas to be left fallow. But that would mean reconciling ourselves to a breaking of the law which would make it possible for individuals to find a way to cultivate more land and own more machinery than certain OUR's [organization of associated labor] of cooperators. Especially when it is not possible to bring about the increase in food production that is so needed and the development of agriculture in rural areas because of the disorganized production and uncontrolled renting of land. The trouble is that the people who are farming in their "free" time and cultivating rented land are mainly those same people who are receiving their personal incomes for forming farmers' associations, for granting pensions to elderly people with farms, for organizing and augmenting the production of industrial crops and for all the other things which are characteristic of a modern agriculture. Finding themselves at that crossroads, a majority decides to work more vigorously on "their own" holding. Recently a farmer in Kula said: "How is an agronomist going to come to my field when he has so many problems on his own, which is larger than that of the OUR of cooperators!"

This excessive interest in "their own" holding also probably accounts for the very frequent phenomenon of a lack of interest which those employed in socialized agricultural organizations show in the jobs through which they obtain their

personal incomes. How otherwise to explain the fact that the number of associated farmers has not advanced beyond the initial success either in content or in numbers and that only about 5,000 hectares have been obtained by awarding pensions to elderly owners of farmland, while the planning target was 100,000 hectares. Whereas, for example, the Kikinda, Zrenjanin and Zitiste opstinas have managed to create conditions under which more than 400 associated farmers are paying for old-age and disability insurance, this kind of protection against old age has been chosen by only 2 farmers in Mali Idjos Opstina, only 1 in Alibunar Opstina, and not a single farmer in Titel Opstina. One can on that basis put the question: Is it possible that there is not a single farm household consisting of elderly members, often without heirs, that wishes to relinquish its land for a pension in Alibunar, Backa Palanka, Backi Petrovac, Bela Crkva, Beocin, Irig, Srbobran, Stara Pazova, Temerin and Sid? Why is it that in 12 opstinas there is not a single farmer who is not a member of an association that would agree to pay for disability and old-age insurance, so that Sremska Mitrovica Opstina, which has only 28 farmers signed up, is regarded as the most successful one?

How Much Does Land Cost?

The answer to these questions usually lies in the almost improbable attitude of those employed in socialized agricultural organizations toward farmers. Recently the "specialized staff services" in Kikinda, when they were bringing previous pension contracts into conformity with the provisions of the supplemented law, calculated that in 1978 land was more expensive than today, though it is well known that in recent years there has been an outright scramble for land. A characteristic example is that of the elderly woman in Melenci who was awarded a monthly pension of barely 2,040 dinars in exchange for 3.5 hectares. Had she leased that same land out for a year, she would have received perhaps three times as much. There are probably other similar examples among the 1,944 pensions awarded to elderly owners of farmland, since in exchange for an average of 2.5 hectares they have received monthly pension benefits averaging only 1,577 dinars. There is good reason, then, to put the question: How bad, remote or broken up must a landholding be, and these are the terms usually used by the socialized organizations, to have such a low value? Rather it might be said that the 56,000 persons employed in socialized organizations, whose average earnings are about 10,000 dinars, are wrapped in a cloak of self-satisfaction through which they are unable to see how elderly farm people are living with a minimum pension of only 890 dinars.

There Is No Stabilization Without the Private Farmers

Food production at present requires much more stability and organization if the goals of economic stabilization are to be achieved, and this does not apply to Vojvodina alone. Without the private farmers who own 60 percent of the plowland and two-thirds of the livestock population in Vojvodina, it is an illusion to think about achieving any of the goals agreed on. Especially since augmentation of food production cannot be achieved by developing new land, but only by more complete, optimum and sensible use of the existing natural resources. That is why it is possible to count on an increase in food production only if better use

is made of the 300,000 hectares on farms where the owners are elderly and of the approximately 1 million hectares of private farms and their livestock population. By no means can this be done through uncontrolled leasing of land, through abuses and through lawbreaking.

No one can violate the law beyond what we allow him to. It seems that recently we have been allowing too much.

List A/1980 (continued)

1	2	3	4
17	Parquet flooring	Thousands of m^3	14
18	Miscellaneous wood products	Thousands of dollars	130
19	Cement	Thousands of tons	20
20	Consumer goods	Thousands of dollars	50
21	Handicrafts	"	800
22	Books, school supplies, phonograph records, etc.	"	100
23	Tomato paste	"	50
24	Essential oils	"	400
25	Medicinal herbs	"	1,000
26	Sage oil	Tons	7
27	Rosin	"	600
28	Turpentine	"	50
29	Cognac	Thousands of dollars	500
30	Tobacco	Tons	2,000
31	Bay leaves	"	10
32	Tropical fruit	Thousands of dollars	130
33	Dried fruit and vegetables	"	250
34	Services	"	100

List B/1980. Exports From the Socialist Federal Republic of Yugoslavia to the People's Socialist Republic of Albania

No	Commodity Designation	Unit of Measurement	Quantity or Value
1	2	3	4
1	Reinforcing steel	Tons	2,000
2	Structural steel	"	1,000
3	Steel rails and connecting plates	"	2,300
4	Steel cable	"	500
5	Omnia strip	"	190
6	Rolled lead products	"	112
7	Rolled zinc products	"	100
8	Lead alloys	"	300
9	Refractory brick	"	8,000
10	Electrodes	Thousands of dollars	200
11	Ferroalloys	Tons	350
12	Ferromanganese for blast furnaces	"	900
13	Ferrosilicon	"	1,500

List B/1980 (continued)

1	2	3	4
14	Ferrochromium	Tons	140
15	Molding sand	"	1,900
16	Asbestos	"	2,100
17	Chain	"	130
18	Steel bottles	Units	2,700
19	Cotton	Tons	2,500
20	Unwashed wool	"	80
21	Synthetic yarn	"	85
22	Heavy hemp rope	"	96
23	Light hemp rope	"	240
24	Calfskin	"	200
25	Paraffin	"	200
26	Dibasic calcium phosphate	"	400
27	Bakelite	"	68
28	Sodium perborate	"	133
29	Glue	"	65
30	Formalin	"	500
31	Muriatic acid	"	1,000
32	Butyl xanthate	"	55
33	Ethyl xanthate	"	35
34	TNT	"	1,200
35	Dynamite	"	470
36	Primers for hunting ammunition	Thousands	2,200
37	Sickles and scythes	Thousands of dollars	179
38	Cloth and jute bags	"	37
39	Fire hose	"	150
40	Rubber hose	"	30
41	Asbestos products	"	200
42	Gear and equipment for industrial safety	"	26
43	Felt for the paper industry	"	300
44	Thread and other goods sold by the meter	"	800
45	Petrex and activators	"	22
46	Cardboard	Tons	350
47	Adhesive tape	Thousands of dollars	170
48	Upholsterer's nails	Tons	14
49	Ammunition for target shooting	Thousands of dollars	32
50	Glass pharmaceutical containers	"	43
51	Wrapping paper	Tons	69
52	Oxalate paper	Thousands of m^2	475
53	Inserts for packing eggs	Thousands	650
54	Stencils and other office supplies	Thousands of dollars	100

List B/1980 (continued)

1	2	3	4
55	Screws and bolts	Thousands of dollars	109
56	Shoeing nails	Tons	19
57	Galvanized drums	Units	640
58	Athletic shoes	Pairs	1,683
59	Edible sunflower oil	Tons	7,000
60	Offset paper	"	170
61	Aluminum foil	"	200
62	Cork paper	"	77
63	Extract for the soap industry	"	1
64	Cosmetic raw materials	Thousands of dollars	128
65	Adhesives for cigarettes CFU	Tons	80
66	Corks for bottles	Thousands	7,000
67	Pharmaceutical raw materials	Thousands of dollars	200
68	Livestock for breeding and young fowl	"	27
69	Screen or netting for pheasant enclosures	Thousands of m^2	76
70	Household refrigerators	Units	2,000
71	Unassembled television sets	Thousands of dollars	1,750
72	Fittings	"	400
73	Antifriction bearings	"	500
74	Pumps	"	126
75	Abrasives	"	250
76	Brake and clutch lining in rolls	"	200
77	Drive chain	"	300
78	Electronic tubes	"	420
79	Spare parts for television sets	"	110
80	Laboratory equipment and measuring instruments	"	113
81	Electric motors	"	125
82	High-voltage equipment	"	240
83	Power transformers	"	1,250
84	V-belts	"	56
85	Firefighting equipment	"	86
86	Spare parts for tractors	"	158
87	Other spare parts	"	400
88	Control panels and measuring instruments	"	95
89	Mining hammers	"	66
90	Miscellaneous	"	200
91	Services	"	800

YUGOSLAV-ALBANIAN TRADE LISTS FOR 1981

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 12, 27 Oct 81 MEDJUNARODNI UGOVORI pp 800-802

[Decision ratifying the trade protocol between the Government of the Socialist Federal Republic of Yugoslavia and the Government of the People's Socialist Republic of Albania for 1981, with appendices, signed in Belgrade 14 July 1980]

[Excerpt] List A/1981. Exports From the People's Socialist Republic of Albania to the Socialist Federal Republic of Yugoslavia

No 1	Commodity Designation 2	Unit of Measurement 3	Quantity or Value 4
1	Chromium ore	Thousands of tons	265
	Kamtropos alone	"	65
2	Liquid asphalt	"	30
3	Natural asphalt	"	4
4	Petroleum coke	"	p.m.
5	Petroleum derivatives	"	30
6	Electric power	Millions of kwh	700
7	Copper wire	Thousands of tons	300
8	Sea salt	"	25
9	Zirconium concentrate	Thousands of dollars	100
10	Naphthenic acid	Tons	25
11	Cotton fabrics	Thousands of meters	700
12	Machine-made garments	Thousands of dollars	1,500
13	Knitwear	"	250
14	Cement	Thousands of tons	30
15	Urea	"	1

List A/1981 (continued)

1	2	3	4
16	Sulfuric acid	Thousands of tons	1
17	Sodium silicofluoride	Tons	200
18	Colophony	"	50
19	Miscellaneous chemical products	Thousands of dollars	200
20	Wood products and parquet flooring	"	150
21	Products of handicrafts and the like	"	1,500
22	Plate glass	"	p.m.
23	Tobacco	Tons	2,000
24	Cognac	Thousands of dollars	500
25	Essential oils	"	300
26	Medicinal herbs	"	1,000
27	Rosin	Tons	500
28	Tropical fruit and dried fruit	Thousands of dollars	500
29	Fresh vegetables	"	p.m.
30	Measuring instruments	"	100
31	Blooms for rolling	Tons	p.m.

List B/1981. Exports From the Socialist Federal Republic of Yugoslavia to the People's Socialist Republic of Albania

No 1	Commodity Designation 2	Unit of Measurement 3	Quantity or Value 4
1	Railroad rails	Tons	2,400
2	Reinforcing steel	"	8,000
3	Structural steel	"	4,000
4	Pipes for compression pumps	"	1,000
5	Pipes for the petroleum industry	"	1,650
6	Other steel pipe	"	4,000
7	Cast pipe	"	550
8	Steel cable	"	1,230
9	Bronze in ingots	"	500
10	Lead in ingots	"	300
11	Aluminum in ingots	"	300
12	Aluminum products	"	200
13	Alloys of nonferrous metals	"	620
14	Bronze alloys	"	360
15	Copper alloys	"	320
16	Brass alloys	"	200
17	Refractory materials	Thousands of tons	10

List B/1981 (continued)

1	2	3	4
18	Ferroalloys	Tons	5,100
19	Electrodes	"	2,000
20	Asbestos	"	2,500
21	Technical oils and lubricants	"	750
22	Cotton	"	3,500
23	Miscellaneous explosives	"	2,700
24	Printing paper and stationary	"	300
25	Paper containers	"	200
26	Cardboard and pasteboard	"	300
27	Unscoured wool	"	100
28	Synthetic fibers and yarns	"	250
29	Raw hides	"	300
30	Miscellaneous goods sold by the meter	Thousands of dollars	1,000
31	Consumer goods	"	700
32	Pharmaceutical products	"	130
33	Table clocks	"	170
34	Formaldehyde	Tons	500
35	Hydrochloric acid	"	2,500
36	Miscellaneous rubber hose	Thousands of dollars	450
37	Felt for the paper industry	"	1,000
38	Sewing thread	"	300
39	Miscellaneous chemical products	"	1,250
40	Dibasic calcium phosphate	Tons	450
41	Glue	"	70
42	Paraffin	"	420
43	PVC resin	"	280
44	Talc	"	600
45	School supplies	Thousands of dollars	150
46	Heavy and light rope	Tons	450
47	Detonators	Thousands of dollars	450
48	Sand	Tons	5,700
49	Edible oil	"	4,000
50	Powdered milk	"	330
51	Paper for the cigarette industry	"	400
52	Glue for cigarettes CFU	"	60
53	Concentrated feed for broilers	"	200
54	Drugs	Thousands of dollars	300
55	Electric motors	Units	100
56	Pumps	"	50
57	Refrigerators	"	5,000
58	Antifriction bearings	Thousands of dollars	1,800

List B/1981 (continued)

1	2	3	4
59	Miscellaneous spare parts	Thousands of dollars	850
60	Unassembled TV sets	"	1,100
61	Machines and equipment	"	1,150
62	Abrasives	"	220
63	Clutch and brake lining in rolls	"	230
64	Fittings	"	600
65	Equipment for transformer substations	"	1,200
66	Laboratory equipment and messuring instruments	"	950
67	Miscellaneous products	"	950
68	Services	"	1,000

YUGOSLAV-USSR COMMODITY TRADE LISTS, 1980

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 12, 27 Oct 81 MEDJUNARODNI UGOVORI pp 752-758

[Decree ratifying the trade protocol between the Socialist Federal Republic of Yugoslavia and the Union of Soviet Socialist Republics for 1980, with appendices, signed in Moscow 12 December 1979]

[Excerpt] List 1. Goods To Be Delivered From the USSR to the SFRY in 1980

Commodity Designation	Quantity or Value	
Metal-cutting machine tools	237	Units
Forging machines and presses	29	"
Spare parts for machines tools, forging machines and presses	150	Thousands of dollars
Factory equipment for motor vehicle manufacturing (machine tools)	6	Units
Steam boilers with a capacity of 25 tons of steam per hour	2	"
Devices and spare parts for power equipment, including rotor elements for steam turbines	230	Thousands of dollars
Miscellaneous power generating equipment (equipment for boilers)	80	"
Electric motors for rollers (roller conveyor motors)	340	Units
MFI-6-0.25 electric furnace	1	Unit
Parts of glass suspension-type insulators	400	Thousands of units
Low-voltage equipment	1,230	Thousands of dollars
Model CPK-2 tunnel-cutting combine	5	Units
Model PPN-18 loading machines	5	"
Drilling machines and equipment as follows:		
ZIF-1200MR	1	Unit
UBV-600	1	"
1BA-15N	3	Units
UGB-50	6	"
Miscellaneous equipment for drilling and for the petroleum industry, including spare parts	800	Thousands of dollars

List 1 (continued)

Commodity Designation	Quantity or Value	
Truck cranes as follows:		
KS-4561A	15	Units
K-3562	15	"
Model TO-18 loader	1	Unit
Equipment for the food manufacturing industry	400	Thousands of dollars
Spare parts for oxygen equipment	300	"
Wavy unit [(?) rolling mill] with spare parts	1	Complete unit
Woodworking machines	23	Units
Dredges as follows:		
EO-3322A	3	Units
EO-2621A	10	"
E-10011D	5	"
E-304B	2	"
E-1252	4	"
ETC-252	5	"
ETC-202	6	"
ETC-165	8	"
EKG-4.6	3	"
Spare parts for dredges	1,000	Thousands of dollars
Self-propelled road graders, 90 HP, DZ-99A 1 (D-710B)	3	Units
Self-propelled road graders, 130 HP, DZ-31-1 (D-557-1)	2	"
Self-propelled road graders, 250 HP, DZ-98 (D-395)	5	"
Bulldozers mounted on the T-130 tractor, 160 HP (DZ-110A)	22	"
Bulldozers mounted on the DET-250 tractor, 300 HP (D-572)	2	"
Self-propelled scrapers, scraper capacity 8 m^3, D-357P1	5	"
Asphalt mixers D-508-2A, 25 tons/hr	2	"
DS-126 asphalt-paving machines	5	"
Spare parts for roadbuilding machines	2,000	Thousands of dollars
Kama-3 pumps	30,000	Units
2H-6T (H20/81-T) pumps	2	"
Spare parts for 2H-6T-1 (H20/81-T) pumps	3	Thousands of dollars
VOD-21 fans	2	Units
Equipment for the printing industry, including spare parts and matrices	2,800	Thousands of dollars
Equipment for stores and the food service industry	140	"
Black-white television picture tubes	160	"
Communications equipment	115	"
Instruments as follows:		
Electrical measuring	230	"

List 1 (continued)

Commodity Designation	Quantity or Value	
Radio measuring	150	Thousands of dollars
Hydrometeorological	315	"
Optical	300	"
Rescue equipment	100	"
Cinematographic equipment	100	"
Binoculars	530	"
Stopwatches	75	"
Antifriction bearings	5,380	"
Medical equipment and instruments	300	"
Metal-cutting tools	920	"
Abrasives	15	"
Synthetic-diamond tools	1,600	"
Hard alloys	1,000	Kilograms
Tractors as follows:		
T-25A1	1,200	Units
T-40AS	1,200	"
MTZ-82	600	"
K-701	30	"
T-150K	30	"
Agricultural machines	500	Thousands of dollars
Spare parts for tractors and agricultural machines	5,000	"
Workshops and garage equipment as follows:		
Model 3903 mobile workshops	10	Units
Model PRM-1 mobile workshops	2	"
Pieces of equipment for technical servicing as follows:		
ATO-9966	2	"
Garage equipment	325	Thousands of dollars
ER-31 electric motor trains	8	Complete sets
Trolleybuses	32	Units
Devices and spare parts for railroad equipment	300	Thousands of dollars
Trucks as follows:		
BELAZ-540A	10	Units
BELAZ-548	10	"
MAZ-5549 chassis	400	"
KRAZ-256B chassis	445	"
KAMAZ-5410 chassis	150	"
KAMAZ-5511 chassis	100	"
Dnepr' series dry cargo ship with a capacity of 13,500 tons	1	Unit
Ro-Ro vessel with a capacity of 4,000 tons	1	"
Kometa hydrofoil vessels	2	Units
1,200-HP tugboat	1	Unit
Ocean-surface skimmer	1	"

List 1 (continued)

Commodity Designation	Quantity or Value	
Marine equipment, including main engines	3,000	Thousands of dollars
TU-134A airplane	1	Unit
MI-8 helicopters	13	Units
Spare parts for aviation equipment and major overhauls	2,700	Thousands of dollars
Automobiles as follows:		
ZAZ-968 V, Zaporozhets	600	Units
Moskvich	4,000	"
Volga	1,200	"
VAZ-469 B	400	"
Spare parts for automobiles (not including VAZ)	6,000	Thousands of dollars
Delivery on the basis of industrial cooperation:		
VAZ automobiles	16,000	Units
Spare parts for VAZ automobiles	5,850	Thousands of dollars
Miscellaneous machines and equipment	15,000	"
Coking coal	1,500	Thousands of tons
Metallurgical alone	1,200	"
Anthracite	300	"
Petroleum	5,000	"
Lamp oil	150	"
Gas oil	500	"
Heavy fuel oil	500	"
Mineral oils and lubricants	12	"
Petroleum coke	8	"
Creosote oil	10	"
Natural gas	2,100	Millions of m^3
Iron ore (concentrate)	120	Thousands of tons
Manganese ore (Nikopol')	40	"
Chromium ore	55	"
Asbestos	40	"
Cement	300	"
Graphite	250	Tons
Apatite concentrate (39.4% P_2O_5)	25	Thousands of tons
Kaolin	10	"
Pig iron	100*	"
Scrap iron	100	"
Rolled products of ferrous metallurgy	200	"
Rolled products of ferrous metallurgy based on exchange of assortment	45	Millions of dollars
Tinplate	4	Thousands of tons
Cold-rolled strip	3	"
Nickel	2	"

* Substitution for scrap iron optional until 31 May 1980.

List 1 (continued)

Commodity Designation	Quantity or Value	
Aluminum	40	Thousands of tons
Magnesium	500	Tons
Zirconium	80	Kilograms
Chromic anhydride	500	Tons
Aniline hydrochloride	100	"
Potassium bichromate	500	"
Potassium cyanide	100	"
Calcium chloride	550	"
Caprolactum	3,000	"
Boric acid	500	"
Xylol	2,500	"
Copper sulfate	1,000	"
Nickel sulfate	50	"
Potash (100%)	1,000	"
Laboratory reagents	80	Thousands of dollars
Coumarone resin	125	Tons
Coal tar	100	"
Butyl alcohol	1,500	"
Isopropyl alcohol	1,070	"
Monoethylamine	200	"
Sodium sulfate	5,000	"
Red phosphorus	50	"
Sodium bichromate	2,500	"
Water softeners	115	"
Ethyl acetate	1,500	"
Ethyl benzine	2,000	"
Acetone	1,300	"
Butyl acetate	500	"
Synthetic dyes	860	Thousands of dollars
Carbon black	800	Tons
Dibasic ammonium phosphate	415	"
Ammonia	15,000	"
Styrene monomer	10,000	"
High-density polyethylene	600	"
Vinyl chloride	10,000	"
DDVP 90-92%	10	"
Copper oxychloride	300	"
Tribasic sodium phosphate	1,000	"
Carbon disulfide	800	"
Miscellaneous chemical products	1,100	Thousands of dollars
Potassium salts (60% K_2O)	150-250	Thousands of tons
Ammonium sulfate (20.5% N)	50	"
Tires	2,500	Thousands of dollars
Synthetic rubber	25	Tons
Pulpwood	800	Thousands of m^3
Of hardwood species alone	50	"

List 1 (continued)

Commodity Designation	Quantity or Value	
Softwood lumber	100	Thousands of m^3
Paper pulp	60	Thousands of tons
Ordinary paper cable insulation	600	Tons
Cardboard and paper (exchange of assortment)	1,150	Thousands of dollars
Cotton	55	Thousands of tons
Industrial vegetable fibers	1	"
Fur	260	Thousands of dollars
Pickled swine skins	200,000	Units
Seedlings and nursery stock	6,300	Thousands of dollars
Beef tallow	5	Thousands of tons
Fresh-frozen fish	3	"
Vodka	15,000	Decaliters
Drugs	4,000	Thousands of dollars
Industrial consumer goods as follows:		
Household dishes and eating utensils	220	"
Timepieces	850,000	Units
Spare parts for timepieces	45,000	Thousands of dollars
Still and movie cameras	160,000	Units
Accessories for cameras	300	Thousands of dollars
Opera glasses	1,000	Units
Musical instruments	970	Thousands of dollars
Hunting and target weapons	440	"
Sport fishing tackle	110	"
Camping equipment	120	"
Handicrafts	115	"
Toys	30	"
Equipment for use of visual aids in instruction	50	"
Amber products	230	"
Books, magazines, philatelic articles and phonograph records	600	"
Films	150	"
Miscellaneous goods		

List 2. Goods To Be Delivered From the SFRY to the USSR in 1980

Commodity Designation	Quantity or Value	
Metal-cutting machine tools as follows:		
Special machine tools and machine tools made up of standard components	64	Units
Machine tools for manufacture of engine parts	59	"
Manurin single-spindle automatics	30	"
General-purpose metal-cutting machine tools as follows:		
Tool milling machines	40	"

List 2 (continued)

Commodity Designation	Quantity or Value	
Cylindrical grinders	20	Units
Surface grinders	40	"
Assemblies and parts to be incorporated in machines being manufactured in the USSR	870	Thousands of dollars
Spare parts for metal-cutting machine tools	150	"
Programming devices for machine tools	3,100	"
Forging machines and presses as follows:		
Double-arm presses with handle with a (curvilinear) force of 200 Mp or higher	6	Units
Eccentric presses	32	"
Raster automatic mechanical presses, high speed	30	"
Machines for bending sheet and edges	6	"
Miscellaneous equipment for forging machines and presses	15,400	Thousands of dollars
Spare parts for equipment used with forging machines and presses	300	"
Pneumatic friction clutches	10,000	Units
Power transformers I-III	500	MVA
Complete transformer substations	500	"
High-voltage equipment for voltages of 15-20 kV	1,100	Thousands of dollars
High-voltage porcelain	1,000*	Tons
Metallurgical equipment	100,000	Thousands of dollars
Electric overhead cranes, capacity as follows:		
160 tons	6	Units
80 tons	5	"
Chain conveyors with capacities of 25, 50 and 100 tons/hr	100	"
Tunnel kilns with mesh floor and floor area between 50 and 100 m^2	5	"
Tomato sauce production lines with a capacity of 500-800 tons/day	6	"
Tomato sauce production lines with a capacity from 200 to 300 tons/day	2	"
Spare parts for equipment used in the sugar industry	300	Thousands of dollars
Spare parts for equipment used in the baking industry	100	"
Spare parts for equipment used in the canning industry	360	"
Spare parts for livestock feed mills	1,500	"
Spare parts for equipment used in the meat and dairy industry	100	"

* Assuming mutual agreement on the itemized list.

List 2 (continued)

Commodity Designation	Quantity or Value	
Equipment for making leather for footwear and clothing from raw pigskins	575	Thousands of dollars
Equipment for manufacturing footwear by the gluing method	3,000	"
Dyeing units	12	Units
Loading bridges	2,000	"
Spare parts for machines used in the dry cleaning of clothing	100	Thousands of dollars
Complete equipment for stores of the Universam type	1,900	"
Automatic telephone switchboards with 4,000 jacks for institutions	500	"
Automatic intercity telephone switchboards, including spare parts	9,700	"
Equipment for automatic intercity telephone switchboards (Yerevan)	10,700	"
Equipment for automatic intercity telephone switchboards (Kiev)	8,600	"
Automatic telegraph-teleprinter switchboards, including spare parts	10,300	"
International quasielectronic telephone switchboards	316	"
Spare parts for ultrashort-wave radio stations used in agriculture	15	"
Spare parts for hybrid computer	120	"
Steel industrial fittings, including acid-resistant fittings	20,000	Tons
Cast iron industrial fittings	1,200	Thousands of dollars
Typewriters	5-10	Units
Spare parts for typewriters	40	Thousands of dollars
Laboratory glass	500	"
Tools used in machining metal	500	"
Tools for fitting and installation	300	"
Circular saws	300	"
Abrasive tools	300	"
Rolling-element bearings	1,100	"
Spare parts for agricultural machines	500	"
Semerings [?], belts and chains for silo combines	2,300	"
Electrical and brake equipment for electric motor trains	1,700	"
2,300-HP tugboats	2	Units
5,000-HP tugboats for moving drilling platforms	2	"
Floating dock with a lifting capacity of 30,000 tons	1	Unit

List 2 (continued)

Commodity Designation	Quantity or Value	
Vessels used to supply floating drilling platforms with a capacity of 1,200 tons	4	Units
Marine suction dredge with a capacity of 1,000 m^3	1	Unit
Ramp for loading and unloading ferry	1	Complete unit
Marine equipment and shipbuilding supplies	2,300	Thousands of dollars
Marine equipment and spare parts for ship repairs	5,000	"
Ship repairs	23,000	"
Deliveries under industrial cooperation:		
Assemblies and parts for manufacture of automobiles at the Volga Motor Vehicle Plant	36,000	"
Parts to be incorporated in trucks being built at the Kama Motor Vehicle Plant	46,000	"
Lead storage batteries for starting	21,000	"
Industrial storage batteries	12,000	"

TAX BREAK TO BOOST PRIVATE AGRICULTURAL PRODUCTION

Bratislava ROLNICKE NOVINY in Slovak 17 Oct 81 pp 1, 3

[Article by Eng Jaroslav Prochazka, Federal Finance Ministry: "Tax Exemption on Income From Agricultural Production--Important Provisions for Small-Scale Breeders and Growers"]

[Text] The 16th session of the CPCZ discussed and approved the results achieved by our socialist agriculture in the past period and at the same time set new, more challenging tasks for this sector, including the basic direction and objectives for further general development of agricultural production. In this connection the importance of more systematic utilization of all agricultural land was also emphasized, as well as the need to support more actively the production of small-scale breeders and growers, not only for their own use but also for the worthy purpose of enriching the market.

One of these measures also provides a tax exemption to citizens for income derived from private agricultural production, which, on the basis of CSSR Government Resolution No 113 of 9 July 1981, was approved by the CSSR Government in its Resolution No 227 on 19 August 1981 and by the SSR Government in Resolution No 268 on 30 September 1981. These government resolutions will be implemented in the near future by directives of the finance ministries of both republics and will be published in the FINANCNY SPRAVODAJ [FINANCIAL REPORTER] and registered in ZBIERKA ZAKONOV.

However, it should first be emphasized that the tax policy of our socialist society is based on existing needs and possibilities and hence should not be considered as an isolated matter. The above-mentioned tax exemption of income from agricultural production is related to a number of concurrently passed basic measures in this area.

Who Is Affected by the Tax Exemption

The authorized tax exemption applies to all citizens who get income from agricultural production insofar as they are engaged in it in their free (nonworking) time.

A critical condition for the tax exemption, however, is that the citizen (taxpayer) must submit a statement from his chief employer, cooperative, organization or school confirming that in the year preceding the year in which the tax is assessed he regularly performed his working or study duties.

The citizen must submit this statement by 15 February of every year to the local (municipal or district) national committee in charge of tax administration (beginning in 1982). The statement must bear the seal of the appropriate organization or school, with the signature of the responsible worker or official. Persons who are not permanently employed and are drawing a pension will submit a statement from their post office indicating that they are receiving a pension.

In this connection it should be stated that the tax relief based on paragraphs 31 and 33, section 5 of Law No 103/1974 of ZBIERKA on agricultural taxation remains in effect. This means that if the taxpayers cited in these provisions of the law (especially members of Unified Agricultural Cooperatives, workers in agriculture and other organizations and keepers of fewer than 15 bee colonies) have only income that is already exempt from taxation, they need not submit the statements. If, however, they get income from the cultivation of special crops and from specialized animal production or other revenues from agricultural production to which the tax exemption does not directly apply, such persons are also obliged to submit the required statements.

Also remaining in effect are directives of the republic finance ministries on tax relief for citizens with income derived from contractual fattening of certain farm animals (FINANCNY SRAVODAJ Nos 4 and 5 of 1979 and Nos 10 and 15 of 1980). This relief may also be granted in those cases where the citizen (taxpayer) does not meet the requirements of tax exemption according to these principles.

This measure also does not affect the tax exemption of annual income up to 6000 Kcs from the sale of hay harvested on land outside the agricultural area (Decree No 152/1980 of ZBIERKA).

What Income Is Exempt From Taxation

The agricultural tax applies to any kind of activity connected with agricultural production and fish hatching, including incidental activity and secondary production, as long as they are directly related to plant or animal production.

The above-mentioned tax exemptions thus apply to all income (regardless of amount) derived from agricultural production and to income from incidental activity and secondary production provided, however, that the latter only supplements income from agricultural production. The tax exemption, however, involves income primarily from plant and animal production.

The exemption also applies to income from so-called specialized production, which is the raising of common farm animals (beef cattle, hogs, sheep, goats, geese, chickens, turkeys, rabbits, etc.) carried on by nonfarmers or to an extent not commensurate with the amount of plant production, and the raising of fattened nutria (not, however, if raised for their fur), laboratory animals and beekeeping.

At the same time it refers to income not only from the sale of the product but from any kind of related production. Thus, in the case of beekeeping, it is income not only from the sale of honey but also from the sale of propolis, queen bee jelly, beeswax, partitions and bee colonies, as well as income from bringing bees to flowering crops, etc. In the case or rabbits, sheep and goats it applies also to income from the sale of skins or the sale of wool and similarly it applies to income from the sale of other products.

The tax exemption likewise applies to income from the cultivation of special crops, particularly all kinds of vegetables, fruits, strawberries, medicinal plants and herbs, seeds of all kinds, mushrooms and so on.

To What and to Whom the Measure Does Not Apply

As already emphasized, the tax exemptions as well as the other measures are aimed particularly toward supporting the development of those activities directly related to our ever increasing consumption of basic foods and agricultural products. At the same time it is a matter of activity in which individual citizens engage beyond the scope of their main working or study obligations in their free time. Thus, it is not to support private enterprise or excess needs.

Consequently, the above tax exemptions will not apply to:

--Income from cultivating and processing grapevines, and flowers and the raising of fur-bearing animals (except for raising and selling nutria for slaughter),

--Taxpayers who secure agricultural production by using hired labor or on plots taken over from other citizens,

--Individually operating farmers whose chief occupation is agricultural production--here the directives call for making the necessary determination in this regard for tax purposes.

The tax exemptions also do not apply to income derived exclusively from the sale of agricultural products obtained through various middlemen who did not directly share in their production. This kind of income continues to be subject to income taxes in accordance with Law No 145/1961 of ZBIERKA.

This measure in no way affects a citizen's obligation to pay his land tax, which, among other things, should bring about better utilization.

When the Tax Exemption Becomes Effective

Upon meeting the above conditions this tax exemption will be granted for the first time in assessing taxes on income from agricultural production or taxes on citizens' income in the year 1982. This means that income

--From basic agricultural production for which the tax is determined according to income calculated on the basis of average norms of fertility per hectare of farm land will be payagle beginning with 1982 (the tax for 1981 should already have been assessed and paid this year).

--From specialized animal production and from the cultivation of special crops is already exempt from taxation for income earned in 1981.

If, however, a citizen (taxpayer) fails to submit in time his statement of employment or schooling regarding regular fulfillment of his working or study obligations for the past year (initially by 15 February 1982) or does not meet the above conditions for tax exemption, then he is obliged to file his tax declaration as previously (by 15 February). In case he fails to meet these obligations the appropriate national committee in charge of tax administration will proceed in accordance with the applicable provisions of Law No 103/1974 of ZBIERKA on agricultural taxation and Decree No 16/1962 of ZBIERKA on procedures in matters of taxes and payments.

All other details of these tax exemptions will be contained in directives of the republic finance ministries, which will be received by the appropriate national committees, where citizens will be able to get information about them.

These tax cuts are an expression of societywide support for this creditable activity, whose continued development should contribute to a fuller and better satisfaction of the needs of our population in this area. The citizens who do this do not simply increase their own food supplies; they also make it possible to enrich local markets by the sale of fresh vegetables, quality fruit, small farm animals and other kinds of essential products. It will be up to the national committees, in particular, in cooperation with other bodies, organizations and citizens to set up the proper conditions in this area. Likewise, on the basis of current experiences, they should take the initiative in suggesting and carrying out other solutions that may contribute to the development of this activity, including the proper and consistent implementation of the measures adopted.

FUEL, ENERGY SUPPLIES FOR NEW FIVE-YEAR PLAN DISCUSSED

Prague PLANOVANE HOSPODARSTVI in Czech No 9, 1981 pp 1-8

[Article by Karel Houdek, Doctor of Social Sciences, State Planning Commission: "Fuel and Energy Supplies at the Beginning of the Seventh Five-Year Plan"]

[Text] The development of the fuel and energy base has always significantly influenced the national economic growth rate. Recently this connection has been even more noticeable than before, from the viewpoint of both internal and external conditions of the assurance of the fuel and energy resources necessary for the planned rate of development of our economy.

Changes in world markets for fuels, energy, and raw materials which have taken place in recent years are especially serious in this regard. Our fuel and energy balance is severly dependent on imports of these items, which account at present for 38 percent of total resources. The constant increase in world market prices for fuels, and especially for crude oil which, after a certain moderation from 1975-1977, since 1978 has again resumed its dynamic growth, thereby significantly increasing demands on foreign trade. On top of this external situation, there also is the objective reality (due to the natural conditions of our coal deposits) that it is more and more difficult to recover domestic fuel resources, a problem also related to increased extraction costs. This is, however, substantially more moderate than the price evolution for fuels on international markets. The increased outlays which must be expended by the national economy for the assurance of fuels and energy are significantly greater than the reduction in the energy intensiveness of production, as expressed by the energy equivalent of the amount of primary resources used per billion korunas of national income formation. In other words, it is necessary currently, from the viewpoint of needed fuel and energy resources, to incur much greater costs than previously for their production. This development is having a significant impact on the entire Czechoslovak economy, an impact which will clearly intensify further in the near future.

Resolution of this complicated situation requires an increase in the efficiency of national income formation through the practical application of the newest findings of scientific and technical development and the maximum feasible intensification of rationalizing trends in the Czechoslovak economy. In this connection, demands must be minimized on crude-oil imports, and the greatest possible frugality and efficiency must be ensured in the consumption of all fuels but especially of crude-oil products.

The development of fuel prices on international markets means that, for practical purposes, the previously most dynamic component of the fuel and energy balance, i.e., fuel imports, will influence the assurance of increased fuel and energy resources to a much lesser extent in upcoming years. While from 1975-1979 imports accounted for about 70 percent of the increase in domestic consumption, including increased inventories, in 1981 and 1982, they will account for only 15 percent. The focal point of the resolution of increasing domestic consumption, then, rests in the development of domestic mining and nuclear energy. The significance of these resources for the assurance of national economic needs is and will increase now and in the future, and it therefore is necessary to eliminate still more diligently the risks and problems which are restricting the increases provided for by the plan in terms of both volume and structure.

An analysis of the problems involved in supplying the national economy with fuels and energy in the first years of the Seventh Five-Year Plan shows that the situation will be very complex, especially in the second and third year of the plan. The fundamental task of this period is to reduce energy intensiveness substantially and to achieve maximally feasible energy conservation in the production process. In order to get through this period, it is essential to strive for the creation of a favorable starting base by means of a maximum increase in fuel inventories. In mining, it is necessary to focus attention on the fulfillment and exceeding of planned tasks, thereby creating the preconditions for an increase in electrical energy production based on brown coal.

A solution to the structural problems of the fuel and energy balance also will be extraordinarily complex. It is a matter primarily of coming to terms with an absolute decline in supplies in light fuel oils and with stagnation in supplies of heavy fuel oils. In accordance with worldwide trends, we must restrict the consumption of crude-oil products for the production of electricity and heat in favor of the increasing needs of petrochemistry, motorization, and other sectors where they are irreplaceable. In the first stage, it will be a matter primarily of freeing up light products, i.e., light fuel oil, propane-butane, and fuel oil from consumption related to energy generation. In a later stage--after 1985, when a catalytic cracking facility, which will make possible the more complete processing of crude oil and increase the yield of the irreplaceable light products through the cracking of heavy fuel oil, should have been constructed--it will be necessary to reduce absolutely the consumption of heavy fuel oils for energy-generation purposes. Given a stagnation in the current level of crude-oil imports, this would provide a means for reducing somewhat the tightness in the supply of light products.

A gradual limiting of the share of light fuel oil in consumption for energy-generation purposes is essential in view of the current and prospective development of the fuel and energy balance. Handling this process successfully and in a planned way will require the focusing of rationalization measures, to the greatest possible extent, on the conservation of crude-oil products through a reduction in the standard consumption for individual products and activities and replacing them, whenever possible, with fuels that are available. This will, in some cases, be natural gas (the imports of which have increased moderately), but only in technical procedures and boilers in those areas entitled to preferential treatment from the viewpoint of air quality. In other instances, it will be a

question exculsively of low-calorie coal for energy generation. It also will be necessary to adapt the concept of heat generation to this, above all in terms of an intensive orientation toward the pooling of investment resources for the construction of large, common boiler rooms in which the above-mentioned coal may be burned. This will, likewise, require the construction of appropriate energy-generating equipment, especially boilers.

The above situation rules out the possibility of ensuring heat supplies which were previously derived from the utilization of light oils or heating gases with provisional or replacement techniques. It is, therefore, essential to assure the planned schedules for construction of joint and centralized boiler rooms in accordance with the construction of housing and production facilities.

The starting point for evaluating the planned levels of coal and lignite extraction which are being presented by individual economic production units for 1981 and 1982, in response to "Directives" issued by the CSSR government is, on the one hand, national economic requirements and, on the other hand, the actual level of installed extractive capacity at the conclusion of 1980.

Table 1. Evaluation of Coal and Lignite Extraction Levels

	1980 Actual	1981 Planned	1982 Guidelines
Domestic Coal and Lignite Resources -- Total	123.1	123.3	124.4
Of Which Brown Coal and Lignite Represent	94.9	95.5	96.7
Coal Extraction Under the "Directives"		126.5	127.7
Of Which Brown Coal Represents		98.5	99.8

CSSR Government Resolution No 123/76 decreed the preparation of the brown coal regions for the production of 98.5 million tons in 1980 and, although this level was not reached (by 3.6 million tons) and 94.9 million tons was mined with a maximum of effort, the preparedness for extraction has not improved to the necessary extent. On the contrary, the amounts in the above lines would indicate that the determination of the extraction level is the regulating factor, especially at most of the facilities of the coal mines in the North Bohemian Brown Coal Basin, which produce about 54 percent of total domestic supplies of solid fuels. Even though the basin will fulfill and exceed its own plan for preparations in the "extractable reserves" category, it will not assure its task of this year to the fullest extent. The main reason for this is a low stripping lead time as of 31 December 1980, which amounted to only 60 days at the V. I. Lenin Mines concern enterprise, 41 days at the J. Fucik Mines concern enterprise, and 43 days at the Antonin Zapotocky Fuel Combine concern enterprise, at the same time that the figure is supposed to be about a minimum of 150 days. It is a matter, above all, of developing facilities which, with their planned increases based on capital investment, should also provide a replacement for locations that are running out of coal.

It is not possible, then, to consider the plan targets for 1981 and 1982 to be easily fulfillable, from the viewpoint of the critical ratio of the level of preparation of extractable reserves to total extraction. The reason for this is a worsening in the ratio of level of preparedness of extractable reserves to total extraction from 46.1 percent to 37.1 percent, and the falling behind in overburden removal. In 1975, the ratio of coal extracted to overburden was 37.52 percent, but in 1980 it was already 43.8 percent. It will be necessary to devote much effort to the fulfillment of mining targets in upcoming years if the national economy is to continue its dynamic development.

Solid fuels, and especially brown coal, occupy the dominant position both in the sphere of resources and of consumption for the short term as well as the long-range outlook for the fuel and energy balance of the CSSR. The qualitative correspondence between resources and requirements will be a serious problem related to the solid fuel balance in the Seventh Five-Year Plan. In connection with the limited supplies of enriched fuels and their delivery to both the population and several industrial sectors, it si clear that, during the Seventh Five-Year Plan, there will continue to be a high demand for quality types of brown coal from the North Bohemian Brown Coal Region. This is true not only of graded but, also, of quality powdered coal.

Inadequate production and quality of graded coal is being caused by a long-term lag in mining activity at the Maxim Gorky and Czechoslovak Army open pit mines. This is a result of frequent failures of the heavy-duty mining equipment at the mines, compounded by the influences and consequences of natural and geological conditions of extraction (worsening quality), structural changes in coal mining (the exhaustion of older mining locations producing quality coal and the developing production of single-purpose energy coal), and its replacement at other locations, above all at the Nastup Mine where coal is being mined exclusively for energy-generation purposes.

This problem had already appeared in the previous five-year plan and will be an integral part primarily of the initial years of the Seventh Five-Year Plan, with the result that the planned volume of production of graded coal will be achieved only in the event that certain grades of coal do not meet their usual standards for heat value. It is, of course, true that the FMPE [Federal Ministry of Fuels and Power] and the North Bohemia Brown Coal Mines concern are attempting to formulate a set of measures for the assurance of maximal production of mined coal appropriate for grading and for the optimal utilization of coal charges at coal preparation plants, with the objective of systematically increasing the volumes of graded coal, but these measures are fo a short-term nature (annual).

It is necessary to comprehend that the possibilities are limited and directly related to shortages of quality powdered coal suitable for the production of coal gas, and to the supplying of the Chvaletice electric power station with coal corresponding to the established fuel base. Supplies of brown coal, lignite, and briquets are lower than provided for in the Seventh Five-Year Plan directives. The established limits do not cover the requirements of the sectors, especially from 1982-1984, when their level is to remain at that of 1980-1981.

The decline in graded coal supplies is seriously threatening the coverage of the needs of the nonproduction sphere. The resolution of this problem will require

the development of brown-coal mining at those locations where it will be possible to extract the greatest possible amount of graded coal. At the same time, it is necessary to limit more decisively the use of graded coal in industry and to pay attention to its conservation in the consumption sphere.

In spite of a moderate increase in investment volume and an increase in the average number of employees, the preconditions have not as yet been created for the assurance of the required volumes of extraction at underground mines, especially in the Ostravsko-Karvinsky region, as it has proved impossible entirely to eliminate worsening technical conditions of mining. These are becoming evident with extraction at greater depths, with the advance of working faces into interrupted seams and saddle seams with great variations in thickness, into areas where it is necessary to change both techniques and technologies more quickly and to create more optimal conditions for the work of the miners in the mines.

Several other factors also are influencing the lowering of the daily production of the Ostravsko-Karvinsky region, such as the continuous increase in the volume of gangue accompanying the mining of the coal, which is beginning to restrict even the fundamental factor of the capacity of the mine conveyor system.

Table 2.

	1975	1978	1980
Average net coal extraction (thousands of tons per day)	91.6	88.4	86.5
Average gross extraction, including gangue (thousands of tons per day)	128.5	130.1	129.4

A consequence of this situation has been above-average extraction on nonworking days, which has been continually increasing.

Table 3.

	1975	1978	1980
Total extraction (millions of tons) of which:	24.4	24.6	24.69
on nonworking days			
in millions of tons	0.6	1.33	1.69
as percent of total	2.45	5.4	6.84

Besides the gradual introduction of a new work schedule which is to limit the amount of overtime work, an additional improvement in organizational and managerial work, the development of labor initiatives, and the application of efficient types of economic incentives within the framework of the Set of Measures are all being counted on to aid in the assurance of extraction targets, in

conjunction with the assurance of a labor force and deliveries of reliable mining technology. All of these measures, however, will have only a gradual influence; but it is essential to strive for their timely implementation in the interest of improving the readiness of the Ostravski-Karvinsky region for coal mining.

In 1980, operation of the electrical energy system assured the smooth supplying of the national economy and the population with electrical energy without the imposition of regulatory levels. Moreover, all user groups in the socialist sector put into place measures directed at the conservation and efficient utilization of electricity supplies. At the same time, several planned management instruments were applied consistently, for instance:

-- annual and quarterly electrical work funds for large and medium consumers of electrical energy,

-- the negotiation of binding consumption schedules according to differences in the times of peak energy usage,

-- limitations on electrical consumption by small-scale consumers, and

-- promotion among the general population of rational electrical energy consumption.

In 1980, the production of electrical energy increased 6.7 percent and reached 72.7 billion kilowatt hours. Public and factory-based steam power plants produced 84.7 percent of this total amount; nuclear plans, 6.3 percent; and hydroelectric, including pumped-storage plants, 6.3 percent.

As a result of excess production at nuclear and hydroelectric power plants, the annual electrical energy production at public power plants increased 8.6 percent. This made it possible to limit the operation of several factory-based power plants burning fuels which were in short supply and to ensure the smooth supplying of electrical energy to the national economy and the population even given a reduction of 36 percent in its imports from abroad in comparison with 1979. The overall volume of useable electrical energy supplies increased 3.8 percent in 1980.

This positive development was brought about, above all, by positive operational results in coal-fired steam power plants and at the V-1 nuclear power plant at Jaslovske Bohumice. The planned volume of electrical energy production at two nuclear units with Soviet VVER 440 reactors, the first of which has been operational since December 1978 and the second since March 1980, was exceeded by 37 percent. The fuel contribution of the V-1 nuclear power plant at Jaslovske Bohunice, given its 1980 output of 4.5 billion kilowatt hours, was equivalent to about 4.9 million tons of brown coal for energy generation and contributed, in comparison with past years, to a substantial improvement in the fossil fuel supply situation of electric power plants.

This 37 percent overfulfillment of planned electrical energy production at the V-1 nuclear power plant resulted in a saving of about 1.3 million tons of brown coal, which represents 6 days of consumption at public power plants fired by

brown coal. The successful operation of the V-1 nuclear power plant made possible the accumulation, by the beginning of January 1981, of an exceptional supply of brown coal at the coal storage facilities of public power plants, enough for 16 days.

The operational performance of the Czechoslovak electrical system in 1980 confirmed the correctness of the orientation of its future development toward the construction of its basic generation facilities in nuclear power plants. The utilization of nuclear energy represents, in our situation, the main focus of a long-range solution to the energy-generation problem. The construction and assimilation is to be completed this year of the last two large, brown-coal-fired condensation power plants, Melnik III (one 500-megawatt unit) and Prunerov II (five 210-megawatt units). The objective for future years will be the bringing on line of the new nuclear generating facilities, V-2 at Jaslovske Bohunice (two 440-megawatt units in 1982-1983), and V-3 at Dukovany (four 440-megawatt units in 1983-1985). The utilization of a new primary energy resource--atomic fuel--will enable the future development of electrical energy generation to influence, to an ever greater extent, the potential pace of overall energy consumption in the CSSR. The increase in the share of electrical energy produced at atomic power plants will significantly change the structure of final energy consumption, which has heretofore been oriented predominantly toward the direct consumption of domestic coal or imported enriched fuels. The mastery of the developmental objectives of Czechoslovak electrical energy generation is, then, directly related to the pace of preparation and implementation of construction of nuclear energy supplies.

The 1981 plan assumes that electrical energy supplies of 77 billion kilowatt hours will be assured, more than 73.4 billion of which will be covered by Czechoslovak electric power stations, and the remainder by imports to be assured on a contract basis. The critical problem for the fulfillment of the tasks facing Czechoslovak electrical energy generation is the resolution of deliveries of coal and other fuels for public steam power plants, a problem related to the fulfillment of tasks in the extraction of domestic fuels and with the development of fuel and electrical energy imports from abroad.

The first quarter of 1981 saw certain deviations in the fulfillment of state plan objectives in the supplying of fuel to power plants. Even after the release of replacement supplies and with the increased use of the Vojany II power plant, which burns heavy fuel oil and natural gas, coal inventories at power plant storage sites as of 31 March 1980 were lower in comparison with the previous year by 10.4 percent in the case of brown coal and by an astonishing 29 percent for bituminous coal, as shown by the following table.

Table 4. Coal Inventories at Public Power Plant Storage Sites (Thousand Tons)

Type	31 Dec 1979	31 Mar 1980	31 Dec 1980	31 Mar 1981
Bituminous Coal	1,025	702	910	500
Brown Coal	3,083	2,137	3,464	1,910

The development of the fuel situation in electrical energy generation is making it necessary to introduce additional measures directed at the rational utilization of resources and limiting the growth of electrical energy consumption, as well as improving the instruments of planned management for this sector of the economy. In cooperation with the coal industry, this means the creation of a comfortable level of fuel supplies at power station storage sites prior to the winter of 1981/1982.

As of 1981, the Czechoslovak electrical grid has at its disposal adequate reserve capacity, which is being further improved by the operation of new electrical generating facilities at the Melnik III steam power station (500 megawatts), and the gradual coming on line of the 210-megawatt steam units at the Prunerov II power plant, which will have an overall installed capacity of 1,050 megawatts, the gradual start up of the 110 megawatt units at the Cierny Vah pumped-storage hydroelectric plant, and the assimilated operation of the V-1 nuclear power plant at Jaslovske Bohunice (800 megawatts). The facilities which have been constructed are sufficient to handle the projected maximum electrical demand of consumers. This means, then, that only the fuel-supply situation for power plants will significantly influence the operational situation in the electrical grid in 1981.

Heating gas supplies were provided in 1980 without interruption, at the same time that their consumption increased moderately. Currently, as well as for next year, we do not foresee any serious problems, even in view of a certain stagnation of supplies, above all thanks to the ongoing transfer of consumers from coal gas to natural gas. In connection with this evaluation, however, it is necessary to be aware that the development of consumption is being held up administratively, and that the implied delays in transfers, to the extent that they are not rectified, will hold up planned hookups of new consumers. Every gas-manufacturing enterprise ought to be aware that, throughout the geographical extent of its jurisdiction, that a foot-dragging attitude in this area will result in the unnecessary angering of customers, as well as a need for explaining why it will be impossible to deliver coal gas. The same is true for certain sectors in which the transfer of consumers from coal gas to natural gas is, in limited areas, conditional on the fulfillment of preparedness deadlines.

Natural gas consumption was expanded by an additional 686 million cubic meters in 1980. This represents almost a 9 percent increase from year to year and made it possible to conserve other forms of energy, especially fuel oils. It will be necessary, however, to expand the potential for its storage. Insufficient lead time in the planning of supplies and jumps in increased usage are leading to a situation in which disproportionately high amounts of natural gas continue to be burned under the boilers of large energy-generating facilities while, on the other hand, unnecessarily large amounts of gas must be produced from quality graded coal, with the attendant energy losses. Nor is is possible to be content with the fact that an improvement in the energy base of Prague, for which natural gas has been budgeted in sufficient quantities, is being held up by factors lying outside the area of fuel and energy policy.

In the agreed upon directives for 1982, there are several unresolved problems in the natural gas area, to which we must return at the time of plan formulation. Among others, there is the dilemma of to what extent it is possible to

put up with further voluntarism in the hooking up of new seasonal boiler rooms and small boilers in the nonproduction sphere, when it will be possible to get gas for them during the first quarter only by the strict regulation of industrial users, in conjunction even with the shutting down of certain operations.

In 1980, deliveries of heavy fuel oil decreased almost 7 percent in comparison with 1979. The consumption of fuel oil for the generation of electrical energy declined in a planned fashion, and natural gas was used in two-burner systems even in the wintertime. Consumer inventories also declined, however.

Consumption of light fuel oil was roughly at the 1979 level. As a result of conservation measures, a quota was established for new consumers and preparations were initiated for the transfer of selected consumers from light fuel oil to other fuels.

A very tight situation, however, will occur in future years regarding light fuel oil. While during the Sixth Five-Year Plan its consumption increased almost 17 percent, it will decline almost 30 percent during the Seventh Five-Year Plan, 12 percent of which will take place in 1982.

Light fuel oil is consumed predominantly in the nonproduction sphere. It is a matter of a large number of small consumers for whom efforts to reduce consumption and to substitute other fuels run up against, among other things, a lack of interest, because this fuel seems to them to be technologically and economically advantageous. In the Seventh Five-Year Plan, however, it will be impossible to physically ensure supplies of light fuel oil, to the extent that we want to use light petroleum products primarily for chemical and motorizational purposes. Overall, then, a level of consumption of light fuel oil will be ensured which will be, in any event, lower than last year. It is, therefore, essential to implement quickly measures aimed at reducing its use to an acceptable minimum.

Heavy fuel oil had become, at the time of low crude-oil prices, a factor in increased efficiency and improved labor productivity. In 1976, for instance, its consumption was double the 1970 level. Due to radical intervention in recent years, however, its use has stagnated, so that, in 1980, about the same amount was used as in 1976. The situation in the assurance of crude oil and the resulting necessity for reducing the consumption of crude-oil products for fuel and energy purposes, demands that the consumption of heavy fuel oil be substantially reduced, mainly in the area of electrical energy generation, and replaced by other, more available fuels.

The fuel and energy balance of the CSSR is more and more complex, both in terms of total obtainable supplies and in terms of structure. At the same time, at the end of the seventies and beginning of the eighties a new situation is arising in this area, above all from a qualitative viewpoint, which is characterized by:

-- sharp movements in world market prices of fuels in 1979 and 1980 and the necessity for revising previously projected volumes of fuel and energy imports;

-- limited leeway for further increases in domestic extraction of fuels, especially in the gradual shift to areas with very unfavorable mining conditions;

-- the necessity for resolving a major part of additional increases in energy-generation requirements through the construction of nuclear energy-generating facilities and the utilization of atomic fuels.

This requires that, in this year alone, a number of measures be implemented which will ensure a reduction in domestic requirements for primary energy resources from levels provided for in the state plan. This, however, brings all the more into the foreground the assurance of the tasks of the state target program for rationalizing the consumption of fuel and energy. From a prospective viewpoint, this is a matter of the timely implementation of the atomic energy program. It will be possible to develop further the production of heat to cover the essential needs of the national economy solely on the basis of the fuels freed up by the generation of electrical energy from the start up of nuclear power plants.

The resolution of the problems connected with fuel and energy supplies at the beginning of the Seventh Five-Year Plan requires a consistent approach based on the long-range objectives of our energy policy and links to the development of the entire economy. It is a matter not only of the consistent fulfillment of the tasks of the state plan, in conjunction with the expansion of fuel and energy-generation production facilities, but also of the accelerated implementation of those findings of scientific and technical development which will make possible an improved valuation of the energy resources at the disposal of the national economy.

FODDER FROM WASTE MATERIALS PLANNED

Bratislava SMENA in Slovak 19 Oct 81 p 3

[Interview with Academician Kiloman Bod, director of the Institute of Farm Animal Physiology, Slovak Academy of Sciences, by Tatiana Jaglova: "A 'Gold' Mine in a Pile of Rubbish"; date and place not specified]

> [Text] Nature is a thrifty manager of everything, be it a dead leaf that fell last autumn, a worm, a bug or a rotted stump. Everything has its role in the many facets of life ever dying and reviving. Man learns from nature how to be thrifty--at one time in the villages nothing that came up was superfluous--if it was not good as feed for farm animals it was returned to the earth. Every little place of wood, straw or peeling was put to use by the farmer. With the advent of big cities the word "waste" appeared and with it the problem of where to put it. What to do with the masses of seemingly useless "junk," the residues of every type which pollute the surroundings and need more and more space? What a mountain of rubbish would pile up in 10 years if it were all heaped up from just a single household, when statistics show that the amount of waste per person represents 200 kilograms a year! One of the target projects of basic research in the Seventh Five-Year Plan which was prepared and is being coordinated by the Institute of Farm Animal Physiology SAV [Slovak Academy of Sciences] is the recycling of organic matter. It is based on the close relationship between man and nature and leads of maximum utilization of all waste matter of organic origin. We talked about this project with the director of the institute, Academician Kiloman Bod.

[Question] Today, instead of the word waste we more often use the term secondary raw material. We usually say this about anything that is not utilized in industrial plants. However, great amounts of waste also are produced by big cities, towns, villages, settlements, and every household. Of all this refuse, what can be turned back into biological circulation?

[Answer] Leftovers from the food industry and from distribution of services represent altogether about 5 million tons annually. The solid wastes of the lumber industry amount to over 700,000 cubic meters in the form of sawdust. About 30,000 fluid discharges from the lumber industry are still polluting our watercourses. We also should not forget the quantities of waste from the tanning and poultry industries. In the CSSR, the mass of animal waste in the next 10 years will be more than one-fourth more than at present and the situation will be similar with other kinds of wastes. The target project anticipates that technology and production will be evolved to obtain the protein constituents from hitherto unused wastes of animal origin--from feathers, eggshells and anything that is discarded in processing poultry, from incidental products of the tanning and dairy industries, from kitchen wastes, especially from restaurants and public food purveying enterprises and from various wastes of plant origin--secondary products of agricultural production and the food and lumber industries.

[Question] This is all waste that was utilized very little or not at all up to now. How can it be of any use?

[Answer] All matter of organic origin which is now called waste should find its way back into the biological cycle. Many waste products can be made into feed, for example, from feathers--feather meal, from sawdust--bulk feed for cattle, from the fluid discharges of the lumber industry--wood molasses, from kitchen refuse and certain leftovers of the poultry industry--feed paste. Whatever cannot be converted into feed can serve as fertilizer. Moreover, all excrement of farm animals is a potential source of biogas production.

[Question] One of the lessons of the biological revolution which is currently much talked about is obtaining energy by entirely nontraditional methods--from biomasses. In Brazil, they are producing fuel for cars, ethanol, from biomass waste. In 1979, Brazil covered 14 percent of its fuel consumption by ethanol, which represents an annual production of about 20 billion liters. So biomass is really promising as a substitute for traditional sources....

[Answer] The scope of our project also includes obtaining energy from nontraditional sources, especially from the excrement of farm animals. The production of biogas, for example, should be possible on farms with 300,000 hens and 8,000 head of livestock. This source of energy will be very important in the future as a partial answer to our energy requirements in agriculture. It also will help provide high energy-demanding technology, for example, in the production of bulk feed from sawdust. If we locate a processing plant on a cattle farm, we will obtain the source of energy for it--biogas. Individual elements of the recycling system are already developed in several of the other CEMA countries. Great attention is being given to the use of nontraditional feeds in the GDR; in the USSR they are concentrating on utilizing secondary products of forestry management and concrete results have already been achieved in these areas by scientists in Poland, Hungary, and Bulgaria. So we are not embarking on an entirely unchartered course.

[Question] What kind of return do you expect from the target project by 1985?

[Answer] Our project is expected to provide an annual increase in fodder protein of 10,000 tons within this 5-year plan, over 100,000 tons of feed paste, 6,000 tons of wood molasses, and about 1.5 million kWh of energy. At the same time, conditions will be set up for extensive formation of recycling models in accordance with our own specific conditions. Their significance should be more clearly apparent around the year 2000, not only as a contribution in the field of energy and food for farm animals but also in the area of protecting the biosphere.

[Question] The project also will affect protection of the life environment, since in many cases it will prohibit pollution but at the same time it will also mean saving our natural resources. A plan like this, however, first calls for some models. Are you already working on any?

[Answer] I already mentioned that world scientists have been working on this idea for some time and even with good results in some places. For the most part, however, it is not so much a complex program but rather one that we ourselves are striving to set up. We have to find an original, comprehensive approach which would take into consideration our domestic conditions. In our project, we expect to prepare several recycling models. These should be set up in the vicinity of large producers of waste--city and industrial complexes, large-scale animal production and such. There are plans under way to build urban animal farms which would make maximum use of the secondary products of the food industry. There are three objectives here: optimal production of food, minimum consumption of energy, and protection of the environment. Most of the partial tasks are already done to the extent that it is possible to start with the job.

[Question] Such an extensive project, however, requires cooperation with other work centers....

[Answer] The Institute of Farm Animal Physiology SAV is the coordinator of a number of work centers of basic research, applied research, and production organizations. There are also 10 other scientific and research institutes in the CSSR which will participate in the project and its implementation as well as technical workers from universities in Bratislava, Kosice, Nitra, and Zvolen.

[Question] In the past, it has happened that basic research has come up with a valuable projection, eminently usable in the national economy, and still nothing came of it. Among the reasons was, for example, a shortage of capacity to produce the necessary equipment. Your project is especially demanding of engineering production. Aren't you a little afraid about being able to have it carried out?

[Answer] Obviously, it is essential to create the production capacity that would directly ensure, particularly through engineering, the production of semioperational facilities and operational prototypes and equipment as well as the technology to make use of new findings. Such capacities, not very large, should exist in selected sectors and the production program for them should be set up as necessary to meet the requirements of the project. To be sure, it also will be necessary to build the required technology for purifying the processing wastes. The whole recylcing system could be original from a worldwide point of view.

No project of any size can operate without its own internal resources. I believe that, in order to take care of all the operations, it would be necessary to establish a council composed of members working in the various sectors, enterprises, and institutions. It should be a flexible and authoritative body which would help in solving everything--from technical studies all the way to constructing facilities.

We must think about the future in time, before our problems become pressing. The plan to recycle organic matter is an example of how to handle the problems of our times--pollution and waste--from the broad perspective of solving urgent problems that may surface in the future. It is not without interest that the incentive for this idea was the creation of an artificial cosmic ecosystem in the Intercosmos program. They are working on this task at the institute in connection with preparing Japanese quails for flight into outer space where birds are to be part of the artificial ecosystem. And this also proves that everything has its use and every good idea can be further developed usefully.

ENERGY CONSERVATION PROGRAMS, RESULTS VIEWED

Budapest MAGYAR MENZET in Hungarian 22 Nov 81 p 7

[Article by Gabor Kapuvari: "Energy Conservation, There Is No Other Way"]

[Text] According to a humorous saying in economics, if the facts do not prove the theory they must be rejected.

That is good as poetry. But if its truth content in practical life goes beyond what is permitted then it is thought provoking. Because everytime it is said, accompanied by a nod, a bitter smile indicates that somehow it is true. We know the theory, we see or guess what we must do, sometimes we can even give an approximately good answer to the question of "how". Then come the figures, the merciless hard facts, like those, for example, concerning tha situation now produced by the world economy, a situation most unfavorable for us. Many are not inclined to take cognizance of these; or if they do they do not treat them in accordance with their weight. Many examples could be given....

But there is an area even in the economy where the first signs of rational action have appeared already. Let us talk about these now.

Prospectors and Miners

The energy resources known today will be exhausted around 2030-2050. Mankind is consuming even one of its greatest helpmates, petroleum. This forecast may strike many as dark, but it is only a realistic prediction. And with cold reason objective reality is warning the experts of the world to look for new sources of energy--and to find them as soon as possible. There is one generation to do it in.

Research is going ahead at many levels. On the one hand scientists are experimenting with the most economical way to produce synthetic oils to replace petroleum. On the other hand others are trying to find new, as yet unknown natural deposits. Of course, these are only two trends among many; both promise significant results.

But what is the situation here at home?

We are forced to import from abroad more than half of the domestic fuel needs. This is a very large figure, and naturally it is a lot expressed in money. The goal is to achieve by various measures not to increase but, if possible, to decrease the magnitude of our imports. The solution in Hungary is essentially

twofold--to conduct geological prospecting with great strength and to carry out the government program for energy conservation, which has reassuring initial results.

According to the plans geological prospecting in the Sixth Five-Year Plan must "produce" 35 million tons of natural gas. In light of the results thus far it can be expected that this will be done. The tasks of the prospectors in the past 5 year-plan period was to find 30 million tons of hydrocarbons, and this was significantly overfulfilled. Hard coal prospecting in the past plan cycle not only replaced the quantity extracted but greatly increased the known reserves. This was by eight times the 5 year production of black coal, three times that of brown coal and 30 times that of lignite--I read in a statement. Laying the geological foundations for the development of the Borsod coal basin is now underway. So the prospectors are refuting the view that we are very poor in mineral resources. It is true that we are not rolling in wealth, but the miners will have work for a good time yet....

Coal mining is now contributing significantly to satisfying national energy needs. According to the calculations--as a result of geological research--the current figure can be trippled. There is--and will be--great need for the work of the miners, just as the technical further development of the entire branch is indispensable. There will be a place for the more than 20 billion forints which will be available for developmental purposes during the Sixth Five-Year Plan.

Coal mining now has the rank it deserves--earlier incorrectly disputed. But the efforts of the miners alone will be too little for prosperity. Laszlo Kapolyi state secretary for the ministry of industry, formulated the other very essential course of action as follows at a session of the economic policy committee of the Patriotic People's Front this week: "There is no rational alternative to energy conservation." This means that rational use of domestic resources is more important than ever and, if possible, it is even more essential to find and employ economical solutions.

First Results

How do we stand on conservation?

The industrial committee of the National Assembly recently discussed experiences in execution of the energy conservation program. As is well known the government program is now one year old, a program which has as its goal a moderation in the rate of growth of energy use and a change in the structure of energy resources.

The program prescribed an investment of 30 billion forints during the plan period for the developments necessary to achieve these goals. Half of this will be made up of large state investments and the other half can be turned to enterprise energy rationalization investments.

According to the first experiences in starting the program energy use by the country this year is expected to be less than planned and according to the signs this favorable trend will continue in 1982. According to the experts the saving derives in part from a reduction in the ratio of energy intensive products but

another essential component is that the first results of energy conservation measures, the efforts aimed at more rational use, are beginning to appear. The slogan "less is enough" is slowly becoming part of social awareness. I would be good if this were lasting. If the problems affecting everyone became a common concern psychologically also. According to the signs there is an increasing chance they will.

The first signs of structural change are appearing in that the ratio of petroleum and petroleum products in our energy balance has decreased significantly. In 1982, as compared to 1980, 2 million tons less oil will be used to satisfy consumer needs, so imports can be reduced by this amount.

There Must Be a Contin ation!

Present surveys prove that there is still a possibility for further conservation in very many places. For this reason--I can read in more than one document--studies disclosing losses must be accelerated. This in only a question of determination because the enterprises well know that there is money for investments aimed at further savings....

But this is not the only way to "save" energy. Manufacturing and product development tasks await the technical experts also. The deficiencies are vexing. For example in regard to heating equipment. We burn much more of the expensive raw materials then we have to. And this is simply because we lack suitable heaters, convectors and electric devices. We greet equipment which saves energy virtually as a saviour. But it should be a natural basic requirement that such equipment should exist. As it is natural throughout the world. One can read in the report submitted to the industrial committee of the National Assembly: Reducing the economic burdens deriving from the import of fuel makes it necessary to broaden and accelerate the program; the enterprises and guidance organizations must make further efforts to do this.

This is where we stand now, approaching the end of 1981. There can be no doubt that the situation is not bad, but no one can say that it is good. Coal, gas, oil--these are the raw materials of which much is not enough, and the world market prices show that we will not be rich in them in the foreseeable future. So we must continue the work aimed at additional savings, not only because this is useful. But because there is simply no other possibility.

AGRICULTURAL ACHIEVEMENTS, PROSPECTS VIEWED

Budapest NEPSZABADSAG in Hungarian 12 Nov 81 p 3

[Article by Istaan Almasi: "Crop Growing Is Weighed"]

[Text] When someone examines agricultural production and the possibility of increasing production, usually he starts out with the growing of crops. That is, the yields of crop production in many respects determine the possibilities of agriculture as a whole. One part of the vegetable products finds its way onto our tables directly or after a small amount of processing, and another part of it is used as fodder in raising livestock. Thus in many respects the extent at which the production of meat, milk, eggs, wool, or in short the animal products can be increased also depend on the glowing of crops.

The Key: Grain

The results our agriculture has achieved in recent decades--which deserve recognition even when measured by international standards--are discussed quite often. And justly so. Within the growing of crops, progress is particularly significant in grain production. During the decade of the 1950's the domestic grain production's yearly average barely exceeded 6 million tons. Last year the crop of the harvested grain types--wheat and the other cereals, and corn--was around 13.5 million [tons]. By the end of the Sixth 5-Year Plan we expect almost 15.5 million tons of grain [to be grown per year]. Perhaps it also indicates the significance of grain production that the crops which provide our bread and the most valuable fodder types, occupy 62-63 percent of the domestic plowlands area. At the same time this high area ratio also indicates that the way grain production develops, very strongly influences the performance of the entire crop growing sector in any given year.

In the 5 to 10 years behind us, fruit and grape production can also show [good] results, but--with greater investments, better organization and often also with more favorable weather conditions--these could also have been better. The fact is that in these areas we can not talk at all about being among the best in the world. And as far as the production of industrial crops is concerned: there, too, the results we achieved are far from the world standards, and this is also true for the production of vegetables, mainly of the plowfield vegetables types. And the production levels of fibrous and bulk fodders is low even when measured by the old domestic standards.

It is possible, and even certain, that this judgement of the values is excessively summary, but it is true over-all. And it is also probable that it is not always

proper to use the international elite as measuring stick, but if we want to measure ourselves against something, then--since practically all agricultural branches are interested in export--it is better to measure against this than against our past selves.

Falling Short of the Plan

And there are plenty of things to be done in agriculture. There are, if for no other reason, then because it so happens that in the last 5-year plan this very main agricultural branch did not fulfill the production goals. On the contrary--even though this year is not over yet, and part of the harvesting also still remains to be done--it can be written without any special risk that it will not fulfill it this year, either. We can refer to the winter and spring frost damages, the two cases of drought, the standards which were set high in the plan, but the fact remains fact: domestic crop production will this year again fall short of the expectations.

Compared to the previous 5 years, during the time period of the Sixth 5-Year Plan the agricultural production must increase by 12 to 15 percent according to the projections--calculated, of course, at unchanged prices. Within this, the growing of crops has the larger task. We expect a 16-18 percent production increase from our farmland, and 8-12 percent from livestock raising. This was also the projection of the Fifth 5-Year Plan. But no matter how far livestock raising overfulfilled its plan, the growing of crops fell so far short of the plan that in the final analysis even agriculture as a whole failed to reach its planned goal. Between 1975 and 1980 crop growing produced 11 percent more and livestock raising 20 percent more than in the previous 5 years. The two major agricultural branches can not be this far apart from each other for an extended period of time.

All words lead to one conclusion: more attention and greater resources than ever before must be devoted to crop growing if we want our agriculture to give as much to the country during the present 5-year plan period as we expect on the basis of the plan. The start, the balance of the first year's crop production is not eccouraging at all, even if we will be able to enter a record corn crop production average into the books a few weeks from now.

To be sure, we have set the standards high for crop production which is influenced much more by the weather than livestock raising. The problem is not that the projected yield cannot be achieved in the case of a crop or two, or even of a minor branch of production. It can also be achieved for wheat (for which we planned a yield of 4.9 tons per hectare in 1985), and the average of 6 tons can also be achieved for corn. Indeed, the average yields for some crops--among the several dozen crop types--may even be higher than planned. In spite of this, it is difficult to achieve that within the same year all crops have high yields.

Universal agricultural progress is needed for this, and faster than we had in the past--since the effective moderation of the weather-caused damage which cannot be calculated in advance, is also one of the tasks. One could get into lengthy details on what jobs have to be done now in grain production, in [the area of] industrial plant crops, or in the horticultural branches, and to what questions must effective answers be given in practice. Besides all these, there are some correlations which affect practically all crop growing branches.

Faster Progress

According to the experience of recent years, one percent increase in the value of crop production required two to three percent increase in expenditures of industrial origin. The consequence of this was that due to the growth and to increasing preduction, some branches began to produce less and less profit, or even became loss producers. There is no doubt that in this age, crop growing cannot exist without materials and equipment of industrial origin. More and more of these are used in agriculture. But this ratio, according to which a one percent production increase requires twice or three times as large as increase in material and equipment costs, must be changed and reduced by all means. Reduced by modifying the price ratios, improving the usefulness and efficiency af materials and equipment, and last but not least by better organized and more rational use of these.

If someone thinks of very simple details, which are not at all simple to implement, these are some one can list: putting more plant nutrients into the soil, and better soil work; faster progress in shaping the production structure, so that each crop would be grown in that area of the country where it can be grown most rationally as far as the country is concerned; taking a more effective stand against weeds; and vigorously increasing the very low yields in the production acreages of fibrous and bulk fodders, including also the production of hay.

Even these detail topics branch out in many directions. It so happens that providing nutrients for the crops is also a complex task. Better utilization of livestock manure and other organic materials may improve on the situation. But what is happening in the utilization of chemical fertilizers, can not be counteracted by anything. These days significantly less chemical fertilizer is being put under the crops than even 5 years ago. Even though it is true that at that time, compared to the yields, often unjustifiably large doses of chemical fertilizers were put on some areas. According to surveys, the next year's chemical fertilizer projections continue to indicate a decline. And we can not expect a rich harvest from a poorly nourished crop, no matter how favorable the weather. Without appropriate plant nourishment there is no use to talk about the producing capabilities of the new types, six to seven tons of wheat per hectare, or 10-11 tons of corn. Changes, further dynamic production increases can be achieved only by deeds. The regulation according to which after 1982 those farms which significantly increase grain production compared to the previous year's average, can receive higher income for the increment, provides the incentive for such deeds.

There is plenty to do, from protecting the producing ability of the soil to vigorously decreasing the shrinking of plowlands; there are opportunities for progress. There are, because in the directing and on the farms there is significantly more experience [now], and it can be calculated more and more accurately what the consequence of each step will be. There are also the will and the intention to this end. Now, in the autumn the weather has also taken us into its patronage [sic]. Of course, we cannot really build on this, but we can build on our readiness and on our industriousness. And if all this is coupled with the right direction of material and technological development, the plan will not remain just a wish but will become reality with the aid of favorable knowledge. And our major agricultural operations as well as the country have very important interests tied to this.

GUIDELINES FOR CHANGES IN ECONOMIC PLANNING REPORTED (PART ONE)

Warsaw GOSPODARKA PLANOWA in Polish No. 7-8, Jul-Aug 81 pp 344-349

[Part one of the summary on the first phase of activities conducted by a task force for planning: "Directives for Changes in the Planning System" 15 May 81]

[Text] 1. General Principles

1. A planning reform should conform with the assumptions that underlie the new system for the functioning of the economy and ought to be coherent with the envisioned institutional and organizational changes. That system can hardly be defined with a crisp journalistic formula ("regulated market economy" or "planned economy utilizing economic laws") because it envisages varying roles to be performed by planning and by the market, depending on target periods, types of problems and economic sector. The "Basic Assumptions for the Economic Reform" published in January 1981 identifies principal changes in the functioning of the economy and parallel organizational and institutional modifications. Of primary significance among those are enterprise autonomy, streamlining of administrative structure, enhanced role for the banks and courts, and that of representative bodies as against the executive organs.

In relation to planning problems, the following can be regarded as the principal assumptions:

-- autonomy of enterprises, guided centrally by means of economic indicators, provided that, in particular areas or in exceptional situations, measures of a different kind can exceptionally be used, as specified further in this report;

-- departure from rank ordering of "lower level" plans to subject them to central plan, and departure from the system of "addressed" directives and "distribution lists" though the latter are likely to permit only a substantial narrowing in scope during the transition period, as presented elsewhere in this report;

-- socialization of the planning process by basing it on improved identification of society's needs, on assured dominance of genuine nationwide objectives and on broader participation of the people in the planning process, an increased role for the worker self-government bodies should be the principal form of socialization of the planning process.

These general guidelines determine the plan system, the substance and extent of plans and methods for planned control over enterprise activity.

2. Central planning will focus on strategic problems and those problems that cannot be properly solved by the enterprises on their own within the market mechanisms (allowing even for centrally determined economic parameters).

In general, the "decisionmaking" field for central plans can be defined as including the following:

-- the rate of economic growth and directions for change in the economic structure and increases in the country's productive capacities;

-- selection of overriding socioeconomic goals and a matching strategy of development policies in employment, investment, foreign trade, research and technology, and the pattern of distribution of national income;

-- economic and scientific-technological collaboration with other countries;

-- defense requirements;

-- policies in income, prices, budgeting, and credits conforming with the requirements of socialist principles of distribution and the needs to delimit parameters and economic standards.

3. The central plan simultaneously performs two principal functions that should be clearly distinguished in the substance and layout of plans:

-- it defines the activities of the government and its agencies, with the proviso that, since the product of a central plan is none other than the state in its entirety, economic ministries cannot be the organizational units in a central plan;

-- it sets the parameters and supplies data to enterprises, labor unions, (both local and central) authorities and administrative bodies, hence, it creates information-based premises for choice and evaluation standards.

4. Ultimately, central planning should differ from present planning in the following features:

(a) it should increasingly include economic-financial and social income categories, especially as regards active influencing of cost ratios and distribution, pricing, generation and distribution of income and development of funds for processes of adjustment in the sphere of supply and demand;

(b) it should more broadly incorporate the categories of needs and societal aspirations in respective structures, types, products, organizational and territorial units, while applying objective standards for living needs, with particular regard to meeting minimum needs in each sphere;

(c) there is a need for deeper probing of external conditionings to the development of the Polish economy from the standpoint of:

-- supply and demand trends and price trends in foreign markets,

-- structural and technical changes implemented and envisaged by our foreign partners, and

-- modifications in international financial relations.

5. Enterprises independently determine the scope of plans they need and fix their target periods, provided that, in some cases, such periods can be defined in a central plan (e.g., in extractive industry enterprises or power industry).

Enterprises plan on the basis of:

-- their relationships with other enterprises,

-- contracts with state bodies,

-- banking arrangements on credits for development,

-- their own predictions and data from a central plan, and

-- parameters and economic norms set in a central plan.

To ensure cohesion in central planning and enterprise planning, it is necessary to inform enterprises early enough about general intentions and forecasts of a central plan (its informational portion) and to provide for consultations of central planners with enterprises during the preparation of a central plan.

6. Enterprise planning should be ruled by cost-effectiveness analysis and self-financing based on commodity-monetary categories developed in keeping with objective market laws. This is a precondition for efficient and streamlined activity on the micro scale and for utilization of grass roots initiative of individuals and human groups. Under such conditions, enterprises will themselves be interested in the quality and effectiveness of planning for their own operations and development projects.

The processes of central planning should support enterprises in the above-mentioned actions and should furnish information on which bank crediting is based.

Negative economic results and poor economic and financial standing of enterprises that fail to meet external requirements, or cases of other enterprises exploiting their monopolistic position should be revealed. Consequently, appropriate remedial measures should be prepared and agreed on, inclusive of liquidation of an enterprise.

7. According to the above listed assumptions, a two-stage planning system is accepted as an overall systemic principle. This system includes:

(a) planning in enterprises and

(b) planning on the central level.

This principle is not contradicted by transfer of a specified rante of central planner's authority to local authorities, nor by combined plants' and large enterprises' development of plans for their component units if the management of an enterprise regards such action as purposeful, provided that this fact does not release enterprises from preparing their own comprehensive plans.

Infrequent departures from the two-stage system can occur:

(a) in voluntary associations whose bylaws would transfer to the association a portion or all of the mandate of associated enterprises.

(b) in enterprise groupings created by law in certain production sectors, provided that delegation of authority, if any, by the enterprises to the grouping should be spelled out in its bylaws approved by a supervisory authority.

Further work is needed to develop planning principles for public utility enterprises and those enterprises that enjoy a nationwide monopoly (e.g., Polish State Railways or the post) or a local monopoly (e.g., municipal services).

These enterprises will be particularly affected by the supervisory bodies' application of either the general regulations on interference in the activities of enterprises having monopolistic positions and major importance for the economy, or agreements to be concluded periodically with appropriate state units and specifying mutual obligations.

Economic ministries (much less numerous than has been the case until now) should also participate in the planning process, especially in:

-- preparation of strategic research projects (especially those concerning structural transformations) to the extent dictated by principal functions of central planning with regard to proportions of economic development,

-- preparation of premises for the performance of supervisory role with regard to enterprises within the boundaries precisely delimited by appropriate legal acts, conducting consultations with enterprise managers on their development programs and economic-financial conditions.

The planning process should include local bodies, especially those concerned with environmental protection, rational territorial management, and improvement of local standard of living.

8. The target planning system must provide for change in all principal categories of plans, that is long-range, long-term, and annual plans. The basic

thrust of this change should be reinforcement of the role of 5-year plans and enhancement of their strategic function in the entire system.

The precondition for this is:

-- on the one hand, basing the 5-year plan on a more extended concept of the country's development to be expressed in the long-range plan, which presupposes increased importance of that type of plan;

-- on the other hand, reduction of the role of the annual plan to exclusively executive function as against the 5-year plan, so as to exclude the possibility of alteration of the 5-year plan assumptions by means of the annual plan.

At the same time, the role of preplan research studies must be increased. These should be understood to mean various types of forecasts, programs, research projects, and analyses. They should be devoid of the aura of an imposed decision and serve instead as material for development of central plans and plans for economic organizations.

2. Relationships Between Economic Units and Central Level Planning

1. Relations between the levels should be based on the following principles:

-- enterprises, as basic entities in economic activity, acquire autonomy subordinated to the rules of cost-effectiveness analysis and self-financing; employee self-government and enterprise management are authorized to make decisions on all matters except those clearly restricted by respective legal regulations;

-- convergence of enterprise activity and goals of the state's socioeconomic policies should be ensured in the main by means of parametric impact measures rather than directive distributional measures.

This should be aided by:

-- first, the conduct of a state price policy whose premises and regulatory instruments should be expressed in planning on central level;

-- second, determination of economic financial parameters and norms (such as tax rates and percentages, currency rates and customs duties and financial norms) to match the requirements of plan proportions;

-- third, financial accountability of enterprises for their results (self-financing plus repayable bank credits) which should activate processes leading to equilibrium and improvement in efficiency in the management of current outlays and development outlays through matching those outlays with financial potential developed by an enterprise;

-- fourth, enterprise participation in overall economic planning through two-way flow of information (between planning bodies and enterprises), especially as concerns development of supply and demand ratios and anticipated variations in price ratios;

-- fifth, horizontal contractual agreements between enterprises, along with assured institutionalized protection of recipients against monopolistic practices of suppliers (arbitration, modifications in instruments of economic regulation);

-- sixth, application of state contracts as a fundamental conduit for unmediated inclusion of enterprises in the implementation of selected undertakings with strategic national significance;

-- seventh, application of administrative management instruments in selected cases, for example, in licensing export and imports, certification of certain products as a condition for allowing their sale, and zoning constraints.

The central level will use parameters to determine computational and decisional bases for enterprise planning. Under these conditions, universal compliance with centrally established parameters and norms, along with other provisions of the law, will be devisive for autonomous enterprise plans to be in consensus with the tasks and proportions in a central plan.

2. Relationships between central planning and enterprise planning should vary with objective conditions under which enterprises operate and grow, especially the frequency of changes in demand and technology and length of cycles for modification in production equipment. Provisions should be made for a relatively broader extent of direct relationships in the case of enterprises characterized by longer modification cycles or lower frequency of change in demand and technology. Other enterprises should receive from the central planner general information on operational conditions in the future and should conduct their economic activity under conditions of, and pressure from competition.

Enterprises can be obligated to form certain components of their plans in keeping with determinations made by the central planner (e.g., in state contracts, export or import licensing) but only in a measure that does not affect adversely the principles of self-financing and integrated cost and effectiveness analysis in enterprise economy.

Central planning should be ahead of enterprises in creating for them conditions that favor their economically sound management, especially in engaging into development projects, which should take the form of selected long-range decisions on infrastructure on the central level and in providing information on expected variations in demand, supply, and price ratios (in domestic and external markets).

3. In keeping with the above posited general principles, it is assumed that the practice of allocation of resources to individual economic entities in the central plan will be ultimately totally abondoned and that traditional planning directives in the form of specified quantities for mandatory production tasks and service tasks and allocation of capital goods and financial funds for the accomplishment of these tasks will be given up already in the transition period.

For the target model, it is presumed that the central authority will interfere in the enterprise activity and planning only in excpetional forms or in exceptional cases.

A. Bans can be instituted for engaging in certain types of activity, production, or export of specific products. Economic activity also can be subjected to licensing in the form of permits for initiating particular kinds of production, services, or exports.

B. State interference in particular fields, mentioned above, will take the form of state contract orders. A legal act should define the circumstances under which the state is entitled to resort to coercion to conclude a contract if one is not achieved voluntarily, along with the conditions allowing for maintaining profitability for economic organizations. The contract system should be utilized for:

-- accomplishment of central investment,

-- creating state reserve and meeting state defense and security needs,

-- execution of governmental agreements on economic and scientific-technological cooperation with other countries,

-- completion of other important state undertakings.

The functioning of the system of state contracts should be guaranteed by rules of law, binding on enterprises and other economic entities both state and cooperative and private to enter in agreements on fulfillment of state orders as their first priority.

Directive determination of tasks and resources on the central level will take place in the case of budgetary units, with more extensive application of budgetary norms and standards.

4. Units of authority should organize the planning process for the economy in its entirety in order to:

-- assist enterprises by providing them with data needed to engage in adjustment activities;

-- select directions and form instruments for social-incomes policies, pricing, budgetary, and credit policies;

-- give shape to strategic directions for change in the structures and techniques by making decisions on selected long-range undertakings.

3. Content of Plans

1. Assumptions for the target planning system permit only a rought determination of essential plan content of socioeconomic plans (long-range, and 5-year and annual plans). Their substance can be expressed in four problem-centered sections (presented in the annex) which will take concrete forms in respective documents of an NSPG [national socioeconomic plan]. Such determinations, however, do not have to be definitive in nature, but must be subject to verification when executive regulations are being developed.

2. In keeping with the principles presented above, national socioeconomic plans in their future form should include:

Part I. "Forecasts and premises for policy of comprehensive economic and comprehensive social nature." That policy should be determined as a result of extensive consultation with society to include, in synthesis, the strategic decisions through which selection of social and economic objectives was accomplished and it should determine basic economic proportions. The solutions accepted in Part I and numerical calculations constitute the basis for determinations of the instruments for accomplishing plans presented in Part III.

Part II. "Central level decisions on development." This part should include specific economic decisions (e.g., a list of investment titles for central plan investment projects) along with definitions for conditions and modes for implementation of these decisions (agreements with enterprises). These decisions directly intervene in the course of economic processes, especially developmental processes.

Part III. "Instruments for implementation of socioeconomic policy." This part should include norms and economic and financial parameters derived from data specified in Part I as well as containing injunctions, prohibitions, and constraints of a general nature (not addressed to economic entities) that are not handled by the general provisions of the law. These can be location constraints or orders to halt production of specified product. Part III is not included in long-range plans.

Part IV. "Information for developmental activity of enterprises." This part should have a service function with regard to enterprises and define material conditionings of their long- and short-range operation in the future.

Information offered in Part IV should permit greater correctness in enterprise adjustments to match changes in external conditions and, along with economic financial instruments, it ought to be an important factor ensuring the plan's conformity with autonomous enterprise plans.

3. In keeping with the principle on reinforced role of 5-year plans, the content of annual plans can, as overall economic stabilization progresses, be restricted to departures from determinations contained in 5-year plans.

Content of National Socioeconomic Plans with Different Time Range

a. NPSG [national socioeconomic plan], a long-range plan, in principle, for a decade.

b. a five-year plan

c. an annual plan

d. Part I. Forecasts and premises for overall economic and overall social policy.

1. Assumptions concerning generation and distribution of national income (rate and structure).

2. Standard of living components seen in light of population projections.

3. Assumptions for investment policy and investment proportions in the production and nonproduction spheres, with the proviso that the long-range plan is not a vehicle for allocation of investment resources.

4. Social objectives and directions for change in levels and composition of patterns of social consumption.

5. Assumptions concerning international commerce and international cooperation--price forecasting.

6. Assumptions for structural modifications and economic specialization within the CEMA and assumptions on the development of those subsectors and branches that initiate processes of structural transformation.

7. Assumptions on employment policy and changes in employment structure.

8. Assumptions on policy in raw materials and energy acquisition from domestic sources and import.

9. Assumptions of territorial policy and territorial development with emphasis on natural environment, water management, settlement, and technical infrastructure.

1. Generation and distribution of national income.

2. Social objectives of the plan.

3. Assumptions on income and price policy. Monetary revenues and expenditures of the population across income brackets.

4. Expenditures on social consumption (level and structure).

5. Investment outlays by source of funding (including enterprise resources) in the sphere of material production and in the nonproduction sphere. Outlays in a breakdown by sector and subsector.

6. Balance of payments, economic cooperation wiht other countries, foreign trade and credit policy.

7. The state's financial balance sheet.

8. Assumptions for the state's budget policy.

9. Assumptions for credit policies.

10. Employment policy. Principles and directions for manpower management.

11. Policy on procurement of raw materials from domestic and import sources.

12. Assumptions for territorial policies.

13. Comprehensive balance and structure ratios.

1. Generation and distribution of national income.

2. Monetary revenue and expenditures of the population across income brackets.

Part II. Central Level Decisions

10. Long-range social and economic programs--assumptions on the 10-year implementation segments.

11. Strategic research and development programs.

12. Central investment

-- regions and range of demand for structural investment

-- assumptions for technical and social infrastructure development

13. Assumptions for foreign cooperation programs--assumptions for state crediting policies.

14. National defense reinforcement programs.

15. Location-related directives and prohibitions.

7. Long-range social and economic programs--decisions concerning 5-year periods.

8. Central (governmental) research and development programs.

9. Central investment

-- investment projects of structural nature in the sphere of production; lists of tasks.

-- projects concerning technical and social infrastructure.

10. Programs for economic cooperation under CEMA. International agreements. Agreements with enterprises on implementation of multiyear international agreements.

11. Long-term state orders and contracts with enterprises on the fulfillment of those contracts.

1. Expenses on social consumption purposes (levels and structure).

2. Investment outlays by source of funding in the spheres of material and nonmaterial production.

3. Balance of payments, foreign trade credit policy.

4. The state's financial balance sheet.

5. State budget.

6. Credit plan.

7. Annual programs for manpower management (in selected territorial breakdown).

8. Implementation of long-range socioeconomic programs in annual segments.

9. Annual segments for implementation of central research and development programs.

10. Annual segments for implementation of agreements with enterprises of accomplishment of central investment projects.

11. Annual segments for implementation of multiyear international agreements and agreements on short-term international obligations.

12. Annual segments for long-term investment [fulfillment?] of the state orders and agreements with enterprises on annual (short-term) state orders.

Part III. Instruments for Implementation of Socioeconomic Policies

A. Economic financial norms and parameters.

1. Multiyear economic financial norms and parameters (e.g., principles for standards for financial reserves.)

2. Multiyear norms and parameters specified by term (from-to) and principles for their concrete expression in the annual plan (e.g., bank interest rates).

3. Principles for determination of short-term norms and parameters (e.g., currency exchange rates).

4. Principles for determination of economic financial norms and parameters by local bodies of state administration, enterprise associations, and other organs.

2a. Norms and parameters within 5-year terms provided by the plan.

3a. Short-term norms and parameters.

B. Directives, prohibitions, and constraints that do not directly interfere with enterprise decisionmaking.

1. Principles for application of directives, prohobitions, and constraints.

2. Allotments and restrictions for units financed partially or wholly from the State budget.

1a. Prohibitions, directives, and constraints (e.g., export licenses, antimonopoly measures, and location constraints).

2a. Specification of allotments and restructions on budget units to the extent defined in segments of the 5-year plan.

PART IV. Information for Development Activities of Enterprises and Other Units Implementing the National Plan

1. Composition and economic proportions.

2. Economic structure by subsector and branch.

13. Major products (a limited aggregated list of raw and semiprocessed materials for capital goods and important consumer goods).

2. Forecast of international economic outlook.

2.1 Variations in currency availability. Forecasts of currency exchange rates.

2.2 Forecast for change in supply and demand conditions and prices in foreign markets concerning principal commodity groups.

3. Price forecast for the domestic market.

4. Forecast for technological progress. New products, new production engineering techniques. Anticipated directions for technological progress.

5. Forecast for change in manpower market situation in territorial breakdown.

1. Economic structure and proportions.

1.1 Economic structure by subsector and branch.

1.2a Forecast for supply and demand for an expanded list of products, new products.

[2 through 3 as above]

4. Forecast for technological progess. New products, new production engineering techniques, new intermediate products of general use (e.g., electric motors, pumps).

5. Forecasts for outlook in employment in breakdown by territory and branch.

2.2a Short-term forecasts for prices in foreign markets.

3a. Short-term forecasts for price fluctuation in domestic market. Decisions on pricing within the state's decisionmaking range.

4. Shortage rate fluctuations in wholesale goods.

5. Situation in manpower market breakdown by territory and branch.

CRITICAL ANALYSIS OF ECONOMIC REFORM PROGRAM PUBLISHED

Warsaw ZYCIE WARSZAWY in Polish 4 Nov 81 p 3

[Article by Wladyslaw Bujwid: "From the Viewpoint of an Enterprise," editor subtitle "Face to Face with Reform"]

[Text] It was a good turn of events that prior to the final formulation of legislation that is to give shape to the reform a team of enterprise consultants was set up. After their first meeting in which drafts of normative acts were given ad hoc evaluations, it appears that a team of this kind should be appointed before the Ninth Congress so that the assumptions for the enterprise economic system can be discussed prior to their submission to the Congress forum.

The critical observations registered at the meeting referred to proposed detailed solutions as well as certain elements that have their origin in the assumptions. The objections pertained to several problems.

Doubts were raised as to the principle under which enterprises transfer a portion of their capital depreciation to the state budget, because this prevents restoration of the full value of used capital and causes its continued eiminution. If adopted, this principle would, along with the self-financing principle (no subsidies), bring about a gradual reduction of the state sector in the Polish economy.

Profit distribution levels also were questioned. The State Price Commission guidelines on 1982 price determination, mandatory for a majority of enterprises, set standard profits for enterprises at approximately 3 percent of the value of its capital goods. Enterprises are expected to remit 50 percent of that figure to state budget as tax and to pay 10 percent of the remaining 50 percent into a reserve fund. In other words, 45 percent of profit is left to be divided between the development fund and employee fund, amounting to less than 1.5 percent of the value of enterprise capital goods.

In a majority of enterprises, this sum is not sufficient to cover what is termed the thirteenth monthly salary which is supposed to be paid out of profits, not to mention other bonuses until now counted as part of the costs, which are also to be paid out of profits. However, if employee councils, accepting reductions in employee salaries, designate two-thirds of the profits remaining at an enterprises disposal for development, this amount will represent approximately 1

percent of the value of enterprise capital goods. This amount conbined with that portion of depreciation that is left at an enterprise's disposal, which is jointly referred to as the development fund, is not sufficient even to restore used up capital goods. Thus, not only enterprise development but also their very existence are predicated on their receiving budget subsidies.

This is neither self-financing, nor autonomy.

Another problem that was raised concerning the many funds, tax entitlements, and types of authorization for the minister of finance to create further funds and taxes which can work in combination with the balance verification rules to completely deprive enterprises of autonomy and can cause retrogression to the directive-distribution system, different only in that decisions would be made by the minister of finance and his bureaucrats rather than by ministers in charge of industrial branches.

Criticisms were levelled at the principle applicalbe to many enterprises under which prices are determined on the basis of the production costs plus a small profit and identical for all products manufactured by the enterprise. Identical profits on different products will not promote production development of goods that are in demand and necessary. Small profits will not permit establishment of necessary development funds to expand production of articles in demand. By depriving consumers of the right to influence prices and profit levels, society will be deprived of economic instruments that regulate production development of needed articles and services. This, following the elimination of administrative instruments that operated under the directive-distribution system, would put the market in total disarray.

It was questioned whether a low rate of exchange for the dollar, exceeding the present rate by 20 percent, was correctly assumed in view of material price increases of 50 percent to 300 percent and the expected rise in production costs by as much as 100 percent in some enterprises. This will render a substantial portion of our exports unrpofitable and result in lowered prices of imports from the dollar zone. This is one way to spur incentives to abandon exports and promote imports, in other words, to further exacerbate the crisis.

Chances for proper functioning of the envisaged system for employee motivation were critically assessed. Evaluations were invited on a substantial package of regulations containing some but not all of the elements of the system, scattered among various normative acts. We will have to wait for many of these elements because of authorization to develop them being proposed for the minister of finance, minister of foreign trade, and the Council of Ministers. This hinders the development of the overall picture of the motivation system but even the expanded portion is of sufficient complexity to be incomprehensible for an average employee who is supposed to feel like the host in his enterprise. Even enterprise specialists encounter serious difficulties in determining the relationship between employee incomes and efficiency of operation of an enterprise. This system of motivation will not meet society's expectations and will fail to improve economic efficiency.

The critical assessment of submitted proposals generates a need for presentations of alternative solutions favoring economic development and, in effect, promoting improved satisfaction of social needs. Drafts for such solutions are being prepared by many enterprises and organizations. Among these, the managerial staff of the MIFAM Factory for Surgical and Dental Instruments in Milanowek, one of a hundred consultants, has developed substantiated proposals for changes in the economic system and sent them to the Central Commission on Reform. The proposals present a specific view of solutions to controversial problems. The principal goal of the reform should be to create a clear-cut system of material incentives for socially effective activity easily understood by an average citizen, and the establishment of a legal system to make such activity possible.

It was expected that an enterprise's effectiveness of operation would be measured by profit, reflecting the value of the added product manufactured by the enterprise because it is the difference between the generated value and cost. This added value is the only source to increase national assets and consumption levels, i.e., the standard of living. Enterprise profit should be subdivided by enterprises into three portions:

-- one for enterprise development and the remainder to be distributed between;

-- the state budget to enlarge national assets, improve living standards, and debt repayment; and

-- the enterprise's employees, as an incentive for generating added product.

Employee share in the portion of profits designated for distribution among the enterprise's legitimate co-owners, i.e., society and employees working in it, should be proportionate with their contributions to the generated value.

This type of solution for the system of financial incentives to motivate efficient work should be understandable to all employees. It will be possible to determine in each enterprise how many cents its employees will receive per each dollar saved [sic]. At that time, expectably, there would be universal interest in efficient enterprise operation and in the financial system that is genuinely effective.

The amount to be allocated to enterprise development will be determined with a full sense of responsibility because it will reduce the portion of profits earmarked for distribution.

Enterprise losses should be covered by co-owners, that is, the state budget and the enterprise in the same proportion as those used to share profits.

Self-financing of capital goods for an enterprise should be achieved by leaving the entire depreciation fund with the enterprise and repricing enterprises' assets to adjust them to current values. In principle, the tax system should assure nothing but self-financing of the state. Taxes should be levied on manufacturing costs as intermediate costs carried by other economic sectors.

Such functions could be performed by two taxes:

-- tax on enterprise wages, which should provide for financing wages in other divisions of the national economy and for social services. Changes in enterprise wages automatically cause the same changes in wages in other sectors and in social services. This will prevent development of wage disproportions and will be reflected in production costs.

-- tax on enterprise assets, that is, fixed assets and working capital, which should provide for the maintenance of the remainder of national assets at an unchanged level, without depreciation.

These two taxes will simultaneously induce enterprises to cost-conscious use of those limited national economic resources constituted by people able to work and national property in the form of land, structures, equipment, and materials. During the present crisis, it is desirable to apply one more tax--on "luxury" goods. A list of these goods should be made by the Sejm and pared down as the crisis subsides. In the future, this should be limited to such articles as cigarettes and liquor.

The "luxury" tax would function in several ways:

-- limit demand for luxury items,

-- limit production of luxury items in favor of items of general use during the period of restricted availability of materials, and

-- reduce inflationary "carry-over."

Tax categories and rates should be specified by the Sejm. Such authorization should not be transferred to the ministries. The tax system and principles of income profit distribution are fundamental elements of social contracts between society represented by the Sejm and enterprise employees represented by their self-governing bodies. This contract can be altered only by the interested parties. The task of the state and enterprise executive apparatuses is to ensure proper implementation of that contract. The establishment of goal-specific funds in the enterprises should be left to their discretion in keeping with the principle of autonomy.

Once the directive system is abolished, the price system will be the only market regulator. To avoid profiteering and hoarding, we must agree to equilibrium prices. Such prices cannot be fixed simply by agreement between supplier and consumer or their authorized representatives.

The Sejm, as the representative for society at large, should decide the price of natural resources which are the property of the entire nation and, as the representative of all consumers, on prices for consumer goods and in consensus with the producers. This does not change the basic principle.

Transferring to consumers the right to accept a price will allow them to influence the producers and the quality and volume of products. By transferring a

portion of profit made on articles in high demand, which today is most often appropriated by profiteers or bribe-takers, consumers will set in motion the mechanism created to distribute profit:

-- to encourage producers to develop and expand production of scarce goods thus providing for a larger write-off to benefit employees;

-- to increase write-offs for development funds, indispensable for expanding production of scarce goods; and

-- to increase budget revenues for overall social development.

The profit distribution and price determination systems described above will launch and maintain a process of adjusting the production structure to the changing social needs and conditions.

An essential cause of the present crisis is the limitation of imports below the economy's minimum requirements, which prevents full utilization of economic potential. In our credit situation, imports can be increased only by enhanced exports. To start emerging from the crisis, a favorable foreign trade balance needs to be achieved, while ensuring:

-- imports that provide for utilization of economic potential and

-- servicing of the foreign debt.

In connection with the situation presented above, foreign currency exchange rates should be set at levels to permit the valve of our exports to meet the above conditions and to become profitable for the manufacturers. Nothing but export profitability can ensure the establishment of an incentive fund and export development fund, the larger, the more profitable it is to export a given article. High rates of exchange of foreign currencies will bring about high levels of import prices, which will curtail imports to a necessary minimum.

Implementation of these proposals should provide for the modifications in the production structure and foreign trade that are geared to meet society's needs, improve the foreign trade balance, and better utilize economic potential. If the economy takes a turn like this, it can ensure resurgence from the crisis and further orderly economic development.

OFFICIAL OF AGRICULTURAL ECONOMICS INSTITUTE DISCUSSES REFORM

Warsaw ZYCIE GOSPODARCZE in Polish 4 Oct 81 p 6

[Interview with Dr. Leszek Wisniewski, director of the Bureau of Economics and Organization of Socialist Agricultural Enterprises at the Institute of Agricultural Economics, by Marcin Makowiecki: "Enforcement of Efficiency"]

[Text] [Marcin Makowiecki:] Can it be envisaged that the introduction of economic reform to PGR [State Farms] starting from 1 July and to collective farms--from January 1982, will change their present functions in the system of food management?

[Leszek Wisniewski:] In the past, collective farms were assigned various roles. During the early post war years, the basic function--mainly of PGR because cooperatives were in the early stages of development--was the creating of technical and organizational progress in all of agriculture. At that time, for example, seed production and nursery enterprises as well as germinal cultivation enterprises were established, which exist until today. Afterwards, as a result of policies of the 1950's, increasingly more land went to the collectivized sector, not to mention the less inhabited regions, which to put it simply, had to be cultivated. The collectivized sector began to play an increasingly more important role as a producer of agricultural products. This was mainly the function of PGR (unlike in other socialist countries where the RSP [Agricultural Producer Cooperatives] dominate in this respect).

Such a system of functions has maintained itself until today. Therefore, it will continue to be necessary for collective farms to fulfill tasks, which for obvious reasons cannot be accomplished by individual farmers (e.g., seed production, germinal cultivating). Moreover, they must implement production tasks; they occupy an area that is to extensive (over 30 percent of the land is under their administration) to resign from this to any possible extent.

[Question] In practice, it appears that, for exmmple, in recent months a large part, since about 50 percent, of meat deliveries for collectivized procurement comes from these farms. For example, in a matter of 3 months of the current year, individual farms supplied 814 thousand tons of cattle for slaughter (in terms of meat) while collective farms supplied 538 thousand tons. In August, however, these proportions already took on a different arrangement: 58 thousand tons from peasant farms and 50 thousand tons from collective farms. Also, the decline in procurement as compared to last year was smaller on collective farms. They are a stabilizing factor for the market supply. This is also caused by the practices which they employ:

consistency, continuity of production processes, which are immanent traits of this production. For years, they have also been producing a large portion--proportionally greater than their share in the structure of arable land--of certain other important raw materials. All of this speaks on behalf of increasing the production role of the collectivized sector.

[Answer] I believe that no sensible person will deny this. However, it should not cause other matters to be neglected. For example, collective farms, mainly PGR, are a place for testing new technical and organizational solutions; they constitute a base for agricultural science and participate in training a skilled cadre. It would be difficult to burden individual farmers with all this. In addition, collective farms have still other goals--organizational in nature. They create new social conditions in rural communities. In short, this can be described with the slogan: progressive work--progressive living under better housing conditions, with access to social services like those in the city and free time after work, etc.

The fulfillment of all these expectations depends to a large extent on the rate of expansion of the area of collective farms. In recent years, when the number of hectares taken over was converted into a guage for the evaluation of this agricultural sector's efficiency, the possibility of improving results, from the point of view of economic efficiency criteria, was in this way, eliminated. In addition, remaining functions; e.g., creating progress in all aspects of agriculture, were not fulfilled as they should have been. It should not be forgotten, however, that this was also the result of general restrictions, of the glaring underrating of the needs of agriculture in general, which also significantly affected the large commodity economy.

[Question] Despite this, it is said that this was a sector, obviously privileged by agricultural policy, especially in terms of the amount of outlays appropriated for development and current production.

[Answer] It is possible, of course, to arrange various indexes in such a way as to prove this. However, it should be remembered that these are farms with a completely different production technique. On the other hand, in evaluating the amount of financial outlays, it should not be overlooked that they always fulfill two functions: intensifying and substitutional (i.e., they replace people, horses, etc.). In addition, if cumulative guages (production result and total outlays) and not segmentary ones were to be used for intersectorial comparisons, then the trends of efficiency measured in this way would bring this sector increasingly closer to individual farming.

However, the sight of inefficiency offends everyone. People, then, start asking, why do much money was invested there--and they are right. There were, however, situations in which a new farm would come about, usually State-controlled, particularly there, where no one was interested in the land. Only then, the next question arises, why animal husbandry was set up there--without a base, without people, etc. --where, in a number of cases, 15 feeding units per 1 kilo of weight gain were allotted for the feeding of the animals. This offended any and all economic reasoning.

I am, however, convinced that a correct economic account--under the new system--will make it impossible for anyone to use outlays contrary to common sense. Simply put, there will be no one who will pay extra. The new conditions will force farms to

spend money carefully, their economic efficiency will improve and through this, public opinion as well in regard to the entire socialized sector of agriculture.

[Question] It may be feared, however, that by using the economic account as their guide, farms will avoid production which is less profitable but, nonetheless, greatly needed. What should be done to prevent the reduction of the currently important role of collective farms in terms of supplying the market? Incidentally: this topic prompts intersectorial comparisons; it is a question of production marketability.

[Answer] My opinion on this matter is the following: the use of one guage leads to misunderstandings; e.g., marketable production from a hectare or per one worker as the basis for the evaluation of production output. This, of course, may be presented and used. In my opinion, however, a significantly more convincing indicator is the description of that which was produced from an area unit in a year. The distribution of this production is a secondary matter, although, decisive for the market supply, in a strict sense. That is why, I am presenting this data (Table 1). I do not wish to enter a theoretical discussion here on the subject of the methods of evaluating the particular sectors of agriculture. However, recollection should be made of that which we discussed, that one of the reasons for the obtainment of a lower net production from collective farms was and is the use of completely different techniques of production as well as--before the reform of PGR--directive-type management of production, often discordant with econimic and technological reasoning.

I do not think that we ought to fight against making comparisons of the economic efficiency of various agricultural sectors. Actually, there is nothing to hide here, if in the comparisons we account for differences in the conditions of production. The socialized sector fulfilled various interventionist functions; e.g., in the case of cattle raising, manufacturing of unprofitable vegetable products, etc.. Decisions concerning the undertaking of this production were, in general, not influenced by the evaluation of economic conditions on farms. Later, however, comparisons were conducted, which were--when they left out this circumstance--false. Collective farms were, to put it simply, ordered to produce specified raw goods. In addition, if we are already comparing sectors, then we must remember that the efficiency of assumed planning decisions or more broadly speaking, of the policy towards sectors is measured then, when one of them has acted in a system of commands and the other had complete freedom in shaping the structure of production. I would also like to add a very essential matter. Despite these mistakes of directive-type planning, whose consequences converged, to a large extent, on collective farms, there did occur--over a longer period of time--an improvement in the economic and technical efficeincy of this sector. This regularity became disrupted in the last 3 years, mainly because of unfavorable weather conditions.

Does reform change the existing economic ratios? Well, that is why it is introduced but we still do not know what its effects are. However, if we believe--and it cannot be otherwise--in the effectiveness of the stimulators, which we will use to describe the level and structure of production, then it may be expected that a quicker reaction to them will occur there, where the consequences will be envisaged more quickly, thus, among others, in the PGR where there is an educated cadre and a greater access to economic information. In any case, it was this way already. During the periods of time when the PGR enjoyed greater independence in making production decisions, their reaction to changes in profitability was quicker or as quick as that of individual farms.

I wish to state with complete confidence that the interventionist role of the socialized sector of agriculture--after all, necessary--depends not only on the extent of this sector but, above all, on the effectiveness of economic implements. The time has passed when commands were employed, often ineffectively. The intrinsic logic of the economic system is more important.

[Question] Something is wrong, however, if--as I have heard--in accordance with this logic, animal production for example, becomes limited.

[Answer] Farms are reacting in accordance with the accepted primary assumption of the new economic system. We wanted them to be profitable and that is what they are doing. In some cases, this leads to a decline of animal production--there, where it was not balanced with the production of feed (that is also why a certain portion of farms are holding on to grain). They cannot be forced to continue to add on to this production. On the contrary, they must make a choice from the point of view of profitability. In this case, cattle raising for slaughter is the most threatened (on "post-inventory" ["przeinwentarzowanych"] farms) and less in the case of hog raising, which is more profitable. In any case, with exceptions and apprehension, it should be taken into account that farms also have to work for the amortization of barns, therefore, the decline in the number of animals will not be large.

On the other hand, the matter of milk production is more complicated. It is profitable but an increase in the cow population cannot be achieved overnight. In order for new cattle [obora] to function well, at least 7 years are required. As a result, reaction to the improvement of economic conditions cannot be as quick as in the case of hog raising.

[Question] One of the goals of reform is to lower production costs or more precisely --economical management. However, oftentimes the opinion is heard that PRG and cooperatives produce without taking into account the amount of outlays.

[Answer] The postulate of economical management is self-evident, regardless of the system. However, in making cost assessments, it is necessary to take into account the specificity resulting from the technologies used. Again, when we take individual farming as the point of reference, we see, first of all, differences in the scale of production and secondly, a different arrangement in the proportions of production factors. Among other things, the level of employment (12 persons on PGR and 30 on individual farms per 100 hectares) causes financial outlays in the PGR for substitution of the working force to be twice as high.

However, a certain important condition turns up here, immediately. Frequently, as an excuse for the low profitability of PGR, it is said that this is caused by poor price ratios of agricultural products and the price of the means of production. I believe that this is only a camouflage for mismanagement and I have proof for it. We have compared farms variably equipped with these expensive means of industrial origin. It appears that in proportion to the increase of provisions, in other words, the rate of outlays (fixed and circulating funds) per unit area, so at the same time, all indexes of efficient management improve. Please read carefully,the data given on Table 2, which contains information about the 10 best and 10 worst PGR, in terms of efficiency, which were studied by the IER [Institute of Agricultural Economy] in 1979/1980. Obviously, this does not imply that the costs of the means of production are low because operating costs, in particular, are higher than in other countries.

However, at the same time, it should be remembered that "freezing" these prices halts industrial production. An additional argument in this matter is the enormous competition in the procurement of the means of production--if they are willing to buy, then this must mean that it is profitable. What matters is that there be something to buy.

[Question] We are hereby entering a very important area for the method of production steering--planning. It [planning] cannot utilize only economic tools. Besides prices, also of equal importance are supplying the means of production and organization of marketing. Altogether this should assure the synchronization of unitary decisions made by farms with general social needs. How is this going to function in the new system?

[Answer] The supreme principle of agricultural policy is for the most efficient producers to produce the most. This is defined in the method of distributing tasks and means, not only among sectors but also among regions. Let us, then, imagine the decision making process under these new conditions. The producer is well-acquainted with economic conditions, the system of being well-equipped with indispensable products of industrial origin, personal resources and on this basis he assumes work on the annual and long-term plan. This information should serve the Center for the balancing of the needs of the national economy with unit production capacities. The account balancing center should anticipate the possibility of intervention when a shortage or surplus of products occurs. In both cases, it can put into operation subsequent price action, active foreign exchange or interventionist production on a scale that will be required--but always using economical means. I envisage the necessity for the active cooperation of the center in production decisions but not by means of a system of dictates but through the creation of conditions for production.

[Question] The matter of subsidies for enterprises is connected with this. Not all of them have been eliminated...

[Answer] In general, there is a departure from subsidizing production. They have been retained exclusively for purposes dealing with special functions of enterprises; e.g., for seed production, experimentation, germinal cultivation [hodowla zarodowa]. In addition, expenditures connected with production activity have been separated from outlays related to the functioning of the social infrastructure (housing, roads, historical monument conservation, etc.)--there will be subsidies for this as well. In addition to this, subsidies are maintained for nonagricultural operations, for example, for farm processing, production of industrial fodder, construction--just as is the case currently in the appropriate branches of industry.

[Question] How do you see the continued possibilities of collective farm participation in the structural transformation of our agriculture but, above all, in the reconstruction of the agrarian structure?

[Answer] Spatial expansion of the socialized sector is defined, primarily, by the capacities of the national economy. They result, first of all, from the balance of employment (migrational and income potential of populational groups). It is a known fact that in the immediate future, there will be limitations on populational shifting caused by the situation of raw materials, power and that of industrial

investments. Secondly, they result from the balance of industrial means, indispensable for agricultural production. In the very near future, this will have a bearing on the situation of socialized agriculture, which is characterized by a higher consumption of technical resources and lower employment.

However, this does not indicate that the possibilities of the development of farming have been shut. The road to its reconstruction, proven historically by examples of countries with developed agriculuure--leads through the reduction of employment (changes in agrarian structure) with a simultaneous saturation with new technology. This process is before us. The treatment of agriculture as a place where the working force is stored, living under more difficult conditions, is in the longrun socially unjust and ineffective.

It is to be presumed that many factors will encourage individual producers not only to expand their farms but also to merge together into large scale production units; e.g., collective groups, which enable the introduction of more effective production techniques and improvement in the standard of living. This, of course, will also be connected with the inevitable migration of a part of the population from the country into the city. In certain areas, the creation of such units will be impossible and transformation in the form of land ownership will take place there, giving rise to nationalized or cooperative farms. In both cases, these processes cannot be forced administratively.

The rate of technological and social modifications in rural areas will depend on the capacities of the national economy; the quicker, so much the better for everyone. We are, without so much as counting, one of the countries with the most costly food production. Changes for the better will occur in proportion to the improvement of the agrarian structure of individual farms and the conducting of intersectorial relocation of land. At the same time, this does not indicate a weakening of the individual sector. On the contrary, it is known that these farms have acquired the possibilities of strengthening their economic position as well as equal rights to land access and to the means of production.

[Question] Thank you for the discussion.

Table 1. Agricultural production in thousands of zlotys, in terms of 1 hectare of arable farm land (fixed prices for 1976).

DATA ON ECONOMIC RESULTS IN TRANSPORTATION, 1980

Belgrade TRANSPORT in Serbo-Croatian No 5, May 81 pp 3-8

[Article by V. Zivkovic: "Transportation in 1980"]

[Excerpt] Transportation of Goods and Passengers--Transshipment

The work and economic position of transportation last year were affected primarily by trends in the domestic market (production and trade), then foreign trade, transit traffic of goods through our country, and also transportation in the international market, primarily the maritime one. The standard of living of the population was naturally also one of the factors that influenced the business results of transportation, primarily of those OURs [organizations of associated labor] handling passenger transportation.

The financial results that were achieved are more or less satisfactory in all branches of transportation, although their relative proportions are more an expression of the influence of prices than of an increased volume of work. The influence of prices on the economic results of business, however, was dominant in the entire economy, so for this reason the financial results of the transportation business were not an exception.

In 1980, the physical volume of exports and imports was increased by about 3 percent, and the transit of goods through our country was only about 100,000 tons greater (1.3 percent). The volume of international freight transportation (exports, imports, transit, transportation between foreign ports) carried out by the transportation OURs was almost on the level of the preceding year (the volume was increased by only 0.25 percent), and minimal growth was likewise achieved in transportation performance (the increase in ntkm was only 0.9 percent). More favorable results were not achieved either in domestic transportation (the volume of transportation was increased by 1.6 percent, and transportation performance by 1.8 percent).

If to these results one also adds those achieved in passenger transportation, then it is possible to have a clear picture of the results of transportation activity last year, so that on the basis of this the economic effects achieved can also be evaluated more objectively. In fact, the volume of passenger transportation fell by somewhat more than two index points, while the transportation performance (pkm) was only 1.8 percent greater.

Due primarily to the favorable conditions of work in the international maritime market (the increase in freight charges for some shipments), the merchant marine achieved very favorable financial results in shipments between foreign ports. Otherwise, a larger volume of transportation was not achieved here either (it was on the level of the preceding year), or higher transportation performance as well (it was two index points lower than the preceding year). The increase in maritime freight charges was reflected to a very high degree in shipments of dry cargos (a difference of 17 percent for single trips, and as much as 38 percent for term charters), with a lesser increase for liners, and a decrease for shipments of liquid cargos. The revival of this market is also confirmed by the activity and involvement of the world merchant fleet, which in contrast to 2 years ago had a moored capacity of only about 10.0 million DWTs (in the middle of 1978 about 55.0 million DWTs were moored, and this was for the most part tankers).

As can be seen from the above data, the development of transportation last year was slowed down, and in some sectors even stagnant and depressed. In any case, it was not possible to expect more under the business conditions that existed last year in our country and the world.

The volume of freight shipments was increased last year by only about 4.6 million tons, or 1.4 percent, and transportation performance by 1.1 percent, because in some branches of transportation (railway, river) the volume of shipments and the length of the shipping routes declined.

The volume of passenger transportation has been declining constantly for the last few years. In fact, in 1978 the increase in the volume of transportation was 2 percent, and 1 percent in 1979, while in 1980 the volume of transportation was reduced by about 2 percent. A similar thing occurred with the transportation performance, which was increased by only 1.8 percent in 1980.

Table 1. Freight Shipment

Description	1979	1980	Percent	1979	1980	Percent
	in millions of tons			in millions of ntkm		
Total transportation including:	332.6	337.2	101.4	229,382	231,800	101.1
railway	87.8	86.2	98.2	25,925	25,367	97.8
highway	194.6	200.6	103.1	17,663	18,922	107.1
maritime	23.8	24.2	101.9	179,968	182,361	101.3
river	26.4	26.2	98.9	5,734	5,093	88.8

As can be seen, railway and river transportation had a lower volume of shipments and transportation performance, while the increase in the volume of shipments and the transportation performance in public highway transportation was higher than the increase achieved in transportation [in general]. Thus, the expectations, following last year's volume of shipments in railway transportation (the volume of shipments was 8 percent greater in relation to 1978, and the transportation performance, 11 percent greater), of the beginning of a change in the structure of freight transportation in favor of the railways, turned out this year to be unrealistic, because the total increase in the volume of freight shipments, 4.6

million tons, was due on the whole to highway transportation, which in doing so took about 1.6 million tons away from the railroads.

Table 2. The Structure of Freight Shipment

Description	1979	1980	Percent
1. Domestic freight shipment			
--in millions of tons	282.1	286.6	101.6
--in millions of ntkm	36,662	37,330	101.8
2. International freight shipment			
--in millions of tons	50.5	50.6	100.2
--in millions of ntkm	192,720	194,470	100.9
--exports (millions of tons)	8.1	8.5	104.9
--imports "	20.3	20.2	99.5
--transit "	7.2	7.3	101.3
--between foreign ports	14.9	14.6	97.9

Both in domestic and international transportation, minimal increases were achieved in both the volume of shipments and the transportation performance. The railways had fewer shipments in both domestic and international transportation (two index points and one, respectively), while river transportation had noticeably fewer shipments in international transportation (about 17 percent less). In maritime transportation, the volume of international shipments was 3.6 percent greater, and in domestic transportation, there were 11 percent fewer shipments. In highway transportation, international shipments were increased by 8.1 percent, and domestic ones by 3 percent. The transportation performance was 7 percent and 10 percent greater, respectively, because in both domestic and international transportation there was an increase in the average freight transportation route. Except in highway transportation, the increase of transportation performance in the international shipment of goods for all of the other carriers was either minimal (an increase of only 1.4 percent in maritime transportation) or less than in the preceding year (railway and river transportation).

It is interesting to see what the share was of railway, highway, and river transportation in the transportation performance (in nktm) that was achieved in transporting goods in the domestic market. This is especially [true] because of our decisions that in view of the well-known difficulties and problems with fuel (oil) and transportation costs, freight transportation would be increasingly directed toward railway and river transportation. The past year, however, did not provide the expected results on this level, either.

Table 3. Structure of Freight Shipment by Branches of Transportation (Domestic Transportation) (in millions of ntkm)

Description	1979	Share	1980	Share
Total achieved	36,164	100.00	36,907	100.00
--railway	17,499	48.37	17,094	46.32
--highway	16,171	44.73	17,279	46.82
--river	2,494	6.98	2,534	6.86

No commentary is necessary, since it can be clearly seen from the data that highway transportation, in spite of a volume of freight shipment several times greater than the railways (198 versus 63 million tons) in 1980, is also achieving a transportation performance equal to that achieved by the railways. It seems that in addition to problems with fuel and prices, the railways are still not satisfying the users of transportation with the quality of their services. Certainly there are also other reasons (use of the capacity of overhead automotive transportation) and habits that are difficult to abandon.

Last year, passenger transportation, after many years of continual growth, was less than the preceding year in volume. It is interesting that passenger transportation declined in all branches of transportation, which may be an indication of the beginning of an effect of transportation costs on the mobility of the population.

Table 4. Passenger Transportation

Description	in millions of passengers			in millions of pkm		
	1979	1980	Percent	1979	1980	Percent
Total transportation	1,071.4	1,048.6	97.9	44,761	45,567	101.8
--domestic	1,062.6	1,038.9	97.8	38,879	39,560	101.7
--international	8.8	9.7	109.3	5,882	6,007	102.1
a) railway	108.0	107.0	99.0	10,134	10,421	102.8
b) maritime	8.0	7.3	90.6	210	230	109.5
c) river	0.2	0.1	85.3	26	20	77.0
d) air	5.3	4.7	89.6	5,234	5,082	97.1
e) highway	949.8	929.4	97.9	29,157	29,814	102.3

The volume of transportation was about 23 million passengers less, and the transportation performance was minimally increased--by only 1.8 percent. The most passengers were lost by highway transportation, but all of the other carriers also performed less transportation than in the preceding year. It remains to be seen whether there will continue to be a decline in the transportation of passengers in public transportation, although it would be normal, in view of the fact that the use of private automobiles is becoming increasingly more expensive, for this transportation to be increased. This is also indicated by transportation in city transportation, which last year increased the volume of transportation by about 17 percent, and carried about 1,879 million passengers.

In the ports, the total turnover of goods was 34.0 million tons, and was increased by 9.2 percent in contrast to the preceding year. Domestic turnover was about 400,000 tons or 17 percent less, and international turnover was 3.2 million tons or 12.7 percent more. Exports of goods through the ports increased by about 250,000 tons, imports by 2.5 million tons, and transit by about 500,000 tons. Goods from foreign trade and transit were 84 percent of the ports' turnover.

The total turnover of goods in river docks was 51.4 million tons and was 450,000 tons less than the preceding year. The international turnover was about 5 million tons and domestic turnover was 46.4 million, which means that international turnover (exports, imports) has about a 10 percent share in the total turnover of the docks.

Table 7. Income Per Worker in Transportation (in Dinars)

Branches	1979	1980	Percent
Transportation--overall	187,639	238,966	127.35
--railway	149,828	178,559	119.18
--maritime	234,810	439,718	187.27
--river and lake	192,360	211,486	109.94
--air	276,542	308,735	111.34
--highway	186,920	225,238	120.50
--city	166,662	203,928	122.36
--transshipment	208,862	279,880	134.00
--postal, telegraph, and telephone	232,944	290,973	124.91

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

MEASURES TO IMPROVE PLANNED MANAGEMENT IN AGRICULTURE

Prague ZEMEDELSKE NOVINY in Czech 6 Nov 81 Supplement pp 1-8

[Supplement to ZEMEDELSKE NOVINY: "Measures for Improving the Planned Management System in Agriculture Beginning in 1982; passages enclosed in slant lines printed in boldface]

> [Text] The Government of the CSSR, during its proceedings of 17 September 1981, passed measures for the improvement of the planned management system in agriculture beginning in 1982." In view of the importance of the measures which were adopted, we are publishing supplements representing a portion of Government Resolution No 249/81 on this issue. These supplements contain new regulations for agricultural planning, changes in economic instruments, especially in the pricing of agricultural necessities and in the purchase prices of agricultural products, and new principles for the implementation of the economic incentive system. We will be returning gradually to individual measures with a more detailed, expert interpretation.

I. Rule for Improving Planning in the Agroindustrial Complex and in Agriculture

(Excerpt from supplement No 1 of CSSR Government Resolution No 249/81)

A. Planning within the Framework of the National Economic Agroindustrial Complex (the Foodstuff Production and Consumption Complex) A broad and multifaceted intersectorial division of labor, its further intensification, the development of science and technology and the forces of production, and the level which has been achieved in the intensiveness and productivity of agricultural production and the production of foodstuffs all require the planning and assurance of foodstuff production within the framework of all the sectors which comprise the national economic agroindustrial complex.

/In the preparation, formulation, and implementation of plans, it is essential to assure the active cooperation of those ministries which make up the agroindustrial complex (the agriculture and food sectors, FMVS [Federal Ministry of General Engineering], FMHRS [Federal Ministry of Metallurgy and Heavy Industy], FMPE [Federal Ministry of Fuels and Energy], FMZO [Federal Ministry of Foreign Trade], the ministries of industry, construction, health and of forest and water management of

the CSR and the SSR) in the creation of the material, economic, and organizational preconditions for the planned volume and qualitative increase in agricultural production and the production of foodstuffs, primarily by means of the consistent provision of all the production assets and preconditions for technical development and capital investment, while assuring the effectiveness of social labor inputs./

On the basis of the established methodology, the federal and national sectors comprising the agroindustrial complex will submit proposals of plans for intersectorial relationships to agricultural and foodstuff production, following mutual discussions of the State Planning Commission with the planning commissions of the republics and between the pertinent federal and republic-level branch departments.

/Branches reponsible for delivering the production equipment and for assuring production services are to formulate, negotiate at an interdepartmental level, and submit, as a component of their proposed plans, a plan for the assurance of the developmental needs of the agricultural and foodstuff industries, which will form the basis for national economic five-year economic plans and for long-range projections./

The proposals for these plans are formulated, depending on the nature of the deliveries from specific supplying departments, in aggregate volumes expressed in terms of value, especially in the case of deliveries for agroindustrial complex investment and deliveries of spare parts within major, specified material deliveries (especially budgeted items of the state plan, budgeted items approved and regulated by central agencies, and additional agreed upon items), the schedule for deliveries of innovative products, and deliveries of raw materials, components, and products for the assurance of the implementational outputs of the state and sectorial plan for VTR [scientific and technological development].

/After the approval of the state national economic five-year plan, it is essential to create the conditions, in the branches of suppliers of production equipment, for guarantees of the assurance of deliveries, as well as their level of sophistication. /

On the basis of the methodology of the comprehensive plan for the agroindustrial complex, the agriculture and food sectors submit to the central planning organs proposals for a plan for the purchase of agricultural products, as well as the most important aggregated indicators characterizing agricultural development, the production and deliveries of the foodstuff industry to consumer goods inventories, including specified deliveries of the most important foodstuffs, and aggregated indicators of the relationships of the food and agriculture branch to foreign trade. In addition, they will submit proposals for plans for employees and wages, for capital investment and the development of long-term assets, as well as for the major indicators of the financial plan. After the approval of the plan for the agroindustrial complex, they are responsible for fulfilling these parts of the comprehensive plan and introducing conceptual and operational measures for the assurance of plan fulfillment.

On the basis of sectorial plans, the State Planning Commission and the planning commissions of the republics will submit to the federal and national governments

for approval, after intersectorial discussions, an aggregate plan for the agroindustrial complex in the form of a system of indicators expressing the comprehensive interbranch relations of those branches assuring agricultural production and the production of foods.

To assure an improvement in the planned management of the agroindustrial complex at the level of the State Planning Commission, the planning commissions of the republics, in the sectors supplying production equipment and the sectors of agriculture and food, it is essential to create the personnel and organizational preconditions for an improvement in the planning and management of intersectorial relations.

In conjunction with the planning system for the agroindustrial complex, it is essential to adapt the system of socioeconomic information of statistical and other agencies to the requirements of management, control and plan evaluation.

B. Rules for Improving Planning in Agriculture

The rules for improving planning in agriculture seek the improved assurance of social requirements in the production and purchase of agricultural products, an increase in the economic efficiency of agricultural production, a more thorough application of the principles of democratic centralism, a strengthening in the authority of the plan at all levels of management, and the full development of the creative initiatives of employees and the economic activity of agricultural organizations.

A comprehensive five-year plan, balanced both internally and between sectors, elaborated for individual years, and which defines demanding yet feasible targets for the efficient development of agriculture, must be considered the basis of the planned management of agriculture at all management levels and in agricultural organizations.

In the formulation of annual plans, it is necessary to begin from the specification of the guidelines, and from the responsibility of agricultural organizations and agencies of the middle level of management to submit on an annual basis a detailed plan proposal to supervisory organs.

/The basic rule for the formulation of five-year plans in agriculture is the application of the principle of counterplanning. In accordance with this, agricultural organizations compile their five-year plan proposals prior to the approval of the five-year plan--on the basis of an acquaintance with the requirements for the assurance of social needs, with material and technical assurance and with the economic conditions of the managerial agencies of the agricultural, supplier and consumer sectors. These proposals are then utilized by the central agencies for the elaboration and allocation of the approval five-year plan./

Agricultural organizations will proceed in accordance with this principle even in the formulation of plan proposals for economic development for the 1981 to 1985 period. They will negotiate these proposals with supervisory agencies. The results of these discussions will be used to itemize the five-year plan after it has been approved by the government. The following approach will be applied to the preparation, negotiation, and approval of the five-year plan:

The acquaintance of agricultural organizations with the social requirements for the purchase of agricultural products for state inventories, with the production, material and technical, and investment assurance of these products, and with economic conditions.

/1. In the planning of purchases of agricultural products for state inventories: the ministries of agriculture and food of the CSR and the SSR, the regional agricultural administrations (KZS), the district agricultural administrations (OZS), and the centrally administered organizations will acquaint all organizations with agricultural production (JZD [united agricultural cooperatives], state farms, joint agricultural enterprises, and enterprises of centrally managed organizations), with the social requirements for purchases of grains, sugar beets, potatoes, oil plants, flax, vegetables, fruits, hops, tobacco, poppy seed, livestock for slaughter including cattle and poultry, milk and eggs grouped according to individual years of the five-year plan./

The social needs for grain and total livestock purchases (excluding poultry) will be established in a binding fashion for all levels of management by the state plan. Regional agricultural administrations, district agricultural administations, and VHJ [economic production units] composed of centrally managed organizations may establish additional indicators, up to a maximum of three, for directly subordinate agricultural organizations, in the interest of assuring social needs for the production and purchase of agricultural products.

They will itemize and revaluate, according to indiviudal agricultural organizations, the fundamental budgetary links within the plan of agricultural production and purchases, and especially the accounts concerned with requirements for and the replacement of fodder, and the production and usage of grains.

/According to their affiliation, consuming organizations will acquaint all organizations engaged in agricultural production with social needs for the purchase/ of agricultural products, without aggregating them in the indicators of specifically allocated agencies of the middle level of agricultural management, and with the production and purchasing of seed, seedlings and livestock for breeding and raising, after discussions with the pertinent level of management (the ministries of food and agriculture of the CSR and the SSR, KZS, OZS, VHJ and URO [the Central Council of Trade Unions]).

/Consuming organizations will assure the social needs for agricultural product purchases for state inventories in the full assortment of purchased agricultural production, by concluding agreements concerning the preparation of deliveries for the five-year plan with sectorial and nonsectorial organizations engaged in agricultural production./ They are to utilize established machinery guidelines and generate efforts for the full coverage of social purchasing requirements, for the assurance of a balanced coverage of the raw material requirements of processing organizations, and for the minimalization of handling, warehousing and transportation costs. They are to create the organizational, material and technical conditions for the smooth and balanced marketing of agricultural production. In conjunction with atricultural organizations, they are to see to an efficient and effective intensifying of the concentration and specialization of agricultural production. They are accountable for the development and deepening of cooperational and integrating links within the framework of the agro-food complex.

/2. In the planning of material and technical assurance./ In the interest of assuring the tasks of agricultural production development and agricultural product purchases for state inventories, as well as the balance of the links between plans for plant and livestock production, the ministries of agriculture and food of the CSR and the SSR, the KZS, the OZS and the VHJ of centrally managed organizations will establish the following binding upper limits:

/--fodder subsidies from the central fodder stock (CFK) will be tied to the distribution of agricultural product purchases for state inventories and on the fodder balance.

/--limits on feed mixtures will be linked to livestock product purchase tasks and to the coverage of the raw materials requirements for their production.

/--limits on propellants, fuels and energy will be linked to the production structure and development of the remaining economic activities of agricultural organizations./

Supply organizations managed by the Ministry of Agriculture and Food--depending on the itemization of social needs for purchases of agricultural products for state inventories--will negotiate the assurance of deliveries of individual types of feed mixtures, deliveries of industrial and calcareous fertilizers, agrochemcials, seed, seedlings and livestock for breeding and raising. The supplying organizations are to verify the results of these dicussions withthe appropriate agencies of agricultural management, and to conclude agreements with agricultural organizations concerning the preparation of deliveries of necessities for the five-year plan.

/In the area of machinery, equipment, and transportation technology, the agricultural management agencies are to acquaint agricultural organizations with deliveries which are the subject of state plan budgets and the subject of budgets and regulation at the ministerial level./

/3. In planning the implementation of the results of scientific and technical development./ VNJ and organizations responsible for the implementation of technical development, after discussions with the ministries of agriculture and food, will acquaint organs of the middle level of agricultural management and, concurrently, agricultural organizations with the intentions of specific projects in the implementation of scientific and technical development in individual years of the five-year plan, and especially with the material focus of the projects, with the possibilities for the extent of facility usage during implementation in terms of their material and technical assurance, with time deadlines and implementation location, with the designation of the organizations responsible for the assurance of implementation, and with the projected production and economic contributions.

The ministries of agriculture and food will designate the most significant projects in the implementation of scientific and technical development as binding tasks for the appropriate agricultural service organizations responsible for their implementation.

/4. In the planning of capital asset replacement. There must be an application to agriculture of the categorization of investment projects in terms of less than or

more than Kcs 5 million in budgeted costs./ The central management of targeted capital investment in agriculture will be applied in particular to projects with more than Kcs 5 million in budgeted costs. For these projects, binding limits on the budgeted costs of projects already underway and the year of beginning and finishing the project must be established for all management levels and for all agricultural organizations.

/The category of special agricultural investment projects must also include, in addition to orchards, vineyards and hop fields, drainage projects up to Kcs 5 million in budgeted costs, rural roads, repairs on small streams, small reservoirs, ponds, fertilizer storage areas, the construction of grazing zones and ensilage pits, to which the binding limit on newly initiated construction projects does not extend./

Machinery and equipment is to be planned for in material units only of specifically designed types (budgeted at the level of the state plan and regulated at the ministry level).

The ministries of agriculture and food of the CSR and the SSR, the KZS, OZS and VHJ of centrally managed organizations will acquaint subordinate organizations and agricultural organizations:

--with the intentions and priorities of investment policy, with the orientational volume of work and deliveries overall, as well as divided into construction and equipment investments. They will establish as binding specific capital investment projects of more than Kcs 5 million budgeted cost, a limit to the budgeted costs of these projects, and deadlines for their initiation and startup. Specifically, they will determine the magnitude of deliveries of selected agricultural machinery, tractors, and transportation equipment (in material units).

/5. In the financial plan./ The ministries of agriculture and food of the CSR and the SSR, the KZS, OZS and VHJ of centrally managed organizations:

--will acquaint subordinate organizations with the economic conditions of five-year plan formulation;

--will establish for state and cooperative organizations, binding limits for their relations to the state budget (subsidies, subventions) and, for organizations of the state sector, the indicator of total costs as a percentage of output, including extraordinary revenues;

--will introduce orientational limits for supplementary price instruments (differential surcharges, premiums and surcharges on purchase prices);

--will introduce total costs as a percentage of output including extraordinary revenues, as an orientational indicator for cooperative organizations;

--will introduce overall output, including extraordinary revenues, as an orientational indicator.

/6. After informing agricultural organizations of the requirements/ for the assurance of social needs for the production and purchase of agricultural products for state inventories, and after acquainting them with deliveries of production assets and with the tasks in the implementation of scientific and technical development, /the supplier and consumer organizations:/

--must negotiate supplier-consumer relationships for a previously determined range of products and conclude, through discussions, protocols concerning the results of negotiations according to Decree No 48/1980 of the Laws of the CSSR: these protocols will be the base upon which they will conclude agreements concerning the preparation of deliveries for the entire five-year plan;

--on the basis of agreements concerning the prepration of deliveries, they are to conclude agreements concerning the delivery of agricultural products and necessities, usually for one year.

Procedure for Preparing Five-Year Plan Proposals in Agricultural Organizations

/1. The formulation of five-year plan proposals in agricultural organizations. Agricultural organizations will draw up five-year plan proposals which are broken down into individual years on the basis of the requirements for assuring social needs, the material and technical conditions of their implementation in the five-year plan, the outcome of negotiations with consumer and supplier organizations concerning arrangement of deliveries and the decreed economic instruments in effect from 1 January 1982, and will submit them to the appropriate management organs for negotiation./

Through the timely involvement of all agricultural organizations in the preparation of five-year plan proposals, it is sought to create the conditions so that, on the basis of the rules for improving the planned management of agriculture, agricultural organizations may contribute through their activity and initiative to the thorough utilization of the unused portions of their production potential to make production more efficient and to improve the quality of that production which is providing for social requirements.

/The VHJ of biological and technical services, organizations of the scientific and research base, and additional organizations which have been entrusted with the implementation of scientific and technical development are to negotiate the approach to, and the concrete implementation of scientific and technical development with the appropriate elements of agricultural management and with individual agricultural organizations./ In conjunction with them, they will draw up their proposals of procedures for the implementation of the results of scientific and technical development, broken down according to individual agricultural organizations, regions (KZS) and districts (OZS).

Agricultural organizations are to aggregate into their five-year plan proposals the implementation of projects to the extent of the tasks established by the ministries of agriculture and food, as well as those projects whose implementation they must arrange with service organizations.

/2. Negotiating the plan proposals of agricultural organizations with management agencies./ Agricultural management organs will negotiate the plan proposals of agricultural organizations with individual enterprises in all aspects of the plan. They will evaluate, in particular, the overall economic development of individual organizations from the viewpoint of the proposed structure and intensiveness of agricultural production, the efficient intensification of concentration, specialization, and cooperation, the utilization of internal unused capacity, the development of the material and technological base and the efficiency of utilization of material resources, the objectives and assurance of investment development, the assurance of a labor force and increased labor productivity, overall economic efficiency, the generation of in-house financial resources, profit and return on investments.

/For organizations with below average economic performance figures, the appropriate supervisory management elements will reach agreement on the concrete preparation of technical and organizational measures to assure the balancing out of their production and managerial performance at the level of average organizations in the course of the five-year plan./

Through the limiting of the administrative establishment of tasks for agricultural organizations, it is sought to increase the accountability of managerial agencies in the planning sector, especially by means of a substantial increase in the quality of the forms of direct dealings of managerial agencies, supplier and consumer organizations with every agricultural organization during the process of assuring social needs and the overall economic development of individual agricultural organizations. Throughout the entire planning porcess, the idea is to increase the quality of labor of all the managerial organs in agriculture, especially of the district agricultural administrations, above all in the application of industrial production systems, the findings of scientific and technical development, and in the implementation of optimal variants for the utilization of production conditions for the full assurance of social needs.

Agencies engaged in the economic management of agriculture and consumer and supplier organizations are to inform higher levels of management regarding the fulfillment of social needs in the plan proposals of agricultural organizations, regarding the outcomes of their negotiations, and the preliminary results of the supplier-consumer assurance of the development of this branch in the five-year plan. All levels of management are to utilize these principles in the breaking down of the approved state five-year plan.

Procedure for Plan Refinement at Individual Levels of Management After Approval of the Five-Year Plan by the Government of the CSSR

/1. Itemization of the five-year plan at individual management levels./ The ministries of agriculture and food of the CSR and the SSR, and the middle levels of management are to itemize, for subordinate levels of management and agricultural organizations, five-year plan tasks to the extent of binding and orientational indicators. In itemizing the five-year plan, individual management levels are to utilize the principles concerning the fulfillment of social needs in the five-year plan proposals of agricultural organizations and the guidelines for consumer organizations concerning the outcomes of supplier-consumer negotiations.

/Organs of the middle level of management, when breaking down five-year plan tasks, are to assure that as an inseparable part of the five-year plan, adequate technical and organizational measures are established for organizations with below-average economic performance to guarantee the implementation of the five-year plan./

The ministries of agriculture and food of the CSR and the SSR are to establish for agricultural service industries (the Oseva, Slovosivo, Sempra, Semex, and hop-processing VHJ, the Bratislava Wine plants, state breeding enterprises, State Veterinary Administration, the Large Feed Lot sectorial enterprise, the Poultry Industry VHJ, the State Fisheries, the Nitra Agrokomplex, the State Tractor Station and Agricultural Machinery Repair Shops VHJ, the Agricultural Construction VHJ, the Institutes of Scientific Management Systems and of Agroprojects) specific tasks for the implementation of the findings of scientific and technical development and the conditions of economic incentives for their implementation.

The appropriate VHJ and service organizations are to assure the introduction of the approved projects in the implementation of the findings of scientific and technical development at individual agricultural organizations by establishing specific accountability of their components for assuring the implementation of individual projects. They are to establish the facility allocation, duration and location for the implementation of particular plan tasks in the implementation of the findings of scientific and technical development. These agricultural organizations will then aggregate the tasks in the implementation of scientific and technical development into an indispensable component of their own five-year plans.

The ministries of agriculture and food have issued detailed instructions regarding the assurnace of tasks in the implementation of scientific and technical development.

/2. Procedure for plan refinement in agricultural organizations./ On the basis of the breakdown of five-year plan tasks, their material and technical assurance and constraints established by the five-year plan, agricultural organizations are to refine their own five-year plans, in which:

/--they will adhere to the binding tasks established by the state five-year plan for the purchase of grains, total livestock for slaughter (excluding poultry), and to the binding tasks established by an organ of the middle level of management, integrate into their plans the results of the supplier-consumer clarification of the purchase of agricultural products, and assure full self-sufficiency in the production of bulk fodders, including the creation of adequate reserves;

/--they will adhere, in their plan for material and technical assurance to the binding subsidy constraints from the CFK, and for propellants, fuel and energy;/

--they will integrate into this plan the results of supplier-consumer negotiations for seed, seedlings, livestock for breeding purposes, and additional deliveries of productive assets and requirements from suppliers managed by the ministries of agriculture and food;

--for deliveries of productive assets from supplying organizations of other sectors, they are to formulate gross volumes of deliveries based on itemized state plan budgets, allocation budgets and plans which have been approved by central agencies and deliveries of centrally regulated machinery and equipment;

/--they will adhere, in their capital asset replacement plans, to specifically establish projects over Kcs 5 million in value, and the initiation and completion of which is projected for particular years of the five-year plan;

/--they will adhere, in the labor force plan;

/--to the binding norms for wages payable in conjunction with the existing rules for wage regulation in the state sector,

--to the limits on numbers of technical-managerial employees applicable to the state sector;

/--they will adhere, in their financial plans:/

--to establish limits in relationships to the state budget (subventions, subsidies) and, for the state agricultural sector, the binding indicator of total costs as a percentage of total output, including extraordinary revenues;

--they will introduce, for the state and the cooperative sector, a documented volume of total output, including extraordinary revenues;

/--In the plans of joint agricultural enterprises:/

--representatives of the joint agricultural enterprises, during the preparation and formation of the five-year plan, are to negotiate and agree upon the material and financial aspects of cooperation with the member organizations;

--the five-year plans of joint agricultural enterprises are to be discussed and approved by a committee of representatives of the member organizations prior to its negotiation with economic management agencies.

/3. Approval of organizational five-year plans./ Agricultural organizations are to submit to their supervisory agency for approval completed five-year plan proposals. The supervisory agency is to approve the five-year plans following a thorough verification of the extent of assurance of social requirements, and in particular:

--the assurance of binding tasks and the maintenance of binding constraints;

--the assurance of social requirements for the purchase of agricultural products;

--the overall balance and proportionality of outputs, and their material and technical assurance;

--the requisite formation and efficient utilization of resources;

--the adherence to principles of wage development and economic incentives;

--the financial assurance of the replacement process;

--the assurance of social development.

The economic management agencies for agriculture will inform their own supervisory agencies concerning the fulfillment and assurance of social requirements in the approved five-year plans of agricultural organizations.

Additional Measure To Improve Planning

/1. Links between five-year plans and annual implementation plans. The five-year plan of agricultural organizations will be neither changed nor recalculated/ during the five-year plan, with the exception of plan delimitations stemming from changes in internal and external conditions, which will be incorporated into the implementation plans. Five-year plan tasks established for appropriate years of the five-year plan form the base for the formulation of the annual implementation plans.

/The annual implementation plans approved by the government are to be broken down for agricultural organizations, beginning in 1983, only by those indicators in terms of which the implementation plan significantly differs, for legitimate reasons, from the five-year plan tasks for the year in question./

Necessary alterations to achieve greater precision which are dictated by new findings of scientific and technical development are to be incorporated in the annual implementation plans of agricultural service organizations, the scientific and research base and agricultural organizations within the framework of the resources allocated by the annual plans.

/2. Intensification of worker participation in the formulation of the Seventh Five-Year Plan in agricultural organizations./ Immediately during the stage of five-year plan proposal preparation, the management of agricultural organizations is to acquaint labor collectives with the social requirements, material and economic conditions of its assurance. Management is to discuss with all labor collectives the possibilities for utilizing unused capacity in individual sectors, as well as the conditions for economic incentives, and additional conditions for economic and social development.

/The positions of trade union and Cooperative Farmer Union organs are a part of the plan proposals. The management of agricultural organizations will incorporate these positions, as well as employee initiative proposals and suggestions into its plans for economic and social development./

II. Measures in the System of Economic Instruments for 1982 and Later Years of the Seventh Five-Year Plan.

(Supplement No 2 to CSSR Government Resolution No 249/1981)

The following measures are to be carried out with the intention of further improving the level and relation of the purchase prices for agricultural products, increasing the efficiency of other economic instruments and resolving consequences stemming from

--the termination of supports for the prices of fodder mixtures;

--the second stage of the one-time alteration of wholesale prices;

--the increase in selling prices of diesel fuel, light fuel oils and lubricating oils (at the budgetary level):

I. In the Area of Prices

A. Prices of Inputs

Market prices of fodder mixtures are to be increased by an average of 15.6 percent, in conjunction with the elimination of their wholesale price supports.

B. Purchase Prices and Supplementary Price Instruments for Plant Products.

a) Prices, price surcharges, and premiums are to be modified as follows:

1. the purchase prices for early potatoes are to be raised by an average of Kcs 240 per ton;

2. the purchase prices for late eating potatoes are to be increased by an average overall of Kcs 332 per ton, of which an average of Kcs 82 per ton is due to the elimination of premiums for specialization;

3. the purchase prices of industrial potatoes are to be increased, assuming a basic starch content of 15 percent, by Kcs 170 per ton, of which an average of Kcs 70 per ton is due to the elimination of premiums for specialization;

4. the purchase price surcharge for rye is to be increased by Kcs 150 per ton;

5. a purchase price surcharge is to be introduced for oats of Kcs 140 per ton;

6. the purchase price surcharge for corn is to be increased to Kcs 140 per ton;

7. the purchase prices of rough, dewretted flax is to be increased by an average of Kcs 400 per ton, and differentiated surcharges on the purchase price are to be introduced in the SSR in the average amount of Kcs 370 per ton;

8. the purchase price of flaxseed is to be increased by Kcs 200 per ton;

9. the purchase prices of black and white mustard are to be increased by Kcs 2,000 per ton;

10. for sugar beets, which have seen an average increase in purchase price of Kcs 13.50 per ton since the 1981 harvest in conjunction with monetary compensation based on sugar content, the purchase price is to be increased an additional Kcs 20 per ton, and premium introduced which will average Kcs 10 per ton;

11. the purchase price of chicory is to be increased Kcs 300 per ton;

12. the purchase price of hops is to be increased Kcs 3,000 per ton;

13. the purchase price of tobacco is to be increased Kcs 1,500 per ton;

14. differentiated purchase price surcharges are to be implemented for greenhouse vegetables produced on a base of light fuel oils, to offset rising costs;

15. for hot-air-dried fodder produced with a base of light fuel oils, state subsidies on a per-ton basis are to be introduced in the amount of Kcs 470 per ton of fodder delivered to authorized purchasers.

b) In conjunction with alterations in the purchase prices of plant products, the necessary alterations are also to be carried out in the purchase and wholesale prices of seed and seedlings, and in the wholesale prices of potato sets, eating potatoes for market consumption and peeled potatoes.

c) In connection with the one-time modification of wholesale prices, separate alterations are to be carried out of product markups, by increasing them for poppy seed products and wool and reducing them for agricultural chemicals while providing mutual compensation without increasing demands on the state budget.

C. Purchase Prices and Supplementary Price Instruments for Animal Products

a) Prices, price surcharges, and premiums are to be altered as follows:

1. the purchase price for milk of first-quality category, with at least 3.6 percent fat content, is to be increased Kcs 0.50 per liter;

2. Reimbursement for livestock for slaughter is to be increased an average of Kcs 2.39 per kilogram of net weight; this figure reflects

--an increase in the purchase price of feedlot cattle by an average of Kcs 3.42 per kilogram of net weight,

--an increase in the purchase price of cows for slaughter of Kcs 1.40 per kilogram of net weight,

--the elimination of premiums for fattening bulls up to higher weights,

--an increase in the purchase price surcharge on cows which have dropped their first salves of Kcs 2.00 per kilogram of net weight;

3. an average increase of Kcs 0.60 per kilogram of net weight for calves for slaughter;

4. an increase in the purchase price of swine for slaughter of Kcs 1.50 per kilogram of net weight;

5. for pigs

--the purchase price for pigs up to 25 kilograms in weight is to be increased Kcs 2.00 per kilogram of net weight,

--the purchase price of pigs (gilts) between 25 and 30 kilograms of weight is to be increased Kcs 1.50 per kilogram of net weight for every kilogram in excess of 25;

6. for sheep for slaugher

--the purchase price of lambs for slaughter from intensive and semi-intensive feeding operations is to be increased Kcs 2.00 per kilogram of net weight,

--the purchase price of all other sheep for slaughter is to be increased an average of Kcs 1.25 per kilogram of net weight;

7. the purchase price of sheep's milk cheese is to be increased an average of Kcs 3.42 per kilogram;

8. the purchase price of wool is to be increased an average of Kcs 5.23 per kilogram;

9. the surcharge on the purchase price of wool on the skin is to be increased Kcs 0.80 per kilogram;

10. the purchase price of chickens for slaughter is to be increased Kcs 2.00 per kilogram of net weight;

11. the purchase prices for turkeys for slaughter are to be increased Kcs 2.00 per kilogram of net weight;

12. the purchase prices of geese for slaughter are to be increased Kcs 3.20 per kilogram of net weight;

13. the purchase prices of ducks for slaughter are to be increased Kcs 1.50 per kilogram of net weight;

14. the purchase prices of hen eggs for consumption are to be increased Kcs 1.20 per kilogram;

15. the purchase prices of fresh water fish are to be increased an average of Kcs 2.00 per kilogram;

16. the purchase prices of bee honey is to be increased Kcs 10.00 per kilogram;

17. the purchase prices for game animals are to be increased an average of Kcs 3.90 per kilogram;

18. firm purchase and wholesale prices are to be decreed for rabbits for slaughter, and purchase price supports introduced to maintain an average level of Kcs 4.50 per kilogram of net weight.

b) Purchase price surcharges are to be eliminated for milk, lambs for slaughter from intensive and semi-intensive feeding operations, and sheep's milk cheese originating from intensively utilized meadows and pastures.

D. Differential Surcharges

/1. Selected types of fruits and vegetables are to be included in eligibility for differential surcharges.

/2. The increase in receipts/required for eligibility for differential surcharges is to be increased

--for potatoes, from 100 to 140 percent,

--for milk, from 110 to 140 percent,

--for other products of livestock husbandry, from 100 to 140 percent,

--for products of sheep husbandry, from 100 to 140 percent.

3. The influence of the existing rates for differential surcharges on interoblast income differentiation is to be evaluated. Targeted changes which do not effect the state budget may be incorporated into implementation plans beginning 1 January 1982.

E. Premiums for Increases in Receipts for Agricultural Production

/The awarding of premiums is to be introduced for increases in the production of agricultural products for market in the amount of 30 percent of the increase in receipts; the premium for increased receipts in a given year is to be based on the average receipts of the 3 preceding years./

The basis for the awarding of premiums will be total receipts for agricultural production after deductions for the value of purchased seed, seedlings, feed and fodder mixtures, livestock and other intermediate agricultural products that had to be purchased.

Part of the resources gained through these increased premiums is to be used for the direct strengthening of individual and collective economic incentives for employees of agricultural organizations.

II. In the Area of Other Economic Instruments

A. State Subvention and Subsidy Policy

1. The following are to be eliminated:

a) stabilization subsidies awarded from the state budget to agricultural organizations with insufficient in-house resources;

b) subventions for investments granted to the same organizations on a targeted basis for selected investment projects;

c) subventions for housing construction with a view to the introduction of a new method for financing housing construction with state budget participation with validity beginning on 1 January 1981.

/2. An intensification fund is to be created, divided internally into a operational component and an investment component, for the purpose of supporting intensification programs at enterprises which have lagged behind for some time and, in justifiable instances, for subsidizing investments by other agricultural enterprises which may suffer from a temporary lack of in-house resources. The ministries of agriculture and food of the two republics will make decisions concerning the uses of this fund./

3. The range of projects covered by provisions of the laws concerning soil enrichment are to be expanded to include projects of the nature of so-called special agricultural investments, /i.e. orchards, vineyards, hops fields, the creation of grazing zones, ensilage pits, field storage areas for manure, small water reservoirs, repairs to small streams and ponds, the repairing of rural roads, and the like./

4. Operational subventions which are designated for the support of the preservation and nutrition of plants, the enrichment of new strains of fruits, the agrochemical testing of soil, the development of the breeding and treating of domestic livestock are to be retained.

5. A work force stabilization fund is to be put in place, with the objective of supporting more significantly, and expanding the types of measures aimed at work force stabilization, especially in remote oblasts and in those with difficult living conditions, and at the training of apprentices according to new training conditions, etc.

6. The system of financial reserves is to be retained in the organs of state management of agriculture, in particular:

a) a systemic reserve to resolve deviations between the plan proposals of enterprises and societywide requirements during the process of plan formulation and implementation, while strengthening it financially; the tying of asset utilization to the agreement of the Federal Ministry of Agriculture and Food;

b) an uninsurable-damages fund to moderate any damages to plant production not covered by either legal or contracted insurance;

c) financial reserves formed from the unused operational assets of the intensification fund, the work force stabilization fund, the unused assets of the investment component of the intensification fund and designated for use at the discretion of the ministries of agriculture and food. Other resources may go to the composition of this fund at the discretion of the ministries of finance.

B. Coping With the Risk Involved in Agricultural Production

/1. A proposal is to be prepared for new, unified insurance for livestock which will combine the coverage of risks of both legal and contractual insurance./ In rates for the insured, only a minimal profit and the coverage of costs of insurance are to be considered. Bonus principles are to be actively applied within this context. These measures are to be implemented prior to 1 January 1983. Until this time, differences between insurance and damages in 1981 and 1982 are to be resolved under the guidelines of resolution No 170 of the Presidium of the CSSR Government, dated 12 July 1979, and concerning modifications in the system of economic instruments in agriculture for 1980 and the period of the Seventh Five-Year Plan.

2. Current findings from the insurance of harvests of selected plant products for the period which has passed, as well as the experimental verification of the comprehensive insurance of harvests of remaining crops for 1981 must both be evaluated and a proposal for improving the efficiency of current agricultural insurance must be prepared during the Seventh Five-Year Plan.

C. In the Area of Credit

1. In order to strengthen the stimulative function of investment credit, /interest rates must be differentiated more significantly/ and established at the following levels (in percentages);

—for soil enrichment - 1;

—for developing cattle and sheep husbandry (including the conservation of bulk fodders) - 2;

—for the construction of warehouses and the alteration of production - 3;

—to agricultural chemical enterprises for agricultural chemical activity conducted by other organizations - 2.

Investment credits for other projects are to be granted under the existing guidelines.

/2. From 1982-1985, make it possible for enterprises which have long lagged behind economically to defer payments on their investment credits on the condition that after the deferral period interest will be charged on credit payments at half the prevailing interest rate./

D. In the Area of Taxes

The current principles of agricultural taxation will not be changed for 1982. Needed alterations in agricultural taxes are to be carried out in connection with the general alterations beginning in 1983, without the submission and discussion of the principles of the law, which will change and supplement the law concerning agricultural taxation.

E. In the Area of Services

Within the framework of additional work on the improvement of the planned management system in agriculture in the course of the Seventh Five-Year Plan, the following are to be prepared and implemented to the extent possible:

1. With the goal of evaluating objectively the results of the specialized activities of biological service organizations and gaining reliable bases for the determination of costs and established prices, /the preconditions are to be created gradually for the separate planning, monitoring, and evaluating of services which are provided and of other specific activities,/ in such a way that following verification during the Seventh Five-Year Plan, these measures could be implemented to their full extent as soon as possible after the start of the Eighth Five-Year Plan. For VHJ, STS [state tractor stations] and OZS [agricultural equipment repair stations], a method for itemizing the plan, its outputs, and ties to the financial and labor plans should be implemented which will make it possible for subordinate organizations to fulfill their own designated mission in a priority fashion. These ties are to be assured by itemizing the plan according to the structure of activities.

/2. In order to strengthen the mutual trust among service organizations and enterprises engaged in primary agricultural production, a system of guarantees for performed services and activities is to be worked out,/ in particular:

a) for biological services, an evaluation is to take place, during the Severnth Five-Year Plan, of the existing situation in this sector from the viewpoint of the requirements of primary agricultural production, studies undertaken of the possibilities for their expansion, and they are to be verified gradually in selected organizations engaged in primary agricultural production, especially in the areas of seeds, seedlings and nursery materials, artificial insemination, and deliveries of animals for breeding, raising, and for feedlots;

b) for technical services, a system of guarantees is to be formulated and verified gradually at selected enterprises during the Seventh Five-Year Plan in such a way that it may be applied to its full extent in the Eighth Five-Year Plan, especially in the sector of mechanized livestock production, machinery repair, in harvesting, post-harvest processing, and warehousing, in the balanced supplying of industrial fertilizers in a planned structure and to established tolerances, as well as in the production and delivery of fodder mixtures.

3. The economic regime (including its tax and transfer payment aspects) for technical service organizations is to be modified in such a way that the provision of these services is not economically less advantageous for agricultural enterprises than the provision of these activities by the enterprises themselves, and so that this will not serve as a path to the systematic increase of costs of agricultural enterprises and the growing transfer of assets away from agricultural enterprises.

4. For the employees of service organizations, whose participants share in the performance of individual activities of agricultural enterprises may be limited, a portion of individual and collective economic incentives is to be tied to the performance of these activities.

Aggregate Quantification of Needs and Resources for Modifications in Economic Instruments Beginning in 1982, by Republic

	Millions of Korunas		
	CSR	SSR	CSSR
A. Need for Resources			
1. Purchase price modifications	4,276	1,529	5,805
2. Differential surcharge modifications	1,428	1,281	2,709
of which			
--from influence of purchase price modifications	481	425	906
--influence of increased numbers of receipts for eligibility for differential surcharges	947	844	1,791

	CSR	SSR	CSSR
—inclusion of selected fruits and vegetables for eligibility for differential surcharges	0	12	12
3. Introduction of increase premiums	574	398	972
4. Introduction of subsidies for hot-air-dried fodder	45	22	67
5. Increased reimbursement of non-price instruments	205	139	344
TOTAL	6,528	3,369	9,897
B. Resources			
1. Elimination of fodder mixture supports	1,654	827	2,481
2. Increased fuel prices	1,113	594	1,707
3. Operational part of second stage of one-time modification of wholesale prices	810	375	1,185
4. Investment part of second stage of one-time modification of wholesale prices	687	431	1,118
5. Increased taxes on agricultural organization profits	372	134	506
TOTAL	4,636	2,361	6,997
C. Increased Reimbursements			
Total	1,892	1,008	2,900
of which increased wages in state sector	123	57	180

III. Measures in the Area of Replacement and Labor Force Stabilization and the Compensation System for 1982 and Subsequent Years of the Seventh Five-Year plan.

(Supplement No 3 to CSSR Government Resolution No 249/1981)

The following measures are to be taken to intensify merit in the individual economic incentives for the development of the quality and efficiency of agricultural production:

I. In the Area of the Targeting of Wages Payable

A. The State Agricultural Sector

1. A two-part regulation is to be applied, with the basic component of wages payable being tied to total output, including extraordinary revenues, and the incentive components tied to profits. In enterprises where planned profits are lower than twice the annual volume of the incentive components, the incentive component will be tied to the total costs as a percentage of total output indicator.

2. If the indicator for the incentive component of wages payable is not fulfilled, then it is to be reduced in such a way that it disappears when the indicator is fulfilled at a level below a limit established by the Federal Ministry of Agriculture and Food in conjunction with the Federal Ministry of Labor and Social Affairs.

3. The volume of wages payable is to be modified by excess costs which arise from limiting the consequences of unfavorable climatic conditions, excess costs from recultivation work above the level of the plan, and excess costs due to obstacles to work in border zone Z.

4. The bonus fund is to be subsidized at a level up to 30 percent of the increase premiums for increased receipts in comparison with previous periods.

B. United Agricultural Cooperatives

1. A one-part regulation is to be applied, with total resources for compensation tied to the total output indicator, including extraordinary revenues. The level of the incentive component and the bonus fund are to be defined within the framework of total resources.

2. Resources for compensation are to be established by the average coefficient of 0.7 in conjunction with the percentage increase in total output in comparison with the performance of the previous year. In the event of greater deviations of actual performance from the plan, and the disruption of the ties between the volume of resources for compensation and the total output for the previous year, the planned level of the previous year is to be used (the starting point). In the event of changes in organization, in the percentage of investment activity in relation to in-house overhead, in the structure of production or of the activities of the cooperative, the JZD may agree on changes in the initial base with the district agricultural administration.

3. It is to be possible for cooperatives to adjust the volume of resources available for compensation for the excess costs which may arise as a result of limiting the consequences of unfavorable climatic conditions, by the costs of recultivation work above the level of the plan, and for obstacles to work in border zone Z, all without the need for reimbursement from societywide resources. No other recalculation elements may be used.

4. The bonus fund is to be subsidized by up to 30 percent of the increase premium for increasing receipts in comparison with previous periods. This subsidy is not to be included in the resources for compensation used as an initial base for the economic plan.

C. In Both Agricultural Sectors

1. A set of qualifying indicators is to be established for the calculation of wages payable. The selection of concrete qualifying indicators for an enterprise will be carried out by middle-management levels from this set.

2. The current adjustment is to be applied to regulatory indicators for unreimbursed damages which have come about due to unfavorable climatic conditions.

3. The cultural and social services fund is to be subsidized by a percentage of the increase premiums from increased receipts in comparison with previous periods. This increased supplementary allocation can amount to as much as 0.4 percent of the annual volume of wages payable. It is better to utilize the resources of this fund in such a way that they contribute more efficiently to the intensification of agricultural output through the resolution of specific problems of the social collective of employees of an agricultural enterprise.

II. In the Area of the Labor Plan

1. To assure a work force in the needed numbers, requisite structure and with the necessary qualifications for state agricultural organizations operating on the land, so as to achieve a higher level of efficiency and intensity of production in these organizations, wages payable are to be strengthened in a planned fashion, beginning in 1982, with the intention of gradually balancing the differences in the level of average wages between this sector and the national economy as a whole in the course of the Seventh Five-Year Plan.

2. In conjunction with the formation of wages payable and the subsidization of the bonus fund from increase premiums, a planned strengthening of the incentive component of these resources is to be assured with the intention of having them represent a 20-percent share of total wages payable by the end of the Seventh Five-Year Plan.

III. Strengthening Economic Incentives

A. Increasing the Efficiency of the Incentive Component of Wages

1. Agricultural enterprises are to determine the specific forms of compensation for individual production sectors and work sites on the basis of the methodological guidelines of the ministres of agriculture and food of the republics and the results of technical and economic analyses in accordance with the enterprise concept of wage development, and the structure and differentiation of wages.

2. Annual performance premiums are to be implemented for the fulfillment and overfulfillment of production tasks and the production for market of the economic plan. In plant production, an advance is to be provided for established stages of production, and in livestock production advances are to be provided on a quarterly basis. These premiums may be increased by those resources which the organization gains as a share of the increase premiums for increased receipts in comparison with previous periods.

3. An annual bonus is to be established for managerial employees, according to generally valid rules, at a rate of up to 30 percent of their basic pay. This bonus may be increased by as much as an additional 10 percent in connection with increase premiums which have been achieved, and paid out from the subsidies to the bonus fund gained from these increase premiums. The precise percentage increase is to be established by a supervisory organ with a view to the level of increase premiums and the economic performance of the organization. In the event that market production tasks and increases in them are fulilled and the planned relationship of total costs to toal output maintained throughout the entire five-year plan, target bonuses may be awarded in the amount of 50 percent of the basic pay of the managerial employee for the final year of the five-year plan. Fulfillment of indicators for annual bonuses is evaluated taking into account objectivization according to the principles valid for the targeting of wages payable.

4. Instead of target bonuses for fulfilling five-year plan targets, a target bonus for fulfilling the tasks of an intensification program is to be awarded to managerial employees of selected enterprises which have been lagging economically for a long time. This type of target bonus is to be rigorously differentiated according to the extent and difficulty of the tasks and other considerations, up to the amount of Kcs 60,000 for the entire period of intensification.

5. The utilization of wages paid in kind is to be possible, especially in the assurance of the production of fruits, vegetables, potatoes, and possibly other products which are not a part of the central fund of fodder and of state purchases.

B. Increased Efficiency of the Tariff System

1. Tariff grade number 3 is to be applied:

--for specialized professions in plant production in fruit raising, gardening, vegetable raising, tobacco growing, grape raising, hop raising, and in the area of plant enrichment and hybrid experimentation;

--for the blue-collar employees of construction groups which handle the construction of larger construction projects (labor productivity per employee of more than Kcs 80,000 total annual output).

2. The existing indicator for the categorization of enterprises and internal enterprise units is to be retained, and the number of categories expanded by one or two. For auxiliary operations, indicators are used for categorizations which recalculate the number of employees according to the level of outfitting with capital equipment.

3. Managers of operational units who directly manage blue-collar employees are to be granted the same advantages as masters or high masters.

4. It is possible to award a tariff class one level higher than established by the appropriate qualifications catalog to creative technical-managerial employees entrusted with the performance of a function (work activity) belonging to the 11th tariff class and higher agronomists, zootechnologists, and mechanizers at state breeding enterprises and the sectorial enterprises of Sempra, Oseva, Slovosivo, as

well as at JZD and state farms entrusted with the reproduction of seeds and seedlings, or the breeding of animals for direct application in agriculture, who are systematically entrusted with the most complicated and difficult tasks, who constantly achieve good work performance, fulfill the qualification requirement of a college education, and have 12 years of professional experience.

5. Modifications in the qualification catalogs are to be carried out so that the qualifications will reflect the state of the art in techniques and technology, the social division of labor, the level of organization and management of agricultural organizations. Classes 8 and 9 are to be used for newly introduced work activities, while fully respecting the guidelines for the compilation of qualification catalogs.

6. Senior workers and specialists whose work represents a creative contribution to the assurance of production are to be more significantly evaluated in terms of wages by the awarding of a personal evaluation, and in some cases a personal paycheck.

7. It is to be possible within the cooperative sector for organs of a cooperative to aggregate surcharges (for overtime work, for difficult working environments, for Saturday and Sunday work, night work, and split-shift work) into the incentive component of wages.

8. In those places in livestock production where work has been established on a split-shift basis, a surcharge is to be applied for a day which has been worked.

C. Remaining Measures in the Regulations

1. The system for permitting overtime work above the generally established limits is to be simplified by shifting authority to the middle level of management, and by establishing an average limit per profession, or center, over an extended period of time, usually 3-5 years.

2. The extra activity of constantly active employees in the category of assisting workers (seasonal) is to be documented by calculations based on hours worked.

ECONOMIC POLICIES FOR 1982 ANNOUNCED

Budapest FIGYELO in Hungarian 11 Nov 81 p 11

[Article by Peter Medggyesy: "In the Interest of Uncovering Reserves"]

[Text] Several elements of the economic regulators will have to be modified at the end of this year and the beginning of next year. The general state of the economy and the unfavorable conditions require an economic-management and financial practice that can ensure, even amidst the worsening conditions, fulfillment of the requirements of general equilibrium, acceleration of the formation of income, maintenance of domestic expenditure within sensible limits, and centralization of income at the present level.

In socialist commodity trade we have met the commitments we assumed during the past two years; in foreign trade with capitalist countries our balance of trade and terms of trade have improved; and equilibrium on the investment and consumer markets is satisfactory. These results, however, stemmed from the utilization of reserves that are the easiest to mobilize and are about exhausted.

Economic growth in 1980 was slower than had been planned. Growth in 1981 has accelerated somewhat but is still below the growth rate planned. Which means that real incomes in the economy are not increasing adequately. Transformation of the economy's structure is a time-consuming process, and we are only at its very beginning. However, acceleration of economic growth under the present structure of the economy would raise incomes in the national economy, but the unfolding trends of external economic equilibrium would be jeopardized.

A basic requirement is that the improvement of efficiency, transformation of the economy's structure, expansion of national economic income, and improvement of external equilibrium must all take place simultaneously. From the results to date it seems that there is not enough pressure for the intensification of the processes, and therefore the necessary changes must be accelerated and stimulated.

In our external economic conditions, too, the anticipated improvement has not occurred, and we can expect even a deterioration. An upswing of business

activity in the capitalist world has not occurred this year, and we can hardly expect one even next year, and this makes our selling and marketing conditions more difficult. And in trade cleared in transferable rubles, the capitalst world's economic problems, their effect on the entire world economy, will reach us with a certain lag, in 1982-1983.

Finally, there are problems also in the distribution of available incomes that in the short term can increase only within limits. In 1981 we have been able to achieve only partially an increase in the state budget's share of incomes. Contrary to our intentions, an increase of the budget's sources of revenue has lagged behind the expansion of state tasks. Thus overspending in the national economy manifests itself predominantly in the state budget, and--unless we succeed in moderating this trend--this could again jeopardize our efforts to improve external economic equilibrium.

Changes in Producer Prices

An analysis of our economic results and problems supports the conclusion that adjustment to external conditions must be strengthened within the economy, and qualitative performances must improve in every area.

To this end it has been necessary to intensify the pressure that the price system and system of regulation exert on stepped-up performances and better work. The price system, too, must adapt to the changing conditions. A very large proportion of the producer prices falls in the category of free prices, and there this requirement is obvious. However, adjustment to the changing conditions is necessary also in the noncompetitive sectors where fixed prices apply.

Among the measures affecting producer prices, the most significant has been the rise in the producer prices of sources of energy, as of 1 November 1981. Their increase--in accordance with the principles formulated in the price system for fuels and energy--has been made necessary by the price-increasing effect of the rise in the dollar's exchange rate. Accordingly, the price of petroleum has increased 12 percent, while the prices of petroleum products other than gasoline have been raised in a differentiated manner, with due consideration for the world-market prices of the individual products. The price of natural gas has been raised 15 percent; that of coal, 10 percent; and of coke, 5 percent. At the same time, the price of electricity has increased 9 percent; and that of thermal energy, 11 percent.

A 15-percent increase in trucking rates and domestic rail freight rates is warranted to stimulate economization on energy-intensive transportation costs, and also to alleviate the transportation-related burden on the state budget. Simultaneously, the rates for freight shipments by rail [sic] and export-import shipments are increasing on average by 20 percent. The measures are effective as of 1 November 1981.

The budgetary subsidies for passenger transportation will be reduced by the abolition of the budgetary subsidy on commutation tickets. As of 1 January 1982, the prices of commutation tickets will increase 25 percent. However,

this increase will not affect the workers since it will be borne by their employers.

The directives regarding unfair profit limit attempts to take advantage of shortages when setting prices, but at the same time they permit departures from the long-term median price calculated according to the new regulations, respectively from the prices that are in force, since such departures are necessary for the normal functioning of the economy. A higher profit may be included in the price when, for example, the production cost is reduced through technical and economic measures, when the price is being adjusted to the capitalist export or import price, when an enterprise is being supplied that produces for hard-currency export, or when financing development that is essential to satisfy the demand. The profit-reducing effect of producer-price measures must be offset through greater efficiency and more economical management of the restrictions. Realistic consideration of the circumstances requires that we offset the cost increase in some areas.

Noteworthy examples of such areas are large-scal farming, where 75 percent of the cost increase will be refunded temporarily; intecity passenger service, with an 80-percent refund; and the cement industry, with a 90-percent refund. The entire increase in costs will be refunded to the economic units in municipal mass transport; in the case of budgetary institutions that provide essential services and operate under an incentive system that is based on the profit remaining after taxes, wages and obligatory fund allocations; in sanitation services; and in the supply of fuels and energy to households. The budget will offset 50 percent of the cost-increasing effect of the motor vehicle tax on trucks in the case of large-scale farms; and 100 percent in the case of sanitation services.

Income Regulation

In the interest of achieving our objectives, the sharing of incomes between the state and the enterprises must be changed. This change, moreover, will have to stimulate higher incomes based on real additional performances. This must be accomplished in such a way that simultaneously the profit incentive will not decline, and pressure for higher profits based on efficiency will increase. The profit tax will remain unchanged, but the wage-commensurate taxes will be increased by 3 percentage points.

To ensure that wages can be increased more on the basis of greater real performances, while at the same time the changes in the conditions for raising wages will exert pressure for attaining higher real profits, the rates of the system for regulating wages and earnings will change. The wage multiplier assigned to the wage-development indicators will drop from 0.3 to 0.2 in the case of payroll-budget regulation based on performance, and from 0.3 to 0.25 in the case of wage-level regulation linked to performance. The rates of the centrally guaranteed wage increases will be reduced from 4 to 3 percent under central regulation of the payroll budget; from 3 to 2 percent under central regulation of the payroll budget in combination with relative [performance-linked] elements; from 4 to 3.5 percent under central regulation of the wage level; and from 3 to 2.5 percent under central regulation of the wage level in combination with relative elements.

In agreement with the objectives of economic policy, however, the old rates will apply to coal mining, to the mining of other ores and minerals, to ferrous metallurgy, baking industry, dairy industry, domestic trade (with the exception of wholesale trade in capital goods, stockpiling, and wholesale trade in by-products and scrap), and to enterprises and cooperatives providing consumer services.

Incentive for Greater Effort

The conditions of wage management at efficient and highly profitable enterprises will improve: instead of the 2 percent at present, the rate of increase in wages without revenue transfer will be between 2 and 4 percent, differentiated in accordance with the level of profitability. Such enterprises will benefit also from the provision that the 150-percent transfer of revenue on an increase of the wage level by more than 9 percent will be payable in the future only if the increase of the wage level exceeds 12 percent. It could be a sign of the currency's depreciation if certain enterprises or sectors disburse wages for no performance or for inadequate performance. Both the honor of labor and the protection of our forint require that wage increases be based on available performance data. The enterprise collectives, managers, and local social organs are equally responsible for this.

The system of material incentives for top enterprise managers will also undergo modification. To provide greater incentive, the multipliers that are linked to indicators of enterprise profitability and determine the amounts of the managers' premiums will be tighter than at present.

Care had to be taken to ensure that the measures do not place a heavier burden on the more efficient enterprises than on the average ones. Indeed, such a solution is always a great temptation, because it is always easier to take more away from the efficient enterprises than to prod the weak enterprises to greater effort (the social and economic conflicts are fewer and smaller).

We chose the latter solution, as evident also from the fact that we reduced or abolished several kinds of tax benefits. For example, in the case of enterprises in the lime and cement industry, asbestos-cement industry, and within the Livestock Trading and Meat Industry Trust (Allatforgalmi es Husipari Troszt). As of 1982, these enterprises will be able to retain only 80 percent of their depreciation, as opposed to 100 percent at present. This represents a step closer to the general system. Aid for production modernization will be reduced at an accelerated rate, mostly in light industry, agriculture and the food industry, and at a few engineering enterprises. The measures affect also the subsidization of certain activities. Subsidies to seasonal stores in domestic trade will be abolished, and the subsidies to the fruit and vegetable trade will be reduced 25 percent.

Welfare Measures

To encourage hiring the handicapped, as of 1 January the enterprises and industrial cooperatives that hire such workers will be able to claim subsidies amounting to 40 percent of the wages paid to the handicapped, instead of the 30 percent at present. A new feature is that budgetary plants also will be able to claim such subsidies in the future. The procedure for determining who qualifies as handicapped worker will be simplified.

The provision that fees paid to innovators from the profit-sharing fund will not be subject to progressive profit tax is expected to end the problems in conjunction with rewarding innovators.

The rules governing the formation and use of the welfare and cultural fund will be modified slightly. To increase the proportion of workers using plant cafeterias and to balance the expenditures of the enterprises, as of 1982 the overhead on cafeteria meals will be charged to miscellaneous expenses and allotted to the welfare and cultural fund. In this way the overhead will not burden the per capita allocation, while the raw-material costs of meals at plant cafeterias will continue to be covered from the per capita allocation and the workers' contributions. (Because of the changeover to the new system of accounting, a one-time reduction of the per capita contribution will be necessary; however, this reduction will be only of a technical nature and will not affect the actual amount of the welfare fund.) To facilitate the replacement of capital assets dedicated to the workers' welfare, the general rules of capital depreciation will apply also to such assets. In the case of welfare investments, the first procurement of expendables--i.e., the purchases before the completion of turnkey construction--may be financed from the development fund.

Investments

In order to regulate domestic expenditure within our means, it will be necessary to reinforce the selectively restrictive nature of our investment policy.

Development projects to build capacities producing goods that can be exported for hard currency, investments to rationalize energy consumption, and development projects for the utilization of waste and scrap will continue to enjoy priority. Parallel with these priorities, however, the total amount available to provide free state aid for investments will be curtailed in comparison with previous years. In the case of specific large-scale investments the state will be able to assume only smaller burdens commensurate with our means. The financial resources available for so-called other state investments will be sharply reduced. A 6-percent reserve will have to be formed in the case of lump-sum investments for specified objectives. As a disincentive to construction-intensive developement projects, the rate of the construction tax has been increased to 20 percent, from 10 percent earlier.

A basic consideration is not to hamper the investment projects already begun, because this could cause the national economy more harm than good. However, we will be applying greater restrictions and stricter criteria to new starts. In accordance with this, we will increase from 15 to 20 percent the formation of the obligatory reserve fund, and the higher rate will apply already to the allocation of 1981 profits. This measure will not hamper fulfillment of the financial obligations in conjunction with the development projects undertaken earlier, but the stricter financial conditions for new investments will help the enterprises to start only truly profitable development projects and to be more selective.

All the measures jointly will foreseeably reduce demand on the investment market by more than 10 billion forints, in order to achieve a better balance of the formation and use of incomes also in this area.

The purpose of the price and regulator changes is unambiguous: to stimulate and even to increasingly compel more efficient economic activity. In their sum total, the price and financial measures will result in a reduction of enterprise profits in the economy, of the order of 20 billion forints. However, this does not mean that we are raising an impregnable wall before the enterprises, and that the future opportunities of every enterprise must necessarily decline. Our objective is specifically that enterprise profits increase parallel with the unfolding of favorable economic processes, but only if this is backed by more efficient and better work. As a result of the stricter criteria, we expect that the dynamically growing and profitable enterprises will be able to exceed the high standards and increase their profits. But there also will be enterprises forced to seek other ways and means.

CRITICAL ANALYSIS OF ECONOMIC PERFORMANCE PUBLISHED

Economy Up to 1970

Warsaw FUNDAMENTY in Polish No 29, 19 Jul 81 pp 8-11

[Discussion with FUNDAMENTY's Stefan Jedrychowski, Bronislaw Minc and Eugeniusz Szyr moderated by Bugoslav Reichard, also participating, Mieczyshlaw Gorski and Krystyna Jurczynska of: "The Windings of Industrialization"]

[Text] At the high point of the discussion of economic reform and of the causes and sources of existing crisis, we have decided to attempt to evaluate the principles and the implementation of industrialization and investment policies in People's Poland. We believe that this evaluation and the conclusions drawn from it may turn out to be crucial not only for historians but also for the formulation of proposals regarding our present situation.

To participate in the discussion of structural problems of industrialization in Poland, we have invited two men prominent in the fields of politics and economy who, during different periods of the People's Poland, participated in an important way in the formulation and implementation of economic policy and, also, professor of economics who actively participated in developing the concepts of early economic plans and their implementation.

Dr Stefan Jedrychowski--lawyer and economist, among other functions he served as minister of maritime and foreign trade, deputy premier, chairman of the Planning Commission of the Council of Ministers, minister of foreign affairs, and finance minister. In the years 1956-1971 he was a member of the Political Bureau of the Central Committee of the Polish United Workers Party.

Eugeniusz Szyr--economist, soldier in the International Brigade in Spain, has among others been deputy minister in the Ministry of Industry and Ministry of Industry and Trade, deputy chairman and chairman of the State Commission for Economic Planning, vice premier, member of the Political Bureau of the Central Committee of the Polish United Workers Party, and presently minister for material economy.

Dr Bronislaw Minc--eminent economist, professor of the Main Planning and Statistical School in Warsaw. In the years 1946-1952 he worked in CUP [Central Planning Administration] and PKPG [State Economic Planning Commission] in the capacity of director for the department for coordinating economic plans. He is the author of a number of books and many other economic papers. "Political Economy

of Socialism" appeared in five printings in Poland was translated into five foreign languages, in 1977 he published a book in Italy titled "New Political Economy."

The editors were represented by Mieczyslaw Gorski, Krystyna Jurczynska and the editor-in-chief, Boguslaw Reichart, who led the discussion.

Today, we are publishing part one of the report covering the years until 1970. The sequence, covering the 1970's, will be published in the next issue.

Stefan Jedrychowski: It is necessary to start by explaining some general matters. Occasionally, one encounters views that the whole 36-year period was one continuing crisis. I do not think so. Of course, there were some crises. I am not avoiding this term regarding the years 1956, 1970, 1976 and 1980. Those were successive crises produced by certain events stemming from the economic [problems]. Between these crises, however, we had periods of quite successful development.

In what I am going to say now, I am going to disregard the 1970's. During the previous period, we did not deal with the phenomenon of falling production. There was, however, the problem of stagnation and in certain periods the problem of decreasing real wages has not been always exhaustively analyzed and clarified. For instance, price and wage reform in 1953 was presented as a reform that was supposed to bring a 5 percent increase of real wages. There is a strong suspicion, however, that in effect there was a certain decrease of real wages.

Eugeniusz Szyr: Agreed. Let us assume that the key subject of our discussion is the structural problems of industrialization and investment policy. I understand that we are dealing with basic relationships which determine investment and consumption outlays, their interaction and their timing. I believe that we must not forget the noninvestment factors of economic growth that have great effects and are often neglected causes of an excessive growth in investment outlays.

Bronislaw Minc: Now, we can look back at the 3-year plan period and the 6-year plan period. Experience and the progress of science make this easier. I wish to start by formulating certain theses for discussion. I think that there was not enough attention paid to the fact that at the beginning of People's Poland we were facing problems of economic underdevelopment. Poland was a country economically grossly underdeveloped and devastated by the war. Also, because of the war, our cadre training was seriously delayed. Because of this, and also because of the drive to accelerate economic development, difficulties had to arise. Especially, as certain national and social ambitions were added because of the political system. Thus, my first thesis addresses the impact of economic underdevelopment and its effects on the totality of the developmental processes up to and including 1980.

The 3-year plan was a very successful economic concept that fully passed the test and was accepted by the society. Thanks to it we successfully and quickly solved the post-war crisis. The great merit of that plan was to clearly define

the main objectives and systematically implement them. Using today's term, which was not used then, that objective can be defined as the maximalization of consumption resources. The aim was to improve the standard of living which was very low at that time. All the production and investment decisions were approached with the major objective in mind. Only such variants and such tasks were selected which produced the greatest increase of consumption.

It was the rule that during the first 2 years of the plan period, i.e. 1947-1948, no investments were made that would not produce results during the plan period. Only in 1949, investments were made which would produce effects during the 6-year plan period.

The 3-year plan was a great contribution to the development of our economic theory and practice but not only ours. That plan proved that such objectives as maximalization of consumption resources could be achieved and that all other tasks could be subordinated to such main objectives. Good economic planning was that which led to optimal implementation of a well-chosen objective. The assumptions were very modern, not only in relation to the then existing theory but also in relation to today's theory.

Stefan Jedrychowski: I agree with Prof Minc's evaluation of the economic reconstruction plan. But it is necessary to add that the circumstances were favorable then as indicated by the very name of the plan: it was a reconstruction plan. Thus, with relatively minor investment outlays, it was possible to achieve great results. It was done by eliminating bottlenecks and rebuilding the least damaged objects. Another favorable factor was the reconstruction of the regained territories which, although badly ravaged, had usable basic infrastructures. For instance, at the beginning there was no need to build residential dwellings in the territories. It was enough to repair and clean up the existing ones. Of major importance was that these territories could be used for agriculture.

It is necessary to add to what Prof Minc said about the main objective of the 3-year plan that its main objective had been to reach and exceed the pre-war standard of living. This was achieved. In certain respects, this was already done in 1947.

But at the time of transition from the 3-year plan to the 6-year plan we were facing completely different problems. While rebuilding the economy, it was possible to be guided by what had been there before but, while developing an industrialization program, it was necessary to answer some very difficult questions: what, when and how? And at the same time, it was necessary to rebuild Warsaw, Poznan, Szczecin, Gdansk and many other cities.

Eugeniusz Szyr: The 3-year plan was characterized by the fact that, although the targets were ambitious, all of them were significantly exceeded. Thus, the plan did not fully utilize the total economic potential.

This was a comfortable situation as opposed to counting on unused potential that is not there. Secondly, the noninvestment reserves were impressive. The

economy using extensive reserves never had such a surge upward as in that period. We had a huge surplus of manpower. They were young, strong men coming from the country, coming from the Eastern Territories, returning from P.O.W. camps and forced labor in Germany. They were vigorous, full of initiative and enterprising.

This, among other things, explains almost instantaneous reconstruction of comprehensive production facilities. Let me mention the renewed production of optical glass, railroad cars and production by many chemical plants. This was happening at the rate which today seems beyond understanding and belief.

In the years 1945-1946, the favorable international situation positively influenced economic processes in Poland. It was planned that one-fourth of the investments be financed by foreign credit and that there be economic relations not only with the East but also with the West. Negotiations with France and other countries were producing favorable results. There was hope that economic development will not be threatened. This changed already in 1947. First signs of questioning the return of Regained Territories appeared at that time and first steps towards the Cold War were taken. This must be remembered.

Stefan Jedrychowski: This should be discussed in the terms of Anglo-Saxon powers because France stood to the side and did not yet join this approach. It was the speeches by Churchill and Byrnes questioning our western borders and later the attempts to rebuild German bourgeois state that caused the reaction by USSR. Also, this was manifested by the unjust attitude towards Yugoslavia and the rejection of the Marshall Plan. (Initially, both in Poland and in Czechoslovakia there were tendencies to accept that plan.)

Bronislaw Minc: The events in 1948 did not really affect the implementation of the 3-year plan. Through all its years, i.e. in both 1948 and 1949, the main objective was consistently pursued, and that was to increase consumption.

A key element of this plan and its realization was the struggle against inflation. It was a matter of defending the zloty to forestall a decrease of consumption by the main strata of the working class. I had written a paper on this subject but in 1980 (before the August events) its publication was blocked. I am planning to publish it now.

It was quite obvious that because of serious backwardness, industrialization of Poland was absolutely necessary and had to be large scale. For instance, let us consider the population problem. In 1946, Poland's population was 24 million. This year, there is 36 million of us. What would all these people do if a great effort of industrialization had not been undertaken early?

Also, we had to decrease the gap in economic development that separated us from the more developed countries of Europe and the world. Besides, this was necessary to develop exchange and economic cooperation with foreign countries.

The 6-year plan was intended to play the principal role in the industrialization of the country. In this respect, the plan's objective was fully correct. Let us add that the share of accumulation in the national income was relatively

small, about 21-23 percent. In view of the large increase in national income, this indicates a relatively high effectiveness of accumulation.

Stefan Jedrychowski: This depends on the price system, the index of net share of accumulation in the national income is often misleading....

Bronislaw Minc: However, the basic error of the 6-year plan was to change the main economic objective. Maximization of consumption was replaced by an attempt to achieve the greatest possible increase of production capacity and economic capability.

I am developing a thesis for discussion: in the socialist economy, the only natural main economic objective comprehensible for society is to create conditions for the highest possible increase of consumption, of course this includes the development of health care, culture, science etc. This can be done either over a long period of time which requires a greater share of accumulation in the national income or over a shorter period of time when that share would be smaller. Increase of consumption, however, must remain to be the main economic objective.

Giving up this objective in the 6-year and the subsequent plans was unjustified. It led to negative results which persist till today. Because the main objective became the maximization of economic growth (or of economic potential) measured by the increase of national income, the main task became to increase the national income in constant prices which was associated with excessive accumulation and neglect of those sectors of the economy which determine the level of consumption and, generally, the quality of life of the population.

This led to a lack of balance in development of the economy and caused cyclical development. Necessarily, the greatest emphasis was placed on these sectors which produce the greatest increase of national income, i.e. primarily heavy industry. In these circumstances, there had to be a slowdown in agricultural development and consumer goods industries as well as services, infrastructure maintenance and repairs. This could not avoid having a negative impact on the standard of living of the population.

Why was this development cyclical? Because trying to maximize the national income in terms of constant prices, development was accelerated in the first period of each plan. This led to a neglect of those sectors about which I was talking. After a time, the lack of balance was becoming acute and this was forcing a redistribution in favor of consumption and those sectors that determined it. Consequently, investments had to be decreased and the work on investment projects underway had to be partially discontinued.

This practice was called "freezing investments." Of course, it caused economic losses. When, after a while, the balance was somewhat restored, the efforts were resumed to achieve the main objective of maximizing economic growth.

Cyclical development of the economy was caused by trying to achieve a certain main objective. During the 3-year plan, when the consumption was being maximized, development was not cyclical. Cyclical development appeared during the

6-year and subsequent plans when economic growth was being maximized. During the 6-year plan, an acute lack of balance appeared in 1953, in the fourth year of that plan, and consequently a change of allocations in favor of consumption took place at the Second Congress of the PZPR. That change, however, was inadequate and temporary.

With maximization of economic growth as the economic objective, a peculiar dogma is set forth: that there is a law that growth in the means of production (first category of social production) is faster than growth of consumer goods (second category of social production).

By the way, I may add that I spoke against this totally false dogma in 1954 and I was duly reprimanded for it in NOWE DROGI.

The peculiar cyclical development manifesting itself in an alternately accelerated and decelerated rate of economic development is caused by violating the regularity described several times by Marx: under socialism the main objective of the economy ought to be the maximization of living conditions, and of the population's standard of living.

All our development is based on the nationalization of industry in Poland. Our economic system must be described as an economy subordinated to the state. It is characterized by the continuing enlargement of the state's economic role.

The increasing and enlarging of economic role of the state were slow during the 3-year plan, but greatly accelerated during the 6-year plan and the rate became really rapid in the last 10 years. From a theoretical point of view, nationalization is synonymous with socialism but it is not synonymous with socialization. It must, however, be done in accordance with the classic precept of Marx to transform the state's economic functions into directly social functions.

The elements of social democracy which to some extent existed during the 3-year plan gradually disappeared. The economy became more and more subordinated to the state. Socialistic transformation leading to more thorough socialization did not take place. This was determined by changing the main objective of the economy, as I was saying before.

Eugeniusz Szyr: Just stating the objective is no guarantee. The best proof is that the Gierek team claimed that consumption was the main objective. We know how it was done. I think that it is not enough to consider the maximization of consumption as the main objective, it is also necessary to consider social changes. Two elements should be included in the main objective. Because it also consists of, as the professor said, creating socialist social conditions. This was the objective of the 6-year plan. Its implementation differed greatly from the theoretical plan.

The fact that the economy is speeded up during the first 2-3 years and then slowed down is caused by controllable factors. I think that the reasons can be found in the methodology and the errors of planning. Five-year plans are not tied to each other, there are no long-range plans, there are no plans

defining economic allocations for the next 10-15 years, there is even lack of continuity between annual plans and biennial investment planning--all that impacts unfavorably on the implementation of plans.

Also typical is lack of continuity between the last years of one plan and the initial years of the next multiyear plan. In those last years, the important thing was to fulfill the plan and the new plan usually was not ready yet.

I think that cyclical development cannot be explained solely by an incorrect objective. No objective can be achieved using faulty economic planning.

I would like to return to 1953. At that time criticism of the "previous period" was voiced. In more or less the same words as today, a program was prepared for the Second Congress of the PZPR. It was accepted as the main objective that consumption must increase, agricultural services must be improved, the rate of accumulation must be lowered and investments slowed down (in 1954, investments increased by 3 percent and in 1955, decreased by 6 percent).

Stefan Jedrychowski: The objective of the 6-year plan was to significantly increase consumption. This was not achieved. The foundations of the plan crumbled. Excessive acceleration of investment processes and reorganizing agriculture into cooperatives without having the necessary technical means played their role. Additionally, in the years 1950-1951, the 6-year plan had to be supplemented by expenditures for armaments which was caused by the international situation. This was done at the expense of other elements.

The unfavorable developments in the 6-year plan were aggravated by the unfortunate international situation in 1950-1953.

Eugeniusz Szyr: At the end of 1951, there was a discussion at the Boleslaw Beiruts. We were facing the problem of inflation which was caused by exceeding the planned investment outlays and by the unforeseen expenses to strengthen the defense position of the country. It was necessary to scale down the objective in order to balance (the deficit was sizeable) the financial plan which at that time was being prepared and which lost its importance later because it ceased to be used.

At the same time, an exceptionally dry weather in the second 6 months of 1951, was seriously threatening bad harvests. As a preventive measure, it was decided to revive the rationing system without, however, limiting the investments. The enlarging of the armament industries at that time had to be done at the expense of other subsectors and by using the cadre taken away from the machine tool and chemical industries.

We were able to build tanks and start production of jet airplanes in Poland within 1 year. We had very good cadre in the armament industries. We started many difficult, complex production lines and the results testified to the ability of Polish workers and engineers. Soviet specialists stated that they had not expected production to be started at such a high rate and of so high a quality. No license in the 1970-1980 period was implemented at such a rate.

Stefan Jedrychowski: In that period,the best cadre were in the agricultural machinery industry. This was the only fully developed machinery producing industry in Poland. And this sector should have not been permitted to suffer.

It must be said that in that period we developed other industries too. Then, starting from scratch, the development of the shipbuilding industry, truck bui building industry, metallurgical industry, ball bearing industry and chemical industry was started.

Bronislaw Minc: The 6-year plan, both its concept and its implementation, despite the reservations I have mentioned before, was a great step forward. Implementation of this plan, for the first time in history, provided the foundation for Poland's large-scale industrial development. It was the 6-year plan that provided the means for an increase in consumption which might have been modest in terms of real wages but significant considering the increase of employment; this continued in the period after 1956. The increase of national income was largely due to the increase of labor productivity which took place despite the increase of employment. Large-scale technical progress took place at that time.

Eugeniusz Szyr: There were accusations that the 6-year plan devoted 60 percent to new investments and only 40 percent for modernization and reconstruction. In the last 10 years, only 20 percent have been spent on modernization and reconstruction.

Bronislaw Minc: I still insist on what I said before about the role of the main objective. Contrary to the 3-year plan, in the following plans, when there were difficulties, it was wages, residential construction and services which were sacrificed, all elements that served the direct consumption, while great effort was made to preserve the investments. Of course, economic growth must take place, but it must be optimal and not the highest possible. Only the main objective of the plan should be maximized and it should be the consumption.

The cause of cyclical, crisis ridden development is the increase of the role of the state and the reduction society's role in the economic process which is the result of accepting the maximization of economic growth as the main economic objective. Crisis situations are the result of the processes stemming from the economy subordinated to the state. Changes in the base, in the economic system were not sufficient. Of course, controllable errors are very important too but they can occur systematically only when there is lack of social control and when the character of main economic objective is not clear.

Fourteen years of Wladyslaw Gomulka's government was also a period of regression. The incapacitation of workers' councils in 1958, creeping bureaucracy and the events of 1968 and 1970 bore witness to that regressive process.

Eugeniusz Szyr: We are continuing the discussion whether it is principally the formulation of the objective or errors in the art and methodology of planning that influence the implementation of plans. In my opinion implementation of plans, especially in the area of investments, is mainly influenced by erroneous planning methodology. In light of today's scientific knowledge, I am convinced that, especially in the seventies, economic tools to plan investments and cost-effectiveness analysis of production plants were not used.

Long range quantitative analysis was not done and cumulative effects of investments were not considered. A glaring example was to offer to some Western countries to export electrical energy, coke and carbide. There was also some talk about exporting lime nitrogen.

Theories were proclaimed that exports of energy and material-intensive products should be increased because there is an abundance of raw materials in Poland. Long range quantitative analysis have proved without any doubt that export of highly energy-intensive products does not pay. There were individual attempts to introduce such an analysis but they were ignored because of lack of understanding. Investment planning was far removed from the context of interbranch and intrabranch analyses, or of being done by comparing effects of optimal solutions.

Regarding exports, the cost-effectiveness analysis should not be based on the system of ministerial planning. The dominance of ministerial planning approach automatically determined the ministerial investment planning. This favored the creation of pressure groups and, in turn, they distorted even the most correct opinions. Of course, planning to improve consumption requires outlays for coal, transportation and energy without which production cannot be expanded. In 1946, as much as 70 percent of investment outlays were devoted to that purpose. Today we are facing the same problem. Again, the economic life of the country depends on increased coal production.

Stefan Jedrychowski: I agree with Prof Minc regarding the role of main objective. In practice, the objective of the 6-year plan was to develop production capacity rather than to increase consumption. Residential construction provides an example. There was no plan to solve the problem of residential construction. Residential construction was just an appendage of industrialization, it was tied to new, large investments. Reconstruction of Warsaw was an exception.

Bronislaw Minc: I would like to emphasize that during the 3-year and 6-year plans, pressure groups were not deciding the overall economic policy. After 1970, however, they began to make decisions and upset the balance.

Stefan Jedrychowski: In the last phase of the 6-year plan there were symptoms of crisis related to failures in achieving the aims in improving living standards. The information about a 29-percent increase in real wages was greeted with resentment and protests.

We were dealing with the frustrations of Polish society after the death of Stalin and especially after Khrushchev's revelations at the 20th Congress of the Communist Party of the Soviet Union. The climax occurred in 1956. The additional cause of the Poznan events was lack of responsiveness of economic administration to petitions, complaints and grievances. This was crucial. There was also a local factor: the Cegielski Works had poor prospects. Production of steam locomotives was coming to an end and the new product line, that of marine engines, was not yet in sight. This was reflected in the wages and in the mood.

The subjective feelings of people were that the standard of living was very low and that it was improving very slowly. This was the background of the crisis which was reinforced by the negative political events of that period. Limitations on investments after the Second Congress was started too late and on a too restricted scale.

Eugeniusz Szyr: I have a different opinion on this subject. An investment commitment cannot be redirected quickly to new investments aimed to maximize consumption. To solve the problem of restructuring investments within 2 years has been and is presently almost impossible. Consequently, what was achieved then was really quite impressive. Many investments were frozen and the start up of new ones was stopped.

I believe that shifting the investment resources to agriculture at that time should be viewed critically. They were too small. This, however, does not change my opinion that in 1954-1956 we did not deal with an economic crisis. But, of course, the perception and the feelings of people do not have to agree with figures or even facts. There is no doubt that the standard of living of millions of people who moved from the countryside to the cities had improved. But it was a difficult period for highly skilled workers. Certainly, the situation of intelligentsia has not improved. The social dissatisfaction undoubtedly had economic roots but the causes were primarily social and political.

In the years 1954-1955 there was no breakdown in the implementation of the plan, the market was in equilibrium. We should now like to have a market like we had in 1954-1955; of course, I am referring to the state of equilibrium, not to the level of consumption.

Bronislaw Minc: I think that in 1956 we had a crisis which started a whole series of crises. There would have been no crisis in 1980 if there had not been a crisis in 1956. But the main cause of the crisis then was social, in the narrow sense of the word not economic. There was a crisis of the system that manifested itself by exposing personality cult and lack of progress of democracy, primarily social but also political. No doubt, there was also disillusionment among the working masses regarding the rate of growth of consumption and a negative attitude to excessive differences in income and social standing of various social groups.

In Poznan, at that time, the requests were very mild. In 1980, they would have been satisfied immediately. Gierek would have added a few more billion to avoid strikes. But the administration at that time was oriented towards accumulation and reduction of costs and it viewed those requests with horror. A social crisis does not have to be the result of a decrease in the national income.

The weakness of all discussions of the sources of crises is that they are one-sided, they tend to consider the superstructure, the role of leadership, etc. Thus, we cannot dispel the threat of new crises. The sources of crises, analysis of which would permit us to reverse the course of fatal events, have to be sought at the base or the socioeconomic system. Only then, would it be useful to analyze the superstructure and the resulting conditions for the true socialization of economic process and for restoring to socialism its true spirit. The true spirit of socialism is to treat economic objectives as means to create conditions for comprehensive human development and for economic decisions made directly by the society and its organs.

Stefan Jedrychowski: Wladyslaw Gomolka, from the moment he assumed his duties, became deeply involved in the agricultural policy problems. Unfortunately, the hallmark of his actions is that, at the start of his comeback he severely

criticized the subsidies to state agricultural farms which at the time amounted to 1 billion zloty and, when he was leaving, the subsidies to state agricultural farms amounted to 6 billion zlotys. I have to admit that I did not quite agree with Gomulka's position presented at the 7th Plenary Session. His presentation was not approved by the Political Bureau. Supposedly, two members of the Political Bureau saw it in advance.

I have to say that Wladyslaw Gomula at all times put pressure to consider in any economic activity the needs of agriculture and, in the 1960's, a lot of good was done in this area. The artificial fertilizer industry was developed and old manufacturing plants were significantly enlarged.

Eugeniusz Szyr: Lack of a consistent agricultural policy was always our Achilles' heel. The roots were in the planning errors, erroneous economic analyses and in the social factors of increased agricultural production. Problems were often expressed in amateurish terms. Also, actions were taken just to impress the public as in the case of chemical fertilizers.

Personally, I believe that the effectiveness of fertilizers is very low because of the lack of synchronization with the supply of plant pesticides, agricultural engineering support, and agricultural machinery and equipment In the area of investments for land improvement, drainage was preferred but it was discovered during the first drought that there was no system to bring in the water. The alliance of workers and peasants was often violated and there was no consistency in developing agricultural organizations and peasant self-government.

Stefan Jedrychowski: Gomulka's concern for agriculture was rather one-sided especially when the line between agriculture and food industry was crossed. He did not agree to treating jointly all investments in the food economy sector. He tried to eliminate all imports of grain and fodder. At that time, imports amounted to 3 million tons. Today, when the amount is 9 million tons, his efforts may seem justified. Under the circumstances then prevailing, it was not rational. The plan for the years 1966-1970 should have established, it was really inevitable, the number of hogs would not be increased. The Planning Commission received an order to maintain the number of hogs at the 14 million level. As a result, there was a limit imposed on meat production and, thus, on meat consumption.

Eugeniusz Szyr: During that time, I prepared a proposal to treat grain imports separately and to devote a separate import category to hog production. I proposed the use of the income derived from slaughter animal meat export to pay for grain and fodder imports. Economic analysis proved that under the conditions then prevailing, this scheme would have been profitable.

Stefan Jedrychowski: I remember this subject being discussed at a Political Bureau meeting or in a smaller group. We proved that it was profitable by using the example of other socialist countries--Hungary and Czechoslovaka.

Eugeniusz Szyr: It is worth remembering an anecdotal fact. In a half-conspiratorial manner, we undertook to export outside the plan the slaughter animals and beef which were much more expensive in Western Europe than pork.

Taking advantage of the price differential, the extra monies obtained were kept in a special bank account which served to finance the import of pork outside the plan. When, by chance, Boleslaw Jaszczuk learned about this, there was a scene and the account was frozen.

Stefan Jedrychowski: Wladyslaw Gomulka was afraid of debts even when credits could have brought high returns. He was afraid of inflation and bankruptcy. Both of these fears seem justified in view of what was done by the Gierek and Jaroszewicz team. But at that time, his fears were dampened by the development and the increase of standard of living.

Eugeniusz Szyr: Wladyslaw Gomulka also had erroneous views on so-called selective development. In fact, he was misinformed about these matters. His aim was to eliminate the airplane and flax industries and to limit the shipbuilding industry.

Stefan Jedrychowski: The Economic Council, which existed in the late 1950's developed an economic reform plan similar to the current concept of independent and self-governing enterprises. Gomulka rejected it without discussion. This was not even a subject for discussion at the Political Bureau. The negative decision was passed by Wladyslaw Gomulka to Jozef Cyrankiewicz and, soon after, Gomulka sent the word to do away with the Economic Council. In 1956, there was an increase in development workers' councils. But soon there was a drift away from that. Workers' Self-Management Conferences were set up soon and they consisted mostly of people who participated because they had positions in other organizations: party, labor unions etc. The last phase of doing away with the self-government, already during the tenure of the new team, was to eliminate most of workers' councils in 1979. This was done under the slogan of enlarging workers' self-government.

In the 1960's, many restrictions were imposed on the Planning Commission. Agricultural production could only be planned according to the level of average harvest of the last 4 years. There was a fixed limitation imposed on the food and agricultural exports. This was done not to satisfy the needs of the country but conform with the then popular thesis that such exports are unprofitable. The upper limit was 1.3 billion of foreign exchange zlotys. It was considered that if earning $1 costs more than 60 zlotys then it does not pay. Even though for that "unprofitable" export it would have been possible to obtain highly profitable imports. When the new government team changed the situation, it turned out that there was a considerable net gain.

Short-term indebtedness was not permitted to exceed the $100 million plus limit. Compare that with the 1970's when short term indebtedness reached $3 billion. It was permissible to use only conventional credit to buy grain and fodder for up to 3 years [garbled sentence follows] credits related to purchase of major investment items. To help ourselves with financial credits was out of the question.

In view of the madness that reigned in the 1970's, these restrictions appear reasonable. In fact, in those days, they were going to the other extreme.

the foundations of a generalized plan for the next 15 years were prepared. They were also rejected, however, without any discussion. I guess that the reason was that the highest priority aims were in the area of consumption. The attitude was that we were leaning too far towards consumption. As the time passed, this attitude became more prevalent.

In the late 1960's, in the area of residential construction, in view of rising costs the so-called inexpensive construction was favored which had conveniences in the halls for common use. In 1969, the growth of outlays for residential construction was slowed down.

I would divide those years into two periods. Until 1959 we had relatively successful development. We used the reserves created during the 6-year plan and the Soviet and American credits. Conversion of defense industry to civilian production took place. Thanks to this, the production of many durable goods was begun. This was a real achievement of the 6-year plan which came to fruition in the late 1950's.

In the 1960's, accumulation started growing again, new developmental priorities were established. At that time, our production capacity and national income were growing at a relatively good rate. They were growing at the rate of 5-6 percent annually. In those years, the growth of employment was also sizeable. In the 1970's, a thesis was advanced that a growth of investments was necessary which to satisfy the need for employment opportunities. I have made some calculations and it turns out that in the 1960's more jobs were created than in the 1970's with the help of three times lower investment outlays in constant prices. At the same time, the growth in the standard of living and the real income was very low and very slow. It amounted to about 2 percent per year and in some years it hovered around 1 percent. With such growth, some sections of the working class and the intelligentsia must have felt that their situation was deteriorating. Of course, the growth could not have been even. There was some discontent and frustration. This was the background in 1970.

Despite this, I believe the 1970 crisis could have been avoided, regardless of certain stagnation in the standard of living, if it was not for the fact that in 1967-1970 several deflationary measures were taken that affected the situation of many groups within the working class. Piecework requirements were raised without monetary compensation and the so-called wage scales were being eliminated which affected skilled workers.

The new system of economic incentives which was scheduled to start on 1 January 1971 took away from the workers the hope of quick improvements. That concept was being prepared for implementation since mid-1970. That system, in its first phase, led to decreases of wages and was immensely complicated. Even members of the Political Bureau could not understand it.

I did not agree with that plan. On the other hand, Wladyslaw Gomulka, attempting to make the system perfectly fair, introduced detailed corrections, thus making it even more complicated and less understandable. This also reinforced the feeling of discontent. Then, in December 1970, there was the sudden and unexpected price increases which was to be offset by price reductions of some durable goods. The working class and the society did not accept it.

Eugeniusz Szyr: It is a fact that it was done in complete secrecy. At that time, I was the vice-premier whose jurisdiction included the market matters but I did not receive the information even about the preparation of price increase. The chairman of the Price Commission came to show me in confidence the already prepared documents.

Stefan Jedrychowski: Day before the meeting of the Political Bureau during which these matters were to be decided, we received some materials which did not clearly indicate what would be discussed. There were various tables and price ratios. During the discussion, only I voiced some objections and doubts. I was against the increase of prices. Later, at the Eighth Congress, I did not speak up, I was discouraged because many comrades who had previously stood at attention without one word of protest were now very eager to speak and were taking advantage of the situation by venting their suppressed complaints and ideosyncrasies. Eugeniusz Szyr also occasionally stood up to Gomulka. But he was an exception.

Eugeniusz Szyr: Speaking about the sources of the 1970 crisis it is necessary to remember 1968. Without it there would have been no 1970 regardless of how one evaluates the roots and causes of the 1968 events.

Stefan Jedrychowski: Except that the working class was not involved in the 1968 events, not on a mass scale anyway.

Bronislaw Minc: I am submitting the following thesis: during the crisis in 1980-1981, the experience, the results and the scars of the crises in 1956 and 1970 played an enormous role. In both cases, new administrations obtained power riding a wave of criticism and hope. But their policies were simply the continuation of errors which had caused the preceding crises. Also, there were regressive moves. First, workers' self-government was discontinued and transformed into Workers' Self-Government Conference; second autocratic and irrational decisions were made, mostly in the economic field. In the year 1968, there was a crisis involving the intelligentsia and the students. It was an ominous signal of a social storm that was not understood.

Adopting a policy, later dubbed the "March policy," blinded the party and government, accelerating the crisis and distracting direct attention from the real causes of the coming crisis, which could still have been prevented. Instead it deepened contradictions and aggravated negative phenomena. In this sense, the year 1968 prepared the ground for December 1970. And one more element. While Wladyslaw Gomulka was in power, personality cult became pronounced. But Gomulka achieved power as a result of violent criticism of this phenomenon in the party and the society. The criticism that Gomulka directed against his predecessors in 1956, can be fully applied to him because of his policies and practices in the 1960's.

His policies continued to increase the role of the state and to decrease self-government.

Economic policy continued to have as its principal objective maximization of economic growth rather than consumption. The optimization theory was totally

ignored. There was a certain optimum of foreign credits that should be obtained. These credits were to be neither too large nor too small. Also, there was a certain optimum in trade relations with abroad. The volume of foreign trade was to be neither too large nor too small.

At the end of the 1960's, the opportunities for development of economy, including credit and relations with foreign countries were not fully used. The economy had elements of deflation and stagnation. The society felt that the prospects for the future were poor because of stagnation.

At the same time, science and planning were demoted. This was especially so in the field of economic sciences. For instance, the concept of selective development was completely at odds with the modern economic theory which emphasizes that the economy must be treated as a system.

The meat price increases in 1970 were correctly seen by the working class as an absolute threat to its standard of living. The compensation offered was illusory.

Stefan Jedrychowski: If one compares the increase proposed by Jaszczuk, which amounted to a total of 14 billion zlotys, with the increase proposed by Gierek and Jaroszewicz in 1976 it appears that the latter would have amounted to a total of over 100 billion zlotys.

Bronislaw Minc: There was another difference, however, that in 1976 income was rising while in the late 1960's they were stagnant. A farsighted policy would have avoided price increases at the time of retrenchment and stagnation. If, however, such increases had to take place under the conditions of stagnation or economic crisis, serious difficulties had to be expected.

Eugeniusz Szyr: In the late 1960's, the center of decision making which properly belong to the government, moved to the Political Bureau. The situation was such that the government could not make any serious decision. Most often, decisions were made by the economic secretary of the Central Committee invoking the position taken by the first secretary. The practice of restricting decision-making to an ever more limited circle of people culminated in the next decade, during the years 1970-1980.

The above mentioned processes started to develop in the late 1960's and at the same time the role of the Planning Commission was diminished and its influence on correct economic development decreased. The first secretary made authoritative decisions about increasingly more detailed matters. This was the foretaste of the situation that developed to monstrous proportions in the 1970's.

Political revival after 1956 also impacted the operations of the Central Committee. During the first years, there were quite spirited discussions at the Central Committee. Later, discussions died out and reporting style dominated. Arguments did not develop. Especially, during 1966-1970. At that time, the conditions for correct economic and social policies still existed. Solid information about society's feelings were reaching the leadership but they were deaf to those voices. Gomulka was reading the information and his reaction was to

suffer but not to take political action. He did not comprehend that there was a threat of social conflict if we continued with existing policies.

Decisions such as the price increases in 1970, should not have been taken without considering social consequences. The point is not how much could be gained but the question is how much could be lost. From the economic point of view, the meat price increases were justified, if the compensation had been persuasive, even though its value significantly exceeded the value of meat price increase. The matter of price relationship alone was well worth it. But nobody wanted to discuss the various possible solutions to this problem with a wider group of people.

Additionally, expanding the number of price increases reinforced the degree of surprise and upheaval. The process of secret decision making under the social conditions prevailing in 1970 showed a blindness and detachment from reality as well as contempt for consultations with the party and society.

I agree with the view that the successive social conflicts had a common source: personalities changed but, despite initial promises, the operational mode of the party and the state remained unchanged. That mode was the centralism without vibrant intraparty democracy and a planning and management system not appropriate to the level of development of production capacity and not responsive to the need for developing socialist social conditions.

Economy Between 1971-1979

Warsaw FUNDAMENTY in Polish No 30, 26 Jul 81 pp 5,6

[Text] In the previous issue of FUNDAMENTY we published the first part of an editorially sponsored discussion entitled "The Windings of Industrialization" in which Stefan Jedrychowski, Bronislaw Minc and Eugeniusz Szyr analyzed our national development. That discussion covered the period 1945 through 1970. Today we are publishing the continuation of that discussion in which the participants, prominent economists and organizers of the economy, deal with the period of the 1970's. We give them the floor. At the same time we are informing our readers that their comments will gladly be published, especially because a sizeable number of our readers are familiar with the previous periods from their own social and work experience.

The Editors

Bronislaw Minc: In the 1970's, the state's economic functions were enlarged and the bureaucratization process was progressing. That bureaucratization included the state enterprises and it was bigger than just the central bureaucracy. That period was characterized by the growing monopolization of the economy. Monopoly of the state in various fields was reinforced directly and indirectly. Large economic organizations were created which had monopolistic positions in which the customer faced only one exclusive organization.

Symbolic is the elimination in 1976 of the state retail food trade and the creation of one monopolistic organization. The chairman of "Spolem" served simultaneously as the deputy minister of trade and services. As a result, the consumer was totally disarmed. He did not even have a choice between two organizations, as he had before, and had no one to appeal to.

Eugeniusz Szyr: I think that to evaluate this period, it is necessary to consider a broad spectrum of problems. Of special importance is the fact that during that period the planning process was weakened and the methods and forms of managing the national economy had badly deteriorated. The theory of open ended planning actually meant giving up the discipline to implement 5-year plans and the infraction and breaking of quantitative relationships prescribed by the plans. In investment planning, it was permitted to freely add to the plan large, new investments which occasionally had no relationship to the previously designed programs. And the bigger, the more costly the investment, the lesser the requirements were for control of project documentation. The majority of large investment projects, even those whose costs exceeded 100 billion zlotys, were added to the investment plan on the basis of preliminary estimates without technical and economic analysis or technical documentation.

Negative changes also spread to the area of economic activity. Salaries and social services were determined on the basis of foreign loans rather than national income without considering that the moment would come when it would be necessary to lower the real value of monetary income to repay the credit obligation, especially those incurred for consumption and raw materials purchases needed for current production. In the late 1970's, 70 percent of foreign credits were not used for machinery and equipment purchases but for raw materials, fodder, consumer products etc.

Loans were granted to various investment undertakings without an exact calculation of their effects and without analysis as to the repayment capability within the prescribed time. All permissible limits between credits and exports were exceeded, both those based on conventional and those based on economic determinations and calculations.

Effective control of these problems was made impossible even for the Council of Ministers. Thus, a "credit noose" was put around the neck of our economy. It was said that that indebtedness could be repaid by the exports produced in the factories built with investment credits. But when we compare the relationship between the purpose for which the investments were used and their usefulness for exports, it turns out that many assumptions were wrong and many calculations faulty. Also, a new kind of credit was created outside the plan which was justified by the recipients with their commitment to the so-called "self-repayment." In this manner, the already extended plan was increased by many new large investments. The majority of these investments either could not achieve the "self-repayment" or achieved it in a fictitious manner.

For instance, they started export of forgings from the Jawor plant to repay loans. It turned out, however, that at the same time these products had to be imported for domestic consumption. While importing, we were paying a higher price for importing the same forgings. If the "self-repayment" was continued, it would mean a clear loss of hard currency. Hence, the conclusion that the decision to permit purchase of equipment on the "self-repayment" basis was based on erroneous analysis.

Interministerial comparative cost effectiveness analysis of investments was not used in practice. Planning consisted of summing up and correcting ministerial plans mainly from the point of view of total outlays. There was no directive to define objectives and on that basis to determine the function and organization of investment process. Formally, recommendations to start new investments were supposed to be preceded by an examination of the possibility to use, modernize and renovate some existing facilities. In fact, however, only the proponent's statements were considered.

The size of ministerial outlays was decided, to the ever growing degree, not by economic analysis but by the so-called "pull." Pressure lobbies have always existed and will exist but they would not have much to do if a correct economic and financial system was in operation and correct tools were used; tools which would apply comparative cost effectiveness analysis to extended investment outlays and to the economic effects on the users of goods produced after an investment is operational.

Gradually, attempts to conduct the correct analysis were abandoned and not only the planning became open-ended but also the analysis pointless.

The most severe economic consequences resulted from the wrong estimation of demand for coal and energy. Based on the theory that Poland has at its disposal cheap energy, it was concluded that Poland should export energy, fuel and energy intensive products. In practice, this meant offering for export greater amounts of coal, electrical energy and even lime nitrogen and carbide while the domestic deficit was growing.

A classic example is offered by the plans for gasification of hard coal. The processing of 35 million tons of coal by 1990 was anticipated despite the fact that such a quantity of coal for gasification was not available nor could it be made available. The first large plant for which a large loan was obtained was supposed to assure the processing of 6 million tons of coal during this 5-year plan. From the point of view of availability, it was obvious that such an amount of coal could not be used for this purpose without decreasing exports. These arguments were not accepted. Some professors, e.g. Prof Szuba from Katowice, supported strongly this unrealistically extensive project for gasification which, moreover, was based on outdated technology. The cost of this investment was underestimated, similar to what happened in the cases of Ursus and the Katowice iron works. Later, the costs grew and reached 130 billion zlotys. The unprofitability and the lack of realism of this undertaking were striking.

These and related subjects were discussed in closed circles but any reservations were brushed aside and their proponents removed. Luckily, already in 1980 there was an acute shortage of resources making it impossible to implement this plan.

The most negative phenomenon was the progressing deterioration of the economic and financial system and the growing limitation of society's participation in formulating socioeconomic policy. Large economic problems were discussed in an ever smaller group and the decisions were made by fewer and fewer people.

Also, at the last moment we avoided--the government decision had already been made--to start intensive development of an iron ore mine in Suwalki.

There are many more examples of similar recklessness. This is how the investment commitments exceeded 1.2 trillion zlotys and, if complementary investments are included, 1.5 trillion zlotys.

One of the methodological errors was to use a deficient comprehensive development program, or not to have any, for a given subsector or branch where huge investments were made. The Soviet data base on the amounts of interbranch throughput indicate for example a direct outlay for construction of an automobile factory requires sevenfold greater outlays for indirect investments, including coproduction facilities, service facilities and increases of metallurgical, chemical and other outputs.

The national economy can cope with the construction of large investment complexes if it is preceded by a comprehensive and thorough analysis of all eventually needed outlays. The reverse procedure was used. Anticipated costs were artificially underestimated and occasionally some basic components were simply omitted. This is the way it was with the outlay estimates for the construction for mining the new coal basin in Lublin voivodship.

Stefan Jedrychowski: One of the sources of the current crisis is that the economic equilibrium has been disturbed not only in the investment field. The increase of consumption, wages and other income of the population above what really can be afforded also had great significance. The First National Conference of the PZPR in October 1973 introduced changes in the 5-year plan both increasing the investment outlays and accelerating the implementation of the program to raise wages and social emoluments. This, unavoidably, created stresses in the national economy which accumulated with time.

At the basis of this policy was a peculiar philosophy that placed dynamics first and balance and economic effectiveness last.

Our experience and that of other socialist countries show that if accumulation starts to exceed 25 percent of the distributed national income the stresses tend to grow. But this is determined not only by the level of investment outlays but also by their structure, especially by a large share of long-term capital intensive and not so effective investments which push to the back the quick return, modernizing investments.

Also, we had to deal with improper distribution of investments among individual sectors and subsectors of the national economy. The investment boom profited, for instance, the machine tool industry while the investments in the chemical and energy industries remained behind. The same can be said about the infrastructure whose share of investments declined. The results are shortcomings in the health services, education and culture.

The tendency to undertake spectacular projects was dominant. When the crisis was already brewing, a new project "Vistula" came to the forefront, it would have involved new, colossal investment outlays.

Between the Sixth and Seventh Congresses of the PZPR, the Political Bureau enacted about 80 development programs for various sectors and branches of the national economy. Each of them had some value and was creating some prospects. But their combined investment impact exceeded several times the real capacity of the national economy even using the most optimistic estimates. In this situation, the planning body was faced with pressure from the investors and the ministries using these programs as their weapons. The internal consistency of the investment plan was often coincidental. The one who won was the one who was the strongest in the pressure game. A lack of balance resulted.

I do not think, however, that we should condemn everything done in those years. The first 3 years were a period of relatively successful development. Investments and population's income were growing and the indebtedness was still within limits. The limit of safety was crossed only at the end of 1974 and the beginning of 1975.

From society's point of view, the first stresses, namely shortages of meat, appeared only in 1975.

It is a fact that the so-called WOG [large economic unit] reform favored strengthening of large monopolistic organization which grouped individual enterprises. There was a fight to provide them with the parametric system. But at the same time these large economic organizations were reinforcing the directive system regarding their subordinate enterprises. The WOG reform did not include the whole economy, was not comprehensive and failed when confronted with the parallel directive system.

Bronislaw Minc: I reiterate my view that the growing process of monopolization and bureaucratization was the cause of planning errors and of the detachment of planning and management from the economic reality. This, in addition to other serious causes, had to lead to the events of 1980.

There is a high degree of production concentration in Polish industry which provides the natural basis for the process of monopolization. Consumers and other recipients of production are in a worse position than in capitalistic countries where oligopoly exists but where the consumer can choose among various enterprises. True, there is no price competition among oligopolistic enterprises but there is competition regarding the selection and quality of product. Thus, the recipient of production is not indifferent whether he has or has not the choice of two commercial organizations, whether there is or is not someone to receive his complaints... [upper portion of p 6 missing]...in current prices. This was the value added, a variation of net production. The increase of the wage fund was made dependent on the increase of the value added. This had to lead to highly negative outcome. Production was deformed because enterprises were trying to achieve the greatest increase of value added regardless of cost and at the expense of the structure of production. The increase of value added was measured annually. Consequently, outlays for technological progress did not pay, and especially so, for production improvements. Those outlays which paid off in a few years were not profitable because they decreased the annual growth of value added and limited the growth of wage fund. The same applied to undertakings involving justifiable risk. The result was degradation and

bureaucratization of production. All efforts were aimed at achieving the indicators rather than satisfying the needs of customers. Everything that did not produce additional value added in a given year was neglected.

From the economic point of view, the so-called structural effect was taking place. If an effect can be achieved through production of several assortments of goods, the natural tendency is to select the assortment which can be produced with least effort. For instance, by not lowering the costs, not introducing innovations etc.

Basing the economic mechanism on any index governing an enterprise wage fund provides a stimulus to inflation. This is so because wage fund grows as expensive products are encouraged and, thus, the supply structure becomes deformed. (Incidentally, I will tell you that resolution No 118 of the Council of Ministers, on the subject of the so-called minor economic reform introduces net production as the substitute for value added but both are really variations of the same concept. This index will determine the wage fund. In result, we have a deformation of production and even stronger stimulus for inflation. The proposed major reform also moves in the same direction as it sets up annual profit as the chief index which will determine the...[section missing]

...we had in 1974. It amounted to 35.6 percent. Later, a decline took place. Also, during these years the suicidal credit policy was started.

The WOG system also began in the early 1970's. Already then, the conditions leading to the crisis were established. In the attempt to combine the accelerated economic growth with the growth of real wages, the former dominated. The increase of real wages was affected all the time by deformations of production and hidden price increases and was sacrified when the difficulties appeared.

Eugeniusz Szyr: Despite the cyclic pattern observed during individual 5-year plans, when plan targets were brought down as stresses showed up, half way through this one, in 1973, some decisions completely contrary to that experience were taken. The rate of growth of investment outlays was increased and at the same time the outlays for wages and social services were raised too. This was the key to the future tragedy.

Until 1973, the economic situation was developing correctly and the indebtedness did not reach a too high level. Then the reserves left over from the previous period were basically exhausted. There still were some extensive essential reserve. There was, however, no objective analysis of the internal and external reasons for that successful development. Some economists, e.g. Prof Ruarz, claimed that even exceeding the 10 percent rate of annual growth of national income every year should be achievable in our economy. Already then, the example of Japan was thrown in our faces. Also, our high rate of economic growth was contrasted with lower indices in other socialist countries.

I believe that the essential problem, both in the 1970's and during the entire previous period, was that the production and the growth of productive capacity should have been in harmony and that the occurring contradictions should have been overcome by adjusting...[section missing]

....Conclusions and recommenations on this subject submitted by the Ministry of Resource Management did not bring any response. If our investment policy was geared to minimize energy consumption, there would not be such a gap between the production capacity and the ability to provide energy for it. This is the area where solutions for the future can be found. Quite often we can lower the consumption of fuels and energy per unit by investing many times less than would be required to increase the fuel and energy production by the same amount.

The outdated ratio of various products in the production of steel and rolled items was compensated for by a large quantitative increase of production and the plans for the distant future visualized the highest consumption in the world of steel per capita. Accordingly, the capital intensiveness of investments was growing in comparison to the outlays for enrichment of the variety of metallurgical products.

There was no systematic analysis of options leading to the same result. For instance, this applies to construction. Houses can be built of bricks, concrete, cinderblocks and other materials. Insulating materials, such as mineral wool, can decrease the quantity of concrete needed and, more importantly, can lower the heating energy losses occurring in poorly insulated buildings. Economic calculations showing the high effectiveness of solutions using substitutes were submitted but they were not appreciated. Other methods of residential construction were not developed, indeed were not even started. The same applies to the fact that resources were not directed to construction of facilities to produce insulating material but rather toward the excessive expansion of the cement industry.

The data on the decrease of the index of shift work in the production plants indicate that the efforts to improve the utilization of our productive capacity were meager. The outlays for modernization and reconstruction of existing facilities were consistently reduced. [section missing]

....Despite everything, the substantial growth of fixed assets in the 1970's and the unfinished investments which, when started, will bring great results and must not be ignored. Many elements for technical progress were created. Under proper conditions they can be used. Thus, after a transition period, there are basic conditions for directing our economy towards effective development.

Stefan Jedrychowski: I think that serious stresses in our economy began to grow only after 1973 and that they did not surface for the next 2 years. At that time, there was a great increase of prices of fuels and energy on the international market with the oil crisis. At that time, our economic and credit policies should have been changed. This was not done.

I do not quite agree with Prof Minc about the reasons which caused the collapse of the WOG system. The parameters were designed to be economic tools for the central authorities to steer the economy. Why did it not work? The plan was not translated into parameters and, contrary to its concept, the WOG's retained a wide margin of freedom to set prices. Under the conditions of prices affecting the value added, this had to have an inflationary impact. I believe that the weakness of the WOG policy would require a separate discussion.

At this point, I wish to draw your attention to a more basic matter. The erroneous, authoritarian socioeconomic policy was possible because of the existing political system. I have in mind the autocratic system of management not only of the economy but the state. It did not permit criticism and self-criticism or the exchange of opinions. It was considered that whoever had the power was wisest and had the exclusive right to make decisions. Such an authoritarian system of economic management.... [section missing]

....(It is necessary to apply such concepts as objective function, limits, synergism, external effects, etc.)

Eugeniusz Szyr: Those who have made decisions in the last 10 years can be accused of many things but certainly not of having any knowledge of economic theory.

There is still a lot of uncertainty in economics and many opinions, including those of Prof Minc, which are being disputed. In the last analysis, many decisions must be made with a limited store of knowledge. As a rule, decisions affect a broader area than that covered by available knowledge, even under the best of circumstances. It is necessary to make decisions under the conditions of uncertainty. Occasionally, decisions must be made while faced with contradictory opinions of experts. The choice of solutions is up to the decision-maker.

Changes in the management system should lead to a significant increase in decision-making authority at the economic units, field administrative offices, etc. This would further increase the importance of scientific methodology and economic tools to facilitate the optimal decisions.

Management does not rely only on economic theories. It is essential to know social psychology, the results of sociological research and the organizational methods and techniques. There exist a family of scientific research whose results permit the anticipation and elimination of the contradictions arising in the society and the economy.

Contradictions will always accompany social and economic development. Hence, the enormous importance of research methods and practical experience related to these problems.

LABOR-WAGE PROBLEMS DISCUSSED IN INTERVIEW

Warsaw ZYCIE WARSZAWY in Polish 21-22 Nov 81 pp 1,2

[Interview with Labor Minister Prof Antonim Rajkiewicz, by Halina Lesnicka: "Zones of Social Protection and Zones of Sacrifices"]

[Text] [Question] Mr Minister, in assuming this post you declared that this would be a ministry of human affairs and social understanding. How are you managing to do this?

[Answer] We are operating under tremendous pressure. Of the 111 days which have elapsed since I took over the ministry, I have spent only 4 days at my desk in the ministry. Two-thirds of my time is taken up with negotiations with the trade unions and the resolution of conflict situations. We are a ministry in which representatives of all the trade union centers sit down at one table. At the same time, it is worth mentioning that in general, despite the position of these centers, just about all the branches fight for privileges and for conditions most favorable to them for starting the economic reform. The negotiations are often difficult, because we are talking with many partners. For example, "Solidarity" has a whole 145 branch sections.

In these conflicts, the ministry is sometimes presented as a party. This is not normal, because we should represent general social interests, serve mainly as mediator, as a ministry which gives an interpretation of regulations binding on both parties. All over the world, in such conflicts there are two sides participating: the trade unions and the employers. In our country, the employer (branch or ministry) often lines itself up on the same side as the trade unions.

Also, operating on the basis of preventive measures, we have created six mixed teams for negotiations with representatives of all the union centers, the scientific community, and the administration participating. These are groups for a reform of the labor law, a group on employment, a mixed commission on wages, a group to draft a social minimum, and a commission on social security. We have also created a social consul-

tation group which, among other things, has taken up the task of setting tasks for the ministry within the framework of the economic reform.

[Question] Mr Minister, do you not think that the current pressures on wages are mainly the result of the sudden rise in living costs? Those groups which have the greatest striking power win, and as a result there are greater imbalances in wages. Is that not true?

[Answer] It is difficult to say that up until now we have had a cohesive wages policy. Most of the efforts have been intermediary actions. We must just work out such a policy. For example, the mixed wages commission is to take up the question of putting the wage systems in order and to prepare an overall wage system reform. In all the negotiations up until now there has been the prevalent view that we must restore the incentive function of wages, try to remunerate fairly, and avoid any egalitarism in wages.

Let us assume that the wage spread should not be greater than 1:7 (this is the relationship between the lowest and highest pay) or that it should not exceed 3.5 of the level of mean earnings (as follows from both the resolutions of the Ninth PZPR Congress and the First National Congress of "Solidarity"). Wage spirals may be cut by correct tax policy or by payment of a portion of the highest salaries in bonds (although I would exclude from this miners and all of extractive industry, owing to their importance to the national economy).

[Question] More and more often we hear expressed fears that under credit conditions and a later economic reform, it will be absolutely impossible to protect the lowest groups.

[Answer] I think that under crisis conditions there must be a sphere of social protection and a sphere of sacrifices. Where it is a question of meeting the most basic needs, like food, personal hygiene, and heating, there must be social protection. This is a question of biological endurance for the groups least well off, or about 4.5 million people on pensions and annuities, families with many children, and mothers raising children alone.

We have two instruments for the protection of these groups: family allowances and valorization of pensions and annuities. As of 1 November the lowest pensions and annuities were increased for about 2.5 million persons, and for the first time here the categories of the social minimum were put into practice. The system of valorization of pensions and annuities should be implemented along with the new retirement law during the first half of next year. We are also beginning a second phase of increases in family allowances. They will have a far greater role in the budgets of families, particularly those with many children and those with per capita income of 3,500 zlotys or under. Those who

have more will have to bear the costs of the crisis, in proportion to their income, of course.

[Question] Your ministry was charged with establishing the level of the social minimum during the third quarter of each year. What is its practical significance?

[Answer] The social minimum for the third quarter was drafted by the Institute of Labor and Social Affairs for 11 sociovocational groups. Nonetheless, given the sudden increase in prices, the social minimum drafted in September surely is no longer current. We undertook efforts to adapt the minimum to the conditions where the market is out of balance. Rationed commodities represent only about 15 percent of the market basket of goods and services included in the social minimum. Many items are not available on the market and must be purchased out of necessity at very much higher prices (eggs, for example). Thus, when we do our calculations, we have three prices for sugar: 10.50 in the rationing system, 48 zlotys as the social cost of producing it, and 80-100 zlotys as the black market price, that found on the free market. In the calculations we must also take into account the social cost of production.

Therefore, in this situation I would attach less weight to the calculations of the social minimum in zlotys and greater to the social minimum in terms of material benefits. In this conceptualization the social minimum should help plan production, so that each citizen would obtain the essential amount of basic goods, including agents of personal hygiene.

[Question] Unemployment can also threaten the existence of families.

[Answer] I consider it one of the main tasks of the ministry not to permit mass unemployment. This year the situation on the labor market is still relatively favorable. Factors here have been the introduction of paid upbringing vacations, earlier retirements, and the shortened workweek. We have 163,000 jobs open for 33,000 persons seeking work.

Of course, the available jobs are not always in those vocations and localities where people looking for jobs are registered. Hence, we are upgrading the system of job referral. We intend to create a national information bank. About a quarter of a million people can be absorbed by services and the municipal economy and repairs. Tremendous assets are being damaged. On the other hand, shifts of administration employees are occurring on a scale less great than we had anticipated. I would therefore estimate the administrative overage in the central administration, in the industrial associations and other intermediate groups to be eliminated to approximate 30,000 persons. The figure for industrial administration is far greater, about 100,000 persons. Up until now, however, only 2,000 employees have returned to agriculture. Some 3,000 have taken jobs in service industry. Here we are running

into exceptionally great resistance stemming from considerations of prestige, relationships, and ties. Only economic incentives can change this situation. Administrative efforts alone will not do anything here.

There are 14,000 graduates who have not found work yet, but by the end of the year all will be offered work, although not always in the line in which they have been trained. During the next few years we must change the doctrine of training and reorient youth's way of thinking in the direction of taking greater responsibility for choosing their own vocation and making their own luck. The law on planned employment of graduates has been nullified by life itself. The planned employment of graduates can be maintained only in areas like education and public health. Nor would I see any great misfortune in having young people take paying jobs abroad, especially where this produces economic benefits. They would also learn the habits of good work and bring back a little modern equipment too, in the process.

[Question] We know that the principles of regulating foreign wage-earning trips have recently been established.

[Answer] We have adopted the following principles: protection of the countries skilled potential, maintenance of ties with Poland on the part of those travelling abroad, maintenance of human and national dignity, and support of the promotion of Polish culture and foreign trade. We have agreements with the GDR and Czechoslovakia. The agreement with the FRG will probably be extended, although it is to expire this December. Some 90,000 persons are presently employed in organized forms abroad. Priority is given to trips to socialist countries. There are still substantial unutilized possibilities for sending our specialists to the developing countries. We are collecting data to learn how many Poles have taken jobs on their own in what countries. We want to cover everyone with insurance and make return to Poland possible.

[Question] Mr Minister, you conduct the work of the commission on labor law reform...

[Answer] Under the conditions of union pluralism, a number of new problems have arisen, such as who is to represent employees where there are several trade unions in operation and so on. The problem of a guaranteed wage is becoming timely. We may also get to the issue of the bankruptcy of an enterprise and the collective dissolution of the labor relationship. Our group would be ready to finish work on the amendment already, if it were not for the absence of a law on trade unions. On the other hand, the new labor code will be ready in 1983.

We also need to have a law worked out for the remuneration of employees and for plant social benefits, and the issue of deductions for the national cultural fund needs to be put in order. I am an avid advocate

of it. Cultural facilities (dayrooms, libraries) previously maintained in part through trade unions or social funds, for which about 2 billion zlotys has been allocated, are now dying. It is a paradox. After all, we have Saturdays off, but there is less possibility of cultural participation.

[Question] Mr Minister, as a specialist in the realm of social policy and now as a practitioner, how do you view the role of scientific advising and consultation?

[Answer] I think that without scientific counselling and expertise one cannot talk about making the best decisions. Now, as a minister, however, I use practical solutions as the main basis, not the multiplication of ideas. I am considered to be a stubborn pragmatist. In reality I would like to bring practical content to verified categories and concepts of social policy, to bring back healthy reason in the realm of wages and employment. Work must be work, and not a relationship which entitles a person to benefits, and a pension must be a pension, and not an allowance out of social welfare. Wages must be related to productivity and effort. We must resolve these issues which concern basic needs. We must consistently break down the condition of inertia which is so paralyzing to the society and the economy.

METHODS FOR ELIMINATING DEBTS DISCUSSED

Warsaw TRYBUNA LUDU in Polish 26 Nov 81 p2

[Article by Ryszard Bilski: "How Are We Going to Get Out of Debt?" from our own sources]

> [Text] The Sejm Commission on the Economic Plan, Budget, and Finances on the 25th of this month acquainted itself with the country's balance-of-payments situation. Here is a short description (along with the projected structure for the immediate future) as presented by Minister of Finance Marian Krzak.

In convertible currency our indebtedness currently amounts to 25.7 billion dollars (24.5 billion dollars of intermediate- and long-term credit and 1.2 billion dollars of short-term credit).

As the result of multilateral talks with governments of creditor countries and with private banks, there was the possibility of shifting to 1986-1989 the repayment of the credit installments and interest due this year. Because of this Poland's balance-of-payments indebtedness this year will be about 5 billion dollars less.

The decline in production is creating adverse export effects. There is the danger that we shall not be able to fulfill this year's export plan (which is smaller than last year's fulfillment).

The imports structure is unfavorable. In 1980 we spent about 30 percent of our foreign exchange currency for food, but this year food accounted for over 50 percent.

The real possibility of Poland's entry into the International Monetary Fund and the International Bank for Reconstruction and Development is an opportunity for the further refinancing of our debts and for obtaining credit, including investment credit.

Not to Squander Opportunities

The postponement of payments and the reduction of our economy's burden of installments and interest create opportunities for Poland to extricate itself from the greatest difficulties and to slow the sudden downward spiral.

But these are only opportunities, the exploitation of which depends not on foreign bankers but on us ourselves. This is why many deputies' questions concerned the very question of the rational utilization of the loans we are currently receiving.

Deputy Waldemar Michna, for example, called for drawing the marks showing the rise in loans during the past period farther apart, and the reasons for such catastrophic indebtedness were stated. It is a question of coming to know these mechanisms and not permitting similar mistakes to happen.

These problems continued in the talks in the corridors. To put them in a few words they can be summarized as follows: during the past decade we fell into a credit trap and now we must avoid falling into the trap of refinancing. Do we know what to do now to avoid having the till empty when the moment comes to repay the deferred debts?

Sell More

The answer came: We must increase exports. But exports will increase only if they are profitable to the independent self-governing and self-financing enterprises, only if they bring benefits to the workers. The economic reform is supposed to create such conditions.

It should also permit the reconstruction of industry, so that industry will import less and sell more. It is a question of eliminating senseless, expensive imports of many partly-finished products, materials, and subassemblies, which we can produce on our own. Deputy Longin Cegielski was one of those who pointed this out.

We must see not only the great powers, the well-known and recognized exporters, but also the minor producers who can also make the country a lot of money. Meanwhile, the small exporters, as Deputy Janina Banasik said, are running into tremendous barriers. For example, profitable exports to the American beet-products market cannot be carried out for lack of packaging.

Let us add that yesterday's meeting set some sort of precedent, because, as Minister M. Krzak emphasized, "For the first time in our practical operations up until now I have the opportunity to discuss balance-of-payments matters at the meeting of a Sejm commission."

During the second part of the meeting, Minister Wladyslaw Baka familiarized the deputies with the targets and course of reorganization of supreme and central bodies of the state administration, in connection with the economic reform being conducted. One of the effects of the reorganization is to be a reduction in employment. Has this effect been achieved? Well, as everyone knows, among other things, nine ministries have been reduced to four. The target was for the employment in these four new ministries to total 2,169 persons at the end of 1981 (in the nine, it totalled 3,739 persons).

This intended level of staffing has not yet been achieved in all the new (combined) ministries, but the tendency toward reduced employment is clear. In the mining ministry, where 500 persons were to work (in place of the former 795), only 480 persons are employed.

The next stage is to dissolve the industrial associations. This stage will begin as of 1 January 1982, and will last about half a year.

ECONOMIC REFORM IN TRANSPORT INDUSTRY DISCUSSED

Warsaw TRYBUNA LUDU in Polish 17 Nov 81 pp 1, 3

[Interview with the new Minister of Transportation, Janusz Kaminski, by Marek Godlewski, Polish Press Agency: "Preparations for the Application of Economic Reforms; To Ensure the Efficient Operation of Transport"; date and place not specified]

[Text] [Question] Mr. Kaminski: For many years the heads of this Ministry were also the main bosses of the PKP [Polish State Railways]. This aroused dissatisfaction among the airline pilots, and others, who felt that the Minister, occupied with the railroads, has little interest in their problems. Will they continue to have reason to believe so?

[Answer] We are now working on the form of economic reform in transport. We must determine which functions and tasks the Ministry should fulfill and what its rights and duties towards its subordinate units should be. We must also define the structure, authority and obligations of the enterprises operating within the jurisdiction of the Ministry, i.e., railroads, aviation, the PKS [State Motor Transport], highways and inland water transport. But these problems will not be easy to solve.

[Question] Why?

[Answer] Because of the specific nature of the Ministry. To accomplish the transport tasks, the principle of central control of the work of the individual enterprises and their sectors must be retained to a certain degree. But this is somewhat in conflict with the fundamental principle of economic reform, i.e., the three "S"'s: independence, self-sufficiency and self-financing [all begin with "S" in Polish].

[Question] Can we assume from this that in the Ministry, reform will be of a limited nature?

[Answer] It is difficult to put it that way. I want to say that I am and have been an advocate of reform, but I am also a realist. Many railroad men would like, for example, broad reforms in the railroads, decentralization of their operation. However, if the PKP is to operate properly, railroad traffic must be planned and coordinated on the national scale. Many PKS sector are awaiting full independence and, of course, even in this case there must be a carrier and its operations must be coordinated at the central level, for example, in preparing the network timetables,

in the area of cooperation with other types of transport, and also in the servicing of export cargo, seasonal transports, cooperation during natural distasters, etc. Therefore, we must reconcile out justified tendencies toward broad application of the principle of reform with the efficient implementation of transport, which has the higher priority. Changes in transport must take into account both, partly conflicting, principles.

[Question] What decisions concerning transports should, in your opinion, be made at the central level?

[Answer] Insofar as PKP is concerned, the timetables must be compiled centrally. At this level, too, it is necessary to plan the organization of the repair of the rolling stock, the distribution of the means of transport, and the major overhaul of the main railroad lines. Decisions on investments must be made and, of course, the operation of the network must be coordinated at this level. I do not mention here the entire block of employment-wage matters and problems relating to train traffic safety. The role of the central headquarters in relation to PKS would be much smaller; the association of PKS enterprises would occupy itself with the preparation of network timetables, the distribution of rolling stock and scarce materials, the organization of technical facilities to make the more important repairs, training, and finally the coordination of operations on the network scale.

[Question] From what you say it appears that preparations for application of reforms in the Ministry are, at the moment, not too far along.

[Answer] I do not concur with such an opinion since we have done a great deal of conceptual and legislative work and are continuing this activity very intensively. It is a fact, however, that the specific nature of the Ministry requires preparation of separate structure and organizational systems which would ensure the efficient work of transport while at the same time the basic principle of economic reform are being applied. I believe that in the Transportation Ministry the reform should be introduced in stages in the individual branches, no earlier than in a few months.

[Question] Why so late?

[Answer] To avoid serious troubles. Reform is supposed to go into effect in January, i.e., in the middle of winter, which is our most difficult period, when freezing weather, snow, ice and lack of materials, compound our already sufficient problems. Application of reforms at such a difficult time in all branches may complicate the implementation of transport tasks, and this will be felt by all of society and the entire economy.

[Question] How are you preparing yourself for transports during winter?

[Answer] I have already mentioned our supply problems. We lack spare parts, various materials, for example, to de-ice the roadways, and also storage batteries and tires. These shortages may make our work this winter so difficult that we will not be able to accomplish all our tasks. So we have established priorities. Most important, as always, is the transport of passengers.

In second place we put the transport of goods which are of the highest importance to our economy: liquid and solid fuels, food articles, cargoes connected with agriculture and imported and export commodities. The remaining tasks will be performed in successive order. Our transport capacity during the winter will to a large degree depend on the help given us by the individual sectors of the economy and by the individual enterprises. We are concerned mainly with timely and complete deliveries of materials and parts. Should there be deep snow, we will require the assistance of work forces outside our Ministry to remove it.

[Question] Can you now tell us something about plans for the immediate future?

[Answer] One of the most important problems in all of transport is the poor condition of the rolling stock, due to delays in developing technical-repair facilities. I believe that despite the country's present economic difficulties these facilities should be expanded within the next 3 years and equipped to a degree that will ensure that the railroad and vehicle rolling stock is serviced properly. In order to relieve these facilities, the old, depreciated rolling stock, repairs on which are labor-intensive and require large amounts of spare parts, should be done away with. During periods of lower demand for transport, we should also limit the purchase of new means of freight transport.

[Question] What will be done about fuel?

[Answer] Everywhere on the railroad where it is possible, we will send our trains on routes that are electrified. That is why we must electrify the railroads more rapidly. The present length of PKP electrified lines (about 7,000 kilometers) is absolutely unsatisfactory to us.

[Question] Do you prefer electrification because you are a specialist in electric traction?

[Answer] No. Simply because electrification is very advantageous. An electric locomotive uses 10 times less contracted energy than a steam locomotive. One hundred kilometers of average loaded electrified line saves 100,000 tons of coal or 12,000 tons of diesel fuel in a year. In addition, an electric locomotive travels twice as far and hauls twice the load in a 24-hour period as a steam locomotive.

[Question] What are the plans concerning other fields of transport?

[Answer] Certainly we will give their development the same attention we give the railroads. But I do not want to go into detail now, since the direction of the activity of the individual transport enterprises (the same as PKP) will in large measure depend on the means we have available to us and on the work of the work forces under the new economic reform conditions.

[Question] Will it be easier for the passengers to travel?

[Answer] I have already said that passenger transport has priority. Improvement in this field will depend primarily on delivery of rolling stock. Unfortunately, we are receiving much too little of it. Nevertheless, we would like to assure the passengers that traveling conditions will improve, insofar as possible. But I cannot promise too much.

RAILROAD INDUSTRY RESULTS FOR 1980, DRAFT PLAN FOR 1981-85

Railroad Industry Plan Completion for 1980

Warsaw TRAKCJA I WAGONY in Polish No 5-6, May-Jun 81 pp 129-132

[Article by Jerzy Przewlocki MS Eng, department chief in Locomotive Section of the Ministry of Communications: "Assigned Task Execution by Locomotive Service in 1980"]

[Text] During 1980, Polish State Railroads [PKP] transported 1,093.5 million passengers (98.5 percent of the plan) and 473.1 million tons of freight (95.4 percent of that planned) which, compared to 1979, constitutes an increase in passenger transport of 0.1 percent and of freight transport by 0.6 percent. In making these comparisons one has to bear in mind that during 1979, the deciding influence was exerted by the extraordinarily difficult weather conditions which prevailed during the first quarter of that year.

Utilization and Work of Locomotive Vehicles

In 1980 locomotives performed work amounting to 639.92 million vehicle/kilometers, i.e. greater by 2.3 percent than in 1979; 97.6 percent of plan were accomplished.

Table 1

(17) Razem	(16) [illegible] pojkm	625,39	[illegible]	[illegible]

The share of electric and diesel locomotives in vehicle/kilometers, in total haulage service was 86 percent and steam locomotives, 14 percent.

The work of locomotives expressed in gross-ton-kilometers [btkm], as compared to 1979, rose by 0.7 percent amounting to 334.1 billion btkm. The 1980 plan was 95.5 realized. The share of electric and diesel engines was 92.8 percent, and steam engines, 7.2 percent.

It is worthwhile to draw attention to a considerable growth of work of electric engines, both in vehicle/kilometers and btkm (respectively 7.5 and 5.2 percent) with a simultaneous reduction in work of diesel fueled locomotives compared to 1979. This was a direct result of activity aimed to limit the consumption of liquid fuels (which includes withdrawal into reserve of certain number of line diesels and elimination of diesel engines on electrified lines).

Specific data is presented in Tables 1 and 2 pertaining to work output of locomotives, in vehicle/kilometers and btkm, plus the percentage share of the particular types of engines in the work achieved in 1980, as compared with the plan and with 1979 results.

In the area of actual use of locomotives (Table 3) in 1980, compared to 1979, an improvement in daily utilization ratio was achieved in almost all modes, both in passenger and freight service (except for self-propelled electric trains and diesel engines in freight service).

However, the daily utilization (except for steam locomotives in passenger service and self propelled diesel trains) was still below the stipulations of the 1980 plan.

The continuing, basic reasons for this state of affairs were: line closings, extended locomotive turnaround times, speed limits and the taking over of work on short hauls by electric and diesel locomotives.

The times during which locomotives, employed in freight service, were at the disposal of the transport branch exceeded the time allowed by the transportation plan and was essentially maintained at the 1979 levels (Table 4).

In connection with the recently noted distinct decrease in PKP transport effort, creating conditions favoring a more regular scheduling of freight trains and a better exploitation of the existing locomotive potential, the operational department should take appropriate steps in that direction.

Locomotive Modernization

In 1980, 307 new locomotives were brought into use including 146 electric, 186 diesels, and 75 self-propelled electric units. In the electric locomotive deliveries 43 percent comprised engines of ET41 and ET42 series which boast a 2x2,000 kW power rating.

Elektryczna (8)	19,3	15,9	19,0
Spalinowa (9)	19,4	16,3	19,3

Also, during the same period, the following were removed from the inventory: 53 steam locomotives, 24 electric and 8 diesel locomotives, 42 self-propelled electric and 3 self-propelled diesel units.

Status of the locomotive inventory at the end of 1980, as compared to the preceeding years is presented in Table 5.

In 1980, 181 km of the line was electrified and turned over for use including:

Goleniow	-- Swinoujscie	78 km
Dziewoklicz	-- Szczecin Port SPB	4 km
Kutno	-- Florek	6 km
Biala Poldlaska	-- Terespol	37 km
Lublin Tatary	-- Adampol	8 km

Connections in the Silesian region:

Technical Status of Locomotives

The percentage of out-of-service ("sick") locomotives, in relation to the total available numbers, (as compared to the 1979 plan execution and to the 1980 plan) is presented in Table 6.

The decidedly improved posture of this indicator, in comparison equally to the 1979 results and to the 1980 plan, occured in the electric locomotive field (electric engines and electric self-propelled units); on the other hand there was a marked worsening in the steam and diesel locomotive field.

The situation concerning passenger diesel locomotives series SU46 and SU45 continues to be particularly difficult. Considerable numbers of these vehicles remain out of service due to repair and materiel difficulties.

In 1980, as compared to 1979, the need for replacement of locomotives en route rose by 21.5 percent, from 455 to 553. This deterioration occurred in all types of locomotives, the largest proportion in deisel locomotion--by 44.9 percent, in steam locomotion, by 6.3 percent, and in electric locomotion, by 5.5 percent. Reduction of replacements occurred in the Silesian Railroad Directorate Region [DOKP] (by 9.8 percent), Lower Silesian DOKP (7.4 percent) and Central DOKP (6.7 percent). Largest increases were in Western DOKP (135.3 percent) and the Southern and Pomeranian DOKP's (at 100 percent each).

Fuel and Energy Consumption of Locomotives

The planned consumption of electrical energy, solid and liquid fuels was exceeded in 1980.

Coal consumption in steam locomotion for passenger service reached 85.26 kg per 1,000 btkm (the planned amount was 84.66 kg), in freight service--46.62 kg per 1,000 btkm (plan 46.1 kg) and in non-train use--20.01 kg (plan 19.84 kg). On the entire PKP net an extra 24,354 tons of coal (actual weight) were used over the quota.

The main reason for this state of affairs was irregular deliveries of railroad grade coals, which coupled with minimal reserves (and sometimes without any reserves) made it impossible to prepare properly constituted mixtures of coal.

In diesel powered passenger service, consumption of fuel oil amounted to 9.89 kg per 1,000 btkm (the plan 9.66), in freight service--4.67 kg (plan 4.63) and in non-train use--2.37 kg (plan 2.36). This resulted in an over-quota use of 6,154 tons of liquid fuel. The principal reasons were: a 2.52 percent reduction of hauled weight in passenger service and 2.79 percent in freight service, also an increase in the percentage ratio of runs without trains to the total runs in freight traffic--by 5.59 percent.

Electric energy in electric locomotion of consumption was exceeded by using 20.06 kilowatthours [kWh] per 1,000 btkm instead of the planned 20.00 kWh/1,000 btkm.

Safety in Train Traffic

In 1980, as compared to 1979, the total number of accidents caused by railroad service personnel was reduced by 5.6 percent. Improvement was achieved in the accident category caused by running through a "stop" signal--by 11.5 percent, also in accident category attributed to defective technical status of locomotives--by 23.1 percent; however, a deterioration was noted in the category of exceeding the permissible speed limit--by 100 percent, and in accident category of failure to observe proper precautions on lines equipped with self-actuating barriers--16.7 percent.

The amount of track damage, as calculated per 100 track/kilometers of the line, was reduced from 9.19 in 1979, to 8.92 in 1980, i.e. by 3 percent (Table 7). An improvement was achieved in the damage category related to the Rail Network (by 11.8 percent) and in the group independent of electrical traction (by 12.7 percent); however, a deterioration was noted in the category of accidents pertaining to electric locomotives (by 35.7 percent). The deterioration was observed in the Silesian, Northern and Southern DOKP's, improvement in the remaining DOKP's.

Employment in the Group of Locomotive Crews

In 1980 employment of locomotive crews increased by 0.2 percent. Growth of employment in this category occurred in three KOKP's: Eastern (4.5 percent), Silesian (2.3 percent) and Pomeranian (0.5 percent). Reductions were noted in: Lower Silesian (2.4 percent), Western (1.2 percent), Central (0.9 percent) and Northern (0.5 percent). Employment of crews in Southern DOKP did not register any change.

Zależnych od elektrycznych pojazdów trakcyjnych (6)	1,79	2.43
Niezależnych od trakcji elektrycznej (7)	4.68	4.09
Ogółem (8)	9,19	3.92

On the entire PKP net the shortages of locomotive crews, as compared to the needs, amounted to about 9 percent, according to the status on 31 December 1980. Largest shortage occurred in Lower Silesian, Western and Central directorates, i.e. in those directorates where a reduction in employment of locomotive crews was noted and this is very disturbing.

Despite a certain improvement, as compared to 1979, in the locomotive crews category, there was an excessive number of overtime hours. Monthly average of overtime hours, per one employee, during the 11 months of 1980 observed, amounted to 39.6 hours, during a corresponding period of 1979--41.6 hours.

Deliberations of Parliament Commission

Warsaw TRAKCJA I WAGONY in Polish No 5-6, May-Jun 81 pp 172-175

[Text] One of the conditions for restoration of economic balance in our country is to insure smooth efficiency of our entire transportation system. The basic element of transportation's technical base--which decides on the level of transportation capability and the efficiency of national transportation system--is the size and the technical status of the available transportation means.

The status and the perspectives of assuring transport equipment for the transportation industry were a subject for the deliberations by the (Sejm) deputies during a joint session of the Commission for Heavy Industry, Machinery and Steel Manufacturing and the Commission on Transportation and Communications, which took place on 26 February of this year.

Also taking part in the deliberations were representatives of the interested ministries, i.e. Ministry of Heavy and Agricultural Industry with minister Stanislaw Wylupek, Ministry of Machine Industry with minister Henryk Gawronski and the Ministry of Communications with viceminister Janusz Kaminski.

It appears, from the information presented to the deputies by the Communications ministry, that during the coming years the actual problem will be the need to replace, more rapidly, a large number of railroad cars due to their considerable worn condition and low technical condition.

Also, the requirements connected with the need to form a rolling stock reserve are mounting, and this ties in with a deterioration of the external working conditions resulting from an increased number of leisure days and the resulting irregularity in service.

As a result of changes in economic directions the requirements for the rolling stock needed in investment service (open gondolas) will be lessened while the need for the remaining types of rolling stock (boxcars and specialized cars) will increase.

Besides a necessity to improve the wear and tear resistance and the breakdown frequency of rolling stock, a need to increase the cargo carrying capacity, and a better adaptability of freight cars to automated loading services, and an increase in locomotive power and an imporvement in the parameters of their utilization; the foremost need becomes a reduction in energy intensiveness of the inventory and an increase in the level of safety automation, while in passenger service--an increase in the level of passenger travel comfort.

Railroad Transportation in 1981-1985

The draft of the national socio-economic plan for 1981 provides for transportation of 450 million tons of freight over standard gage track.

Also forecast is the emergence of the national economy from the current recession, this should, towards the end of the 5-year plan, bring an increase in material goods production in no lesser degree than in the previous years. This in turn should find expression in an increased demand for rail transport, which according to initial estimates should amount to 500 million tons of freight in 1985.

Current tendencies permit stipulation that passenger transportation will remain basically at an unchanged level and will amount to 1,100,000,000 passengers. Maintenance of this level of passenger participation will depend, in a great measure, on the travel conditions which the railroads will be capable of insuring for these passengers.

In narrow gage transportation it is anticipated that freight transport will be at a level of 9.6 million tons during the current year, approximately 9 million tons in 1985, and the passenger transportation will be respectively 8-7 and 6 million passengers.

Actual Rolling Stock Status

The structure of the freight car inventory, based on status as of the end of 1979, was as follows:

boxcars	-- 13.3 percent
coal cars	-- 57.7 percent
flatcars	-- 11.0 percent
other cars	-- 15.0 percent

The low proportion of boxcars is the result of a decrease in deliveries from 3,000 in 1971 to about 1,000 in 1977, to their abandonment in 1978 and their deletions from the inventory--this proportion is steadily shrinking both in car numbers and their loading capability.

The orientation of national economy towards market production and the resulting necessary changes in organization of transport services, i.e. taking over by the railroads of some transportation tasks formerly performed by trucking results in a considerably greater demand for boxcar transportation services.

The situation in freight car administration is made even more difficult by a great number of defective cars whose numbers in 1980, grew to a level of 36,500 cars.

A particularly serious problem, which has not been solved for a number of years, is an inadequate reserve of freight cars. The work of railroad transport is characterized by variations in intensity, not only on a yearly basis, or even quarterly and even on a daily basis. In order to compensate for the irregularity of cargo loads which may occur on a particular day of the week it becomes necessary to have a provisional reserve, which should amount to about 3.5 percent of the working freight car pool. This is caused by a necessity to maintain a fully rhythmic flow of loading operations in Silesia and in other regions of mass loading and also to insure the continuity of loading operations in case of transportation difficulties.

Independently of the above railroad reserve there should also be a standing reserve in order to cover additional transportation requirements resulting from seasonal escalation of transports of agricultural products, domestic heating coal, temporary increases in foreign goods shipments, increases in goods transshipments from seaports and possible increase in the number of PKP cars departing abroad. Size of a standing reserve is estimated at 10,000 freight cars to include some 6,000 coal car and 2,500 boxcars.

Positive changes in the structure of the passenger car pool which, although slowly, occurred during the recent years were accompanied by a gradual improvement of the basic technical characteristics of this pool. About 98 percent are equipped with roller bearings, about 85 percent have electric heating, some 98.7 percent of the 4-axle cars have modern construction and equipment. The oldest cars with wooden body construction, which in 1970 constituted about 30 percent of the entire passenger car inventory, were withdrawn from service in 1976. Due to new car deliveries and removal of old cars the average age of passenger cars went down by a half in the recent years and is now at a level of 15 years old. Number of cars over 30 years old makes up less than 10 percent of the inventory.

At the same time--the step with electrification and conversion to diesel power which are currently in progress on the PKP net--the number of cars in electric self-propelled units is increasing. Until 1975 there also was an increase in the number of cars in diesel self-propelled units (since 1976 the deliveries of diesel self-propelled units have been halted and as from the end of 1976, the number of these cars--as a result of deletion from inventory of cars no longer in use--was further reduced by 15 percent).

One of the indicators which are characteristic of travel conditions is the number of (potential) passengers per one seat in the inventory. From 1975 statistics it appears that per one seat in railroad inventory, in passenger service, there were 1,439 persons in Poland, by 1980 there were 1,320. Although this indicates a small shift towards improvement it is still far from accepting travel conditions as being satisfactory.

The size of the PKP rolling stock inventory is still insufficient and causes serious situations, in particular during peak passenger travel demand periods. These difficulties will grow during 1981, principally because of introduction of a greater number of free Saturdays and limitations on bus travel, particularly on long distance lines. As a result the demand for rail passenger service will be increased.

Locomotive Vehicles

A characteristic mark of the change in locomotive inventory during the fifties was a gradual elimination of steam power in favor of electric and diesel powered engines. The pace and direction of these changes resulted from the electrification of the PKP net and the rate of deliveries, from domestic and foreign sources, of modern traction vehicles.

Growth of electric locomotives was particularly rapid during 1960-1970. During that period it was linked with the rate of electrification and the undertaking, by domestic industry, to produce serially electric locomotives of EU07 series and electric self-propelled type EN57 cars.

A reduction in the work rate resulting from electrification--in particular during the later half of the seventies--resulted from the reduction of speed of PKP net electrification, relative to intensification of investment and contract work in construction of the steel mill-sulphur lines.

Basic development of diesel locomotion in PKP dates back to the first half of the sixties and is connected with initiation of domestic serial production of switching engines series SM42 and import deliveries of a considerable number of diesel engines type ST43 and ST44. From that time on the progressive development of diesel locomotion maintained a regular pace.

After 1970, the deliveries of new rolling stock and the elimination of worn out inventory (mainly steam engines) were responsible for a further improvement of the locomotive inventory, which in 1979 looked as follows: steam engines--26.2 percent, electric engines, 29.5 percent, and diesel engines--44.3 percent.

During the past 5 years (1976-1980) the needs of the passenger service found full response in the means of transportation. However, in freight service--because of a lack of reserves--there were several difficult and tense moments both in full and part time freight service. In order to smooth out these difficulties the ministry of communications undertook organizational type measures. For example, a system was developed for many lines whereby electric or diesel locomotives were so assigned as to serve a train with the same locomotive for the entire length of a given trip. Additionally, locomotive crew hiring was given preference and changes were introduced in the field of the extent of train locomotion service sectors, etc.

New Rolling Stock Delivery Needs for 1981-1985

The necessity to increase the independence of transportation and an increase in the demand for transportation dictate that the deliveries of new and fully serviceable inventory be insured.

Freight Cars

Freight cars deliveries during 1981-1985 should make it possible to exchange worn out cars, qualified for a deletion from the inventory, achieve growth of transport capability proportional to growth of transport demand and a formation of a utility reserve.

Transportation by rail, during the coming years, of freight in the quantities stated and predicted at the beginning of this report, will require an increase of the freight car inventory by some 26,000 freight cars. To make up for losses resulting from wearing out and inventory deletions, which according to initial estimates (mostly of old types with low capacity) will amount to about 50,000 freight cars during that period, it will be necessary to receive deliveries of over 28,000 new freight cars. Formation of a necessary reserve needed to maintain an uninterrupted flow of work will require a delivery of 11,000 more freight cars.

Total freight car deliveries during 1981-1985 should amount to some 65,000 freight cars including 8,500 boxcars, 30,000 coal cars, 12,000 flatcars and 7,500 of dump cars.

Taking into account that in 1981, deliveries of freight cars will total 6,400 cars including: 3,500 coal cars and 300 dump cars, the average yearly (future) deliveries of these cars should be markedly increased in the coming years.

In case of a failure to accomplish the necessary freight car deliveries the transport work of the railroads will be plagued by the lack of sufficient reserves. This can have a very negative influence on the transportation task and in an extreme case may limit our country's development. The acceleration of boxcar deliveries is absolutely indispensable, even at this time.

The Ministry of Communications is making efforts to speed up freight car deliveries for grain transport, of 4-axled, wide boxcars as well as the 2-axle types and of 6-axled flatcars. Of particular significance is the matter of a rapid initiation of boxcar production as their shortage is now being felt with an ever increasing degree of acuteness.

Passenger Cars

Fulfillment of the requirement to improve travel conditions requires the realization, during 1981-1985, of passenger car deliveries earmarked not only for an inventory exchange (it is estimated that inventory deletions will include, in this period, about 1,700 cars including 1,500 passenger transit cars), but also for formation of the necessary reserve pool to smooth out the difficulties occuring during the peak passenger demand periods.

According to an actual forecast the new passenger car deliveries will total about 1,800 cars, from domestic and foreign sources, which will be slightly more than the losses, it should have a contributory effect on the improvement of the total travel conditions.

It is also being planned to increase the number of passenger cars in the electric trains and self-propelled units. Deletions from inventory, during 1981-1985, are estimated at 12 electric self-powered units, i.e. 36 passenger cars and 20 motorized car units. During the same period the deliveries are expected to supply 350 electric self-porpelled units, i.e. about 1,050 passenger cars, which should provide an increase of about 1,000 passenger car units and will positively influence an improvement in suburban and urban transportation. Talks are also being conducted relative to deliveries of rail buses and rail trailer car units from Czechoslovakia, destined for service in low passenger density sections and where other forms of rail service are not economical.

Locomotive Vehicles

Continuation of the electrification program for railroads and the expected increase in transportation requirements will necessitate an increase in the electric locomotive inventory up to 950 electric engines by 1985.

Taking into account that the currently forecast deliveries will total 140 units this year, the deliveries in the coming years will have to be correspondingly increased.

The current energy-fuel situation in the country makes it necessary to limit the development program for diesel engines on PKP net, this will be reflected in the number of diesel engine deliveries.

As it appears, from the opinions expressed by the deputies--members of the Heavy and Agricultural Machinery Commission--based on personal visits of the deputies teams to railroad rolling stock plants, the assurance of deliveries of rolling stock as to satisfy the needs of PKP will be an extremely difficult task and will require special care and organizational activities. This is so because the material supply situation of materials needed to fabricate rolling stock is extremely difficult, there are defective cooperative communications and many other obstructions whose removal is not always in the hands of crews or even the associations themselves.

The plan proposed by TASKO [ZPTK--Association of Railroad Rolling Stock Industry] for railroad rolling stock production for 1981-1985, diverges, as ascertained by the deputies, quite widely from the timeliness, type designations and quantities of the requirements of the Communications ministry. Causing a particular worry is the divergence between the requirements published by the Ministry of Communications and the actual production capabilities of the rolling stock manufacturing industry for PKP of line and switching engines and freight cars. The industry, as confirmed by the deputies, is not capable of providing the national economy the needed quantities of means required for the needs of transportation because of the status of its industrial support base. [R.G.]

CROATIAN AID TO UNDERDEVELOPED REPUBLICS, KOSOVO

Zagreb VJESNIK in Serbo-Croatian 4 Nov 81 DELEGATSKI VJESNIK Supplement pp 7-8

[Text] What interest have OUR's [organization of associated labor] in SR [Socialist Republic] Croatia shown in solving problems of the supply of energy and raw materials and in building manufacturing plants on the basis of equal division of labor and the same kind of income-sharing position for all phases in the cycles of reproduction on the principles of the verified commitments to development made by associated labor in the three economically underdeveloped republics and the Province of Kosovo? The activity to date of the Economic Chamber of Croatia and its Social Council for Coordination of Activity in Pooling Labor and Capital has resulted in the registration at the outset of this year of some 80 initiatives for self-management linkage among economic entities in those federal units. It is the assessment that more than half (some 50) of the investment proposals are realistically acceptable as a joint development effort with the underdeveloped and that associated labor in SR Croatia is prepared to finalize them in the very near future in the form of investment programs and to begin carrying them out.

These are projects which would unfailingly fill gaps in the production commitment and round out units and relationships in reproduction and which, further, would transfer to the underdeveloped regions certain production operations (because of the lack of manpower and other conditions), would result in adoption of new products attractive to the domestic, and especially the foreign market, would open up manufacturing plants at sources of certain raw minerals, and so on.

In direct contacts with OUR's in SR Croatia, through entities responsible for conducting the policy of a comprehensive organized effort in each underdeveloped region, but also in collaboration with general associations and regional economic chambers, work has been done in the competent standing committee of the PKH [Economic Chamber of Croatia] to define the proposals which have been accepted in conformity with the broader Yugoslav conception of socioeconomic development and the policy of stabilization, and "platforms" have been prepared for talks with delegations from the chambers of the various republics and the Province of Kosovo. At the same time in the competent republic administrative agencies, the executive council of the assembly and the PKH the criteria and forms of use have been adopted concerning the portion of the funds of the compulsory loan which OUR's can pool with organizations from the underdeveloped

regions to invest in joint development programs on the basis of shared income and common interests (the republic law). What yet remains is to definitively arrive at a specific agreement which will set forth the conditions and schedule for pooling the portion of the resources of the Federal Fund for Credit Financing the Faster Development of the Underdeveloped Republics and SAP [Socialist Autonomous Province] Kosovo and to adopt an agreement on special measures to implement the policy of the fastest development of SAP Kosovo in the current medium-term planning period.

On that basis and with the help of the model outline of the self-management accord on the pooling of labor and capital by OUR's on the basis of shared income and common interest, which has been jointly prepared by the economic chambers in the country and the fund already mentioned, the necessary conditions will be created for conclusion of specific accords among OUR's in advance of carrying out each investment program which has been verified in the competent bodies of the three republics and SAP Kosovo.

Kosovo: Half of the Compulsory Loan Has Been Committed

Some 10 projects from the platform have been finalized with the delegation of the Economic Chamber of Kosovo and have been incorporated into the sociopolitical commitments contained in the medium-term plans of SR Croatia and that province (in Kosovo this document is in the phase of "additional work"). Since this is a matter of pooling labor and capital on the basis of shared income and since it involves 50 percent of the money obligations to the Federal Fund, we can justifiably expect that fuller prospects will be opened up for closer linkage of OUR's of the two economies within the interdependent flows of social reproduction in Yugoslavia as a whole. Certainly this is the way to repair the consequences of the past exclusiveness and disproportionate structure of the Kosovo economy (the transition is now being made in that province from heavy industry and energy to construction of manufacturing plants in which the cost per job is not to be greater than between 1.5 and 2 million dinars. Thus, in addition to income, creation of new jobs is also becoming an important investment criterion).

Of the 20 or so projects offered and agreed on with partners in Kosovo in recent months, full consent has been granted so far to about 10. That constitutes commitment of half of the 8.2 billion dinars of initial funds which OUR's in SR Croatia may directly commit over the entire 5-year planning period as part of the mandatory aid in the form of credit to the development of Kosovo. To be sure, it still remains to furnish the commercial and bank credits, including the available resources which the organizations themselves--the investors, are to furnish for reproduction, as well as to conclude the specific SAS's [self-management accords]. Only then will these very attractive development programs begin to be carried out.

Here we are referring first of all to a factory for refrigeration systems and equipment for which Djuro Djakovic prepared a preliminary project study covering an investment of 450 million dinars. Its partner is the Welded Pipe Factory in Urosevac, which is also where this joint project would be located. Construction would commence in April 1982 if all the financing for this investment project is provided for in the meantime.

The programs of the Zagreb TPK [Steam Boiler Factory] and Jugoturbina of Karlovac, on the one hand, with Metal of Prizren on the other, have been accepted by both sides, and now quite serious work needs to begin to build the plant for repairing equipment in thermal electric power plants and for manufacturing boiler components (a figure has not been put on the project). Plants for manufacturing single-stage turbines, compressors and reducers will be built in Pristina, Kosovska Mitrovica or Obilic (the investments are estimated at 410 million) in conjunction with Elektrokosovo or some other partner. Realization of the first project is possible even before the end of the year, and commencement of work on a second during 1982.

The Zagreb organizations TOP [expansion unknown], Munja, Chromos and Gorica, along with the metallurgical combine known as the Sisak Steel Mill and Dalmastroj of Split, are interested in developing mines and promoting the processing of lead and zinc, since this would provide materials to meet their own production needs. The two chambers are currently arranging further discussions with the Trepca RMHK [Mining, Metallurgical and Chemical Combine] of Kosovska Mitrovica. The project would be carried out in three phases: geological explorations, production of litharge and production of lead stabilizers. The total value of the investment would be about 1.2 billion dinars, and the construction date is 1986. Chromos' OOUR [Basic Organization of Associated Labor] "Paints and Varnishes" and Karbon of Zagreb are prepared to help Extra of Vucitrn in carrying out an investment program for paints and varnishes. The suggestion has been made to the investor that it choose possible partners, that is, that is furnish the 150 million in funds which are lacking on a tripartite basis.

The program for production of cell-type batteries which the work organization PTT [Postal, Telegraph and Telephone] Services in Kosovo would carry out in cooperation with Nikola Tesla of Zagreb (the value of the investment project is about 1 billion dinars, and construction is possible even next year) also has received interchamber support. The same is true for the project to set up a stone quarrying and dressing operation which would be jointly built by Feronikl of Pristina and Viadukt of Zagreb (about 200 million dinars are still needed to put the quarry in operation). The two delegations also concluded that there is a need to speed up and enliven the investment project for the plant to make semifinished products from gas concrete which Porobeton of Pula and the Croatian Machinebuilding Industry are offering to the Sar Cement Plant in Djeneral Jankovic, involving joint investments of 650 million (and creating all of about 600 jobs). This would serve as a demonstration project for the export of such plants to the developing countries, and it is urged that the work begin even before the year's end.

We should also mention construction of a plant to product glass tiles for mosaics, which has been offered by Boris Kidric of Pula and accepted by the Mosaic Tile Factory in Kosovska Mitrovica (an investment of 400 million), and then the container and sheet plant of INA Oki [Organic Chemical Industry, a subsidiary of INA, which is the Zagreb Petroleum Industry] using expanded polystyrene at Kosovoplast (Dj. Jankovic), Kras' offer to build a cookie bakery at Zitopromet (Pristina), Poljoopskrba's milk processing plant at Erenik (Djakovica), a plant for recycling secondary raw materials which would be built by 3 Maj of Rijeka in

Kosovska Mitrovica, and Ghetaldus' readiness for division of labor with the eyeglass factory being built in Pristina.

The two delegations also exchanged opinions concerning 57 investment programs in various branches of the economy which SAP Kosovo is offering to all the republics and SAP Vojvodina to be carried out on the principles of the verified interests in development of associated labor, with the support of federal planning agencies.

Bosnia-Hercegovina: The First SAS Has Been Concluded

OUR's in SR Croatia, metal manufacturing firms in particular, also have "ties" to sources of raw materials and intermediate products in SR Bosnia-Hercegovina. That accounts for their interest in committing the portion of the funds of the compulsory loan which organizations may invest in joint programs to develop heavy industrial facilities on behalf of long-term supply of materials for their production, coal in particular. This does not mean, however, that they have not also given consideration to programs for development of plants in the manufacturing industry, especially in the case of a new production operation of common interest to the economies of the two republics. Croatia has taken the decided position that there must be no restriction or narrow limits placed on assignment of the portion of the funds of the compulsory loan which may be pooled. Especially since the set of programs offered to the Bosnia-Hercegovina delegation afford opportunities for quite extensive integrational undertakings and then for continuation of that process until cycles of reproduction are rounded out on the scale of Yugoslavia as a whole.

So far an agreement has been reached on an investment program whereby the Sisak Steel Mill Metallurgical Combine, together with certain other consumers, would pool 962.5 million dinars of funds of the compulsory loan to maintain the present level of production and augment exploitation of iron ore in Ljubija, so that the needs in SR Croatia would be met as well. The investment schedule would extend into 1983. Jugoturbina on the other hand has a complete investment program for a plant that would produce multistage pumps and pump components in Drvar, involving a total investment of 254.3 million dinars (147.6 million of which would come from pooling). Djuro Djakovic has made a preproject study for a factory to make farm machine attachments (corn picker) in Bosanski Brod (project cost 634.3 million, 444 million of which would be pooled). Realization of these programs could begin.

Elka has acted on its intention to furnish aluminum wire to consumers in SR Croatia in the form of a specific SAS, the first of this kind. It is a question of 280 million dinars of pooled funds which would be invested to expand the capacity of EAL [expansion unknown] in Mostar. Even before the year is out Borovo may undertake construction of a shoe upper plant on a site in Odjak, if 92 million dinars are furnished from the resources of the Federal Fund (the total investment is 230 million), and a tire vulcanizing plant is being set up in Prijedor at a cost of 285.3 million dinars (the share of the pooled funds is 142.6 million). Several other agreements have been finalized. They include the second phase in reconstruction of Sportnautika in Gradacac (70 million dinars of

pooled capital from RIS [Rubber Products Industry] of Zagreb), and then construction of a plant for production of fatty acids at Hemija in Modrica to meet the needs of Saponija (60 million). Then comes augmentation of the capacity for production of alpha and beta gypsum at a site in Donji Vakuf, in which the investor is Jugokeramika (160 million), Kras' elimination of bottlenecks in the production of cookies at Mira Cikota in Prijedor (100 million) and Agrokomerc's (Velika Kladusa) program for production and processing of turkey meat and finished food products based on that meat, in which the Karlovac Agricultural and Food Processing Combine will invest 135 million dinars.

A total of 2.6 billion dinars of the resources of the compulsory loan would be committed to these 11 projects, which is nearly half of the sum which OUR's in SR Croatia may pool with organizations of SR Bosnia-Hercegovina in joint programs during this 5-year period. Joint investments have not been defined for another 10 programs or so which Croatia has offered. OUR's in SR Croatia have shown interest in 6 of the total of 18 projects which were at the same time offered by the Economic Chamber of Bosnia-Hercegovina, and talks have already begun on possibilities of joint investments to carry them out as soon as possible

Montenegro: Continuous Discussion Toward Agreement Is Needed

In this initial year of the actions to pool a portion of the resources of the mandatory loan in joint programs with OUR's in SR Montenegro, it is obvious that the available 404 million dinars will not all be used. That is why in contacts between delegations of the economic chambers of Croatia and of that republic support has been given to the idea of SR Macedonia that an exception be made in 1981 so that the funds under programs covered by interrepublic agreement by the end of this year and for which SAS's are concluded on the pooling of capital be regarded as funds which have been committed even though actual realization of such programs begins in 1982. In this case the funds built up for pooling this year would be credited to the bank of the trading partner in the underdeveloped federal community for pooling in the next year instead of being credited to the Federal Fund.

In the exchange of opinions on each project proposed by OUR's from SR Croatia it has been evident that Croatia is most interested in development of the production of quality steels at the Niksic Steel Mill and in the production of Titograd aluminum. This is the initial interest which the Croatian economy has shown in the Montenegrin economy, but it would be augmented by a number of other additional programs involving the finishing of these materials for production. Thus both sides accepted the pooling of resources of Jugoturbina with the Boris Kidric Steel Mill (total investment 150 million up to 1985) and with the Aluminum Combine (200 million). Jugoturbina has also been accepted as the entity responsible for the program of the bimetallic strip factory in Danilovgrad, for which it is preparing to invest 400 million dinars of its own during this 5-year period.

Joint interest in the program proposed by Djuro Djakovic has been confirmed. This has to do with a plant for production of equipment and machinery used in timbering and forest management, which could be built even in 1982 at Bijelo Polje in collaboration with Radoje Dakic, which is located there (no figure has

been put on the investment). A favorable assessment has also been given to the interest expressed jointly by Djuro Djakovic and Janko Gredelj in building or organizing a plant in Bijelo Polje or even Titograd for overhauling and repairing railroad cars used on the lines of the Titograd Railroad Transportation Organization. The desire of Josip Kras to establish lasting business collaboration with the 13 July Agricultural Combine of Titograd in large-scale raising of hazelnut trees and with Crnagorakoop of Danilovgrad for joint construction of a plant for confectionery products (the pooled funds would amount to 100 million dinars) was also well received.

Podravka is preparing a number of programs which will be ready for realization in 1982, which it would carry out jointly with the Sulfate Pulp and Paper Mill in Ivangrad, the Titograd Aluminum Combine, the 13 July Agricultural Combine, etc. The purpose is to obtain materials and ready-made containers for Podravka's products, but also products which it will market (total investments about 500 million). The Kutjevo Agroindustrial Combine has also shown an interest in developing grapegrowing in order to produce grape soda in Montenegro, and then interest of the Belje Agroindustrial Combine to become involved in building mini projects for fattening young beef cattle for which it would furnish the breeding stock, Cibona's desire to participate in planting tangerine orchards and olive groves in the area around Ulcinj, and so on.

All these projects need to be examined more fully, the right partners determined, the value of the investment defined and firm financial packages put together, the site chosen, the date fixed for commencement of construction, and so on. Which means that the talks already begun need to be continued at a fast pace and conducted continuously in the future. Especially since the opportunity exists for cooperation in still fuller utilization of secondary raw materials (paper) in paper production (Belisce with an investment of 320 million), and then in tourism, shipbuilding, maritime fishing, and oil and gas exploration in the Adriatic Sea bed. To this we should add that Adriagradnja of Rijeka and the OOUR "Housing Unit Factory" in Spuz, a subsidiary of the Titograd Construction Work Organization, recently concluded an SAS on joint investments in additional production lines for components used in industrial fabrication of housing and industrial structures and structures belonging to the social standard of living, except that at present the share of the Croatian partner is short 32.4 million dinars which would have to be furnished from the portion of the resources of the mandatory loan which would be put up by organizations interested in this relationship. The amounts of investments already indicated would "take up" 1.75 billion dinars of the 1.92 billion total envisaged for OUR's from SR Croatia to set aside in this 5-year period for pooling with organizations in SR Montenegro.

Fifty Percent of the Funds for Pooling at the Republic Level, in millions of dinars

Republics and Provinces	1981	1982	1983	1984	1985	Total 1981-1985
SR Croatia	4,085.0	3,531.7	3,736.5	3,928.6	4,159.1	19,440.9
Breakdown:						
For SR Bosnia-Hercegovina	1,139.7	985.3	1,042.5	1,096.1	1,160.4	5,424.0

Table (continued)

Republics and Provinces	1981	1982	1983	1984	1985	Total 1981-1985
For SR Montenegro	404.4	349.6	369.9	388.9	411.7	1,924.5
For SR Macedonia	800.7	692.2	732.4	770.0	815.2	3,810.5
For SAP Kosovo	1,740.2	1,504.6	1,591.7	1,673.6	1,771.8	8,281.9

[Note] The level of SR Croatia's annual advance to the Federal Fund for 1981 on the basis of the compulsory loan and the pooling of labor and capital was established by applying the rate of 1.83 percent to the planned social product of the socialized sector of the economy in current prices, following the principle of pure activities. This amounts to a total of 8.17 billion (half of which is 4.85 billion). The level of SR Croatia's annual advance to the Federal Fund for 1982, 1983, 1984 and 1985 on the basis of the compulsory loan and the pooling of labor and capital was established by applying the rate of 1.83 percent to the planned social product of the socialized sector of the economy in permanent prices. By years this is as follows:

1982	7,063.4 million dinars
1983	7,473.0 million dinars
1984	7,857.2 million dinars
1985	8,318.2 million dinars

Added to the amount for 1981, this gives a total of 38,881.8 million dinars, and the 50 percent for pooling would amount to 19,440.9 million. SAP Kosovo is entitled to the largest part of the resources of the fund because of the total 1.83 percent of the country's planned social product, 0.33 percent has been set aside for this province in advance as special funds. Of the remaining 1.50 percent SR Bosnia-Hercegovina is entitled to 34 percent, SR Montenegro 12 percent, SR Macedonia 24 percent and SAP Kosovo 30 percent.

Macedonia: Investments Including Those To Develop Raw Material Resources

Again in the case of SR Macedonia OUR's from SR Croatia have from the very outset taken care to find broader programs attractive from the standpoint of income, especially those which would develop manufacturing capacities and which would organize new production operations, including those suitable for export. A readiness has also been expressed in investments to develop raw material resources, which is an overall interest of the Croatian economy. Thus the list of programs offered encompasses fields from ferrous and nonferrous metallurgy and metal manufacturing, including the chemical industry, to agriculture, the food manufacturing industry and tourism.

The two delegations have already reached agreement in principle on some 10 programs (amounting to 3 billion of investments up to 1985). The most interesting to the two republics are the programs of Rade Koncar. Of the seven of them

which have been offered one after the other, five have already been accepted. They include an investment in two OOUR's of Koncar's Appliance Equipment Work Organization in Skopje: in the production of switches and relays and in the production of special devices, automatic devices and welding equipment. An investment would be made in the OOUR "Refrigerators" at Bitola to increase the production of refrigerators and freezers, and then in the OOUR "Commercial Refrigeration Equipment" and the OOUR "Industrial Refrigeration Equipment"--once again to expand capacity. In addition, a OOUR "Components for Household Appliances" would be organized; nearly 1.4 billion dinars from the portion of the resources of the compulsory loan would have to be set aside for all these investment projects.

With respect to investment in the Skopje Steel Mill and delivery of an appropriate assortment of products, it has been agreed that the delivery would be 500,000 tons during this 5-year period, and the steel mill's capabilities of meeting possibly larger needs of consumers in Croatia would be reassessed in the context of total Yugoslav demands for those products.

Jugoturbina's interest in investing funds in the 18 November MEGO [(?) construction organization specializing in electrical installation and engineering] in Gostivar to build a plant for making steel strip, what are called X beams for roof fabrications, has been judged to be low with respect to the financial participation (40 million). Acceptance has for now been given to an undefined joint investment by TOP, Munja and Chromos to expand the mining and smelting capacities of the Skopje Mining, Metallurgical and Manufacturing Combine in order to obtain certain amounts of lead and lead oxide, but the amount that would be pooled from the portion of the resources of the compulsory loan have yet to be defined. The program of Chromos' OOUR "Kutrilin-Dispersion" for reconstruction and enlargement of capacity for production of vinyl acetate monomer from calcium carbide at OHIS [Skopje Organic Chemical Industry] in Skopje has also been given interchamber support, though possibilities are being investigated for increasing the consumption of electric power (Chromos would invest 40 million).

The programs offered in the fields of agriculture and the food manufacturing industry, in whose realization Podravka, Kras, Badel and corresponding partners in SR Macedonia are interested, are to be given specific form in the upcoming direct meeting between business executives, but Badel's initiative to build a wine cellar, including grape processing, at the Radovisko Pole ZIK [Agroindustrial Combine] in Radovis won immediate support (Badel would invest about 110 million). The same is true of construction of a hotel in Skopje (and a subsequent addition to the Metropol Hotel in Ohrid) in which Generalturist would have a share of 166.2 million dinars in an investment project of Interimpeks-Makedonijaturist of Skopje.

Along with these initiatives, which are contained in the platform of SR Croatia, the Macedonian side has proposed the pooling of labor and capital in 13 programs. Of some of them, for example, FENI of Kavadarci (ferronickel and low-alloy steel using nickel), the Boris Kidric Porcelain and Ceramics Factory in Titov Veles (household porcelain) and OHIS (acrylonitrile monomer and fibers from that raw material), that they are undoubtedly acceptable, but that the interest of direct consumers in SR Croatia in their realization would be studied before continuation of the talks.

STABILIZATION COMMISSION FACING UP TO BUDGET PROBLEMS

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1608, 25 Oct 81 pp 8-9

[Article by Velizar Zecevic: "The Magic Box of Expenditure"]

[Text] Last Thursday and Friday some 30 members of the Commission for Stabilization Problems gathered around a round table in the conference room on the second floor of the Federal Office Building in Belgrade. The seats off to one side provided for newsmen were all taken: no one wanted to miss an occasion to hear and record what would be said and concluded concerning the two "problems of stabilization" singled out for this occasion--the deficit in the balance of payments and the federal budget.

The newsmen's curiosity about the topics which were discussed was understandable. The country's payments deficit, which in everyday business and human communication is manifested as a shortage of foreign exchange, has long been a dilemma and trouble close to practically every Yugoslav--when foreign exchange is lacking, it is a simple fact that many other things are also lacking. Yet neither is the federal budget any unreal and distant depository of "government money," whose collection and expenditure cannot be greatly influenced. The budget is a cash drawer into which nearly 1 dinar out of 10 of the national income flows and from which it ordinarily flows out in several principal directions (the armed forces, veterans' benefits, the underdeveloped regions, the federal administration ...) in the form of a deficit, and more than that.

Without Intermediaries

On this occasion the usual curiosity about the budget and the payments deficit was augmented by the question which had been put back in early October when it was announced that two federal social councils were establishing the Commission for Stabilization Problems--how would it operate?

It was clear at once that this would not be one of the many commissions, one of the many places in which distances are measured off and views brought closer together concerning those economic topics through which the political economy of stabilization is expressed. The prestige of the political positions held by all the members of the commission was appropriate to the importance of the questions scheduled for its discussion, it was stated at the first meeting.

Several members of the State Presidency of Yugoslavia, several chairmen of republic central committees or other officials of the highest republic political bodies, the president of the Yugoslav Assembly, the chairman of the Federal Executive Council--this is undoubtedly a representative body which can take up the outstanding issues in all their complexity. Exactly as they are.

The unpretentious title of the Commission for Problems of Economic Stabilization of course implied that differences on the issues which will be the topic of conversation and debate will be taken up without being tied too closely to narrow interests and conceptions and from viewpoints which point and lead in the direction of unity and common interest. "Our task is to try to agree on something which within the context of differing interests contains that one common interest. It is important that we be unanimous in this. The rest will be achieved thanks to public scrutiny of our proceedings and our accountability to everyone," one of the members of the commission said in its second session.

In the first session of the commission it was also announced that there would be no intermediaries between it and the public. It was stated that it would not issue those special communiques which are published after closed sessions. The doors are open to the newsmen who come to the sessions, they can hear everything, attend all the proceedings, but they have a duty to devote their accounts primarily to the topics being debated, to the problems which are on the agenda, and less to the persons who are the participants in the discussion. This is a practice which has been in effect for a long time now in reporting on the proceedings of federal social councils.

The Budget on Trial

The figures mentioned or used in these sessions need not always be acceptable for publication unless they have been fully verified--this explanation which the newsmen reporting on sessions of federal social councils have long ago accepted and put into effect should also apply in reporting on sessions of the commission. In the second session it was indeed put into effect, but difficulties and disagreements were not lacking: certain figures truly were not for the public, at least not for that part of the public which is inclined to put any imprecision to bad use; there were also times when things were said which could not withstand public verification. How is one to separate one from the other?

The commission's mode of operation, the openness of the sessions to newsmen and the special form of communication with the broad public were still not sufficient to fully explain the commission's place in the structure of self-management and social decisionmaking. Questions on this point were raised not only in the first session, when the commission was introduced, but also in the debates last Thursday and Friday, when in the course of a 20-hour debate procedures were sought for penetrating those areas of agreement and accord on stabilization policy which have up to now been impenetrable and unsusceptible to its basic reasons and needs.

The debate of the budget, which will in the usual way be initiated next month, will show how important what the commission discussed has been and how great a

contribution it will make and how great an impact it will have toward the seeking of new solutions with more boldness and openness.

Actually, the commission did not concern itself with the budget for 1982, with the usual revenue and expenditure items. The magic box of budgetary expenditure was opened from the other side by the question--How to set up an expenditure equation so as on the one hand to satisfy the demands not to infringe upon acquired spending rights and so that on the other budgetary expenditures, as an integral part of distribution of the social product, are reduced?

Today the federal budget, now that certain expenditures have been transferred to the republics, embraces between 7 and 8 percent of the social product, and a designated purpose is assigned in advance to every dinar which goes into it: 60.3 percent to finance the Yugoslav People's Army, 18.9 percent for benefits of disabled veterans and 9.8 percent for special contributions to the underdeveloped regions. The extent of the rights to expenditure, at least as far as these three basic items of budgetary expenditure are concerned, as we know, is established by law, and any reduction in them must be brought about by the same legislative means. Is it possible to speak of stabilization, of reducing the budget's share in the social product, if all these rights are to remain untouched? The winds of inflation are in all of this devaluing the budget just like everything else.

There Are No Vested Rights

"We have to accept and carry out, however painful it might be, a revision of all rights which involve expenditure. There can be no exception, there are no sacred rights. They must all be made subordinate to the vital and fateful goal of economic stabilization."

This was stated and reiterated in the 2-day meeting of the Commission for Problems of Economic Stabilization, which met for the second time in a span of 7 days. This can also stand as a summary of the debate of the federal budget as stated by Sergej Krajger, the commission's chairman. It was at the same time its most important conclusion.

Not a single vested right, not even those established and meted out by law, can be a "sacred" right, not a single one can be used and recognized in all its previous forms and magnitudes, as though nothing had been happening in society and the economy in recent years. This should apply even to the Yugoslav People's Army, to benefits of disabled veterans and to supplemental resources for the underdeveloped republics and Kosovo, that is, even to those "rights" to expenditure which under protection of the law have been treated as a kind of subscription to a certain portion of the national income. Elimination of the "untouchability" of these rights, of their inaccessibility to the reasons and needs of economic stabilization, has also eliminated the remaining elements of indefiniteness and ambiguity in past demands for all expenditure, without any exception, to be brought within the limits of real capabilities, that is, within the available income.

The commission's conclusion was copied down as from dictation, so to speak literally, from life itself, from where the inequities in expenditure are taken as an unjust distribution of the burden of stabilization. Though this was not directly related to the topic which was under discussion, the commission was unable to detour around the fact that in the policy of economic stabilization, which as yet has not been sufficiently studied and has not been given a precise form (does it exist at all?) the moves made so far were mainly those which were compelled and have resulted in a reduction of real personal incomes. The explanation that the reduction of earnings occurred following the euphoric explosion of personal consumption in the seventies, can be an acceptable explanation only if it is accompanied by a proportional reduction of other forms of expenditure as well.

"If budgetary consumption is not optimally reduced to the level afforded by the social product, even a real reduction of real personal incomes will not amount to the necessary contribution to stabilization, but will be its unnecessary victim," it was said in the debate.

Verification of the Conclusions

The conclusions concerning the budget, as well as those concerning the payments deficit, now that they have been adopted in the commission, become an integral part of the atmosphere and of motivation and effectiveness in the conclusion of agreements and accords. The prestige of the political offices held by the members of the commission will certainly have a bearing on the impact and role of its conclusions. Had this not been counted on, there probably would have been no commission.

The conclusions the commission has reached so far on the first two topics which have been on the agenda will in the full sense of the word become a valuable contribution to stabilization only if the political prestige of the commission is perfectly aligned with the internal logic of its conclusions. In other words, if the first assessments of the commission are also accompanied by the first estimates of the value and importance of its work today and its future work, both one and the other will be verified in the life-and-death struggle to get onto the road of stabilization as soon as possible.

DELEGATE QUESTIONS CONTRADICTORY VIEWS ON FOREIGN DEBT

Belgrade BORBA in Serbo-Croatian 6 Nov 81 p 4

[Article by D Kesic and E Vecovska]

[Text] Several days ago, a delegate's question and its long-awaited answer provoked a debate at a session of the Council of Republics and Provinces of the Yugoslav Assembly, and brought up several sharp issues.

In expressing his dissatisfaction both with the contert of the response he had received from the Federal Executive Council and because of the manner in which that answer to his query had been prepared, Zoran Zagar, a delegate from Slovenia, attempted to demonstrate that the institution of delegate's queries in the Yugoslav Assembly had reached a serious crisis.

None of those present at the session of the Council of Republics and Provinces rose to dispute him.

A long Wait

What was Zoran Zagar's question, and what was so caustic in those few sentences? "Has the Federal Executive Council considered the situation that has emerged because of the divergent positions of responsible federation officials? What has it undertaken in that direction to avoid unnecessary consequences that might have their reflections abroad because of those positions?"

Zoran Zagar presented this query on 6 August 1981, pursuant to what were to him the "divergent declarations" of Petar Kostic and Ksenta Bogoeva.

At that time, Zagar said, "For some time now, representatives of the Federal Executive Council have been making public statements about the same matters, but with varying, and at times opposite, content. When these relate to crucial economic trends, this sort of behavior is extremely sensitive. On 15 July this year the federal secretary for finances spoke, and the press, television and other media reported, about the collapse of the Yugoslav balance of payments system, and about repercussions that threatened our liquidity in foreign accounts, as well as the poor evaluation given by the International Monetary Fund mission, so that their credit of 2.1 billion dinars was threatened.....

"On 31 July, however, the governor of the Yugoslav National Bank gave contradictory information on the same topic at a press conference. He said that everything is in the best possible order in credit and monetary policy, even though the initial issue of money had been surpassed by 62 percent. Liquidity in foreign payments is in order, and the Monetary Fund regards our efforts at stabilization positively.

"In conversation with reporters at a press conference on 24 June 1981, the federal secretary for finances commented on Yugoslav indebtedness, saying that the level of indebtedness did not exceed 20 percent, and that the International Monetary Fund considers a country to be overly in debt if this level exceeds the critical point of 25 percent. We have, however, adopted the policy that every year the level of indebtedness is to be reduced by 1 percent. In comparing these public statements on the same topic, relating to national indebtedness and foreign liquidity, it can be determined that they were synchronized and that they evaluate the current situation in this area in the same way.

"At a session of the Legislative and Legal Commission of the Council of Republics and Provinces of the Yugoslav Assembly on 15 July 1981, during consideration of the draft law for a special federal tax for the operations of customs agencies, in his oral presentation the federal secretary for finances spoke about trends that could threaten the country's balance of payments situation, which had a planned deficit of 1,800 million dollars. Failure to realize the planned foreign exchange income was leading to numerous disturbances in the process of capital reproduction and was arousing questions of confidence in world economic and financial circles, and according to data of the Federal Statistical Office, from 1 60 16 July 1981 the trade deficit with convertible currency areas amounted to about 3,859 million dollars. At that time the foreign exchange reserves were below the level established by the Yugoslav Assembly, so that we were not in a position to meet our obligations on time for credits from the International Reconstruction and Development Bank, and other difficulties also began to crop up regarding the payment of foreign obligations. The latter was well-known in some foreign financial circles..."

The Federal Executive Council's answer stressed that the "statements of the federal secretary for finances and the governor of the Yugoslav National Bank were in agreement, and that they were correct for the situation at the time they were made, and not for the trend that was following its course." It stressed that in the statements the "emphasis at the session of the Legislative and Legal Commission of the Council of Republics and Provinces was on a process that needed to be halted in order to avoid the indicated negative consequences..."

A Logical Initiative

In expressing his dissatisfaction with this response, delegate Zoran Zagar said that this behavior serves to prove even further that the institution of delegate's query had reached a crisis, first because an answer comes as a rule only after great delay, without convincing reasons for the slowness, and second, the party to whom the question is addressed directs the bulk of its efforts to prove that the query was unnecessary, not to clarify the situation.

In his subsequent response, Petar Kostic, federal secretary for finances, attempted to show that the response of the Federal Executive Council was absolutely correct, or that the Federal Executive Council's interpretation was correct in saying that

the federal secretary for finances and the governor of the Yugoslav National Bank had given identical statements about the same set of problems. In other words, these statements did not create an awkward and uncertain climate among the people, or damage Yugoslavia's reputation abroad.

It is difficult to say whether the Federal Executive Council's response to Zoran Zagar's query satisfied the delegates of the Council of Republics and Provinces of the Yugoslav Assembly. The always adept Marko Vulc, a delegate from Slovenia, found the right answer: "Since there have been very frequent comments in the public media on the responsibility or lack of it for the numerous declarations by delegates and officials, I suggest that we begin debate at the next session with that issue."

It should not be expected that the assembly debate, which has already been scheduled, will determine precisely whose words in this confrontation are covered, or whether the Federal Executive Council's explanation approached the truth with its conciliatory interpretation that the words of the federal secretary for finances and the governor of the Yugoslav National Bank were not general assessments, but rather a report on the situation of a particular moment.

Nevertheless, certain facts remain that cannot be avoided. Adverse evaluations, even of momentary situations in our payment capabilities and foreign debt status, have created an uncertainty and fear among the people, and this fact was not forgotten by either the delegates or the Federal Executive Council representatives attending the indicated session of the Yugoslav Assembly.

It was also unavoidable that the initiative begun by Marko Vulc should be taken.

For if the lack of responsibility for both statements and behavior has become the manner of operating, and if no one is immune from that irresponsibility, then it would be logical at the same time for the elimination of responsibility to become the manner.

EARLY START-UP OF POWER PLANT AVERTS CRISIS IN MACEDONIA

Skopje NOVA MAKEDONIJA in Macedonian 26 Nov 81 p 1

[Article by E.R.]

[Text] The serious electric power situation in the Republic of Macedonia, which has been going on for too long, has required the start-up of the Negotino TEC [thermal-electric power plant]. The third stage of limitation of consumption has not been able to achieve the expected results. On the contrary, the situation continues to get worse since the daily needs for electric power are increasing and they cannot be met even by maximum use of all the production capacity.

On the other hand, the reservoirs in the republic are approaching the dangerous minimum and the supply of electric power from the other republics and provinces has been reduced. This was the reason that Elektrostopanstvo of Macedonia sought to have the commission impose drastic reductions in consumption of power by introducing the fifth stage of limitation. Having in mind the serious consequences of the introduction of such drastic limitations on consumption of electric power, where direct consumers would be supplied with 30 to 40 percent less power than the planned needs and general consumption would have to be reduced by 25 percent, which means that each household would be without power for 12 hours every other day, the Executive Committee of the Assembly of Macedonia in a joint session with the large consumers decided to start up the Negotino TEC, which is the first time this has been done with only a single boiler. For the implementation of this decision the consumers will provide $8 million for the purchase of 40,000 tons of mazut.

Putting the Negotino TEC into operation alleviates the current situation. This does not mean, however, that all the problems are solved. The electric power situation in the republic is still unfavorable, which means all consumers will be hurt. Thus the third stage of limitation of consumption of electric power will still remain in force, meaning the direct consumers will continue to be supplied with 15 to 20 percent less than the planned needs. General consumption will from now on be able to be limited by 10 percent, which means in practical terms that households and other consumers will be cut off from electric power for specific periods as it has been up to now.

BRIEFS

TRANSFORMERS FOR SYRIA--Ohrid, 15 Oct--The first shipment of transformers for Syria was sent today from the Elektromontaza firm in Ohrid. By the end of June 1982, 900 transformers valued at some 6 million West German marks, will be shipped to this Near East country. In fact, this is 50 percent of the total production of this Ohrid factory which will sell 70 percent of its total transformer production to hard currency markets in 1982. For the next 3 months several of the Elektromontaza factories will concentrate on work for export. Insulators and jumping cams will be delivered to the Federal Republic of Germany and a significant quantity, worth about $7,500, will also be shipped to Albania. FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

DEVELOPMENTS IN CEMA CHEMICAL INDUSTRY HIGHLIGHTED

East Berlin AW DDR-AUSSENWIRTSCHAFT in German Vol 9 No 44, 28 Oct 81 p 14

['AW Market Information' report by Information and Public Relations Department, GDR Ministry for Foreign Trade: "From the Chemical Industry of Socialist Countries"]

[Text] People's Republic of Bulgaria: Close Cooperation With Other CEMA Countries.

Bulgaria's first chemical combine, the plant for production of nitrogen fertilizers in Dimitrovgrad, began production in 1950. Shortly after, in Devnya, the combine for production of soda and soda products, was created in a joint undertaking with Czechoslovakia, the GDR, Poland, the USSR and Hungary. If the chemical industry now ranks among the leading branches of industry in Bulgaria, accounting for some 20 percent of the national income produced by Bolgarian industry, this is substantially the result of socialist economic integration. The production units constructed with the aid of the USSR alone--in Burgas, Pleven, Stara Zagora, Svistov and Vidin--have attained a level of 55 percent of the total output of the Bulgarian chemical industry; in the petrochemical industry as high as 80 percent, and in the production of cellulose and paper more than 65 percent.

Bulgaria's chemical industry, within the terms of CEMA resolutions at bi- and multilateral levels, participates in the development of more than 100 concentration areas. Some 50 agreements link Bulgaria with other CEMA partners. Within the framework of its cooperation in the international economic organization "Interchim", to which Bulgaria has belonged since its founding in 1969, it is now able to meet the needs of other CEMA members for a number of plant protective chemicals. Bulgarian experts have been working on more than 20 "Interchim" projects aimed, among other things, at the development of pesticides, dyes, dyestuffs, bleaches and household chemical products.

Czechoslovak Socialist Republic: Steady Growth

The share of the chemical industry in the total industrial production of Czechoslovakia increased in 1980 as against 1975 by 14.6 percent. Production in those areas basic to technical progress showed a particularly marked advance, the petrochemical industry having increased production by a factor of 2.3 the plastics industry output having more than doubled and the production of organic dyestuffs having increased by more than 50 percent.

During the past five-year planning period, production in the Czechoslovak chemical industry increased by 29.9 percent. In the course of this advance, the quantity of refined petroleum grew by 19.2 percent compared to 1975, to 19 million tons. The importation of natural gas from the USSR increased in the same period by a factor of 2.1.

Within the framework of cooperation with CEMA countries, relationships with the USSR showed a particularly strong advance. At the end of the five-year planning period just concluded, 57 coordination centers for scientific and technical research were operating in the CEMA. Czechoslovakia's participation was lacking in only three of these. In 1980 the production of chemical products showed an advance of 2.7 percent; in the petrochemical industry a growth of 2.2 percent was recorded and in the rubber and plastics processing industry an advance of 5.4 percent. Apart from the high growth rate of chemical fiber production of 8.9 percent, high growth rates were also recorded for the production of plastics (4.8 percent), viscose fibers (4.8 percent), unbleached sulfate pulp (6.3 percent) and artificial fertilizers (4.6 percent).

Foreign trade in chemical products with CEMA member countries advanced by 8.2 percent compared to 1979; that with the USSR by 11.9 percent. Similar trade with non-socialist countries advanced by 17.9 percent.

In the current five-year planning period (1981 to 1985), the planned production development is aimed at creating the conditions for an intensified application of domestic chemical products to cover the needs of various branches of the economy. The production of ND-polyethylene is to increase by 15.4 percent, PVC and its copolymers by 4.5 percent, chemical fibers by 3.1 percent, tires for cars and trucks by 2.9 as well as rubber conveyor belts by 6.3 percent.

In the development of Czechoslovakian foreign trade relationships, the intensification and expansion of economic relationships with the USSR and other CEMA countries, with whom Czechoslovakia has signed agreements for coordination of economic planning from 1981 to 1985, will play a decisive role. The goals set within the framework of the CEMA for multilateral integration measures are a component of the national plan. Agreements for a total of 18 projects have already been drwwn up.

USSR: Systematic Expansion

In the five-year planning period 1981-85 the USSR proposes to increase production in the chemical and petrochemical industries by 30 to 35 percent. The production of artificial fertilizer is to be increased from an annual 150 to 155 million tons (100 percent effective ingredients). Production of synthetic resins and plastics will rise from an annual 6 million tons to 6.25 million and that of chemical fibers to 1.6 million tons. A production increase is also planned for S-rubber, polymers, fine chemicals such as adjuvants for the textile industry as well as catalysts; synthetic dyestuffs, dyes, paints and cleansing agents. The production of household chemicals is to be substantially increased, the range of products expanded and their quality enhanced. Production of synthetic washing agents is to be increased by 1985 to 1.5 million tons.

An expansion of ND-polythylene production from 100,000 to 150,000 tons annually is planned for 1985; HD-polyethylene production is to be increased by 80 to 100,000 tons.

Producers of paints and lacquers plan an expansion of production capacity to an annual 150,000 tons (currently 30,000 oo 40,000 tons); of alkyd and polyester paints 150,000 (present 35,000) tons annually. Production of plant protective chemicals is also to be expanded.

Linked to the favorable supplies of fuel and energy in the eastern regions of the USSR, large scale enterprises for the production of polystyrol, PVC, chlorine and caustic soda are planned, including a chemical plant in Tomsk, plastics facilities in Mangyschlak and Omsk; chemical fiber plants in Kustenei and Barnaul as well as a phosphorus factory in Kazakhstan.

Soviet production of fine chemicals has had until now a varied development. While the production of certain items during the past five-year planning period showed a rapid advance--production of amateur color film increased nine-fold and was sufficient to cover domestic demand--the demand for other products cannot yet be fully satisfied. Altogether the production of fine chemicals 1976/80 rose approximately 39 percent (planned 26.5 percent). The production of synthetic washing materials increased by some 40 percent (production 1980: ca. 1 million tons).

USSR foreign trade in chemical products increased substantially in recent years. In 1980 it imported 1.8 billion rubles (1979: 880,000 rubles) worth of chemical products from abroad and exported a total value of 726 million (1979: 577 million) rubles in value.

Most Important Non-Socialist Trading Partners For Chemical Products

	Exports		Imports	
	1979	1980	1979	1980
	(in mill. rugles)			
FRG	107	104	176	242
Japan	11	13	89	141
UK	-	-	-	87
France	-	-	-	63

From Japan primarily plastics and material for the production of plastics were imported (value 72 mill. rubles). The USSR exported to Japan mainly salts of organic and inorganic acids, products of the coke and petroleum industries, semi-finished products for ani-line porduction, chromium oxide and phosphorus.

Hungary: Above-Average Increases Planned

Hungary proposes to increase its chemical production beyond past averages in the 80's also. Selective support of individual production branches is planned.

In the past 20 years Hungary's chemical industry has advanced to second place in its total industrial picture. In the 1960's growth in the chemical industry was twice that of industry as a whole. At present the chemical industry accounts for 17 percent of all industrial production (1936 [sic]: 5 percent). The only branch with a larger share is machinery production.

The goal-oriented development of the Hungarian chemical industry began in the first half of the 1960's with the expansion of fertilizer production. Since that time production in this area has increased 20-fold, with particular emphasis on nitrogen production. Hungary is now able to meet all domestic requirements for nitrogen fertilizers. With phosphorus fertilizers, approximately 50 percent of domestic needs can be satisfied; phosphate fertilizers are not produced.

In 1957 an olefin plant using benzine as a base went into operation with an annual production of 250,000 tons of ethylene. After the expansion of plastic raw material production there followed a buildup of chemical fiber production capacity. At the moment Hungary produces some 340,000 tons of macromolecular raw materials annually. The greater share of this production falls to PVC, HD-polyethylene and polypropylene.

Hungary's plastics processing industry in particular has seen a sharp rise in the past 5 years. In the course of the five-year planning period 1976/80 more than 50 percent of present production capacities were installed. Production is primarily for domestic consumption, with only limited exports.

The picture is different with chemical fibers, in which area Hungary has specialized in PAN-fibers, of which an annual total of some 11,000 tons is exported. Another area of concentration in Hungary's petrochemical industry is the production of aromatic hydrocarbons. Production here now exceeds 250,000 tons. Plant protective agents, production of which has also increased sharply, now is sufficient to cover some 55 percent of Hungary's domestic needs.

Hungary's pharmaceutical industry, in terms of total world trade, now ranks at sixth or seventh place among exporters. Only Switzerland exports more pharmaceuticals per capita to the USSR than does Hungary. Some 100,000 registered medications are produced. Rubber production in Hungary in recent years has concentrated on technical rubber production, especially deep drilling hoses and belts, truck and tractor tires, as well as camping articles. The production of paints and lacquers is less well developed. Domestic production consists primarily of synthetic resin-based lacquers and enamels.

Production of Selected Chemical Products

	1975	1980
	(in 1000 tons)	
Fertilizers (effective ingredients only)	740	1045
Sulfuric Acid	630	590
Plastics (incl.)	124	328
PVC-powder	40	173
Polyethylene	36	53
Sodium Hydroxide	91	193
Chemical Fibers (incl.)	20	29
Synthetic fibers	11	20
Plant Protective Agents (effective ingredients only)	16	28
Automotive Tires (1000)		
Trucks and busses	591	802
Passenger vehicles	118	24

Points of concentration in the current five-year planning period are two development programs, one for the petrochemical industry, the other for pharmaceuticals, plant protective agents and intermediate products. For the petrochemical industry there will be built or expanded a polypropylene plant (capacity: 40,000 tons/ann.) and a catalytic cracking plant, designed for expansion of the country's olefin basis. Also expanded will be the processing of plastics, particularly containers, foams, pipes, construction materials and packaging materials.

On the basis of the second program, the production of pharmaceuticals will rise some 50 percent by 1985 and that of plant protective agents by 100 percent; intermediate products by approximately 200 percent. The latter is intended to meet the domestic needs of plant protective agent capacities, particularly through the development and/or expansion of production of phosgene-base products, amines and isocyanates. Fertilizer production will remain at about its present rate until 1985. Smaller increases are scheduled only for superphosphates, carbamide and calcium ammonium sulfate. In the rubber industry during the first half of the 1980's, the production of steel belted tires for trucks and busses as well as deep drilling hoses will be further expanded.

Lower than average growth rates are scheduled for the production of paints and lacquers as well as household chemicals and cosmetics. Production of these products is aimed primarily at meeting the needs of domestic markets.

CENTRAL COOPERATIVE UNION CONGRESS STRESSES CONSUMER GOODS PRODUCTION

Sofia RABOTNICHESKO DELO in Bulgarian 13 Nov 81 pp 1, 2

[Article by Stoyanka Radeva and Georgi Apostolov: "Tireless Champions of People's Welfare--Ninth Congress of Central Cooperative Union Begins Proceedings Yesterday in Sofia"]

[Test] The Central Cooperative Union

--comprises 500 organizational and production units, 428 consumer cooperatives, 28 okrug cooperative unions with 2,187,000 members;

--runs 19,125 stores, 10,365 public dining establishments and stands, 114 hotels, 25 motels, 34 camping sites, 800 rayon department stores, 120 amusement parks for young people;

--serves 55 percent of the country's population, 5000 villages and 157 cities;

--has 61 industrial enterprises and about 5000 smaller workshops;

--provides 94 percent of the country's nonalcoholic beverages and mineral water, 60 percent of the confectionery production, 52 percent of the bakery production and 32 percent of the snack production.

During the Seventh Five-Year Plan the TsKS [Central Cooperative Union]

--overfulfilled its net production plan by 7 percent, its plan for the social productivity of labor by 4.5 percent;

--its above-plan profit amounted to 68 million leva;

--fixed assets worth 337 million leva were put into operation.

What is targeted by 1958?

--volume of total industrial output to grow by 64 percent over 1980;

--total amount of commodities by value to exceed 1.6 billion leva;

--over 100 small and medium-sized enterprises to be established;

--production of snacks and bakery products to grow by 21.6 percent over 1980, that of confectionery by 27.6 percent.

Yesterday the Georgi Kirkov Hall in the capital was the gathering place of the delegates of the two-million-strong army of Bulgarian cooperators who had come to their Ninth Congress in order to evaluate their contribution to the country's development during the Seventh Five-Year Plan and to discuss the specific problems that must be solved if the TsKS is to occupy the place assigned it by the Twelfth Party Congress.

Greeted very cordially and with cries in glorification of the leader-party, Comrades Grisha Filipov, Peko Takov, Deputy Chairmen of the Council of Ministers Kiril Zarev and Stanish Bonev, secretaries of the PP [Permanent Presidium] of the BNZS [Bulgarian National Agrarian Union], ministers, deputy chairmen of the National Assembly, and leaders of sociopolitical and mass organizations took their places in the presidium of the congress.

Present at the congress were delegations and representatives of cooperative organizations and movements from 23 countries in Europe, Asia, Africa and America.

Standing for a minute of silence, those present honored the memory of the outstanding cooperative figures, in our country and abroad, who had died between the two congresses.

The congress then entered upon its business proceedings, accepting with complete unanimity the agenda and the elected managing and working bodies.

Comrade Grisha Filipov read greetings on behalf of the BCP Central Committee and of Secretary-General of the Party Central Committee and Chairman of the State Council, Todor Zhivkov.

"The Bulgarian Communist Party," he emphasized, "has always placed tremendous importance on our cooperative movement. For 90 years now it has bestowed unceasing care on its strengthening and development in all aspects.

"The Central Committee of the Bulgarian Communist Party prizes your contribution to the fulfillment of the party program for building mature socialism, for fulfilling the December program for further elevation of the working people's living standard, for providing the population with more goods and services, for developing the system of self-sufficiency of the settlement systems in basic foodstuffs, for implementing the party's foreign economic policy.

"The important advances, especially since the Eighth Congress of the Central Cooperative Union, are significant. What has also contributed is the upswing that has taken place in fulfillment of the decision of the Political Bureau of the Party Central Committee, dated June 1979, 'Regarding the More Effective Development of the Activity of the Central Cooperative Union.'

"In a word," said Comrade Grisha Filipov, "our cooperative movement is successfully fulfilling its mission of building a mature socialist society in our country. And therefore permit me, on behalf of the Party Central Committee, to express gratitude and appreciation to the two-million-strong cooperative contingent for its persistent work and creative labor during the years between your Eighth and Ninth Congresses.

"The main and most characteristic thing about your present congress is that it is being held immediately after the historic Twelfth Party Congress, after the Ruse conference of May 1980 and after Comrade Zhivkov's noteworthy speech to the National Conference of the country's party, state, economic and social activists, held on 24 October 1981.

"These party forums and Comrade Todor Zhivkov's instructions make new demands on, and set important tasks for the entire party and for the entire people, including the Central Cooperative Union. The Party Central Committee believes that during the crucial years of the building of socialism in the Bulgarian People's Republic our cooperatives will play an important role in implementing the Bulgarian Communist Party's economic and social policy.

"As is known, the Twelfth Party Congress confirmed the chief socioeconomic task of the Eighth Five-Year Plan. This envisages the steady and unswerving implementation of a policy of more comprehensive satisfaction of the working people's material, spiritual and social needs. In practice, this means that concern for the people is becoming the immediate task in the work and decisions of all sectors and activities in the country. This is now the basic criterion for evaluating the activity of all bodies, organizations, cadres and labor collectives and within the Central Cooperative Union.

"On this basis, the Twelfth Party Congress confirmed it as the Central Cooperative Union's key task 'to launch, in future, activity for fuller utilization of the country's material and social resources for better satisfaction of the people's needs.'

"In this area you have no small experience and success. But now the agenda sets a new, larger-scale and greater task--that of providing more comprehensively for the new, higher and multifaceted needs of the socialist worker who is building developed socialism in the Bulgarian People's Republic," the speaker emphasized.

"Practical experience, the socialist worker's today and tomorrow, make it imperatively necessary that every settlement system organize its everyday life in such a way that the working people's constantly growing material, socialist and spiritual needs are more and more fully and more and more comprehensively satisfied. The consumer cooperative can contribute much to the implementation of this: it is in every village and in every district of the city; it is closest to the working man's needs. On behalf of the comprehensive satisfaction of this working man's needs the following must be done: produce more and higher-quality goods and, in particular, those which are in short supply at the present stage; perform cheap and more diverse services such as the people need; and take decisive measures for fuller utilization of the potentialities of the individual plot and the labor of pensioners and artisans for the production of retail food and nonfood commodities.

"In future, the Central Cooperative Union must not count solely on centralized marketable goods, but must, through its economic organizations, produce high-quality goods by its own resources. The share which its own production represents of the goods with which trading takes place must become larger and larger. Therefore, on the basis of integration with light industry, the food industry and local industry, the production activity of the cooperative system must be developed to the maximum, and ways and means constantly sought for increasing marketable goods. At the same time, it is a question of producing not just any commodities, but those which are in short supply in the market, are in demand by the population, and are of good quality.

"A great potential reserve, of which the Central Cooperative Union must make much more use in order to increase marketable goods, is the building of small capacities at an up-to-date technical level for the processing of vegetable and animal products, the production of consumer goods, and the performance of services. They must mushroom in our system wherever there are suitable local raw materials and unutilized labor resources."

He pointed out that "At this stage it is necessary, on the one hand, to bring about broad cooperation and integration of the Central Cooperative Union with the National Agroindustrial Union and agroindustrial complexes and other organizations for the joint production of food products, to set up joint forms of livestock raising and develop wide integration ties with economically weaker agroindustrial complexes, giving them active assistance for the effective development of individual activities.

"On the other hand, cooperative organizations must bestow maximum care on the development of personal plots. The Central Cooperative Union must, with still greater scope, launch a wide-scale explanatory, organizational and economic effort in order to discover and utilize to the utmost all the reserves of the personal plot for increasing the production of agricultural output. The chief concern of the cooperative organizations is to provide the personal plot-holder with agricultural implements, tillage equipment, seeds, fodder--in general, everything necessary for highly efficient, up-to-date production.

"Cooperative trade and public dining in city and village systems must be developed on a still wider scale. Special attention must be given to the study of consumer demand, to improvement in organizing the movement of goods, to the introduction of direct connections between cooperative trade and production, to the employment of up-to-date forms and improvement in the standards of service. Still more active work must be done to develop public dining through fuller use of the material and technical resources that have been created and the resources of the auxiliary plots. The policy of expanding and decisively improving the condition of the cooperative markets and trade in goods on commission must be continued.

"As you yourselves understand, comrades, the Party Central Committee regards the consumer cooperative as that cell in the national economic organism which more and more will become an important supply, trade and service center of the population and an important factor in the implementation of the main socioeconomic task approved by the Twelfth Party Congress.

"What is needed in order for you to perform this task successfully is a radical turn in the activity of your union from top to bottom and from bottom to top, towards an intensive development of all your activity.

"The true key to this approach is further improvement of the socialist organization of labor. The cooperative organizations must employ comprehensively modern forms which will enable them most fully to use the three elements of production and trade --the tools of labor, the subjects of labor, and live labor.

"Special attention and concern are needed for the introduction and strengthening of the brigade organization of labor in the cooperative system as the basic factor in the elevation of the efficiency of production and trade.

"At the same time, progressive experience must be converted into mass practice in the cooperative organizations; socialist discipline (planning, financial, technological and labor) must be strengthened in these organizations. Scientific-research, planning and development activity must be decisively improved so that the achievements of technical progress are promptly and widely adopted. We must do everything necessary so that your activity may develop as up-to-date activity, on the basis of new technologies, on the basis of high efficiency, and contribute to a significant rise in the social productivity of labor.

"The decisions of the Twelfth Party Congress require consistent application of the new economic approach and its mechanism.

"The splendid and long-established traditions of our cooperative movement (every cooperative to be self-supporting and to operate exclusively on democratic principles) must be the highest principle in your future activity," Comrade Grisha Filipov pointed out.

"As a socioeconomic organization, the Central Cooperative Union must develop its activity entirely on an economic basis. It must function as a genuine economic association of cooperatives. Within the framework of the state plan and state normatives, it must go out into the domestic and international market and launch inside the country competition with other trading, purchasing and production organizations in order more fully and effectively to satisfy the people's needs.

"The Central Cooperative Union is called upon in future to develop still more extensively, creatively and energetically the independent character of the cooperatives, to expand intracooperative democracy and to step up the social activism of the labor collectives.

"Care must systematically be taken to further strengthen and develop social principles in the activity of cooperative organizations by expanding the rights and responsibilities of elective bodies in the solution of problems, and by helping enlist in their membership leaders with rich organizational and economic experience and make possible close, direct and constant contact with the population. The cooperative organizations must widen their joint activity with the Fatherland Front for broad involvement and active participation of the population in full discovery of the potentialities and reserves for increasing production and raising the standards of service.

"The cooperative movement has struck roots in our lives. The people respect and esteem it.

"Bureaucracy and undemocratic administration must not be permitted to vitiate what is splended; weeds must not be permitted to flourish in the cooperative field. In this sense your congress will perfectly properly discuss new forms and methods for the expansion of cooperative democracy, for the display of the creativity and talent of the cadres on every level of administration in the cooperative system, for the enrichment of consumer cooperatives with new content and for their conversion into a basic structural unit, into real many-sided cooperatives organizationally and economically even more closely bound up with the city and village systems, that will develop their activity in conformity with the territory and characteristics of the obshtinas.

"An implacable everyday struggle must be waged, both at the center and locally, against stagnation, routine and complacency," he emphasized. "The subjective factor is the one which must speedily be restructured and on which further efficient development of our cooperative system depends. These are the demands that practical experience itself makes. For this purpose the system and operation of personnel selection and qualification must be improved. The style and method of operation at all levels must be improved.

"Therefore, the Central Cooperative Union must, in future as well, increase its contribution to the implementation of our foreign political and foreign economic policy. In particular, the foreign economic activity of the Central Cooperative Union must be expanded and stepped up.

"The Party Central Committee and the government believe that in future as well ceaseless pains must be taken to expand relations and align the Central Cooperative Union more closely in every aspect with the Central Union of Consumers' Societies, USSR, and to widen the many-sided collaboration with the cooperative unions of the other fraternal socialist countries. Collaboration with the cooperative organizations and movements in the developed capitalist states, and especially in the developing countries, must be launched on an economic basis by entering into long-term agreements for the establishment of joint plants to increase the country's commodity reserves, by buying technologies and enlisting foreign specialists for the rapid introduction of world-scale achievements and progressive foreign experience.

"On the basis of long-term agreements a start is to be made on developing production and technical cooperation with the cooperative organizations and companies of socialist and nonsocialist countries in order to increase the country's commodities and other resources. On the basis of integration with the State Tourism Committee, still more international tourist activity is to be developed.

"The activity of the Central Cooperative Union and the international cooperative movement must be intensified still more in order to strengthen international cooperative solidarity on behalf of the struggle for peace, democracy and social progress.

"The Party Central Committee is convinced that the Central Cooperative Union, in future as well, will be an active champion of the peace-loving policy of the

Bulgarian People's Republic and its peaceful envoy and propagandist of peaceful collaboration among the nations for the welfare of the people," Comrade Grisha Filipov declared in conclusion.

"The Central Committee of the Bulgarian Communist Party and the government express their firm conviction that the cooperators and all labor collectives within the Central Cooperative Union, united and firmly closing ranks around the Leninist April party line, will labor enthusiastically and selflessly, with initiative and creativity, for the successful fulfillment of the historic projects of the Twelfth Congress and for the achievement of new and still greater successes in the building of a developed socialist society in our beloved Fatherland--the Bulgarian People's Republic°"

The greeting was heard with great attention and followed by thunderous applause.

Tracing the results of the past five years since the Eighth Congress, the chairman of the Central Cooperative Union, Ivan Prumov, in his opening address dwelt in detail on the main problems which the union and the entire cooperative system will have to solve in order to raise their activity to the level of the requirements of the main socioeconomic task during the Eighth Five-Year Plan, namely, the comprehensive satisfaction of the people's constantly growing material, spiritual and social needs.

Emphasizing that the union will launch further activity in the light of the special 1979 decision of the Political Bureau of the BCP Central Committee and of the tasks set by Comrade Todor Zhivkov before the National Conference of 24 October 1981, he outlined specific ways of achieving the high goals: switching from extensive to intensive development; creation--by one's own forces and on the basis of integration with other industrial sectors, agroindustrial complexes and the cooperative organizations of the socialist countries--of enterprises and capacities for the production of consumer goods; elevation of the role of cooperative trade; still further utilization of the potentialities of the personal plot; broadening of the democratic principle; adoption of profit-and-loss accounting, internal profit-and-loss accounting and the brigade organization of labor. The goal is, Iv. Prumov emphasized, to elevate the role of the consumer cooperative, to consolidate cooperatives within the framework of the city and village systems, and gradually to convert the TsKS into a national economic association.

The report of the Managing Council pointed out that the basic economic indices of the cooperative system for the Seventh Five-Year Plan were fulfilled and overfulfilled. The achievements of cooperative trade were significant: the circulation of goods increased, the selection of goods was more abundant, additional marketable goods were provided. Special impetus in this direction was given by the high demands made and tasks set by Comrade Todor Zhivkov at the Ruse meeting.

Satisfaction of the market demand for fruits and vegetables improved and more progressive forms of customer service were employed. The proportion of cooperative industry grew, too, and activity in the purchasing and processing of agricultural products was improved. In the light of increased demands, note was taken of a number of lapses and weak points: shortage of goods in demand by the population; irregularity of the supply of articles not only to state industry, but also

to cooperative industry; a lag in the delivery of agricultural equipment and implements, hardware, materials for electric appliances, and some foodstuffs behind the needs of the people.

Of decisive significance for the results achieved was the employment of the new economic approach and its mechanism. The initiative and personal interest of economic managements and collectives grew. The planning system, the organization of labor, and contract discipline were improved.

The report also outlined the principal tasks of the cooperative organizations during the Eighth Five-Year Plan. The starting point in this direction is the main socioeconomic task set by the Twelfth Party Congress. The mandate that the Central Cooperative Union as socioeconomic organization is to launch activity in the future as well for fuller utilization of the country's material and social resources and for better satisfaction of the people's needs, is the basis of the program, adopted by the TsKS Managing Council, for the development of the basic activities of the cooperative organizations during the period from 1981 to 1985. To realize the program, consumer goods must be increased and diversified, the sphere of public services must be expanded, and consumer cooperatives must become production and trading organizations. The solution of these problems requires speedy measures for the expansion, reconstruction and modernization of capacities and for more efficient use thereof. Public dining must be developed on an up-to-date basis; new technologies must be employed and the organization improved. Critical tasks are set in the area of the purchasing, production and processing of agricultural products. For this purpose, the economic relations and collaboration of the cooperative organizations with agroindustrial complexes and other agricultural organizations will be expanded and strengthened.

One of the most important tasks facing the TsKS is the development of foreign economic relations and the carrying on of highly efficient import and export as a factor in increasing the volume of consumer goods.

The 1979 decision of the Political Bureau of the BCP Central Committee "On the More Efficient Development of the Activity of the Central Cooperative Union" stresses the necessity of a resolute course towards the intensive development of all activities within the TsKS. This is why the many-million-strong army of Bulgarian cooperators must concentrate their efforts on the speedy and effective adoption of the achievements of scientific and technical progress, for which all the conditions are provided. Greater demands must be made on the work of engineering and applications teams, and the technique of achieving high productivity of labor and standards of service must be improved.

The real ways of achieving this goal are: full mechanization of production processes; the introduction of electronic technology into physical production and information processing; study and adoption of advanced experience; the linking of investment policy with accelerated adoption of scientific and technical progress.

Further accelerated and effective development of the economics of cooperative organization requires the economical expenditure of raw and other materials, fuels and energy, with the best achievements at home and abroad used for this purpose.

The basic factor for high efficiency of all activities is consistent and full application of the new economic approach. The report noted the necessity of improving planning and the socialist organization of labor and of establishing brigade organization, brigade profit-and-loss accounting, and full self-support of every economic unit.

The report directed the attention of personnel of the cooperative system to unceasing pains and effective measures for the social development of labor collectives, for the improvement of working and living conditions, for the upgrading of the economic and vocational training of personnel, for the elevation of the level of training and educational work, and for the improvement of socialist competition, of propaganda and mass cultural work.

The period between the two congresses was especially fruitful in strengthening the friendship and collaboration of the TsKS with the cooperative bodies and organizations of the Soviet Union and the fraternal socialist countries and in establishing fruitful relations with kindred organizations and movements in the developed capitalist and developing countries.

The Ninth TsKS Congress was warmly greeted by Aleksey Smirnov, chairman of the Board of the Central Union of Consumers' Societies, USSR, and deputy chairman of the Executive Committee of the International Cooperative Alliance. He spoke about the comprehensive collaboration between the TsKS and the Central Union of Consumers' Societies, USSR, that has been under way now for four decades on the basis of long-term agreements.

Finally, Al. Smirnov dwelt on the growing role and prestige of Bulgarian cooperatives in the international cooperative movement.

The congress continued with speeches regarding the report and other documents.

Those speaking about the achievements and the problems that the cooperative organizations have to solve were the following: Alitsi Alitsiev, OKS [Okrug Cooperative Union] chairman in Ruse; Violeta Meitsova, OKS deputy chairman in Vidin; Rusim Tsekov, city cooperative union chairman in Sofia; Khristo Stoyanov, RPK [expansion unknown] chairman in the village of Yuper (Razgrad Okrug); Stelian Balopopov, chairman of "Metalik" [Metal-Worker] TPK [Labor Productive Cooperative] in Burgas; Lado Rashev, OKS chairman in Plovdiv; Mariya Dokcheva, OKS control council chairman in Lovech; Konstantin Yanev, RPK chairman in Kavarna; Velcho Traykov, OKS chairman in Vratsa; Mariya Markovska, director of the RPK food, wine and tobacco combine in Khaskovo; Georgi Zhelev, hero of socialist labor and cooperative worker from the village of Tenevo (Yambol Okrug); Ivanka Shtereva, department store manager in Peshtera; Yordan Kostov, chairman of the Central Bee-Keeping Council; Stoycho Mitev, RPK chairman in Tutrakan; Stefan Staykov, director of "Trud" [Labor] Canning Combine in Debelets; Dobrinka Toncheva, RPK deputy chairman in Krumovgrad; Ivan Savov, OKS chairman in Smolyan; and Kiril Peychev, chairman of "Septemvri" [September] TPK in Mikhaylovgrad.

The congress continues its proceedings today.

STEADY SUPPLY OF CONSUMER GOODS EMPHASIZED

Sofia OTECHESTVEN FRONT in Bulgarian 25 Nov 81 p 1

[Article by Metodi Tanev, domestic political observer for the newspaper OTECHESTVEN FRONT: "Stable Market"]

[Text] Today it is obvious to everybody that our domestic market is stable and rich. In comparison with 1970, for example, average per capita consumption of meat and meat products last year grew from 41.4 kg to 62.5 kg; of milk and dairy products, from 116.6 to 165 kg; of eggs, from 122 to 203 each; of sugar and sugar products, from 32.9 to 34.2 kg; of vegetable and animal fats, from 16.2 to 20.8 kg; of vegetables and canned vegetables, from 88.9 to 98 kg. From time to time, however, some food product or some industrial product disappears from the market. Such is the situation now, too. The following are hard to come by: mature onions and garlic, string beans, lentils, dried haricot beans, certain assortments of canned vegetables and fruits, various models and sizes of shoes, quilt covers, electric rings, color television sets etc.

The discrepancies between consumer needs and trade emerged in the contracting for goods in the so-called decentralized and centralized stocks for 1983 that concluded a fortnight ago in Fair City at Plovdiv. The figures and facts are known to the producer ministries and trusts, to the Ministry of Internal Trade and Public Services, to the Retail Trade DSO [State Economic Trust] and to the retail trade organizations, but this will hardly change things.

The population's purchasing power is continually growing; real per capita income increased from 897 leva in 1970 to 1336 leva in 1980, or one and a half times. During these 10 years, retail goods circulation increased 1.7 times and went as high as 12 billion leva. This trend will be maintained in the future as well, but this raises acute and important problems for our market. To begin with, the production of consumer gooods and foodstuffs must increase as targeted in the program for the country's socioeconomic development.

A stable market depends on the delivery of goods not only in quantity but also in a selection. What good is it if there are various household appliances in the stores but no spare parts for them? Or let's take the canning industry. True, there are canned goods, but unfortunately the selection thereof is quite poor. And this is due to the fact that our canning industry did not produce this year the targeted quantities of certain important items.

The requirements and goals spring from the decisions of the Twelfth Party Congress and from the clear and categorical points which the secretary-general of the Party Central Committee and chairman of the State Council, Todor Zhivkov, made in his presentations at both the Ruse conference in 1980 and the national conference held in the People's Palace of Culture on 24 October 1981. The reserves and potentialities lie in the material and technical base, which for our country is vast, in the system of self-sufficiency, in unutilized land, in our irrigated agriculture, in scientific and technical progress, in our labor and our sense of duty and responsibility.

Supplying the domestic market is an inseparable part of party and state strategy of unceasingly raising the people's living standard. Hence this concern, hence also these efforts and measures to "find a way out" of the shortage of more than one or two industrial commodities. Work is successfully in progress to achieve what was mapped out at the Ruse conference. Best and most desired is that production should get ahead of consumption, as is the case for some groups of commodities. Our country has sufficient forces and resources to make good on this for the entire domestic market.

The last weeks of the first year of the Eighth Five-Year Plan are passing and we are on the threshold of 1982. This makes it imperative to search out and use the potentialities and reserves not only for the precise fulfillment of the state plan and counterplans, but also for the preparation that will be prerequisite for the compilation of strenuous, but practicable plans for 1982.

The question is what we can have and what we cannot have for some reason of solely subjective character. Organization, efficiency, discipline, control--this is the mandate!

TRADE RELATIONS WITH BALKAN COUNTRIES SURVEYED

Sofia POLITICHESKA PROSVETA in Bulgarian No 10, 1981 pp 41-51

[Article by Ivan Zakhariev: "Economic Cooperation Between Bulgaria and the Balka Countires"]

[Text] The Bulgarian Communist Party and the government of the Bulgarian People's Republic are investing a great deal of effort in developing good neighborly relations and expanding economic ties with the Balkan states. Thanks to our country's initiatives and the positive response of our neighbors, there has been a great improvement in the political climate in the Balkans during the past decade. Comrade Todor zhivkov stated at the 12th BCP Congress that "Despite the currently worsened international situation, the situation in the Balkans has remained relatively calm," that "through joint efforts positive changes have been achieved and great progress has been reached in relations among Balkan countries" and that "this is a great achievement of our nations."[1]

The Balkan Peninsula includes countries with different social systems. Economic relations between the NRB [Bulgarian People's Republic] and the other socialist countries are based on the principles of socialist internationalism and fraternal mutual aid; relations with capitalist countries are based on the principles of peaceful coexistence and mutual benefit. However, regardless of the nature, content and extent of cooperation with the individual countries, the unquestionable fact remains that favorable conditions have been created for the development of extensive economic relations between the NRB and all other Balkan countries.

Development of Trade

Taking foreign trade -- a traditional form of cooperation -- into consideration, we will notice that after 1960 trade between the NRB and the other Balkan countries has been increasing at a faster rate, as the table on the following page shows.

The figures indicate that in 1980 Bulgaria's overall trade with the Balkan countries reached 1,112,900,000 foreign exchange leva, with Greece in a leading position (34 percent), followed by Romania (31.5 percent), Yugoslavia (22 percent), Turkey (10 percent), Albania (2 percent) and Cyprus (0.5 percent). The share of the Balkan states in Bulgaria's overall foreign trade was 6.5 percent in 1980.

NRB Exports to Balkan Countries
(million foreign exchange leva)

Key: 1. Exports; 2. Romania; 3. Yugoslavia; 4. Greece; 5. Turkey; 6. Albania

NRB Imports From Balkan Countries
(million foreign exchange leva)

Key: 1. Imports; 2. Romania; 3. Yugoslavia; 4. Greece; 5. Turkey; 6. Albania

NRB Trade With Balkan Countries[2]
(million foreign exchange leva)

	1960	1975	1980
(1) Румъния	20,4	195,3	356,8
(2) Югославия	19,2	127,9	240,7
(3) Турция	4,7	51,8	106,0
(4) Гърция	5,8	84,4	382,7
(5) Албания	4,6	15,5	21,1
(6) Кипър	—	3,7	5,6

Key: 1. Romania; 2. Yugoslavia; 3. Turkey; 4. Greece; 5. Albania; 6. Cyprus

Intensive trade relations are being maintained between our country and the Socialist Republic of Romania (SRR), on a bilateral and multilateral basis, through CEMA. Let us mention in this respect the coordination of national economic plans, which marks a new stage in the development of economic cooperation between the two fraternal countries -- the stage of accelerated development of intergration processes.

The 1976-1980 period was a favorable one in terms of Bulgarian-Romanian trade, which totalled 1.5 billion foreign exchange leva during the 5-year period. Industrial goods accounted for two thirds of the total, and machines and equipment alone for 60 percent of the total trade. Cooperated and specialized output accounted for nearly one fifth of the entire trade. Bulgarian exports consisted mainly of transportation facilities, fork lift trucks, electronic goods, machines and equipment for the food industry, various brands of steel, ores and pharmaceuticals. Romanian exports consisted of chemicals, industrial consumer goods, some types of machines, electric and medical instruments, precision optical goods, locomotives, trucks, spare parts and others.

Trade between Bulgaria and Yugoslavia showed a steadily increasing trend between 1976 and 1980, exceeding 1.1 billion leva. In 1980 alone, it totalled]240.7 million foreign exchange leva, or about 43 million leva more than in 1979. The trade structure is improving steadily. The machine-building group, whose share exceeded 25 percent, experienced the most dynamic growth. Procurements of specialized and cooperated goods and installations for complete projects of particular importance to the economies of both countries are being successfully made. During the past 5-year period, most of the trade involved ferrous and nonferrous metallurgical goods -- 37 percent of the total trade -- and products of the petrochemical and chemical industries -- about 14 percent. There were increased deliveries of cellulose and paper and textile industry goods, border trade, etc.

Trade between our country and Greece is growing rapidly. It increased from 84.4 million leva in 1975 to almost 383 million foreign exchange leva in 1980, as a result of which Greece became Bulgaria's leading trade partner in the Balkans. Such foreign trade successes are due not only to favorable economic and geographic factors but particularly to the good political atmosphere, which was established and maintained through regular meetings between Bulgarian and Greek government leaders.

Most of our exports to our southern neighbor consist of raw materials such as petroleum products, ferrous and nonferrous metals, timber, chemicals and food products. Exports of metal cutting machines, fork lift trucks, electric hoists,

electric motors, agricultural and food industry machines and various chemicals have increased considerably. We import from Greece principally traditional farm goods such as citrus fruits, cotton, hides, olives and dried fruits. Imports of goods manufactured by the Greek electrical engineering, chemical-pharmaceutical, textile and food industries are beginning to account for an increased share of the total.

Bulgarian-Turkish relations have also developed considerably. They are based on the existing bilateral accords such as the 1974 Trade Agreement on Payments in Freely Convertible Currency, the Declaration on Principles of Good Neighborly Relations Between the NRB and the Republic of Turkey, the Long-Term Agreement on Industrial, Technical and Scientific Cooperation of 1975, the Coordinated Directions For Further Development of Economic Cooperation, which were initialed in Varna in 1978, and others.

In the last 2-3 years, trade between the two countries increased considerably from 49 million foreign exchange leva in 1978 to 106 million in 1980. Another 10 percent increase is contemplated in 1981. Bulgaria exports to Turkey various models of metal cutting machines, fork lift trucks, telephone and electric power measuring equipment, transformers, typewriters, metals, chemical fertilizers, calcinated soda, chemicals and others. It imports mainly cotton, citrus fruits, peanuts, lead-zink, borax and chromium ore and others.

Economic relations between Bulgaria and Albania remain limited to trade, which reached 21.1 million foreign exchange leva in 1980. In addition to machine-building goods, Bulgaria exports to Albania chemicals, metals, pharmaceuticals and consumer goods and imports from that country bitumen, chromium ore, beech veneer, cardboard, cotton fabrics and others. Efforts are being made to expand other forms of economic cooperation, which can contribute to the development of trade.

Trade between Bulgaria and Cyprus totalled 5.6 million foreign exchange leva in 1980. It has shown a trend toward rapid development since 1975 as a result of the adoption of new methods of payment and the energizing of bilateral relations between economic departments and organizations of the two countries.

Cyprus buys from Bulgaria metal cutting machines, glass, porcelain for household and sanitation purposes, fittings, household equipment, plastifyers, concrete iron, steel sheets, preserves, mineral water, fertilizers, electric motors, television sets, typewriters and others. Bulgaria imports from Cyprus mainly consumer and food industry goods. There has been a particular increase in imports of citrus fruits, leather goods, such as shoes for women and children, and knitted and ready-made clothing for children.

Industrial Cooperation

Along with foreign trade, Bulgaria tries to make active use of other forms of economic cooperation, such as industrial cooperation, exchange of technology, building joint enterprises and others. For the present, this remains a bilateral process, although Bulgaria has expressed its willingness to make it multilateral. The accountability report to the 12th party congress states that "We are prepared to extend our cooperation with the other Balkan countries on a multilateral basis in matters of reciprocal interest and in areas in which agreements have already been reached."[3] Unquestionably, the process of multilateral cooperation is itself more

complex from the viewpoint of the countries' interests and of its organizational and practical implementation. That is why the "agreements reached" stipulation reflects quite precisely the prerequisites which must be met before truly successful multilateral cooperation can be developed.

As socialist countries in the Balkans, Bulgaria and Romania are setting an example in the use of new forms of cooperation, such as joint construction and industrial cooperation. Currently, industrial cooperation between the two countries extends over a vast area. A Bulgarian-Romanian Economic and Scientific and Technical Cooperation Committee has been set up. Specialization will be increased and the share of reciprocal deliveries of metallurgical goods will be augmented in 1981-1985. The Ruse-Giurgiu Heavy Machine-Building Plant is under construction. An agreement on specialization and cooperation in the production of transportation equipment and metal-processing and food industry machines is being implemented. Cooperation in the manufacturing of industrial robots and hydraulic elements and specialization in small-batch chemical and pharmaceutical production are developing. Joint scientific research and experimental design efforts, aimed at reaching high technical and economic production standards, is a characteristic feature of the specialized and cooperated items produced by both countries.

Bulgaria and Romania are cooperating extensively in the power industry. This cooperation began in 1949, when a power cable was laid between Ruse and Guirgui. The Eshalnitsa-Boychinovtsi power cable, which was commissioned in 1967, linked the Bulgarian power system to the joint power system of CEMA-member countries. A 400-kilowatt power cable from the USSR to Bulgaria was laid across Romanian territory in 1963. An agreement on laying a direct 750-kilowatt power cable between the USSR and Bulgaria through Romania has been reached.

Industrial cooperation between Bulgaria and Yugoslavia is developing successfully. The first agreement, which called for the manufacturing of automated washing machines, was concluded in 1969. Subsequently (1975 and 1977), other cooperation agreements were made on the manufacturing of Perkins-type diesel engines, steel pipes and refractory materials for the porcelain industry. A General Agreement on Industrial and Technical Cooperation in the Field of Lifting-Transportation Equipment and Agricultural Machine Building was concluded among Balkankarimpeks, the MIN Industrial Combine in Nis and the Universal Company in Belgrade in 1978.

Work groups of specialists from both countries, engaged in drafting projects for specialization in the production of chemical fertilizers, calcinated soda and plant protection chemicals, have been organized by the Mixed Commission for Economic, Trade and Scientific and Technical Cooperation. The specialized production of rubber goods, dyes, lackers and raw materials for their manufacturing, detergents, auxiliary textile industry materials and others has been organized.

A new stage in the development of industrial cooperation and specialization with Yugoslavia began in 1980. It calls for the organization of a Bulgarian-Yugoslav and Yugoslav-Bulgarian economic chamber with centers in Sofia and Belgrade. It is also expressed in the idea concerning economic and scientific and technical cooperation between 1981 and 1985. The possible founding of an economic cooperation association is under study.

Cooperation in the power industry has existed between Bulgaria and Yugoslavia since 1961, starting with the laying of the Republika TETs and Vrla VETs power cable. The Kula-Bor power cable was commissioned in 1964, followed by the Stolnik-Nis and Petrich Strumitsa power cables. These facilities enable the two countries to purchase and sell electric power or to trade electricity on a compensatory basis in the case of breakdowns or temporary shortages.

Industrial cooperation is an important element in the long-term development of Bulgarian-Greek relations. The initial steps in this direction were taken at the beginning of the 1970s, when the Bulgarian Agromashinaimpeks Foreign Trade Center and the Greek Lanoridos Papanikolau Firm signed an agreement on assembling Bulgarian soil cultivators and tobacco processing machinery. Currently, Bulgarian metal cutting machines, buses, fork lift trucks, and electrical insulation and lighting fixtures are being assembled in Greece Complete projects and technological production lines are being delivered. Tekhnoeksportstroy shipped to the Makon Firm a technological line for the production of fruit juices. Bulgaria helped Greece in the building of a leather treatment enterprise and supplied the Greek state electric power organization with a series of transformers.

The steps and directions in the development of economic cooperation through 1985, which were agreed upon in 1979, play an important role in Bulgarian-Greek industrial cooperation and specialization. Studies have indicated that possibilities exist of developing joint enterprises in the food industry, bus and clothing manufacturingbuilding of spinnning enterprises and freight cable lines, port mechanization, etc. The agreement on connection the Bulgarian with the Greek power systems, which calls for laying a 400 kilowatt power cable, is of great importance. The first 200-kilowatt stage will be completed this year.

Industrial cooperation between our country and Turkey has expanded considerably. Bulgarian lifting and hauling equipment is continuing to be assembled in Turkey and a factory for assembling such machinery will be commissioned soon in Edirne. A complex flotation factory is under construction in Usak on the basis of a contract concluded between the Bulgarian Tekhnoimport Trade Organization and the Turkish Usakmermer Firm. Bulgarian mining equipment is being delivered and Bulgaria is producing cigarettes for the Turkish market made of Turkish tobacco.

Both countries are looking for new opportunities for broadening their industrial cooperation. The Mixed Bulgarian-Turkish Economic and Technical cooperation Commission has earmarked new steps for expanded cooperation in the areas of metal processing machines, comprehensive projects, and automotive and tractor manufacturing. Possibilities of building textile factories, dairy plants, installations for the production of carbonated wine, green houses, and others in Turkey being studied.

Bulgaria is exporting to Turkey considerable quantities of electric power. Such exports increased from 96 million kilowatt/hrs in 1975 to more than 700 million kilowatt/hrs in 1980. A Bulgarian-Turkish commission on cooperation in the power industry has been created, and the basic stipulations related to Bulgaria's participation in the building of lignite mines, thermoelectric and hydroelectric power plants and a coal concentration factory in Turkey have been defined.

Several Bulgarian institutions, headed by the Bulgarian Chamber of Commerce and Industry, are studying possibilities of industrial cooperation with firms in Cyprus and Albania.

Cooperation in Transportation

Our country pays special attention to cooperation in transportation. Every year, it participates in various bilateral and multilateral meetings at which important problems in the field of international transportation are resolved. A trend is developing toward turning the country into the transportation center of the Balkans. Bulgaria participated in the Athens conference on train schedules and compositions in 1980-1981.

A number of measures are being implemented in the area of transportation between Bulgaria and Yugoslavia. The two countries built jointly a railroad station in Dimitrovgrad (Yugoslavia) and the Dimitrovgrad-Nis, Petrich-Strumica, Blagoevgrad-Delcevo, Kyustendil-Skopje, Kyustendil-Bosilegrad, Vrushka Chuka-Zajecar and Bregovo-Negotino highways. The Gyueshevo-Kumanovo railroad and the joint Gyueshevo Railroad Station will be built and the Sofia-Nis tracks will be modernized.

Bulgaria and Greece are expanding their trade at a fast pace also as a result of their extensive cooperation in the field of transportation. New roads will be opened in order to increase the role of the international transportation system which runs across the territory of the two countries, by organizing combined and transit haulage. This is based on the increased volume of Greek trade with Central and Northern Europe and Bulgaria's trade with Middle Eastern and North African countries. To this effect, the highway system is being expanded and the Kulata-Promachon railroad tracks are being rebuilt. Tariff facilities are an important area in transportation cooperation. For Bulgaria this applies to the Salonika Port-Tartus (Syria)line; for Grece -- to the ports of Vidin, Lom and Ruse leading to Romania and the USSR.

Several important documents on regulating and expanding transportation relations have been signed between Bulgaria and Turkey. The Mixed Bulgarian-Turkish Transportation Committee, which did the preparatory work for the adoption of the General Agreement on Cooperation in Transportation and the Merchant Marine Navigation Agreement, is doing particularly useful work. Bulgaria and Turkey have agreed to grant each other a number of facilities regarding transit, phytosanitation procedures and others. A ferry boat will operate between Burgas and Trabzon. This will make it possible to increase transit freight shipments mainly from Central Europe to Asia and Africa and vice-versa.

Bearing in mind the great importance of transportation, Bulgaria is trying to develop as an international transportation center. This project was included in the report to the 12th party congress, which states that "Bearing in mind that the Balkan Peninsula is at the crossroads of Europe, Asia and Africa, we favor the development of cooperation in the areas of transportation and communications. This would be in the interest of many countries and peoples."[4]

Cooperation in Agriculture

Several agreements have been concluded between Bulgaria and Romania on the further expansion of relations in agriculture and the food industry. In addition to traditional exchanges of farm goods, studies are under way on 10 general topics in the field of vegetable strain selection, mechanization of processes in truck gardening, etc. Joint studies are being conducted in the area of soil ecology and intensive cattle fattening.

Joint work on the selection and technology of growing corn, soybeans, sunflower and medicinal and aromatic plants, the production and exchange of grape vine planting stock, yield programming and cooperation in engineering activities are important manifestations of cooperation between the two countries. Bulgarian and Romanian specialists will also cooperate in the area of land reclamation, including projects carried out in third countries.

Agricultural relations between Bulgaria and Yugoslavia are based on a joint program and work plans. Particularly good interaction has been developed between the Corn Institute in Knezha and its counterpart in Zemun Pole. Specialists are exchanged with a view to sharing positive experience in the use of new industrial technologies in crop growing, animal husbandry, the food industry, training and retraining of agricultural cadres, etc. A study is underway on organizing a mixed enterprise for the production of vine seedlings and other planting materials and their sale in third countries. The Mixed Bulgarian-Yugoslav Work Group on Agriculture is in charge of all cooperation problems.

The General Conditions For Scientific and Technical Cooperation, which were adopted in Athens at the close of 1979, call for the implementation of joint Bulgarian-Greek measures in agriculture and the food industry. Efforts are being coordinated in tobacco, fruit, vegetable and cotton growing. This will stimulate trade and the joint processing of farm produce.

The Mixed Bulgarian-Greek Agricultural Subcommission set the following lines of cooperation to be followed in the years to come: establishment of closer contacts between similar agricultural institutes; exchange of specialists for the study of practical experience in various agricultural subsectors; cooperation in the areas of selection, agrotechnology, plant protection, animal husbandry and veterinary affairs; further development and expansion of cooperation in plant and veterinary-sanitation control and coordination of measures in the struggle against crop and animal diseases; and reciprocal exchanges of breeding stock.

The similar natural conditions of some areas in Bulgaria and Turkey are a good prerequisite for the development of their cooperation in agriculture. The special agreement, which was concluded 2 years ago, is a suitable manifestation of this fact. A long-term program was adopted by the Mixed Commission For Agriculture and the Food Industry, which met in Sofia in 1980. The commission set specific tasks in the following areas: cooperation among scientific research institutes in the joint resolution of farm problems; cooperation in plant and veterinary sanitation control; exchange of seeding and planting materials and breeding stock; cooperation in the development of industrial technologies and in designing, construction and operation of calf-fattening enterprises; assistance in designing and building agricultural enterprises in the food industry. Cooperation in the establishment of

agricultural enterprises in the food industry includes the building of feed plants, canneries, greenhouses, dairy processing enterprises, livestock farms, etc. Bulgaria will supply Turkey with complete projects, refrigerated warehouses for fruit and vegetable storage with a 500-1000 ton capacity, yoghurt manufacturing enterprises, technological lines for the processing of sunflower seeds and the extraction of apple juice, etc.

Expanding Relations in the Field of Tourism

Our country pays great attention to the development of international tourism and is trying to broaden its cooperation with the Balkan countries in this area as well. An Agreement on Mutual Cooperation in Tourism was signed by Bulgaria, Greece, Romania, Turkey and Yugoslavia. The results have been encouraging: whereas the Balkan countries accounted for 10 percent of the European tourist trade in 1974, today one out of four European and one out of six world tourists visits the Balkan Peninsula. The following data show the percentage of tourists from the Balkan countries compared with the total number of tourists who visited Bulgaria:

(percent)

	1960	1970	1980
From Greece	0.8	0.3	3.8
From Romania	3.6	4.3	4.8
From Turkey	5.7	22.6	32.7
From Yugoslavia	3.2	19.1	14.1

The "Year of Balkan Tourism," which was organized in 1979, marked a new stage in the development of cooperation in tourism. Several meetings and symposiums were held. Information data were developed and disseminated jointly and specific initiatives were earmarked.

Currently, particular attention is being paid to the coordination of efforts regarding third countries, with a view to attracting tourists through combined itineraries and making use of opportunities for extending the tourist season with the help of new forms of tourist travel. Specific initiatives have been formulated on offering combined travel programs to tourists from third countries and aimed at promising tourist markets in Western Europe, North America, Australia, Japan, etc.

The Bulgarian People's Republic began the 1980s with stable economic relations with the Balkan socialist and capitalist countries. The main lines of cooperation through 1985, and in the case of some countries through 1990, have been coordinated. In itself this offers promising opportunities.

Bulgaria intends to pursue its policy of constructive dialogue, good neighborly relations and rejection of hostile actions of one country against another. In earmarking the line followed by the NRB in the area of practical cooperation with the other Balkan states, Comrade Todor Zhivkov stated at the 12th BCP Congress that "We support the type of further expansion and intensification of bilateral cooperation in economics, tourism, science, culture, education and sports which yileds even greater benefits to each country, contributes to the reciprocal

acquaintanceship among our peoples and is a factor in strengthening peace and security on the peninsula" (12th BCP Congress. "Dokladi i Resheniya" [Reports and Resolutions], p 99).

Bulgaria is encouraging the development of scientific and technical and cultural relations with the other countries of the Balkan Peninsula above all for the sake of the peace, security, happiness and well-being of the peoples. This is the only correct foreign policy course, which meets with the approval of the governments and peoples of all Balkan countries.

Chronicle of NRB Peaceful Initiatives

28 October 1944. Armistice agreement between Bulgaria and the members of the anti-Hitlerite coalition signed in Moscow.

10 February 1947. Bulgaria signs the Paris Peace Treaty with the winners of World War II.

18 March 1948. Friendship, Cooperation and Mutual Aid Treaty signed between the NRB and the USSR in Moscow. In 1948 and later, Bulgaria signed similar treaties with other socialist countries. Theese bilateral treaties were renewed between 1967 and 1970.

1949. Bulgaria becomes a charter member of CEMA.

14 May 1955. Bulgaria signs the Warsaw Pact -- the first multilateral military defense alliance among socialist countries.

14 December 1955. UN membership granted Bulgaria by the 10th UN General Assembly Session.

8 July 1959. Declaration of the Bulgarian government on the creation of a nuclear-free zone in the Balkans and the area of the Adriatic Sea.

28 September 1960. New York. Comrade Todor Zhivkov's speech at the 15th UN General Assembly Session entitled "May a Policy of Peace and Peaceful Coexistence Triumph and an End Be Put to Colonial Slavery."

6-8 September 1976. Sofia. International seminar on "Role and Significance of United Fronts" held. Attended by 29 delegations from Asia, Africa and Europe.

2-3 December 1976. Sofia. International conference of agrarian and related democratic parties and organizations held on the theme of "Peace, Safety and Cooperation." Major speech by Comrade Todor Zhivkov.

15-17 December 1976. Sofia. International conference of party and scientific works on the theoretical and practical problems formulated at the congresses of fraternal parties in the socialist countries.

9-10 February 1977. Sofia. Meeting of representatives of peace movements in Europe, the United States and Canada. Romesh Chandra: "The world peace movement considers Bulgaria its native home."

7 June 1977. International writers' meeting opens in Sofia on "The Writer and the World: the Spirit of Helzinki and the Duty of the Masters of Culture."

30 May-4 June 1977. NRB party-government delegation visits the Soviet Union. Bulgarian-Soviet communique issued. The USSR expresses its high appreciation of the role of the NRB and of Comrade Todor Zhivkov's personal contribution to the common struggle waged by the socialist countries for strengthening peace and international security.

15 June 1978. Blagoevgrad. Major speech by Comrade Todor Zhivkov entitled "On the Road to Good Neighborly Relations and Cooperation." Statement by the NRB to the effect that it has no territorial claims toward any Balkan country.

1-5 September 1978. Varna. 28th Pugwash Conference attended by 140 scientists from 40 countries.

State visits by Todor Zhivkov, NRB State Council chairman: Japan, 13-18 March 1978; Austria, 18-21 September 1978; FRG, 16-24 October 1978.

16-29 October 1978. Headed by Comrade Todor Zhivkov, a Bulgarian delegation visits Nigeria, Angola, Mozambique and the People's Democratic Republic of Yemen. Friendship and cooperation treaties signed between the NRB and Angola and Mozambique. Declaration on the development of friendship and cooperation with Ethiopia and the People's Democratic Republic of Yemen adopted.

12-15 December 1978. Sofia. International theoretical conference on "The Building of Socialism and Communism and World Development," sponsored by the BCP Central Committee and the periodical PROBLEMI NA MIRA I SOTSIALIZMA. Attended by representatives of 73 communist and workers parties. Opening speech by Comrade Todor Zhivkov.

9-11 July 1979. Visit to Turkey by Comrade Todor Zhivkov, NRB State Council Chairman. Joint communique issued and agreements on facilitating passenger and freight transportation and on visas concluded.

16-25 August 1979. Sofia. Banner of Peace International Children's Assembly, attended by children from 79 countries. Appeal-address condemning war adopted.

29 September-4 October 1979. Todor Zhivkov, BCP Central Committee first secretary and NRB State Council chairman visits Vietnam, Kampuchea and Laos. Friendship and cooperation treaties signed between the NRB, on the one hand, and Vietnam and Laos, on the other.

18-20 March 1980. Sofia. International theoretical science conference on "Leninism and the Contemporary Ideological Struggle," on the occasion of the 110th anniversary of V. I. Lenin's birth held.

3-7 July 1980. Party-governmental delegation headed by Comrade Todor Zhivkov visits Romania. Joint Declaration and Program For Basic Directions in the Development of Economic and Scientific and Technical Cooperation between the NRB and Romania signed.

7-9 July 1980. Sofia. Scientific conference "80 Years of Bulgarian Agrarian National Union held. Attended by representatives of 84 agrarian and related parties and organizations from 57 countries.

8-9 July 1980. Sofia. International meeting-dialogue on detente held. Major speech by Comrade Todor Zhivkov.

23-27 September 1980. Sofia. World peace parliament of the peoples held. Attended by 2,000 delegates and guests from 130 countries and by representatives of close to 200 political parties and more than 100 international organizations. Major speech by Comrade Todor Zhivkov.

29-30 September 1980. Sofia. Third International Writers' Meeting on "Peace -- Hoope of the Planet." Attended by 160 writers from 47 countries.

21-23 May 1981. Second international meeting-dialogue "For Detente, Peace and Social Progress." Major speech by Comrade Todor Zhivkov.

27-30 May 1981. Bulgarian delegation headed by Comrade Todor Zhivkov visits Greece. Joint Bulgarian-Greek communique reads: "Lasting good neighborly, friendship and cooperation relations consistent with the interests of the two nations and constituting an important factor of peace and security in the Balkans have been established between Bulgaria and Greece."

7 August 1981. Meeting between Comrade Todor Zhivkov and Comrade Leonid Brezhnev in the Crimea. Topical international problems discussed and new measures for the intensification of fraternal cooperation between the USSR and the NRB adopted.

Bulgaria has diplomatic relations with 117 countries, economic relations with 116, and cultural and scientific with 132. The NRB is a member of about 350 international organizations.

Since 1970 Bulgaria has hosted more than 200 international events such as meetings and conferences of political, economic and cultural personalities from all over the world.

ENERGY PROBLEMS, FUTURE SHORTAGES DISCUSSED

Prague LIDOVA DEMOKRACIE in Czech 13 Nov 81, p 1, 3

[Article by Ludmila Kyptova: "Energy Crossroads:]

[Text] It is an old adage that one cannot take a larger slice of bread than the whole loaf of bread itself. Or rephrased in more "economic" wording that one cannot have more than what one manages to provide through one's own work. This is common sense and it applies not only to that proverbial loaf of bread but to the national economy as a whole.

In a month and a half we shall be closing the accounts of the current year and thus the accounts of the first year of the Seventh Five-Year Plan. It naturally would be premature to draw some specific conclusions today, but one thing is clearer than the sun: Unfortunately there will be quite a number of enterprises, quite a number of business managers, who will not be able to face this accounting with a clear conscience. Above all, those who have not yet become accustomed to the idea that one simply cannot take forever from the state (let it cost what it may cost) without giving something (understand: of quality) in return. And when we look at the practices which have become entrenched in our national economy in recent years, a detailed analysis shows that nowhere else did this "system" of unconcerned taking cause so much damage, give rise to so many worries, as in the area of fuels and energy consumption. This applies foremost to the management of crude oil and its products.

Let us look at this situation in the light of some figures: while in 1955 we consumed roughly 45 million tons of standard fuels from primary energy sources, our current consumption exceeds 103 million tons of standard fuel. Some may argue that such a rise of energy consumption is only logical; after all, the economy cannot expand without energy and in the last 25 years we did manage to build and do quite a lot. But the time has come when such arguments will not do--we cannot infinitely increase the consumption (so far 2.3 million tons of standard fuel annually). For one single reason: We simply cannot afford it.

When the oil prices in the world market "surged" in the first half of the 70's, we talked about an oil shock. At that time already our highest state organs cautioned that, however advantageous the costs of crude-oil deliveries from the Soviet Union based on long-term agreemsnts, we must be prepared that unlimited increases of such deliveries (and of our current oil consumption) are not possible. And that the

sooner we learn to appraise crude oil and its products effectively and economically, the less worries we shall have in the future. Only under such conditions can we insure a stable systematic growth of our whole economy...

We all know the present situation. Every one of us could certainly cite many examples from own experience, an unending number of minor and larger observations which would document that we do not manage crude oil as we should (and as is commonplace and the rule of "game" not only in the developed capitalistic countries but in a number of socialist countries as well). What else but irresponsible wastefulness could explain the decision of an employee of the enterprise building in Prague to send an empty truck across the whole country to Kosice to pick up a mere 200 kilograms of nails...? Could they not be procured directly in our capital? How can it be excused when managers, with a complacent shrug of the shoulders, condone transport of material such as construction sand from one region of the republic to practically its other end, while being well aware that sand of the same quality can be delivered from the sandpit located literally around the corner? What "bonus" does the work of a foreman deserve who does not care that his subordinate drivers use company cars and diesel fuel for "black" trips which are of no benefit to the enterprise itself...? And unfortunately we could go on and on like this.

And to all this we must add another fact--our economy does not operate in some sort of vacuum free from outside influences. On the contrary, this pressure is growing stronger: world prices of fuel and energy continue to rise and this is naturally reflected in the prices of other products; rising interest rates increase pressures in world financial markets; from Poland we are receiving only half of the planned imports of black coal...etc. And in these circumstances we must continue to buy necessary raw materials, we must replace through import a certain portion of the shortfall of this year's grain harvest--we simply must provide for a smooth running of the national economy and everything else we need. These are the very circumstances that tipped the scale when it had to be stated how we shall deal with the mentioned undesirable influences on our economy. That is why next year we can only count on a volume of crude oil which will be roughly 2 million tons less than this year; why the recent adjustment of oil and gas prices was adopted, why the federal government is preparing an extensive set of technical, administrative, organizational and economic measures for the field of consumption of solid and refined fuels, heat and propellants. Because--as mentioned earlier--it is this consumption that costs us most and because at present we do not have funds to procure more than we have today.

In this connection, great emphasis is logically placed on rationalization of energy consumption--this necessity was last emphasized also by the general secretary of the CPCZ Central Committee and the president of the republic, G. Husak, in his closing remarks at the recent Fourth Plenum of the CPCZ Central Committee. No, we simply cannot do in the future without rationalization; and it definitely will not be possible for individual enterprises, plants or entire dapartments to deal with this necessity in such manner as did, for instance, the organizations of the SSR Ministry of Industry, which managed to accomplish only one-fifth of the planned rationalization tasks in the first half of this year.

When a man goes to a shop to buy a new shirt, for example, he naturally not only looks to see if the shirt is what he has in mind, but he also asks its price. Would

it not be reasonable if we asked the same question in cases when we must pay from public rather than private funds? And if we also saw the costs of all the work being done? We need not go far for a good example: In the first half of the year, in the GDR they managed to increase industrial production without the slightest increase of energy consumption; our production increase was associated wihh roughly the same increase of energy consumption.

In short, we are standing at an energy crossroad. And it depends on us alone, on our abilities and our brains as to whether we take the right direction.

FURTHER REPORTS ON 1982 DRAFT PLAN PUBLISHED

Variant 1982 Plan Presented

Warsaw TRYBUNA LUDU in Polish 31 Oct 81

[Abridged version of speech by Vice Premier Zbigniew Madej]

[Text] In July 1981 the government presented a report to the High Chamber on the state of the economy and on this basis submitted a recommendation on the necessity of making revisions in the 1981 socioeconomic plan. Under the terms of the resolution adopted by the Sejm on 31 July 1981 the government was authorized to make these changes while at the same time being required to provide the Sejm with periodic reports on the country's current economic situation and on the actions which it has taken. On 24 September 1981, by way of fulfilling this requirement, the chairman of the Council of Ministers presented an assessment of developments in the country's economic situation. In addition, government representatives submitted reports during Sejm committee sessions. The government has instructed the Main Statistical Office to submit special quarterly reports on the economic situation. Today the premier once again presented an assessment of the country's economic situation and a package of remedial measures, which the government will put into effect as soon as possible.

As a result of an initiative launched last year by members of the Sejm, an initiative which was later incorporated into a formal Sejm act on rules of legislative procedure, representatives of the government, starting in 1982, are now obliged to comply with new procedural rules in the course of drafting socioeconomic plans. What is new about these rules of procedure is the fact that, at a relatively early juncture, that is while the main premises of a given plan are still in the preliminary drafting stage, we are obliged to present to the Sejm a statement of government goals for the following year. This is in line with the numerous demands that have been made concerning the need for Sejm deputies to participate as equal partners in the formulation of future draft plans.

Caught Between Fears and Hopes

The preliminary basic provisions of the draft socioeconomic plan for 1982 that were submitted to the deputies of the Sejm very likely represent the first time in the history of economic planning in Poland that an official planning document has been

presented in an optional format. This document spells out three likely trends in the development of the country's economy during 1982, i.e., an option that is filled with fears for the future, an option that is filled with hopes for the future, and in-between option which might be labeled a realistic middle-of-the-road option.

The first option is a kind of extrapolation into 1982 of everything that is going on right now in Poland. The persistence of these trends would lead to a further decline in output, a deterioration in living standards, the devastation of the economy, and, as a result, to a total economic collapse. This is precisely why we call it the fearful option, or maybe we should call it the disaster option.

Just one year ago such an option would have appeared to be a not very likely prospect. We are now forced to advance this option, since a momentum exists within the economy that is leading in this direction and social forces exist that are promoting these trends. We are hoping that this fearful option will not win the approval of a majority of the population and that this majority will actively resist these retrograde tendencies in the economy. We are presenting this forecast to the Sejm in the belief that this will help to energize those social forces which will prevent the disaster option from becoming a reality.

The second option -- referred to as the hopeful option -- envisions an economic revival, i.e., an increase in output, the national income, and an improvement in living conditions. It is based on the potential that now exists within our economy, i.e., on the existing output capacities of raw materials industries and on the production capacities of manufacturing industries. However, the crux of the matter continues to be what happens in the country's sociopolitical situation. In the final analysis it is this factor that will play a critical role in determining the productivity of our countrymen and their attitudes toward the work that they do. It could then be said that, insofar as the hopeful option is contingent upon technical production capabilities, it is a fullproof option, whereas insofar as it is a function of the climate of public opinion it is still a wait-and-see option.

The third middle-of-the-road option falls somewhere between the fearful option and the hopeful option. This option envisions the curtailment of the slowdown in the rate of economic growth and the consolidation and more orderly realignment of forces so as to lay the groundwork for a gradual economic revival which, according to this forecast, might take place during the second half of next year.

So, these are the three options. This is more than just a rhetorical device. The underlying reasons for presenting the issues at stake in this way go much deeper. There are objective reasons for approaching these issues in this way. We find ourselves in the midst of a serious social conflict. We are faced with an extremely muddled situation, and there is a great deal of uncertainty as to the future evolution of economic and political trends. This is why it is hard to say for certain what is in store for us even in the immediate future.

The definition of the issues at stake in optional terms is accompanied by the desire to make people aware of the opportunities they have to make real choices between these three development trends, the desire to open up opportunities for energetic and enterprising people, for workers and regional self-management bodies, and for the management of enterprises. This is also a question of seeing to it that in the

course of drafting plans for the future the emotional predispositions of people are deemphasized in favor of encouraging favorable attitudes toward and the active support of an optimistic, but realistic outlook, the realization of which will depend first and foremost on public opinion.

Coal -- Just as Important as Bread

Coal is now the prime mover of the Polish economy. During the first quarter of 1981 total coal production came to 41.3 million tons. During the second quarter it dropped to 40 million tons, and during the third quarter it remained at the same level. If these trends were to persist on into 1982, then by that year total coal production would amount to only 155 million tons. A decline in coal production to a level of 155 million tons would be tantamount to a further 10 percent drop in the level of industrial output and an 8 percent decline in the national income. The counterargument is sometimes made that there are countries which produce less coal than Poland and do not fall apart for this fact as a result. This is of course true, but for many decades the Polish economy has been based on coal which accounts for 70 percent of our power generating resources. Nor do we have anything to take the place of coal in our export markets. A more than 35-million ton decline in coal production over the past 2 years and an 18-million ton falloff in export sales to capitalist countries, which at current prices amounts to a loss of 1 billion dollars, are bound to deliver a serious blow to our economy. A further decline in coal production threatens to bring about an economic collapse and it might be accompanied by results more serious than those of a natural disaster, since it would give rise to consequences that would persist over a long period of time. This is why we must do everything we can to prevent this pessimistic forecast from becoming a reality.

The hopeful option envisions a coal production level of 175 million tons during 1982. There are realistic prospects that this goal could be achieved. The technical infrastructure of our mines and the skills of mineworkers are sufficient grounds to lead one to the conclusion that it would be possible to produce approximately 630,000 tons of coal per day during the normal working week and around 240,000-250,000 tons on free Saturdays under rules where miners report to work on a completely voluntary basis, i.e., as much coal as was actually mined on the average on Saturdays during the period February-April 1981. If 175 million tons of coal could be mined during 1982, the value of aggregate industrial output could be increased by approximately 5 percent in comparison with 1981, the national income would go up by approximately 2 percent, and export sales could be increased by nearly 10 percent. These percentages would serve as clear signs that the economy had gotten back onto a growth track and offer hope that the crisis could be resolved. So, an upward or downward shift in the rate of production amounting to 20 million tons of coal, for this in fact is the rate of output that distinguishes the hopeful option from the fearful option, is the rate of production that places the entire economy and the chances for ending the crisis at stake.

What kinds of actions are being taken to make the most of this opportunity? During this year alone the level of employment will rise even further. The government drew up and sent to the Sejm a draft law on the delivery of goods and services to miners and their families that made provisions for a reduction in the retirement age to 50 years. It also issued an executive order permitting miners to continue working without forfeiting any of their retirement benefits and with pay earned during normal days off being exempted from the collection of income taxes. A production fund

was set up in order to create a source for the payment of bonuses to miners. The mining industry has access to a fund of foreign exchange reserves equal to 10 percent of coal export sales. Reasonable preferential standards are being applied when it comes to allocations of foodstuffs to miners.

An effort also has to be made to find solutions to our coal problems on the conservation front. The government has come up with a program to improve the efficiency of fuel and energy consumption that encompasses both short-term and long-term measures. This program makes provisions for, among other things, the modernization of more than 600 power generating installations, something which should result in the conservation of from 550,000 to 600,000 tons of coal per year. It is projected that allowances governing the volume of hard coal lost through waste during transport will be lowered. Sales of firewood cut from state-owned forests will be increased. It is estimated that during 1982 all of these short-term conservation measures should result in the conservation of approximately 3 millions tons of hard coal.

Brown coal is a factor of major importance in our country's fuels and energy supply equation. Up until now approximately 20 percent of all the electric power generated in this country has been based on the consumption of brown coal. The brown coal production capacities of existing mines now amount to approximately 36 million tons per year. During 1982 brown coal production will go up by another 2 million tons as a result of the opening of new mines in the Belchatow Basin.

Rebuilding Economic Ties Between Urban and Rural Areas

Agriculture is an important sector of our economy upon which the fate of the nation depends. In this sector too we are presenting optional scenarios of how things will develop during 1982. Under the fearful option we are assuming that weather conditions will be bad. For this reason, we would expect that plant crop production would fall below 1981 levels. On the other hand, animal production should go up, since breeding levels were good this year. According to this option, it is estimated that the value of total agricultural output will be in the vicinity of ZI 600 billion.

On the other hand, according to the optimistic option, which holds out hope for better weather conditions and an increase in the volume of capital goods earmarked for agriculture, it is expected that the value of total agricultural output will amount to approximately ZI 630 billion, which includes a grain harvest of from 22-23 million tons, i.e., a 2-3 million ton improvement over this year.

Every effort should be made to work toward the realization of the hopeful option. Thus far, however, it cannot be said that we have succeeded in doing this. Even though this year we have had good yields and harvests, procurements of grain and animals for slaughter have been moving very poorly. In order to meet personal consumption needs in this country we have to come up with around 6 million tons of grain, and so far we have only procured around 1.3 million tons out of a projected total procurement of 4.2 million tons. If this trend were to continue during the fourth quarter and on into next year, then in this sector of the economy too, we will be drawing near to a point of no return, beyond which consequences will begin to be felt that are reminiscent of the aftermath of a natural disaster. There will not be enough grain for bread, and there simply is no foreign exchange to pay for additional imports. An equally ominous situation may develop in the area of animal procurements.

What do we propose to do to prevent this from happening? There are three courses of action that come to mind in this regard. First of all, there is the idea of a barter system governing trade between urban and rural areas that would be introduced on an experimental basis during the fall season. The details of this operation will be worked out in the next few days. Second, there is the idea of taking further steps to gear industrial production toward meeting the needs of agriculture, a policy which during 1982 should bring about an increase in deliveries of fertilizers, pesticides, machinery and spare parts. Third, there is the idea of creating incentives to encourage people to take jobs in the agricultural sector, a plan which also encompasses further efforts to satisfy the needs of agriculture for highly skilled professional workers.

The Falloff in the Economy's Export Sales Potential

The next problem area that has to be addressed within the context of economic planning for 1982 is foreign trade. There have been three characteristic developments in this area. Namely, a falloff in our economy's export sales potential, an extremely heavy burden of indebtedness to capitalist countries, and a recently growing level of indebtedness to the socialist countries.

According to the fearful option, which is based on a pessimistic coal production forecast and a resulting further decline in industrial production, it is expected that export sales to the capitalist countries will bring in around 19 billion foreign-exchange zlotys, that is, less than was earned this year. It is projected that the value of imports from the capitalist countries will amount to 15 billion foreign-exchange zlotys, i.e., 27 percent less than in 1981. This decline in imports will of course have a negative impact on supplies of raw materials and fabricating materials for our industries. According to the hopeful option, it is projected that the value of export sales to the capitalist countries will amount to 23 billion foreign-exchange zlotys, i.e., an increase of 19 percent over this year. This goes hand in hand with this option's projection of an increase in coal output, industrial production, and agricultural production. According to this option, we anticipate that the volume of imports from the capitalist countries will come to 22 billion foreign-exchange zlotys. This is based on the assumption that, in spite of everything, we will succeed in our efforts to secure new credits that will help to get the economy moving again.

As far as trade with the socialist countries is concerned, we do not foresee any major differences between the respective options, since these economic relationships rest on more stable and long-term foundations. It is one of our most vital interests that we should further strengthen the bonds of economic cooperation with the Soviet Union and the other socialist countries.

Prospects for Meeting the Needs of the Domestic Marketplace

The next problem area is the domestic marketplace. If present market trends were to persist into next year, personal cash incomes would go up by approximately ZI 380 billion, and deliveries of goods and services to the market would necessarily drop by ZI 140-150 billion. This would bring about a total collapse of the domestic marketplace and give rise to the necessity of introducing a universal system of rationing marked by a very low level of allocations for individual commodity categories.

A contradiction exists between the justified aspirations and needs of the people and the real economic situation. For reasons of the public welfare a case has been made and is still being made in favor of the need for higher wages and incomes, for the expansion of public services. But the progress that has been achieved in this area during the past year has nothing to do with and is even at variance with what has been happening in the production sphere, and this has been accompanied by an across-the-board decline in the productivity of social labor. The economic bonds between urban and rural areas have broken down, the procurement of agricultural products is being held up, and the role that money plays in transactions with the private farming sector is diminishing. An effort can and should be made to stop these trends.

The hopeful option envisions a fifty percent decline in the volume of money that is injected into the marketplace and increased deliveries of material goods. It is also projected that a price reform will be enacted covering the retail prices of basic foodstuffs, heating fuel, and energy. This would then create an incentive for producers to boost the production of these goods and lay the groundwork for the application of more efficient management practices, and consumers would benefit from the chance to make their purchases in a more stable marketplace. It goes without saying that some segments of society would be compensated for all this, but people with higher incomes must, unfortunately, bear some of the cost of this policy.

Another important part of the marketplace, which is mainly concerned with the production and sales of producers goods, will be dependent first and foremost on the extent to which output is increased in response to the incentives generated by the new economic mechanisms that will go into effect starting in 1982.

Next year we can look forward to a larger increase in the output of manufactured goods, including in particular confectioner products, pharmaceuticals, soaps and personal hygiene products, undergarments, outerwear, and footwear.

It should be expected at the same time that independent enterprises will be trying to raise their prices whereever market conditions permit them to do so. To be sure, this is in line with the economic laws according to which they will be running their businesses. But this may be painful for consumers, especially those with smaller incomes. Special pains will have to be taken to look after people with the lowest incomes and that sector of the economy generating services that promote the general welfare, i.e., health care services, the arts, and science. The state will have to regulate the incomes of people in higher income brackets by enforcing appropriate tax policies. This is a role that should be fulfilled by taxes, also including the stabilization tax. The budget deficit for 1981 will amount to approximately ZI 200 billion, and next year it might even climb as high as ZI 500 billion. So, where is the money going to come from to provide funding for health care services, education, and science? To enlarge the deficit would be tantamount to the aggravation of inflationary processes. We will not accomplish anything worthwhile by taking this course. The only solution is to increase production and promote sound management practices.

It is expected that the draft plan for 1982 will consist of two parts, one part that is geared toward the presentation of forecasts and progress reports and another part that is prescriptive in nature. The first part is supposed to contain forecasts of socioeconomic developments and will lay down guideline-type foundations for drafting the provisions of a national plan. This part of the plan will also set forth basic

guidelines that are to govern the drafting of enterprise plans. The second part will consist of the general economic prescriptions of the national plan and working programs dealing with priority social and economic goals.

A special section of the plan will focus on practical programs dealing with priority areas of public life such as nutrition, health care and personal hygiene, apparel, footwear, and products for children and young people, exports, fuels, energy and raw materials, and deliveries designed to meet the needs of national defense and security. The intent of these programs will be to give the Planning Commission and government ministries a direct role in regulating the production of selected goods, thereby guaranteeing deliveries of raw materials, fabricating materials, and energy as well as the generation of foreign exchange earnings. The fulfillment of these tasks will be mandatory in nature.

A Three-phase Plan Drafting Process

At the national level our work on the draft plan is taking place in three phases. The basic underlying principles of the draft version of the national socioeconomic plan have already been written up. These materials have been sent out to the deputies of the Sejm and to more than 120 enterprises as well as to the ministries and national governmental agencies. The next step is for the ministries and banks to work out the detailed aspects of the draft plan. Work on this phase of the drafting process will go on until the middle of November of this year. From there the next step will be to draw up an annual national plan and, after it is reviewed by the Council of Ministers, pass it on to the Sejm by the end of November. So, we are now entering the phase when work on the 1982 plan will reach its peak. This is a plan that will be based on new principles which, as a result of the reform, differ from those followed in the past.

To recapitulate, Poland's economic situation during 1982 will depend on the extent to which we now, during the fall as a part of the nationwide debate on the main objectives of next year's plan, succeed in moving away from the apprehensive forecast and toward the hopeful option. Neither the government nor any one individual can accomplish this by fiat, for this is a true act of choice to be made by all members of society. There is every reason to believe that we should pin our hopes nearer to the optimistic option, and we could even try to transform our shortcomings into a chance for success.

The fact of the matter is, after all, that this inflationary manace hanging over us is nothing more than unrestrained demand, something which is opening up great marketing opportunities for many, many years to come for independent enterprises producing goods that are in demand in the marketplace. The shortage of farm machinery and spare parts is opening up a boom market for many factories which are now faced with the dilemma of what to produce and how to generate enough revenues next year to pay the wages of their employees. Even the shortage of coal, the scarcity of animal fodder, and the paucity of foreign exchange is giving rise to the real imperative to enforce conservation measures, and this in turn gives rise to the need to achieve innovations in the technical and organizational areas.

What is needed most of all is tranquillity. History will judge those who do not want to take advantage of the opportunity to reach a social accord and those who, in pursuit of their own ambitions, are declaring strikes and blocking constructive

action in the economic realm. Let us hope that "Solidarity" officials will bear in mind that their ambitions and "political causes" may soon be transformed into causes that portend starvation for everyone. The worsening of the economic crisis, strikes, and the obstruction of efforts to increase raw materials production are not weapons aimed against the government or against people's power. It is our own nation and our own people that are suffering the greatest harm as a result of all this. It is the duty of the government, it is the duty of everyone who cherishes the well-being of Poland to sound a warning against the consequences of such actions and to find ways to solve our problems.

For the sake of our basic national interests the time has come to put a stop to all this turmoil. It is no longer purely a matter of considerations having to do with the structure of our political order, but also a matter of considerations having to do with our social and, for that matter, biological survival that compel us to take action to prevent the economy from being turned into a proving ground for political and ambition-seeking rivalries.

Parliamentary Committee Presents Opinions

Warsaw TRYBUNA LUDU in Polish 31 Oct 81 p 5

[Edited version of speech by deputy Zenon Komender presenting advisory opinion of the Sejm Economic Planning, Budget, and Finance Committee]

[Text] Deputy Zenon Komender (nonparty member of PAX), in presenting the advisory opinion of the Sejm Economic Planning, Budget, and Finance Committee on the draft version of next year's plan, stated that in the present social situation the degree of uncertainty about how to rate the present state and future potential of the economy is greater than ever before. It is also hard to foresee how the price reform and also the results of the implementation of the economic reform will be received. There is also uncertainty about the reactions of our foreign trading partners to cutbacks in Polish export sales.

The Planning Commission has presented two extreme optional versions of the economic forecast for 1982. It is the opinion of deputies to the Sejm that even the "fearful" option may prove to be too optimistic insofar as nothing is done to overcome destructive tendencies in the realm of public opinion and to initiate policies geared toward the revival of basic sectors of the economy producing goods and services.

So, there is a need to fashion an "option of necessity." The targets of the plan are rightly geared toward satisfying elementary needs for foodstuffs, capital goods for agriculture, medicines, products for children and infants, electric power, and heating fuel for urban and rural residents. Equally important are questions having to do with the balance of payments and, above all, curbing the growth of our debt burden.

The committee acknowledged the validity of upholding principles based on the centralized allocation of basic raw materials and fabricating materials and giving first priority to deliveries for those sectors of the economy which satisfy our most important social and economic needs. On a transitional basis it is also necessary to set directive-type tasks with regard to export sales to countries in payments zone I.

The critical issue of increasing coal production is a duty that must be addressed by the economy as a whole. This is a question of producing capital equipment for the mining industry and of bringing about a genuine improvement in the flow of food supplies to miners and solving social problems, especially so in the case of the housing problems of miners' families.

The volume and structure of agricultural production will also continue to be a crucial question. A profound shift needs to be made in the orientation of the entire economy in favor of agriculture. It is also essential that an effort should be made to establish more orderly ratios between procurement prices and retail prices and the prices of capital goods for agriculture. The price reform must be not only economically efficient, but also socially equitable.

The difficult thing about the formulation of this plan is the attempt to foresee turnover volumes and the balance of payments with foreign trading partners. It is the opinion of the Sejm membership that an effort should be made to devise methods aimed at eliminating constraints on tendencies that favor increased export sales and to strive toward the development of stronger ties with the CEMA countries, especially with the Soviet Union. What is needed most of all is an effort to make the public understand the importance of foreign trade and to generate support for those actions which are extricating from the "indebtedness trap."

Unfortunately, further restrictions are needed in the realm of capital investment. This calls for another review of ongoing capital construction projects and for greater commitments of public financial and material resources, especially so in the realm of housing construction and small-scale manufacturing. In order to make the growth of this latter sector a realistic prospect it is necessary to put a stop to current practices and open up new opportunities for activities in the form of such institutions as worker partnerships, small cooperatives, and so on.

Our drastic economic situation is having an impact on the non-material services sector. Nevertheless, the basic planning goals submitted for our consideration foresee an increase in the share of expenditures on social and cultural services in the national income. However, there is a strong correlation between this increased spending and the rise in rpices and the decline in incomes. It is precisely in this sphere that we can perceive the first signs of the threat of a collapse of the material foundations of our national existence.

In conclusion, I would like to express the belief that the recommendations and observations of the Sejm membership will be taken into account in future work on the national plan and budget for 1982. The Sejm's position on these matters will be spelled out in greater detail during the future deliberations of Sejm committees and intercommittee task forces.

INVESTMENTS FOR 1981-1985 PLAN DISCUSSED

Tirana RRUGA E PARTISE in Albanian Aug 81 pp 12-19

[Article by Shinasi Dragoti: "The Investments Program for the 7th Five-Year Plan is Daring, but Fully Realizable"]

[Text] The draft directives of the 8th Congress of the Albanian Workers Party (AWP) for the 7th Five-Year Plan (1981-1985), for the economic and cultural development of the People's Socialist Republic of Albania, which were approved by the 10th Plenum of the Party's Central Committee, were received and discussed with revolutionary enthusiasm and extraordinary interest by the whole nation. Communists and workers have been mobilized in order to assimilate the deep political, ideological, and economic content of the draft directives as they apply to our situation today and to the solution of the tasks which confront us in achieving and surpassing the great objectives which are expected to be achieved in the new 5-year plan. This testifies, once again, to the political and ideological maturity, the high socialist consciousness, and revolutionary patriotism of our nation, as well as to the feeling of responsibility which all the workers of the country, headed by the communists, have for the fate of socialist construction, the continued strengthening of the dictatorship of the proletariat, the defense of the fatherland, and the protection of the victories of the revolution from every danger that threatens them. There is no doubt that this kind of understanding and discussion of the draft directives will serve to enrich and perfect them even more.

An important role in achieving the objectives for which the party is striving in the 7th Five-Year Plan will be played by the large investments which are expected to be made in all areas, especially in the branches producing essential materials. In this 5-year plan, the further development of our productive forces and culture, as well as the strengthening of the defense capabilities of the fatherland rely on a broad program of investments and construction. In comparison to the 6th Five-Year Plan, the volume of investments in this 5-year plan is expected to increase by 23 to 25 percent, and that of construction-assembly by 13 percent. As far as quantity is concerned, these investments will be greater than the total achieved by the first four 5-year plans, 1951-1970, taken together. In 1985, the investments for construction are expected to grow 4.3 times more than in 1960, when we were receiving credit from the Soviet Union and the other ex-socialist countries, and by more than 1.2 billion lek more in 1978 when we were receiving credit from China.

The basic characteristics of this imposing plan in the area of investments and basic constructions are: first, the plan will be completely supported by our own internal accumulation, without any credit or support from abroad, by the material and financial resources created by our socialist economy and it will be implemented by our revolutionary and talented masses, specialists, and cadres. Second, the investments will be used primarily in the branches of material production, principally for the development of industry and agriculture, which will utilize 75 percent of the materials produced, further improving the proportion of their distribution between the productive and the nonproductive spheres. Third, in order to ensure the high and accelerated effectiveness of the plans, it is expected that investments will be funnelled primarily to the most important works which will affect the rapid growth of industrial and agricultural production. Within this framework, attention will be concentrated on expanding and reconstructing the production capabilities of our existing industries, which will increase, at a faster rate, the activity of our basic funds, our machinery, and our supplies. This investment program, more than any other 5-year plan, is distinguished by qualitative changes in the field of improved technology.

According to the draft directives, during this 5-year period, the construction of important industrial projects will continue. A forward thrust will be given to the development of the energy industry. Important tasks confront the construction workers for the completion of work in the "Light of the Party" hydroelectric power plant and for the construction of the hydroelectric power plant in Koman, a project which will have the greatest hydroelectric power capacity of anything that has been constructed in our country to date. The construction of this work will bring to an end the most difficult and vital tasks of the hydroelectric power system of the river Drin. The construction of three consecutive waterfalls on this river, in Vau e Dejes, Koman, and Fierze, not only increases the amount of electrical energy and lowers the price of every kilowatt-hour produced but, also, raises its quality considerably. On the other hand, substantial favorable conditions are created for utilizing the lakes for ferrying and fishing, which will raise the effectiveness of the investments that have been made and will continue to be made. The implementation of the program for the completion of the "Steel of the Party" plant and other industrial works will continue. An important work program for agriculture will be the construction of water projects which will increase the present irrigation ability by an additional 44 to 45 thousand hectares, principally in hilly and mountain areas. This will bring about a considerable decrease in the damaging effects of drought on agricultural crops in these areas. The plan for the construction of 50,000 apartments by the state and 31,000 residences by the farmers themselves, expresses once more the great and continued attention the party has shown to improving the living conditions of the workers in the cities and the villages, where today more than 80 percent of our population lives in new buildings constructed during the period of the people's government.

The realization of such an investment program requires greater mobilization based on more scientific work by the specialists, the cadres, and all the construction workers so that they can confront the large volume of investments at rapid rates and overcome the difficulties that will be encountered in the field of reconstruction, in the construction of those industrial works which require planning and studies, in the production of machinery and equipment, as well as

in the construction-assembly of machinery unknown to our workers until now. It is our duty to study and draft these works on the basis of advanced technology and to prepare designs and estimates based on scientific technical-economic norms. The workers in the scientific research and design institutes, investors and implementors have the task of selecting the most rational construction projects using advanced methods in their calculations, and constructing them at the lowest possible cost and with the highest possible quality.

The attainment of these objectives is not simply a dream. These objectives have been studied, calculated, and supported scientifically. The possibility of attaining the tasks in this area is based, among other things, on convincing factual data from the glorious 37-year history of socialist construction in our country and from the rapid rate of growth of constructions from one 5-year period to another. In comparison with the first 5-year period, the volume of state construction increased, roughly, as follows: in the second 5-year period, by 60 percent; in the third, by 2.5 times; in the fourth, 3.9 times; in the fifty, 6.1 times; in the sixth, 7.9 times; and in the seventh 5-year period, it is expected to increase 10 times. However, the building capacity of the country is even greater if we add to government construction the construction which is being done and will continue to be done by agricultural cooperatives with their own financial resources. These results testify to the rapid growth rates which actually exist. Therefore, the forecasts for the 7th Five-Year Plan are realistic and they have a basis; they certainly are difficult, but they are fully realizable.

Because of the great and continuous care the party has shown, from the first days of the liberation up to the present, gradually, with effort, sweat, and innumerable difficulties, a great potential of abilities to build has been created. Foreign friends and well-wishers who have visited our country have acknowledged that Albania has, in truth, become a huge construction site. Furthermore, numerous foreign specialists, who have come to our country on the basis of contracts and agreements for the construction-assembly of machinery and spare parts for industrial works, have been forced to accept and acknowledge, in their own words, the rapid pace of construction, the professional ability and the technico-scientific talent of our craftsmen, specialists, and cadres. In the 7th Five-Year Plan, this construction skill possessed by our nation will be raised to a higher level. Young specialists and cadres will be added to the great army of builders. The mechanization of work will increase further. Advanced methods for the management and organization of construction work will be expanded and be perfected. Huge reserves will be created to increase this building potential by implementing programs that have been drafted to achieve the very important tasks laid down by the 8th Plenum of the Central Committee of the Party for the development of science and technology.

The building materials industry will develop greatly, which will assure the builders a greater material base than they had during the preceding 5-year period. Production from this industry in 1985 will be 24 percent higher than in 1980. In this way, not only will the needs of construction and the people be fulfilled better with such materials, but the volume of goods for export also will grow. New brick manufacturing factories are being built and will continue to be built; by 1985, there will be factories of this kind in 22 districts out

of a total of 26. Due to the development of the ferrous metallurgical industry, the construction and assembly operations will be relieved considerably of the burden of having to import iron which is used in construction, in the manufacture of galvanized sheet metal and shaped iron. The public discussion of the draft directives is opening new horizons for the development of this industry in increased variety as well as improvements in the quality of products as it is projected for the 7th Five-Year Plan. These and other facts are proof of the great capabilities which have been created so far, and will continue to be created in the course of the new 5-year period in order to confront successfully the ever-increasing tasks in the field of construction. It would be misleading and very harmful to think that these tasks will be achieved easily, without difficulties and obstacles.

It is a fact that the basic investment plans, as well as the whole 5-year plan for the economic and cultural development of the country is the most thoroughly studied and documented of all 5-year plans; however, the complete implementation of the plan, in every part and every special link, requires the kind of organization never seen before, it requires continuous effort and struggle in order to surmount the obstacles and difficulties of growth, and even those obstacles that are not dependent on us, but are created by the conditions of the imperialist-revisionist encirclement and blockade and by the general economic and political crisis which has surrounded the capitalist bourgeois-revisionist world. For this reason, the 10th Plenum of the Central Committee of the Party focused the attention of the communists, the cadres, the working class, the village cooperatives, and all the workers on correctly evaluating the duties laid down by the draft directives; to evaluate the conditions under which they are to be achieved and to utilize with the utmost efficiency all the capabilities which we possess and all those that will be created. It is very important to create a correct understanding and a high feeling of responsibility for a strong regimen of thrift and an increased efficiency in spending, without which the program of accumulation and, as a result, the program of the investments cannot be realized.

The call the central committee of the party has sent to all workers to take part in the discussion of the tasks laid down by the draft directives of the 7th Five-Year Plan has become a powerful drive to uncover new reserves and to define concrete paths for their proper utilization. Not only can these reserves be found by isolating the deficiencies that exist in the areas of management and organization but they also can be produced by the creative work of the working masses, by advanced experience, and by the adoption and implementation of the new discoveries of science and technology. The reserves are often hidden in the breasts of the working masses; and at specific moments, especially when revolutionary situations arise, they come forth and express themselves in all their intensity and grandeur. Such, for example, was the case for many of our workers, cadres, and specialists who did not believe they were capable of completing or building the works planned or left unfinished by the Chinese revisionists; however, when the party called on them, they unleashed all their energies and all their creative technical and scientific skills and built the projects even better than had been expected. Let this marvelous revolutionary experience be worthy of answering properly the call made by the Central Committee of the Party now, on the occasion of the discussion of the draft directives of the 7th Five-Year Plan.

Much has been said about the hidden reserves which exist in construction to lower costs and raise the effecti-eness of investments. Nevertheless, it would be well for us now, on the occasion of the discussions of the draft directives to remember them and evaluate them better. The fact is that, during the preceding 5-year period, work did not progress in the proper direction, especially where the concentration of labor and material resources for the work was concerned. In addition, sufficient measures were not taken for the rational utilization of heavy machinery and other means of construction, for the regular supply of construction materials, and for the timely solution of other problems connected with the completion and delivery time of the finished works. The analyses which were made by the party organizations, the trade union organizations, state and economic organs, the design and construction institutes, and the building materials industry have provided date which show that funds in construction are not always used with necessary thrift and care. In order to prevent the cases where, as Comrade Hoxha points out, there is "aimless use of funds", it is necessary that, in studying and planning construction projects, communists, cadres, and specialists show great care and plan with a tight hand. Experience shows that, to a great extent, the cost of projects depends on the kind of work these people do. The more rational the technological concept and structural content of a work or object, the more rational is the use of the monetary funds and materials. For example, from studies made by the Ministry of Construction, it was found that using reinforced concrete frames and perforated bricks in the construction of residential buildings reduced the weight of the building by 30 percent; the transportation of materials by 40 percent, and reduced labor needs by another 30 percent. These finding substantially lower the costs of residential buildings. The use of more advanced technology for the construction and assembly of the new thermoelectric power plant in Fier made it possible to lower the investment per kilowatt of electrical energy installed to 450 lek when it used to be 1100 lek. There are many such examples. Therefore, the 8th Plenum of the Central Committee of the Party set down the important tasks for the adoption, development, and implementation of advanced science and technology; for strengthening the institutions and organizations responsible for the study and draft of the plan with the most qualified and responsible cadres. The measures which have been taken and will continue to be taken to achieve the duties of the plenum are another important factor of special importance in discovering capabilities and in actually reducing monetary and material expenses in construction.

A long time ago, the party set down directives for the production of light construction materials which, when used, lower the cost of transportation and the weight of constructions and raise labor productivity. The implementation of this directive by the workers in the construction material industry has shown encouraging results in the production of prestressed reinforced concrete ceiling foundations and so on. These instances are rare when one thinks of the great opportunities that exist in our construction material industry. Even today, the capability exists to raise considerably the amount and variety of perforated bricks for walls, for ceilings, and for other kinds of construction; the profitability of using this kind of brick is easy to evaluate. A study by the Institute of Technological Research and Studies in Construction showed that, by replacing solid bricks with perforated bricks in social and cultural constructions, usually put up every year in areas subject to earthquakes, there would be a savings of 50 million regular bricks, which would require 800 people

to work 1 year to produce them; it would save 3.5 million kilowatts of electrical energy, 31,000 tons of coal, 670 cubic meters of lumber, and so on. This is a reserve that is available today. The 8th Plenum of the Central Committee of the AWP stressed that transforming the construction material industry from a relatively backward to a more advanced state will create other and bigger savings; this will lower not only production costs but, also, the construction costs and increase the effectiveness of investments in general.

It is a fact that, due to the party's careful attention, great progress has been made in the study and design of the most varied and most difficult projects. This is an important victory which in no way should lead us to euphoria or self-satisfaction, because the failure to complete projects on time, which has happened quite frequently up to now, results in substantial irregularities and obstacles in the completion of the construction plans. The failure to complete projects on time hinders considerably, among other things, the organization and management of work in the construction area which leads to the ineffective use of labor and the irrational use of the material and technical bases. These late deliveries become the reason for certain other erroneous manifestations and practices, such as becoming involved in too many projects, the violation of planned deadlines, and other phenomena with harmful technical and economic consequences.

The implementation of the task laid down by the Seventh Party Congress--which has been endorsed in the planning methodology--of providing designs and estimates for works, with options, before they have been included in the plan, becomes even more difficult now that all the studies and designs for industrial projects, large and small, are realized completely by our own special, technological and scientific forces. Therefore, in conjunction with the measures that have been taken and are being taken, such as the further revitalization of the institutes for construction and design and technological institutes, the setting up of new technological institutes and other organizations, of great importance are the measures to raise the effectiveness of studies and designs. We have to admit that we lack neither the capacity nor the experience to do this.

Some years ago, we only had a few planning cadres; today, hundreds of them are engaged in this kind of work in different planning institutes and organizations, and the capabilities exist, should the need arise, to increase this number by hundreds. Now it is possible to plan domestically, with our own forces, for all the projects that are needed by our economy and our society. In the last few years, we have gained a great deal of experience in planning for large industrial projects, not only construction-wise but technologically as well; studying, planning, and producing, with our own forces, machinery and equipment. The more than 50 percent increase in the 7th Five-Year Plan, as compared to the 6th Five-Year Plan, for the production, domestically, of machinery and equipment used in the development of industry, is due entirely to this valuable revolutionary experience that we have gained.

It is very necessary, among other things, to further improve urban studies and design activities. There is no objective reason why builders cannot be provided, on time, with complete designs for houses, gardens, nurseries, schools, hospitals, roads, and canals in cities and other inhabited areas. The fact is that, in this 5-year plan, we anticipate having 65 percent more investments allotted

for the communal sector than in the 6th Five-Year Plan. The construction of about 50,000 more apartments and other projects requires that urban planning problems receive the serious attention of the Ministry of Construction, the Ministry of Communal Economy, and the executive committees of the people's councils in the districts. Here we have to deal with further important changes in urban construction. We have to deal with housing and securing other vital needs for about 250,000 inhabitants, that is to say, four-and-a-half times, or seven-and-a-half times more inhabitants than in the cities of Vlore and Berat, respectively. The problem is to know how our cities will develop and grow, how will this urban, esthetic, technological, and economic construction present itself. The development of our cities can no longer be planned partially, without having a master plan based on scientific foundations and without clear perspectives being kept in mind at every step of our urban construction. Now many cities, especially Tirana, have need of more complex operations in the demolition of other buildings, otherwise it would be necessary to enlarge their surface area, which is uneconomical from every respect.

Respecting and shortening the construction deadlines plays an important part in raising the effectiveness of capital investments. Therefore, in order to respect and shorten the deadlines for construction projects, special care and attention is required in establishing the work for managing and organizing the enterprises and all the construction sites. The construction of every project is a link in that chain that is the single state plan. Every extension of the deadline has its own negative influences in the effective fulfillment of this plan and in maintaining the proportions which have been calculated between the branches and the different indicators of economic development. It affects the program for the accumulation of funds, which is the only base on which the bulk of other investments and expenses can rely for implementing the 7th Five-Year Plan, which will be approved by the Eighth Congress of the AWP. Therefore, the workers responsible for the implementation of the plan have the important task and responsibility of respecting the planned deadlines in the construction of projects, and even shortening them. Moreover, this can be achieved by a strong dependence on the advanced experience of the construction enterprises themselves. The examples are numerous, now and in the past, for the completion of projects in record time. Such an example is the construction of the second furnace in the metallurgical plant "Steel of the Party", which was completed almost twice as fast as the first furnace, and this was done entirely with our own forces. Without mentioning here the experiences gained from organizing and managing the work of eradicating the consequences of the earthquake, when the pace of construction for the completion of one residence was about 30 hours per unit.

Problems of this kind are the objects of heated discussions which are taking place in the midst of the workers collectives for construction and planning, the workers in the construction materials industry, and other workers' collectives whose work is responsible, to a great degree, for the realization of the investment plan. It is the task of the basic party organization to organize and guide correctly to its conclusion this broad popular discussion which discovers new important reserves to increase the effectiveness of the investments expected to be realized in the course of this 5-year plan. There is no doubt that the construction workers and the workers in the construction material industry will greet the Eighth Party Congress and the great jubilee of the 40th anniversary of its foundation with a positive balance by fulfilling all the duties of the plan for this year, as well as further improving the indicators of the 5-year plan which will be approved by the Eighth Congress of the AWP.

NEW TASKS OF ECONOMIC, FINANCIAL PLANNING ORGANS

Tirana RRUGA E PARTISE in Albanian Aug 81 pp 29-36

[Article by Bujar Kolaneci: "The Improvement of the Efficiency Indicators Presents Special Tasks for the Planning Organizations"]

[Text] The draft directives of the 8th Congress of the Party for the 7th Five-Year Plan, for the economic and cultural development of the People's Socialist Republic of Albania, have given a new impetus to the creative and innovative ideas of the working masses which are helping to improve the planning indicators and to increase the level of guarantees for their fulfillment.

One of the principal objectives of this broad popular discussion on the draft directives, Comrade Enver Hoxha stressed at the Tenth Plenum of the Central Committee of the Party, is to explain correctly and to imprint in the minds of everyone that the accomplishment of tasks in this 5-year plan requires, more than ever before, the need to discover and mobilize internal reserves, which exist and grow continuously in the heart of our socialist economy.

The attainment of this objective requires all-round explanatory work and the mobilization and organization of the party organs and organizations and, under their leadership, of all the state and economic organs, the mass organizations, and the scientific institutions and organizations. However, there are specific tasks in this area for the specialized planning organizations. Parallel to the great work that is being done by the party organs and organizations and all their levers to carry out success fully the activity of the people's discussion of the draft directives, the planning organs, in all instances, are taking part in a special activity to explain and specify the indicators of the draft plan for the 7th Five-Year Plan down to the smallest units of production and to reflect in the plan the changes that are being proposed and suggested by the working masses.

Meanwhile, the analyses are becoming more profound and different economic and financial studies are being completed which discover new capabilities and reserves to increase production and to improve other indicators of the economic and financial plans.

Good work in this area is being done by the finance and planning sections of the executive committees of the people's councils in the districts of Shkoder, Korce, and Tirana, as well as the finance and planning branches of the "steel of the

party" metallurgical plant in Elbasan, the auto part and knit wear enterprise in Shkoder, the "Misto Mame" wood processing combine, the meat and milk processing plant in Tirana, the textile mill in Berat, and many economic enterprises and agricultural cooperatives in different districts of the country. The positive results of their work speak, among other things, of the important function played by healthy economic thought when it is activated and deeply involved in the scientific treatment and solution of the problems of developing the economy, so that the economic-production and financial activity of the enterprises, the agricultural cooperatives, the districts, and the centralized government departments can be organized, managed, and achieved on the basis of the demands of the objective economic laws of socialism and on the principles of the Marxist-Leninist construction of our socialist society.

The newest experience, the discussion by the people of the draft directives of the Eighth Congress of the Party of the 7th Five-Year Plan, shows that the execution of a complete and deep analysis to recognize the present achievements in production, in technology, and in the matter of their economic efficiency--in order to uncover the conditions under which these results have been achieved and to see the difficulties that have been overcome, the advanced experience that has been gained, the deficiencies and weaknesses that have been noticed and their causes and to define the paths that must be followed and the measures that must be taken to isolate them--is a very important condition for organizing and realizing a more fruitful discussion of the new duties of the plan. It is a fact that whenever these analyses were made, and the workers became aware of the principal conclusions from these analyses during the discussions of the draft directives, a good number of ideas and proposals emerged to increase work efficiency, production, the range of varieties, savings of raw materials and other essential materials, to increase savings of combustible materials and electrical energy and to help solve many other problems. The fact remains that these analyses, whose conclusions open up horizons for the workers, the cooperative farmers, the technicians, and the specialists, should become a standard rule of work for the managers, the economic and government organs, and the planning and financial organizations; and these organizations must strip them of any kind of formality or shallow work. We emphasize this because, during the preparations and the development of discussions of the draft directives with the masses, there were instances in which certain planning and financial organs in the districts, in economic enterprises and agricultural cooperatives did formal and shallow work: analyzing mechanically the figures of the draft plans for sectors, units, and brigades without first making analyses, generalizing positive experience, and without exposing proven weaknesses and defects, in other words, without uncovering all the possibilities and reserves that exist.

Comrade Enver Hoxha's recommendation that "today great opportunities have been created to enable creative innovative ideas to serve the economic development" does not only apply to the workers, the cooperative farmers, the engineers, agronomists, technicians, and other specialists but, also, to economists and financial experts regardless of where they work. The area for the blossoming of their creative economic thought is broad because the economic productive and financial activity of the enterprises, the cooperatives and the districts and economic branches where they work is the same. No technical or scientific problem can be separated from the economic and financial problems. It is a fact that, in enterprises and agricultural cooperatives, this creative innovative

thought is breaking through boldly in the discussions of the draft directives and is being raised to even a higher level. The task of the planning organs is to learn to recognize innovative thought; look at it closely; support, perfect, and apply it with reliance on their own economic studies; opening for it the broadest possible path among the plans that are being drafted.

The financial and economic planning organs have the important duties of studying, discussing, and scientifically debating all the phases of broad socialist reproduction, relying on the demands of the objective economic laws of socialism, because, only be an in-depth knowledge of the demands of economic laws and by harmonizing and reflecting them in the plans of every enterprise and cooperative, even to the branch level and through all the economy, can we secure rapid growth, an optimal rate of broad socialist reproduction, and in increase in the efficiency of social productivity.

Within this framework, the role of economists and the planning and financial organs is irreplaceable. Their task, through complex economic and financial studies and analyses, is to bring forth scientifically based reasonings in order to open horizons which encourage discussion at the brigade, department, enterprise, and cooperative levels to discover, mobilize, and utilize all the internal sources and reserves which will lead to the most rapid growth of social efficiency and production.

Within the conditions existing in our country where the population increases at a rapid rate, higher than in any other country in Europe, and when it is foreseen that, in the course of the 7th Five-Year Plan, the income revenue for each individual will increase by 8 or 10 percent, the need to continue to keep and improve the rate of production growth, to keep the growth of the gross social product always several times greater than the rate of growth of the population, constitutes an objective necessity without which we cannot guarantee the accumulations needed to expand production and the nonproductive sphere; nor can there be an increase of reserves or a gradual improvement in the well-being of the masses. In the same way, experience shows that the rate of growth of social productivity is decisive in the growth of its effectiveness. Therefore, the task of the economic and financial planning organs is to concentrate their attention on realizing and improving the indicators which reveal the proportions between the different areas of the expanded socialist reproduction, such as the net production increases versus the general social increases, the ratio of products for society to personal products, the portion of workers in the material producing areas versus that of workers in the cultural and social areas, and so on. These and other ratios, which, together with the tasks defined in the draft directives, were determined to the optimum relations, as they apply to the whole economy and all its branches, must become objects of profound study in order to realize and improve them in every link of production, in every enterprise and cooperative, and in every district.

Naturally, the planning organs, in order to be able to achieve a task of this kind, must make sure that the workers, besides having a broad economic concept, have a detailed knowledge of the production capabilities of the enterprise or cooperative and actually know, by following the problem closely, how much and how to utilize these capabilities. Only then will they be in a position to make

well-founded, deep, and realistic analyses; to discover the pluses and the minuses, the reserves that have not been utilized; and determine the most effective way of using them. Only in this way can they provide strong support in the struggle against that negative tendency which continues to be present among certain workers who, "to be on the safe side" and not to create problems, withhold reserves for themselves, covering up the deficiencies of their organizational and managerial work. Their purpose is to prevent the planning of the maximum utilization of every technological line, of every piece of machinery and equipment; they do not want to undertake tasks that are always on the increase based on exploiting all the capabilities that exist and are continuously created by our dynamic development. It is imperative to work resolutely and struggle in this field so that we can respond to the fulfillment of tasks defined in the draft directives of the Eighth Congress that 80 percent of the overall industrial production growth in the 7th Five-Year Plan must be assured from the complete utilization of the existing production capabilities and from the planned reconstruction and expansion. It is very clear that the fulfillment of this duty makes it absolutely necessary, above everything else, to utilize fully, not only small units and production lines, but every piece of machinery as well. In order to do this, there is need for important, continuous, and very responsible work beginning with the planning stage, up to and including the implementation stages.

The growth of the effectiveness of social production, based on maintaining and improving the proportions anticipated for the 7th Five-Year Plan, is connected organizally with lowering the expenses for production materials, which currently constitute 58 to 60 percent of the expenditures of the total social product and, in some branches and sectors of the economy, 70 to 80 percent or more of the production costs.

Apart from the fact that there is a continuing requirement and obligation to lower the costs of production materials to increase efficiency, this problem confronts us, with greater intensity, within the special conditions of drafting and fulfilling the 7th Five-Year Plan by relying completely on our own forces at a time when the prices of resources and raw materials, which we have to import, are increasing continuously; and, due to the expanding dimensions of our economic reproduction, a decrease of every percentage point in the cost of materials for production represents hundreds of millions of leks in savings.

Lowering the costs of production is a public duty which can be realized in all the phases of economic reproduction, in every production unit, and every work process. However, the duty of the planning and financial organs is to carry out extensive analyses so that sound foundations for the rational use of material and monetary resources are laid beginning with the planning stage. It is essential to strengthen the mobilizing character of the cost indicators, because a reduction in the cost indicators for the 7th Five-Year Plan would ensure the greatest amount of net revenue for the enterprises.

The achievements for this year show that the capabilities and reserves in this direction are very great. As a result of the good work that is being done to monitor and fulfill the cost plans and as a result of the measures which continue to be taken, based on periodic analyses, during the first 6 months of 1981,

production costs have been reduced by some 10 million lek below the planned estimates. Meanwhile, due to the deficits created in fulfilling the production plan, as well as the failure to implement a strong savings regimen and insufficient controls on spending, a substantial number of enterprises have shown increases in production costs during this period.

Although, during the debates on the draft directives there were examples of serious, profound work on lowering the costs of production, construction, and serfices in general and the costs of material expenses in particular, there also were many instances of superficial and formal work. As a consequence of the discussions on the draft directives and the preparation of the draft plan for 1982, it was found that certain enterprises had not kept in sight, as they should have done, the guidelines given to reduce costs. Thus, the cost plan presented by some enterprises reflects only the improvements that have been achieved until now while implementing the duties of the plan, whereas the achievements which will be assured by the improvement of the socialist organization of work, by the deepening of the technical and scientific revolution, from which profound changes are expected to take place in the norms for the use of raw materials, by the replacement of imported raw materials with domestic raw materials, by replacing those that are costly and cause deficits by less costly ones, by putting aside "leftovers" and "throwaways" and changing them into useful profitable items, are not reflected at the proper level in the draft plan. In addition, in some enterprises, the analysis of the plan has not been supported by all the realistic factors which ensure a reduction in costs. In the construction material enterprise in Shkoder, for example, 81 percent of the plan for lowering costs is expected to be achieved from reductions made at the sector level; in the "Ali Kelmendi" food combine in Tirana, the reduction in costs is expected to be achieved at the 63 percent level by an overall reduction of expenses in the enterprise and the sectors, when it is well known that the overall expenses of the enterprise and the sector only account for a relatively small amount of the production costs. Likewise, in the electromechanical and "Dinamo" plants in Tirana, the cost problem has not been solved according to specific products and according to each sector.

From these defects and weaknesses in the work of handling, planning, and observing the implementation of the cost plan, we see the insufficient work done by some planning and financial organizations in not implementing strictly the planning methodology. They must improve their work in this direction by learning about and realistically monitoring and analyzing the situation, recommending areas which need the most attention in reducing costs. They should give the workers a clear explanation in regard to the cost structures, showing which of its elements are the most important in the overall spending program, so that, in the implementation of the plan, the workers will concentrate their attention on areas that are the most cost effective. The problems of reducing production expenses begin and become fixed at the basic unit level. In every link of production, the capabilities exist to save on material, resources, and manpower with better organization. However, the ministries and other central institutions, in particular, their planning organs, have a special duty to study better than they have done so far, the problem of the specialization and coordination of production and the ensure the most effective use of basic funds, raw materials, and other essential materials; to increase quality in production and changes in the

manufacture of products which will lead to a decrease in the need for raw materials; encourage the most rational distribution of products which will keep to a minimum the damage done to raw materials and other essential materials and goods and save on transportation; and so on. Thus, we should regard the matter of increasing the economic efficiency of production as a problem which is not restricted solely to the enterprise or the agricultural cooperative but as a much broader problem which includes the districts, the economic branches, the ministries, and all our people's economy in general.

In order to increase economic efficiency, very important duties are assigned to the improvement of the social productivity of labor, as the single-most important way to achieve the rational utilization of labor resources, with high effectiveness. The increase of work productivity is the principal factor needed to increase social production in general and in every economic enterprise and agricultural cooperative, in particular. Therefore, the planning organs and all the management cadres, specialists and technicians in enterprises, cooperatives, in the districts and the central government departments, must make a better contribution in this area than they have done in the past. It is our duty to find in every link of our economy ways and means which will lead to the improvement of the labor productivity indicators so that concrete measures can be defined and taken to raise the technical and professional level of the workers, to raise the technological level of work, to improve the existing technology or to replace old technology with new and more advanced technology, to support these measures with the necessary technical and material bases and the proper financial funds, to strengthen those ties that are created by cooperation between enterprises, and to solve many other problems which arise in the process of organizing and managing work and production.

As the mass discussions of the draft directives of the Eighth Party Congress for the 7th Five-Year Plan revealed, in order to bring the social productivity of labor up to a level which will account for 44 to 46 percent of the increase in the total social product for 1985 compared to 1980, special importance is given to the measures to increase the levels of mechanization and to improve production technology and other measures to introduce in production the latest scientific and technological methods, since it is through improvements of this nature that we expect to achieve a 50 percent growth in the social productivity of labor in the course of the 5-year plan. Therefore, it is necessary that the planning organs in every link, and in cooperation with workers and technicians, think deeply and seriously of turning their attention to these problems and defining concrete tasks, by relying in everything on their own forces, on the creative ideas of the workers, on their own advanced experience, and on the experience of other working collectives.

Within the framework of the discussions on the draft directives, in order to raise labor productivity, special and careful attention should be concentrated on matters that deal with the further improvement of the socialist organization of work, by relying on norms for the assessment of work in general and on setting technical work norms in particular. Much remains to be accomplished in this area, especially as far as the technical norms are concerned. This conclusion is derived not only from the fact that work norms are still statistical but, also, because work norms, even technological ones, represent one of the

most dynamic elements in organization, which depends on many ideological, social, technological, and organizational factors. It is for this reason that technological norms become antiquated and do not always represent the real capabilities. Therefore, they must be corrected from time to time, as is happening everywhere right now, in the discussions of the draft directives, by supporting, upholding, encouraging, and establishing the workers proposals and initiatives in this area which is helping to improve the production and labor productivity indicators forecast in the draft plan for the 7th Five-Year Plan.

The draft directives anticipate that, by the end of 1985, around 90 percent of the workers will be working with norms, while the actual work time worked with technological norms will account for 75 percent of the total working hours. These developments in working with norms will serve, first of all, to define even more exactly the amount of hours worked and, on this basis, the amount of compensation for it. This also will regulate certain disproportions, which are seen in certain enterprises and cooperatives, between production growths, on one hand, work productivity, pay funds, and average wages, on the other hand.

The experience gained in many enterprises and cooperatives, such as the "Petro Papi" instrument plant in Korce, the "Stalin" textile mill in Tirana, the wire factory in Shkoder, the iron and nickel mines in Perrenjas, the Rubik geological enterprise, the agricultural enterprise in Lukove, the "Progress" cooperative in Elbasan, and many others, confronts the planning organs at the grassroots and at headquarters with the current task of generalizing and better organizing the work in other enterprises and, especially, standardizing manpower expenditures per unit of product for the same work process and taking measures which will lead to a fuller activization of the factors responsible for influencing increases in work productivity. Greater care also must be given to improve the more rational use of working time by leading workers, who are directly responsible for the fulfillment of the plan and for keeping the workers in departments and subsectors and technical, administrative, and economic personnel fully supplied with work at all times.

We are in the first year of the 7th Five-Year Plan. Therefore, the work for achieving the tasks of this 5-year plan has begun. They are important and considerable in range but fully realizable because they are, more than ever before, scientifically based; the tasks were set and defined after massive all-round studies, evaluation, calculations, and consultations in all their links, persistently and for an extended length of time. The conditions, the real capabilities, and the ways to achieve them are being evidenced once more in the discussions of the draft directives by the people.

Naturally, difficulties in fulfilling these tasks exist and will continue to exist; therefore, a greater, more comprehensive mobilization of the creative realizable energies is required, based on exemplary organizations and steel-like discipline. Within this framework, the planning organs at headquarters and at the grassroots have important duties; they have the task of monitoring, step by step, the entire process of implementing and realizing the tasks of the plan.

BRIEFS

GRAIN SHORTFALL IN SLOVAKIA--According to current agricultural production figures on grain production in 1981, Slovakia has suffered a shortfall of over 645,000 tons of grain. Premature ripening of corn during the summer caused production loss from 2,700 hectares of corn. Sowing of winter grain has been successfully completed; 102 percent of planned wheat, 103.2 percent of rye and 108 percent of barley have been sown. Winter mixtures have been sown on 48,200 hectares, which is 115.6 percent of planned sowing. Wheat has been sown on 398,200 hectares. Compared with 1980 winter crop sowing, 46,700 hectares more have been sown in 1981. In response to recently adopted agricultural measures to reduce the number of pigs, 27,600 sows with low meat yield have been identified for slaughtering in the SSR by 15 December. [Bratislava ROLNICKE NOVINY in Slovak 9 Dec 81 p 1]

PIONEERS COLLECT WASTE BREAD--Members of the Pioneer youth organization have been making door-to-door household collection of dry bread in Stod, Plzen-South District. The bread is used as fodder for pigs at a local state farm. [Prague ZEMEDELSKE NOVINY in Czech 9 Dec 81 p 4]

ENERGY MANAGEMENT, CONSERVATION MEASURES EXAMINED

Budapest FIGYELO in Hungarian No 44, 4 Nov 81 p 7

[Report by Szoke: "A Quick Look at the Conservation Program"]

[Text] Those who know what kind of burden the 10-billion-forint energy investments are for the national economy and what kind of negative effect imported energy has on our foreign trade balance must see the significance of even a 1-percent conservation of energy in the country's energy consumption or in the imports of crude oil and crude oil products. Huge sums are involved here, as the 1 percent mentioned is equivalent to about $70 million worth of crude oil. It is understandable, then, that the results of the energy conservation program, ratified in 1980 by the parliament's industrial committee, drew considerable interest.

This program set a double goal for our energy management: on the one hand, it was supposed to slow down the rate of increase in energy consumption; on the other hand, it was supposed to change the structure of energy consumption and energy resources so that the consumption of domestic energy sources (coal, natural gas, and nuclear power) would increase and that of liquid hydrocarbons would proportionately decrease.

The program allotted 30 billion forints for investments during the plan period. Of this, 15 billion is allotted for large state investments (e.g., the construction of a cracking plant, which would make crude oil processing more efficient; an increase in natural gas supplies, etc.). The other half is for investments in energy rationalization at the enterprise level (this includes a 6.4-billion-forint state subsidy, 8.6 billion forints worth of bank credits, and the enterprises' own resources). In November of the past year, a competition was announced for ideas on the possibilities of using state subsidy and credit; the normative requirements of access to these means of financing was set at that time.

During the year that went by since then, 198 bank contracts on energy rationalization were signed in the value of more than 4 billion forints; and 16 enterprises are implementing investment projects worth 630 million forints, using their own resources without any outside help. At the enterprise level, these investments will make it possible to conserve an amount of energy that is equivalent to about 0.7 percent of the country's present energy consumption. In

addition, the investment projects mentioned, which have been started already, will also help the substitution of a significant amount of heating oil and cokes with other energy sources.

The next year will probably see an increase in loan contracts involving enterprise energy rationalization programs, i.e., the start of investment projects; if we reckon with the fact that the average time required for the completion of these investment projects is 1.5 to 2 years, then the entire 15 billion must be contracted by the end of 1983. In order to achieve this, the enterprise involved also must speed up the making of their proposals regarding energy conservation, the decrease of specific use of energy, and the change to economical fuels.

At the meeting of the parliament's industrial committee, Dr. László Kapolyi, state secretary of the Ministry of Industry, reported that, although only a fraction of the investment projects specified in the energy conservation program has been completed, there are already significant results. In spite of an expected economic growth of 2 percent, the country's energy consumption is expected to be 1 percent lower this year than last year. Consumption is thus about 3 percent lower than specified in the Sixth Five-Year National Economic Plan which, it is true, reckoned with a somewhat faster economic growth than it is expected now. According to estimates, the increase of next year's energy consumption also will be only 1 percent, i.e., half of the annual increase of about 2 percent specified in the 5-year plan.

The decrease in energy consumption is mainly the result of a slower economic growth, but the effect of the change in the structure and a decreased production of energy-intensive products also is significant. The energy rationalization investments are larger than expected; this also is true of the initial results of organizational measures which were greatly supported by the new pricing regulations.

In addition to slowing down the growth of energy consumption, the government's energy program also is supposed to change the energy structure in a way that makes it possible to decrease crude oil and crude oil product imports. As a result of such efforts, the consumption of domestic energy sources increased in the entire consumption by a few tenths of 1 percent, probably reaching 48.4 percent this year. In examining the data of the last 4 years, however, it becomes apparent that imports are still growing; however, imports of crude oil are not increasing but, rather, those of electric power and natural gas which make our energy structure more economical.

The reason why it is important to emphasize all this is that the favorable effects of the conservation measures and structural changes have been apparent in our energy management ever since 1979. One of the results is, for example, that it has been possible to decrease the proportion of crude oil and crude oil products from 40.7 percent in 1978 to about 33.4 percent next year. This means that in 1982 we will use about 2 million tons less crude oil than in 1980 and, of course, our crude oil imports will decrease by the same amount.

In order to make energy imports less of a burden on the national economy, it will be imperative next year to extend and speed up the energy rationalization

program--as stated in the resolution passed at the last meeting of the Council of Ministers. In addition to the results achieved by measures in organization and simple conservation, and maintaining the better-than-expected results, further possibilities of conservation and structure improvement must be found. We must reckon with the fact, however, that the possibilities of conservation without investments, only through organizational measures, are going to decrease in the future. This is why we must not forget that the efforts to improve energy management and to decrease imports require an appropriate regrouping of significant financial and spiritual resources. We must add that the domestic energy investments have a significantly lower-than-average rate of return. This presents a formidable task not only for the enterprises but also for the supervisory and functional management organs, for the specified rate of economic growth also must be attained at the same time.

AGRICULTURAL ACHIEVEMENTS, PROSPECTS ASSESSED

Budapest MAGYAR HIRLAP in Hungarian 8 Dec 81 p 7

[Text] Agriculture will increase production by 4-4.5 percent next year. The national economic plan calls for a greater increase in crop production and a lesser one in the case of livestock according to a report of the agricultural committee at yesterday's session of the national assembly. Under the chairmanship of Dr Laszlo Cselotei, the representatives analyzed the agricultural section of the economic plan in detail. Debates revealed that inclement weather resulted in a disappointing grain harvest which was not offset by the achievements in livestock raising. Nevertheless, there is no cause for complain because the population's supply of food was uninterrupted throughout the year; winter supplies have been safely stored, and export of foodstuffs can increase appreciably.

Preparations for next year's production were carried out systematically, and, according to Ferenc Vendegh, deputy minister of agriculture and the foodstuff industry have been met even in case of merely average weather. This fall more cereal grain has been sown than has been the case for decades. However, this was done at the cost of areas usually reserved for bulk fodder. This is a problem because average bulk fodder and pasture land yields are below expectation. Therefore, production of secondary-crop bulk fodder must be increased along with a substantially greater use of field crop byproducts.

This is all the more necessary, because the national livestock herd is on the increase. If returns from animal husbandry improve, production of meat products can increase to a greater degree than planned next year. Already more fatted hogs are being raised than specified in the Sixth Five-Year Plan, and there is expected to be a slight increase in raising of beef cattle. Although the number of milch cows is decreasing, higher yields are expected from them. There is greater enthusiasm for raising poultry. Growth in the participation of small producers plays an important role in this trend; this should be sustained by guaranteeing that conditions for raising and sales are assured and that supplies of feed will be steady.

Investments in agriculture were substantially greater than planned this year. The financial reasons for this include credits for export-stimulating investments and

energy conservation. Furthermore, farm income was greater than expected because of a good agricultural year in 1980 so that the farms had more resources of their own to use for development. The farms' own investment sources are expected to remain unchanged in 1982 but the extent of state support will decrease and terms for obtaining credit will be more stringent.

This fall for the first time in many years the amount of chemical fertilizer used has increased. This is because changes in regulators were announced in good time.

ESSAY ON POLISH ECONOMIC CRISIS 1980-1981 REVIEWED

Warsaw ZYCIE WARSZAWY in Polish 2 Dec 81 p3

[Article by Janusz Stefanowicz: "A Footnote to 'Polish Crisis 1980-1981'"]

[Text] The short but important essay of Prof Jozef Pajestka, "Polish Crisis 1980-1981," provides inspiration for much reflection. Here are a few possible reflections, simply by way of encouragement to read the essay.

Among other things, socialism differs from the other socioeconomic formations known up until now in that, despite statements to the countrary, it entered the implementation stage not as the result of the press of socioeconomic conditions which had matured in that direction brought to birth by revolution, but only as the result of the victory of a political power which conveyed the ideas and decided to implement them. This circumstance gave rise to two extreme positions. The creators of "real socialism" propagated the extremely optimistic, naive, or else cunning view that this system almost automatically insured social progress and the satisfaction of man's many-faceted needs. When it came up against reality which was often unpleasant, this hypothesis made it very easy for opponents of socialism and also for disappointed society simply to turn it around: if a system allegedly can do everything and actually is not doing much, then that means that the concept is false, empty, and stands in the way of real progress.

The author of "Polish Crisis" answers this with simple wisdom: "It is possible to spoil a country which has a capitalist economy. It is also possible to spoil a country based on the principles of a socialist economy... Planning provides great possibilities, but in and of itself there is no safeguard against bad planning. This is the way it is with every instrument. Socialism is no authomatic assurance of good policy or guarantees that everyone will work wisely and well." In other words, socialism should be treated merely as an opportunity, and those who have it should consider the way to avoid wasting it. Up until now this aspect has not been the strong side of the wielders of socialist power.

The victory of socialism, an exceptionally ambitious variant of ideas of progress, also created another illusion in countries of moderate or low development: It was assumed as a dogma that the sense of mission for development proper to this idea is a proposal which cannot be rejected, it joins the society to the leadership, giving the latter at the same time its own special "carte blanche." Prof Pajestka is certainly a forerunner among theoreticians of this system when he says that "the conflict between the mission for development of the authorities and the aspirations of the population" are the broader underpinnings of the revolt of the working class, and here it was of a rather low level, as he mentions elsewhere, and led to the mission of industrialization.

The author presents two courageous theses against this backdrop. In relation to Gierek's times he states, "The great noncohesiveness of policy between the exceptionally ambitious mission for development of the authorities, on the one hand, and the readiness to carry it out, on the other," initially grew out of the fact that "the mission for development was more of a need of the power elite than a historical necessity." The monarchal style in which socialism was practiced as the grace of power misled the society for a while, but it did not incline it to make the sacrifices necessary to carry out that mission. Right away "dynamic development" was taken up in good spirit, even with enthusiasm -- by the author too, if I remember correctly -- as the gold coins thrown out on the occasion of the jubilee of Aga Khan, the seemingly light-hearted source of his initial successes was monetary, foreign debts. But when the bag became empty, there was no incentive to face up to the impending crisis. There was a weakening of power, along with a charitable smile, which hid the interior conscious arrogance that cannot allow a decline from on high in the standard of living or "the decisive use of state power," and this weakened authority "delayed the crisis at the cost of permitting it to become intensified."

The other "pro futuro" hypothesis requires skilled in-depth analysis, but it is certainly worth great attention: "the implementation of the mission for development by forcing investments has no sense today or for the foreseeable future." The author thereby calls for avoiding delays with strategic decisions with a timeframe to the year 2000 and beyond, because he thinks that it will be upon them that whether or not undertakings in the area of economic balance, the redistribution of the labor force, and the self-government of enterprises make any sense and if so, what sort of sense, will be depend. They all require a tremendous amount of group effort, are generally unpopular (in practice it turns out that they are unpopular in experience with the self-government of the work forces too), and so on, and for this reason they must be installed in such a vision of socioeconomic development which is at the same time as rational as possible and optimally approved by the society. Somebody may say that the thrusting of the forced industrialization, of cumulation was accomplished via facti, but the pressure of current conditions does not create

a vision of the future, and this vision is necessary, obviously not as a successive, willful idea of future incompetent authorities, but as a generator of the ambition of the nation and at the same time as a limiter of an aspect which Pajestka emphasizes, "the danger of the paralyzing play of group interests," which it will be so terribly difficult to avoid.

PROGRESS ON 1982 ECONOMIC PLAN REPORTED

Warsaw RADA NARODOWA GOSPODARKA ADMINISTRACJA in Polish No 19/20, Oct 81 pp 20-21

[Article by Ryszard Cwiertnia: "Work on the 1982 Plan"]

[Text] The Council of Ministers' resolution undertaken on 14 September of this year on the question of the principles for drawing up the drafts of the annual plans and budget of the state for 1982 introduces basic changes in the previous system of planning. The provisions of this resolution are mainly aimed at insuring that the implementation processes of the program for getting on top of the economic crisis progress in a planned manner. Also being addressed at the same time is the question of organizing these processes, which are intermediary by the nature of things, so that they will not slow the inculcation of the economic reform. It was not a simple matter to resolve this problem, because it is not easy to coordinate the necessity of state intermediacy with the independence of the enterprises. Nonetheless, it seems as though the solution adopted will be an effective way for the first stage of getting out of the crisis, a stage which includes the year 1982.

The preparation of the following documents is projected to occur during this period:

Annual Central plan
State budget
Credit plan
Regional plans, and
Plans of the enterprises.

Of course, the most important are the changes in the methods of working on the Annual Central Plan (previously the National Socioeconomic Plan) and the mutual relations between the CPR (Centralny Plan Roczny; Annual Central Plan) and the plans of the enterprises. The Annual Central Plan ceases to be a plan establishing the tasks and funds for the organizational units of the plan, such as the economic-type ministries and others. In this connection there is a departure from directive-distribution methods of hierarchical planning. For the first time planning on two levels was introduced, that at the central level and the enterprise level.

The Annual Central Plan will consist of two basic parts:

I. A forecasting and informative section containing forecasts of socioeconomic phenomena from demographic forecasts to forecasts of the production level for certain goods right up to synthetic forecasts of the results of economic activity; this part serves as the basis for central plan decisions and is one of the informational bases of the enterprise and voivodship plans.

II. A determining section which includes: general economic decisions of the central plan and operating programs for implementing the major socioeconomic goals, with concrete information concerning goods and groups of goods.

General economic decisions of the central plan consist of establishing allotments, prohibitions or recommendations, such as the amounts of investment outlays for certain investment tasks (considered central), prohibitions on the export or import of certain goods, and the command to restrict or discourage the production of certain goods.

Operating Problems

From the viewpoint of the problematics of getting out of the crisis, the method of resolving planning and implementation issues concerning the basic problems of the functioning of the society and the economy is of greatest significance. The following have been recognized as such issues:

Food,
Public health and personal hygiene
Clothing, footwear, and other products for children and young people,
Fuel, power, and raw materials,
Exports,
National defense.

The elaboration and implementation of what are called operating programs are to held in resolving these complex problems. The list of these programs and the chairmen and personnel for the operating groups have already been established. It is to be anticipated that in the operating programs, which are to be drafted with variants, the nomenclature and size of production of goods which are of basic importance in the resolution of a given complex will be specified. It should be assumed that except for the fuel, power, and raw materials complex, the operating programs will set the production volume at a level which will satisfy entirely the needs of the society or the economy (or a specified extent of them).

The most important element of the programs will be to insure material supply to carry out the production contained in the programs. To this end it has been established as a principle that centrally cleared and distributed materials (16 groups of materials encompassing about 17 percent of the total value of supplies in circulation) will first of all be insured for the production included in operating programs. At the same time the allocation of these materials will be made in a manner completely different from that employed in the past.

In the allocation of rationed materials the decisive factor will be the contracting of an agreement on the delivery of goods contained in the operating programs with appropriate foreign trade or market trade organizations. The signing of such an agreement will be authorization to sign an agreement (obtain an allotment) for the delivery of a corresponding amount of distributed materials. Designated centers (enterprises) which handle turnovers of the means of production entitled to exclusivity in turnovers will conduct the turnover of materials included in the distribution.

Resources of rationed materials remaining after needs stemming from operating programs have been provided for will be distributed according to commercial principles in keeping with the priorities assigned in the Annual Central Plan which are obligatory guidelines for enterprises engaging in the turnover of the means of production. These guidelines may vary in nature and will be adapted to the type of material. The priority may be assigned to the type of enterprise, for example, small manufacturing, or the type of production, such as production for market needs or for export, or else to the type of activity, such as transport, repairs, and the like.

This organization of production and supply should provide for utilization of limited supplies of materials in a manner which is rational from the viewpoint of stabilizing the economy and meeting the fundamental needs of the society. In dependent of the above-mentioned centrally guided operating programs, the voivodship governors have been charged with working out special operating programs concerning construction and environmental protection in cooperation with the Minister of Construction and Building Materials Industry and the Minister of Administration, Regional Economy, and Environmental Protection. These programs will be of tremendous significance in the resolution of the enormous regional management problems.

In order to insure the correct and effective drafting of operating programs and the creation of proper conditions for carrying them out, directors of the operating programs will be endowed with extraordinary authority.

The Chairman of the Planning Commission of the Council of Ministers, in cooperation with the Minister of Finance, has been authorized to specify the jurisdiction of the program directors. In the individual ministries plenipotentiaries for implementation of the operating programs will be

appointed at a rank on a par with deputy ministers and will supervise the way the established targets are being met.

The most important task of the operating program directors and ministry plenipotentiaries on their implementation will be to work towards the contracting of agreements among all the enterprises participating in the implementation of the various programs. Of course the groups working out the export programs will have the most difficult task.

Therefore, within the area of the operating programs there will be a close relationship between the provisions of the Annual Central Plan and the plans of the enterprises, but this will not take place by way of the traditional directives established in the past. It is estimated that initially 20-30 percent of the industrial production will be included in the operating plans. In certain enterprises all production may be contained in the operating program. The established procedure for carrying out the operating programs will in no way violate the principle of the independence of the enterprise or other aspects of the economic reform.

A number of problems in the organization of the planning process for 1982 were only eluded to in the above-mentioned resolution.

The Chairman of the Planning Commission of the Council of Ministers has been charged with drawing up the following:

Methodological instructions on the preparation of drafts of annual voivodship plans and the scope of information to be sent to the central echelon,

Inquiries to enterprises producing raw materials, other materials, fuel, and energy and to major exporting enterprises, concerning their planned targets,

Instructions on the preparation of drafts of voivodship plans,

Instructions on drawing up draft plans for ministers handling interministry coordination outside the sphere of material production, and also instructions on drafts of plans for science and technology and for quality and standardization,

Principles and manner of drawing up the plan of deliveries to meet the country's defense and security needs,

Manner of utilizing information concerning investments obtained from investors in the INBANK system.

It is to be anticipated that the scope and quantity of information transmitted in the instructions and gathered at the central level from the drafts and plans of the voivodships will be greatly reduced in comparison to previous practice.

Informational Reports Instead of Directives

An important element of the new forms of cooperation in the structuring of the economic activity plans will be the system of an ongoing exchange of information between the group of selected enterprises of various subsectors of the national economy and the Planning Commission of the Council of Ministers. The exchange of this information will begin in September through direct contacts between designated employees of the planning commission and management of the enterprises.

The subject of the first information from the central planning body consists of preliminary targets of the 1982 socioeconomic plan and the above-mentioned Council of Ministers resolution on the principles for drawing up drafts of the plan for this period. These documents will be the subject of Council of Ministers deliberation this September and will be sent to the Sejm. Informational reports on the problems of the annual central plan will be sent as well to the heads of trade unions and social and political organizations and will be put out for general information in summary form. This means that the principle of socializing the process of planning, as established in the directions of the economic reform, will encompass all phases of it.

The system of exchanging information should mainly insure that the enterprises have an ongoing awareness of the changes occurring in general economic conditions of their operations, such as price forecasts, supply possibilities, and so on, and should orient top bodies of the state administration on the socioeconomic dangers occurring in the enterprises, and the proposals and notions offered concerning the resolution of concrete problems. The principles introduced should help upgrade the quality of planning both at the central level and in the enterprises.

Autonomous enterprise plans will be drafted on the following bases of information:

Agreements with commercial units concerning the implementation of operating programs, discussed above,

Agreements with other units of the socialized economy,

Informational reports stemming from the forectast section of the annual central plan,

Prohibitions and commands contained in the central plan targets section,

Prices, tax rates, customs rates, foreign-currency exchange rates, and other economic parameters.

Rules and mechanisms to which the enterprise must adhere in the realm of the payroll fund and social funds of the workers, turnovers of supplies, foreign trade, and investment and financing activity,

Other data of their own which are essential in drafting the plan for enterprise activity.

As the timetable for work on the economic reform shows, probably hardly any of the basic information will be available to the enterprises before this December. Thus, the current work being done on planning should of necessity focus on direct processes. Taking this fact into account, the 31 January 1982 deadline set for the worker self-government to approve the enterprise's plan for 1982 should be considered to be really asking a lot of the planning services and requiring great concentration.

New Role of the Finance Plan

In view of the inculcation of the economic reform and of its inherent principle of the enterprises' self-financing of their operations, we should note the entirely new role and tremendous significance of the financial plan. This plan previously (except during the period of the application of the principle of the WOG [large economic organizations]) did not play any really important role or awaken any great interest (but should have) on the part of any link in the planning system. Currently in the self-governing enterprises which are independent and finance their own operations, they will become a basic minimum of the economic effectiveness of operations projected by the enterprise. The enterprises will present their annual operation plans to the banks financing them and to the district boards of state income and financial control.

The scope of information on the enterprise plan sent to the central level will be established in a Council of Ministers resolution on the annual central plan for 1982. It is to be anticipated that the number of these informational reports will be limited to the bare minimum and will not be used for any sort of assessment of the results of the activity of the self-governing enterprises by the machinery of the central economic administration.

Informational reports which the enterprises send to the voivodship governors will also be limited in a basic way and will concern planned changes in employment, expected level of the payroll fund, the demand for the intake of water and for transport, level of polluting emissions, effects of housing construction, and changes in land development. This means a basic addition to the content of the voivodship plans.

MINISTER COMMENTS ON PRICES, RATIONING AND CURRENCY REVALUATION

Gdansk GLOS WYBRZEZA in Polish 15 Oct 81 pp 1, 4

[Interview with Zdzislaw Krasinski, minister plenipotentiary for price reforms, by Wojciech Rybowski; date and place not specified]

[Excerpts] [Question] /We talked together for the first time exactly 3 months ago. Then, sir, you were an optimist. Sir, you counted on the public accepting the price increases which would bring positive market results. The first price increases are behind us. To begin with, bread and grain products have increased in price as well as cigarettes and freshwater fish. Well then--do you, sir, continue to be an optimist?/

[Answer] Yes. I see no special reasons for not being one.

[Question] /I'm glad, sir, that you are in good physical and psychological condition. But, sir, you have stated, for example, that increases in the price of bread would quickly bring results in the form of a wider assortment of bakery goods, an improvement in their quality, and a decrease in waste. If one listens to people, it should lead one to the conclusion that they are disappointed./

[Answer] I counted on the increase bringing more quickly more visible results--that is true. However, I don't agree with the statement that the results have been insignificant, or that there have been no results at all. As you know, sir, I haven't been sitting behind a desk; I've been travelling a lot, talking with people; and we've been doing a lot of polling.

[Question] /...and what's been the upshot of these polls?/

[Answer] ...there have been certain, not great, but--let's say--moderate results. There has been less of a demand for bread in the countryside as well as in small and medium-sized towns, where a certain percentage of it is designated for animal feed. This was simply being wasted. Also there has been somewhat less waste in larger agglomerates. In smaller towns, the quality of bread has improved and there is a greater assortment of bakery goods. It is a fact that it is so much the worse in larger towns, but there are exceptions. Furthermore, I was somewhat surprised--knowing the opinion of the large agglomerations--at being interrupted as I was in Poznań at "Cegielski's" when I began to explain why there wasn't decidedly better baking goods.

[Question] /What has your staff said?/

[Answer] They said that we have better bread--let's not return to that theme. Furthermore, I affirm that in the whole, or almost the whole, country, we shall indeed have better baked goods.

[Question] /Firstly, when? Secondly, on what are you, sir, basing this statement?/

[Answer] Of course, I don't want to say that this will occur in 5 or 10 years, because that would be absurd. It seems to me that it won't be long--2, 5, or 7 months, depending on the conditions of the region. The prerequisite for this happening may be the fact that, in connection with the higher price of bread, there is felt the pressure to get about 1,000 flour mills rolling, mainly in the villages. In turn, in the towns there appears to be a tendency and a certain pressure to reactivate and develop small bakeries. This is what I'm getting at--higher retail price stimulates production.

[Question] /"Solidarity" reacted sharply to the price increases of fish and cigarettes. During the second round of the congress, you, sir, were with Minister M. Krzak in Gdańsk and found yourselves on the firing line. Your argumentation was not convincing. Some say that it was simply weak./

[Answer] Often we fall back on the West, let's do that now. France's "Le Figaro"--note well that it is not of the left--commented on Minister Krzak's statement on the subject of the need and appropriateness of the increase in prices of cigarettes, treating it more or less like a good technocratic argument. And the hall protested. Protests also accompanied my statement, which dealt with detailed matters. Only the rather emotional statement of mine that one of the goals of the price increase is to ensure that neither my children nor other people's children would have to stand in line in the latter part of the 20th century was well received. And thus in an incidental way as it were, real sadness came over me when the hall was unresponsive to the argument that increases in retail prices of cigarettes and tobacco would permit increasing revenues in the budget which would supply the sums paid to retirees of the old file.

[Question] /But why wasn't "Solidarity" at least informed about the dates of the increases?/

[Answer] Discussions on the subject of an increase in prices of cigarettes and tobacco already took place in July, and "Solidarity" expressed no opposition. Since this is a rather well-known matter, I am convinced that you, sir, attach great importance to why we didn't make our intention directly known prior to the whole operation. Please imagine to yourself what would have happened had advanced information reached sale points. Cigarettes which were there on hand would have been "laid away" by the sellers instead of reaching the owners of rationing cards. After all, everyone knows that we are in a position of checking on only once every 10th, and perhaps every 7th kiosk.

[Question] /Frankly, I have my doubts whether to question you, sir, unmercifully about further plans, i.e., about subsequent increases, or to question you somehow temperately. The journalist's duty and the readers' curiosity speak in favor of the first approach which results in compelling inquiries. However, one need not go

far in seeking arguments for the second approach, and what's more they are not by any means unimportant arguments. At times it is stated, you know, that in speaking about stages in price increases--whether it is in a previous interview for "GLOS" ["Voice"], or in other publications--and apart from drawing a scenario which will vanish from the market if we don't introduce a reform in retail prices, you, sir, have already contributed indirectly to stripping the market bare of a number of goods, mainly manufactured goods. A close associate of yours has said: When there is talk of price increases a flame shoots forth from our chief, but, in turn, he sets fire to the money in our citizens' pocketbooks./

[Answer] I am aware of this. I think, however, that I have no other way out. The alternative is not saying a thing and making the subject of prices taboo. That's the way it was in the past and everyone knows what not preparing the people for price increases has led to. Now, finally, with the existence of energetic trade unions, an attempt at concealing these plans on such an essential matter as prices is impossible.

Irrespective of the existence of unions, however, speaking on prices and the drawing up of a scenario are a result of my own conscious choice in the method of action. Indeed, in agreement with what I told you, sir, in the first interview, my research has shown that one of the three main reasons for the failure of the attempt at increasing prices in June, 1980, was the authorities' mistrust towards the society. The people replied--they don't want to be surprised and treated like children. Finally, it is not only I who draws a scenario that disappears from the market when reform isn't introduced. C. Bobrowski and W. Herer, for example, also do this. By that, I don't mean to throw off part of the burden from myself. I affirm that this is what is needed and they too are doing well.

[Question] /So what kind of price proposals are we to hope for in the near future? Are you, sir, going to stay with an increase of 220-250 percent?/

[Answer] I think that we have no way out. In the second stage (the first stage encompassed increases in the price of bread and flour-wheat products--footnote, W.R.) we are planning an increase in the retail prices of coal, gas, electricity, payment for central heating and the retail prices of those food articles which producers are beginning to accumulate.

[Question] /In general, what are these products?/

[Answer] This mainly concerns jams and marmalades.

[Question] /What's the reason for this?/

[Answer] Production costs are higher than present retail prices. And continuing with the thread of conversation begun earlier, in the second stage I propose an increase in the prices of potato flour, sugar and salt.

[Question] /When is this going into effect?/

[Answer] We are sending the prepared draft to trade unions this week. Consultation and corrections should not take up more than a month's time, that is to say, increases, if they are accepted, should be in force in the second half of November.

In the next stage I foresee an increase in the prices of milk, milk products, vegetable oils, and in the fourth stage an increase in the prices of meat, animal oil and saltwater fish. This should take place in the first months of 1982.

[Question] /Perhaps a few examples. How much is coal, butter, jam and ham going to cost us?/

[Answer] Coal will cost 2,000 zlotys (currently about 550 zlotys); table butter 60 zlotys per cake (currently 17.5 zlotys); prepared smoked ham about 500 zlotys (currently 180 zlotys); strawberry jam 40 zlotys per jar (currently 7.9 zlotys.)

[Question] /Recently, sir, you proposed about 450 zlotys per kg of ham./

[Answer] Yes, but since 1 October of this year, costs for the procurement of pork animals for slaughter have risen; and if we want to stick to the logic of economics, then we should estimate higher retail prices for products, in this case, ham.

[Question] /Before April, no one really wrote or spoke about prices at any length publicly. Now first professor Zdzislaw Krasiński of the Academy of Economics in Poznań gets heavily involved in expressing himself about the need for a pretty big increase in prices, and 3 months later the minister continued his offensive in this sector. After this, when he turned up his visor, suddenly there were found to be quite a few opponents. They present various views. I will reduce them to three: first--currency reevaluation; second--expansion of rationing. Both in lieu of, or alongside drastic price increases. The third, on the other hand, closely links general economic reform with price increases. Perhaps, sir, you would comment on these propositions?/

[Answer] Currency reevaluation is not possible from technical and social points of view. Technically, since no country in the world will print quickly for us as much money as we would need, even if we wanted a reevaluation. Secondly, I think that society would not accept a currency reevaluation.

In regard to rationing, I am against it. Already in its present form, it appears to be an anti-economic, onerous bureaucratic system that exhibits a disinclination to work. Expansion of rationing would be negative economics. I have taken up this position so as to eliminate rationing and bring about a real, not an illusory, functioning of the market based on price stability. And when it comes to the third solution, there is much to be said for it. We probably could have considered the linking of economic reform and retail price reform at the end of last year or at least at the beginning of this year. In the present market situation, it is first necessary to begin to calm down the market, without waiting for January, 1982, when the big reform is going into effect.

[Question] /But can one be insistent that without an economic balance there won't be a market balance in other important economic areas./

[Answer] My formula is clear--in the situation as it is, first begin to calm down the market, and then we can put the economic balance into perspective. Putting it another way, retail price increases should contribute to the economic reform's

coming into play. This, of course, does not mean that with the reform one has to wait for all the stages in retail price changes of food, heating fuel and energy to be completed. I shall repeat what I have already said many times before: "Solidarity" correctly makes its acceptance of price increases on the condition that economic reform will not be delayed and that it will be profound as well as complex. Only in such a reformed system can altered prices truly fulfill their function and contribute to the proper functioning of the whole system.

[Question] /In principle we have been talking only about price increases, without referring to compensations. The first stage, after certain discussions and perturbations, has produced full compensation. Will these same principles be in force in the next stages, or will they be changed?/

[Answer] As in almost every case, we poll the society. I strongly emphasize this because I want to know the broadest sections of the public as possible. On the basis of this research we have originated drafts for compensation. There are those, for example, who anticipate equal compensation for everyone, as well as anticipating a degression in compensation in proportion to the growth of earnings and incomes per family member. The results of our research show that 68 percent of the persons who were polled were in favor of a degressive equalization of increases in retail prices. Here I would like to encourage once more tha trade unions to join in working out and revising as well the proposed compensations, for we are not treating these drafts or plans like rigid statements.

Moreover, it is necessary to distinguish compensations that come under the rubric of the proposed large increase in retail prices of food, heating fuel and energy, which have remained stationary for years, from compensations under the rubric of "normal" growth in costs of living. We ought also introduce such adjustments in the growth of costs, and, in this matter, I am inviting trade unions to send in suggestions, propositions, and, more generally, to collaborate with us. Finally, exactly 2 days ago, "Solidarity" sent us a message via telex expressing their acceptance of our invitation.

[Question] /The inflationary curve presently amounts to at least 500 billion zlotys. The proposed price increases from compensations cannot, as I see it, contribute to an appreciable reduction of that sum. Next, you say, sir, that the purpose of the state's action is to bring about a balance in the market, but without liquidating or seriously reducing this inflationary balloon. One can only dream about a balance./

[Answer] Correct. Differentiated price increases must, among other things, lead to the formation of a correct ratio between them, and also between retail prices and production costs; they must minimize waste and play an adequate role in economic reform. But since compensations are going to accompany the price increase, such an operation can result in reducing the inflationary curve by about 40 billion zlotys.

[Question] /What about the rest?/

[Answer] Price increases of stimulants, i.e., cigarettes (already completed), alcohol, as well as gasoline, which, in my opinion, do not need to be compensated

for, should bring another 100 billion zlotys. Next--price increases of unessential and luxury industrial items of about 50 percent should give about 140 billion zlotys. By this means, one could reduce the inflationary curve by about 280 billion zlotys. The market could begin to catch its breath, although it still wouldn't be a deep one.

[Question] /There are also other methods. For example, raising interest rates at PKO [General Savings Bank], issuing bonds.../

[Answer] Price increases are necessary as I have argued. And we intend to use just these methods on the over 200 billion remaining zlotys. Speaking more concretely, I anticipate the introduction of a two-digit interest rate on saving deposits in PKO that have been there for a long time; I also anticipate a continuous revalorization of these deposits after the reform in retail prices has ended. Moreover, a tax policy, obviously, has a certain place in the scheme of things (for example, higher taxes from summer homes.

Also there are such proposals or solutions as these that have been coming up: alongside, for example, the 1,000 blue banknote there appears--let's say a yellow banknote. With this yellow banknote pensions are paid off and farmers paid, etc. With the yellow banknotes, the public covers its current expenses. The blue banknotes should be deposited in PKO in one account. Since the market situation is difficult, one part of the blue banknotes could be paid out by PKO, and the other part (the remainder) by PKO only in special cases (buying a house, a lot, funeral expenses). The remaining blue banknotes should not be used for normal time payments, and I underline the word "time." As the market situation improves, sums from the accounts (of course, they have been receiving interest) could be gradually activated.

[Question] /Aren't you, sir, by any chance, proposing too many drastic solutions. Why all of this seems to be unreal./

[Answer] Everything that I have said are projects, proposals, plans, and actually just reflections. And that's why I've been talking about this, because it's going to be necessary to speak out on these subjects.

Finally, I would like to avail myself of this opportunity to urge your readers to acquaint themselves with the brochure, which should come out shortly at the kiosks. It discusses price increases and many projects or plans which I have mentioned here. At the end of the brochure there is also a questionnaire, where the public can decide which solutions or legal instruments they prefer and which ones they want to reject.

[Question] /Thank you for talking with me./

MINISTER INTERVIEWED ON METHOD TO INCREASE HOUSING

Warsaw TRYBUNA LUDU in Polish 18 Nov 81 pp 1, 2

[Interview with Tadeusz Opolski, minister of Construction and the Construction Materials Industry by Hanna Grzegorczyk; date and place not specified]

[Text] Public opinion, and especially the thousands of families waiting for housing, is deeply concerned as people follow the situation at the construction sites of new communities. As director of a department, you were involved with these problems--what is your view of them today when you are the head of the ministry? A PAP journalist posed this question to the minister of Construction and the Construction Materials Industry, Tadeusz Opolski.

[Answer] The implementation of housing plans is really going badly. In 10 months we have only progressed to 61.1 percent of our one-year plan and, consequently, we consider that salvaging the plan by doing everything possible is one of the most important matters at hand.

[Question] Is that realistic?

[Answer] From our analysis of a business evaluation on the progress on many structures, progress could be speeded up to provide an additional 20,000 housing units before the end of the plan year, i.e., 1/4 of the total number completed to date.

Not only we, but the majority of the work force also considers this possible, given certain conditions. There is a shortage of materials. Therefore, we made quick, on-the-spot decisions to transfer these materials from construction sites where they are not currently indispensable. We are likewise inventorying supply centers which still have some reserves. We are stepping up deliveries of those supplies which are indispensable to increase housing construction for this year: floor covering, paint, mechanical components and the like. In my opinion, we still have an opportunity to halt the backlog this year so that we may begin next year with a better start. Not only the future tenants of new housing expect this from us, but also the labor force. I maintain that a considerable majority of construction workers really wants to put in an honest day's work, and not just take money for forced stoppages.

We are trying to increase deliveries of such other basic materials as cement, steel, coal and [liquid] fuel. As yet, it is difficult to judge the results of these attempts. We must ensure our work crews with basic labor work front. A still greater decline in construction cannot be permitted. Our potential, created through toil, cannot be dissipated; it is not something which can be created anew.

In summary I would like to emphasize that we have marked out three major tasks for ourselves for the coming months:

--To halt production decline throughout the construction industry;
--To continue to shift the means of production over to the tasks which are of greatest importance to society--housing, the social infrastructure and investments in the agro-food area;
--To reduce the scope of construction (which, I hope, is temporary) resulting mainly from a shortage of materials to make marked improvements in quality.

[Question] What else is indispensable in order for these tasks to produce the expected results?

[Answer] In my opinion, the success of our immediate endeavors and our other longterm measures lies in the development of close cooperation and partnership with trade union. If we succeed in reaching a state of harmonious cooperation based on rational principles, which does not mean cooperation devoid of discussion, the benefits will be calculable not only for those who are waiting for housing but also for the work force. I do not hide the fact that I consider this very important. The creation of an atmosphere of trust, initially even trust on credit, is an enormous problem.

[Question] And what of systems issues, prospects for the future and new principles of construction activities?

[Answer] We have already sent the Commission for Matters of Economic Reform our drafts of documents concerning the makeup of all construction structures within the country, as well as the actions of our ministry. This should not be an economic ministry, but an organ of the state administration for all of construction regardless of who the superior of a given construction enterprise is.

These are difficult changes to execute, but what makes them more difficult is that they are being executed during a transitional period. So the question comes up--what should be done to best prepare the ministry and the enterprise to embark upon reform? How do we provide all enterprises with the conditions giving them an equal start to act on the basis of the new principles. Some of these enterprises are more, some less, in debt. Some find themselves in a good situation, others, in a bad one. Contractual fines alone imposed for the delayed implementation of investments are enough to ruin the possibility of self-financing. Consequently, the best solution must be found in this regard, and it must find acceptance.

We are all now beginning to learn about reform. At present, there are meetings throughout the country at which representatives of the ministry relay indispensable information concerning reform proposals and work forces, self-government bodies and directorates talk about their problems, what they are lacking and sore spots. We attach much importance to these consultations.

Among the important issues, there is also the need to create conditions which will enable us to halt the decline in construction-assembly production which has lasted perhaps since 1978. We must stop our retreat and take at lease a few steps forward in construction activity. There are a few paths which can lead to this goal; it is indispensable that we nurture the conviction that the development of housing

construction and of what is associated with it is a way out of the present crisis. And in this regard, despite all of our needs, it is worthwhile and necessary to designate the indispensable funds for housing construction. This in no way contradicts the thesis which states that we must limit our investments in general.

If these funds are found, the next task becomes how to make the best use of them. We would like our institutes and scientific-research centers to develop, quickly and accurately, possible technical and technological solutions for construction practice characterized by lower materials and energy intensiveness. We would like them to approach all enterprises with these solutions as examples, not obligatory concepts. We also aim to popularize everything which has thus fare been developed in many design offices and at construction sites in a word, every good idea and example of good work worthy of universal dissemination.

We must also utilize the period of the coming years to restore good quality and the tradition of solid construction work. With the existing skills of our work forces and the available materials, we can afford already now to bring better quality into construction work. However, this requires the application of a whole system of material incentives--efforts in this area continue--to create conditions in which it will not be profitable to do shoddy work.

Among the many other issues of the ministry's concern, I would like to bring up one other one--the creation of conditions of the effective control over compliance with the law in the construction process, i.e., the return to the so-called construction militia or such an organ of the ministry as would be in position to ensure compliance with construction law and would also effect high quality production. We are now at work on these and many other longterm measures.

OPERATION OF BANK FOR INTERNATIONAL ECONOMIC DEVELOPMENT

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 11 Nov 81 p 2

[Text] Significantly better results have been recorded in protecting against noncommercial risks.

Belgrade 10 November. In the first 9 months of the year, the Yugoslav Bank for International Economic Cooperation issued additional credits of 5,850 million dinars for exports. The total value of transactions receiving these credits is $318.3 million. Of the total completed export transactions in the first 9 months of the year that were supported by the Bank, 55.2 percent were with developing countries, 30.8 percent with socialist countries, and 14 percent with industrially developed western countries. The Bank's plan for 1981 expected total exports using credit to amount to $500 million, with the sum of additional credits anticipated to be 9 billion dinars.

For the period in question, the Bank's agencies continued to approve supplemental credits for export transactions that would be completed in 1982 and subsequent years. New export agreements on credit to be completed in the coming years had a value of $304.4 million; and, for them, credits totaling 5,390.3 million dinars were approved. Together with increases connected to the changed exchange rate for the dinar, the total supplementary credit amount is 8,081.8 million dinars.

Among significant transactions for which these additional credits were approved, important ones include three ships being built at the Uljanik shipyard in Pula for Liberia; other ships are being built at the Split, Treci maj, and Viktor Lenac shipyards, and in other yards. Supplementary credits also were approved for shipping 3,000 IMT tractors to Egypt, 5,000 Zastava automobiles to Algeria, and Minel transformers to Greece.

In the first 9 months of 1981, the Bank made promises for additional credits amounting to 19.76 billion dinars for export transactions worth $1,159.3 million. These promises for supplementary credits were given chiefly for investment projects and the export of capital goods to developing countries in the coming years.

Markedly more favorable results than those of the preceding year were realized in the first three quarters of 1981 in ensuring export transactions from noncommercial risks. The value of 312 newly completed agreements amounted to 1,562.8

million dinars. Growth continued in the share of African countries in the total number of concluded agreements, reaching 59.3 percent. The value of insurance agreements for export transactions to African countries reached $925.9 million. The share of Asian countries in these transactions amounted to 27.13 percent. In the first 9 months of this year, 84 insurance commitments for export transactions valued at $2,308 million were issued. Compared to the same period of last year, this figure represented a 97.3 percent increase.

STATUS, OUTLOOK FOR SMALL-SCALE ECONOMY IN POORER REGIONS

Belgrade KOMUNA in Serbo-Croatian No 10, Oct 81 pp 30-34

[Article by Elvira Mandic]

[Excerpts] Advantages of Small Business for Location in the Underdeveloped Regions

A sizable number of major capital-intensive projects are under construction in the regions of the underdeveloped republics and SAP [Socialist Autonomous Province] Kosovo, and they have absorbed the bulk of the capital from the region itself and the additional capital from outside. The resources of the socialized sector, in spite of the aid of the broader community, have not been sufficient to finance the development of all the necessary branches and activities of the economy. Under these conditions development of the capacities of small business [the term covers small-scale business operations in both the socialized and private sectors--translator's note] is imposed as the logical and indispensable solution. This would afford more optimum use of capital-intensive economic potential already built and higher employment of the population labor-intensive manufacturing industries. Investments in small business would come mainly from the available funds of private individuals, which is very important because of the lack of investment resources in the socialized sector.

Moreover, certain characteristics of small busines suggest the conclusion that it is very suitable for location in economically underdeveloped regions.

Smaller production plants are suitable for subcontracting relations with the corresponding industry from the advanced regions on the principle of business-technical collaboration, as well as on the basis of pooling labor and capital. This especially applies to the motor vehicle, metal manufacturing and electrical products industries. Likewise, small business operations can have a considerable impact on import substitution of consumer goods, since they are suitable for production in small runs, with a broad assortment and with quality design. In addition to these sectors, small production facilities can specialize in the processing of secondary raw materials and the rendering of various services to the economy and to the general public. There is a shortage of these activities throughout the country, but in the underdeveloped regions especially.

Jobs can be opened up in the production and service activities of the small business sector at considerably lower cost of investment than in industry and other economic activities. Usually these are plants with a relatively low organic composition of capital, which affords higher employment per unit investment than in other branches of the economy. This is especially suitable to the underdeveloped regions, which have a sizable potential supply of manpower, but not enough capital for investment. The diversity of organizational forms in small business--small establishments in the crafts and trades and hostelry, cooperatives and contract organizations of associated labor--also make it possible to increase employment by enlisting the resources of returnees from temporary employment abroad, a large number of whom are from the economically underdeveloped regions.

Finally, small-scale production and service facilities are suitable for location in prefabricated structures and at temporary sites, which is also suitable to the economically underdeveloped regions because funds are not adequate for construction of business space and the urban plans do not exist which would establish the location of economic facilities on a more permanent basis.

Vehicles for Development of Small Business in the Underdeveloped Regions

Over the period from 1981 to 1985 all opstinas in the underdeveloped regions should enact plans for development of small business, and on that basis they would in turn draft specific programs for opening up new production and service facilities or expanding and modernizing existing ones.

One way in which the programs for development of small business in production activity should be carried out is by the pooling of labor and capital with organizations of associated labor from the advanced regions, in which it is also possible to use resources of the Fund for Stimulating the Faster Economic Development of the Underdeveloped Republics and SAP Kosovo. The resources of the Fund can be used to finance 50 percent of the total value of the investment project.

To the end of developing plants for subcontracting in the motor vehicle, metal manufacturing and electrical products industries, as well as in other industries, large production and distribution systems in the more advanced areas need to draft specific production programs and become vehicles for carrying out appropriate projects on the principles of business-technical collaboration and the pooling of labor and capital.

The trade sector from both the advanced and the underdeveloped regions ought to be the principal initiator for the opening up of plants for production of consumer goods, especially for the purpose of import substitution. These plants would be opened on the basis of plans concerning long-term business collaboration, which would also include the pooling of labor and capital.

Aside from the trade sector, major industrial producers of consumer goods should also be interested in opening up these plants. Plants of the small business sector for the production of certain consumer goods would be welcome to them

because of specialization and division of labor, to relieve them of the production of small and unprofitable runs, to fill out their assortment, to eliminate the need to import parts and assemblies, and so on.

Organizational Forms for Development of Small Business

Under the SFRY Constitution, the constitutions of the socialist republics and autonomous provinces, and the Law on Associated Labor, contract organizations and cooperatives are supposed to be the principal organizational forms in establishing the RO's [work organization] of the small business sector.

Contract organizations are a form for transforming individual labor into associated labor whereby the founder retains certain rights, but in all other respects those regulations apply which pertain to organizations of associated labor in the socialized sector. Organizations of this kind are very suitable for organizing production in the underdeveloped regions, especially to meet the needs of large-scale industry in the more advanced regions. However, the figures show that the number of contract organizations of associated labor which have been established is lowest in the underdeveloped republics and SAP Kosovo. Of all the 91 contract organizations of associated labor, which have a labor force of 1,922, only 28, with a labor force of 602, have been established in the underdeveloped regions. In Bosnia-Hercegovina 11 contract organizations have been established, in Macedonia 10, and in Kosovo 7, while not a single such organization has been established in Montenegro.

It is obvious that the opstinas in the underdeveloped regions must make a considerably greater effort to establish contract organizations of associated labor. These opstinas, which have the greatest interest in stepping up their economic development, ought to commit themselves especially to finding production programs suitable for small-scale production facilities, at the same time respecting the raw materials and personnel potential which are available. There is a need in this connection to furnish incentives to individuals from these opstinas who are employed abroad temporarily to encourage them to establish contract organizations of associated labor. The opportunity to use foreign exchange savings to purchase equipment, which they would bring into the country and use as their share in establishing a contract organization of associated labor, could be especially interesting to workers employed abroad temporarily.

Cooperatives, as a very suitable form of association for performance of activities in the small business sector can also be very beneficial to stepping up the development of the underdeveloped regions. However, here again the figures show that the number of cooperatives established in the underdeveloped regions is relatively small. Only 89 of the total of 256 cooperatives have been established in the economically underdeveloped socialist republics and SAP Kosovo (16 in Bosnia-Hercegovina, 7 in Montenegro, 65 in Macedonia and 1 in Kosovo).

Inadequate Incentives for Development of Small Business in the Private Sector

Aside from contract organizations and cooperatives, private establishments in the crafts and trades, hostelry and other activities are to serve as the third

basic form for development of small business. Unfortunately, the present situation with the development of this type of small business does not as yet conform to the basic social commitments in this sector.

Self-Employment in the Small Business Sector in the Economically Underdeveloped Socialist Republics and SAP Kosovo at the End of 1979*

Activities by Socialist Republics and Socialist Autonomous Provinces	No of Persons Self-Employed	No of Persons Employed by Them	Total (self-employed persons and persons they employ)
Privately owned craft and trade establishments			
Yugoslavia as a whole	115,477	61,236	176,713
Bosnia-Hercegovina	15,604	5,484	21,088
Montenegro	1,395	481	1,876
Macedonia	9,968	4,249	14,217
Kosovo	4,799	1,319	6,118
Privately owned hostelry establishments			
Yugoslavia as a whole	14,317	16,403	30,720
Bosnia-Hercegovina	2,686	3,268	5,954
Montenegro	205	245	450
Macedonia	636	457	1,093
Kosovo	459	54	970
Common carriers in the private sector			
Yugoslavia as a whole	37,562	667	38,229
Bosnia-Hercegovina	6,902	38	6,940
Montenegro	1,087	10	1,097
Macedonia	3,481	3	3,484
Kosovo	1,370	58	1,428
Privately owned stores			
Yugoslavia as a whole	485	47	532
Bosnia-Hercegovina	--	--	--
Montenegro	3	--	3
Macedonia	75	--	75
Kosovo	168	12	180

* These figures of the Federal Bureau of Statistics are published as a rule 2 years after the fact, so that the figures for 1981 will be published in mid-1983.

The opportunities for development of self-employment have not been sufficiently taken advantage of anywhere in the country, but especially in the regions of the economically underdeveloped socialist republics and SAP Kosovo. This especially applies to self-employment in the crafts and trades. Thus the number of persons employed in private craft and trade establishments (self-employed persons and the workers they employ) per 1,000 inhabitants is more than fourfold greater in Slovenia than it is in Montenegro, nearly threefold greater than in Kosovo, and more than twofold greater than in Macedonia. If we compare the situation at the end of 1979 with the situation in 1975, the number of private establishments in the crafts and trades is down 19.1 percent in Bosnia-Hercegovina, while in Montenegro it is down 23.8 percent. The total number of persons employed in private craft and trade establishments has increased only in SR [Socialist Republic] Macedonia (by 1.6 percent). According to regulations, the privately owned craft or trade establishment may employ up to five workers; however, in Bosnia-Hercegovina and Montenegro only one establishment in three, and in Kosovo barely one in four employs an additional worker. The situation is somewhat more favorable in SR Macedonia, where there is one employed worker for every 2.6 private craft and trade establishments. If advantage were taken of the opportunities afforded by the law, nearly 150,000 workers might be employed in private craft and trade establishments in the underdeveloped regions.

The reasons for the decline of crafts and trades in the private sector are most frequently the high age-specific composition of the owners, the lack of qualified young people coming along, the lack of business space, unlicensed work being done on the side by persons employed in the socialized sector the high contributions to self-managing communities of interest, and so on.

In certain underdeveloped opstinas there is also resistance to the crafts and trades in the private sector, often based on the old notions that this form of economic activity results in capitalization and capitalist social relations. Such opstinas have altogether overlooked that small business as a whole, including self-employment, offers them an important opportunity to provide jobs to their population. That is why the economically underdeveloped opstinas ought to establish temporary and permanent locations of business space for self-employed persons and adopt measures to encourage the opening of private establishments in the crafts and trades and private stores. The opstinas should particularly motivate those returning from temporary employment abroad to open up private craft and trade establishments.

Measures To Develop Small Business in the Underdeveloped Regions

Article 15 of the Agreement on the Bases of the Yugoslav Social Plan Concerning the Policy of Faster Development of the Economically Underdeveloped Republics and SAP Kosovo From 1981 to 1985 provides that the signatories must encourage the pooling of labor and capital to support the development programs of underdeveloped regions by proposing legislation which would exempt economic entities either partially or entirely from the payment of certain contributions either entirely or partially. The participants in the agreement also committed themselves to encouraging the development of manufacturing facilities in the underdeveloped republics and SAP Kosovo through the pooling of labor and capital of

organizations from the advanced regions with organizations in the underdeveloped regions. The incentives of the participants in the agreement will certainly embrace small business as well.

Implementation of the Social Compact on the Bases of the Joint Effort To Conduct the Policy of Developing Small Business in the SFRY should also bring about faster development of small business in the underdeveloped regions. The parties to this compact emphasize the need to ensure in the conduct of economic policy appropriate conditions that will motivate efforts toward faster and more uniform development of small business throughout the country, but especially in the economically underdeveloped regions. Article 13 of that same social compact commits the participants to advocate adoption of specific programs for development of various small business activities on the part of sociopolitical communities, local communities and interested organizations of associated labor.

This document also emphasizes the need for industrial organizations to relieve themselves of the production of a wide assortment by establishing small business organizations. Priority in this should be given to location of small business in the underdeveloped regions ["opstinas" was probably meant--translator's note] of the republics and SAP Vojvodina, as well as over the entire territory of SAP Kosovo. The participants in the social compact are to endeavor to have organizations of associated labor in industry, trade, tourism, construction and other activities to make a greater commitment to organizing small business facilities in order to provide a broader assortment of goods and services, to increase exports and to reduce imports. Within the limits of their rights and responsibilities, the participants are to take timely measures to ensure fulfillment of the program for development of small business.

Sources of Funds To Finance Programs for Development of Small Business in the Underdeveloped Regions

Along with the available resources of interested organizations of associated labor, provision has also been made to obtain funds from the Fund for Stimulating the Faster Economic Development of the Underdeveloped Republics and SAP Kosovo and use of international credits in solving the question of financing.

Under Article 10 of the Agreement on the Bases of the Yugoslav Social Plan on the Policy of Faster Development of the Economically Underdeveloped Republics and SAP Kosovo Over the Period From 1981 to 1985, the fund grants credits to the economically underdeveloped regions with an average repayment period of 13 years and an interest rate of 5.5 percent per annum (for SAP Kosovo the average repayment period is 15 years and the rate of interest 4.5 percent per annum), with payment to begin 3 years after the end of the year in which the credit was approved. Small business organizations have been using credits from the fund up to now, and it is logical to expect that programs for development of small business will in the future also be financed in part from this source.

Programs for development of small business are also being financed from the line of credit of the International Finance Corporation in Washington in the total amount of $32 million, for which applications were invited on 30 June 1980. Every republic and province will use $4 million of this credit. The proportions

for use of the credit are as follows: 80 percent of it will be used for credit financing of small business within the sector of associated labor and 20 percent for the credit financing of private establishments. The credit can be used to import equipment and as dinar credit. Under the contract with the International Finance Corporation the credit terms are as follows: a rate of interest of 11 percent per annum with a repayment period of 9 years, repayment to begin 3 years from the date when the line of credit was approved. The banks are required to furnish $2 in dinar credit for every $1 of this credit, and it is therefore indispensable to enlist other sources of resources (bank resources, savings and resources of self-employed individuals, the resources of persons returning from temporary employment abroad, and so on).

Foreign exchange and dinar funds amounting to nearly $50 million will be invested in the small business sector of the underdeveloped regions through use of this line of credit. In view of the agreed guideline that the resources of this line of credit be used mostly to finance construction of small business plants which would establish subcontracting relations with "big" industry and would produce goods substituting imports and augmenting exports, it is expected that this line of credit will help to improve the economic structure and enhance the involvement of small business in foreign trade flows.

ECONOMIC RELATIONS WITH NIGERIA

Belgrade JUGOSLOVENSKI PREGLED in Serbo-Croatian No 9, Sep 81 pp 339-341

[Article prepared by Bogdan Popovic, a journalist of Belgrade; reviewed by Dusan Jovanovic, administrative chief, Federal Secretariat for Foreign Affairs]

[Excerpt) Economic relations between Yugoslavia and Nigeria are characterized by a growing volume of trade and highly developed cooperation in construction work. In a relatively short period, Nigeria has become one of Yugoslavia's most important economic partners in sub-Saharan Africa.

Until 1978, economic relations between the two countries were based on the 1964 Trade Agreement. In December 1977, the Nigerian government annuled the existing Trade Agreement, while at the same time expressing its wish to conclude a new trade agreement on an altered basis. Preparations for concluding the new trade agreement are under way.

The Mixed Committee for Economic and Scientific-Technical Cooperation between the two countries has met four times: from 27 September to 2 October 1974 in Lagos; from 15 to 21 June 1976 in Belgrade; from 11 to 14 December 1978 in Lagos; and from 10 to 13 June 1980 in Belgrade. At these sessions, concrete measures were considered that the two countries could undertake to establish long-term economic cooperation. At the third session of the Mixed Committee, a subcommittee for agricultural cooperation was formed that is expected to make an essential contribution to developing this important area of cooperation. In March 1980, a joint economic office for Yugoslavia was opened in Lagos.

Trade

Within the framework of economic cooperation between the two countries, particular attention has been directed to advancing mutual trade in goods. For the Yugoslav economy, the Nigerian market is important for increased Yugoslav exports and for ensuring a steady supply of crude oil for processing at Yugoslav refineries. Table 1 depicts trade between Yugoslavia and Nigeria from 1962 to 1980. In recent years, the total volume of trade between Yugoslavia and Nigeria has increased markedly. In 1979, it approached the planned overall total of $200 million. In that year, trade increased by 227 percent (with Yugoslav exports rising by 319 percent and imports by 229 percent). The trend toward increased total trade continued in 1980.

Table 1. Trade Between Yugoslavia and Nigeria, 1962 to 1980

Year	In Thousand Dollars	
	Exports	Imports
1962	139	68
1966	1,071	82
1971	1,034	1,698
1974	3,420	1,174
1976	65,595	525
1977	32,521	2,542
1978	18,293	33,617
1979	76,728	110,440
1980 (8 months)	95,951	60,500

A major role in increasing trade between the two countries was played by the exchange agreement concluded at the beginning of 1978 providing for the delivery of Yugoslav ships to be purchased with Nigerian crude oil. The Yugoslav partners to this agreement were the Split Shipyards and INA-Naftaplin [Oil and Gas] enterprise of Zagreb. The agreement provided for the Nigerian partner to receive eight vessels with a value of $120 million, while the Yugoslav petrochemical industry would receive 500,000 tons of crude oil. In 1979, export of ships accounted for 78 percent of Yugoslav exports to Nigeria; and, in 1980, ships made up 64 percent of total Yugoslav exports to that country. Besides vessels, Yugoslav exports to Nigeria include complex fertilizers; medicines, serums, and vaccines; canned fish products; transformers; and refrigerators.

Total Yugoslav imports from Nigeria consist of 80 percent crude oil and 18 percent cocoa.

In order to increase the volume of trade between the two countries, the fourth session of the Mixed Committee agreed to work for diversification of both the export and import mixes, so that these trade relationships would include among Nigerian exports, in addition to oil and cocoa, such items as coffee, raw rubber, hides, medicinal herbs and cotton. Similarly, Yugoslav exports in addition to ships should be expanded to include products of the metal and machine industries; electrical products; agricultural machines; textile, chemical, and wood products; artificial fertilizers; nonferrous metals; processed food products; medical equipment, medicines, and pharmaceutical products; and construction materials.

The INA refinery of Zagreb concluded a long-term contract on 15 May 1980, providing for the purchase of a million tons of Nigerian crude oil annually; this should provide for a high level of trade on a regular basis.

Until 1977, Yugoslavia enjoyed a large trade surplus in total exchange between the two countries. Beginning with 1978, this trade surplus changed to a large deficit for Yugoslavia. Under the new circumstances, the existence of a negative balance of trade became a major hindrance for the Yugoslav economy, particularly since a trend emerged whereby the trade deficit steadily increased because of the purchase of significant quantities of oil. Consequently, at the fourth session of the Mixed Committee, the Yugoslavs raised the question of balancing trade between the two countries.

Investment Cooperation

Investment cooperation was the initial form of economic cooperation between Yugoslavia and Nigeria. Participants at the sessions of the Mixed Committee for Economic and Scientific Technical Cooperation have constantly stressed the desire to have this cooperation expanded, particularly in the areas of construction, agriculture, industry, and energy facilities.

In the field of construction in Nigeria, the Yugoslav economy is represented by the Energoprojekt enterprise of Belgrade.

Energoprojekt has successfully completed a number of construction projects in Nigeria, of which the most significant was the international fair grounds in Lagos, with a value of $185 million. In addition, Energoprojekt has carried out projects for the electrification of 61 cities in western Nigeria with a value of $16 million, as well as projects for the electrification of a number of Nigerian states, valued at $25 million. In addition, Energoprojekt has prepared numerous studies of Nigerian needs in the areas of energy, water systems, and mining.

With the Nigerian federal government as its partner, Energoprojekt established the corporation NECCO Ltd for carrying out construction projects in 1974. It is projected that NECCO Ltd will become a major engineering organization for construction operations. So far, NECCO Ltd has built several significant facilities, of which the most important are Ascon College at Badagry ($70 million) and the Lagos Federal Ministry building ($100 million). Currently, NECCO Ltd is building the Yola and Kano irrigation system ($220 million).

The "Partizanski put" labor organization of Belgrade, as a member of a consortium of Yugoslav labor organizations, participated in the bidding for the construction of the Enugu-Makurdi rail line. A final decision on awarding contracts has not yet been made.

Agricultural cooperation has largely consisted of the preparation of studies by Yugoslav organizations on the possibility of establishing fish ponds in Nigeria (by PPS of Osijek [expansion of PPS unknown]), and of corn-raising farms and hog farms, animal feed factories, slaughter houses, meat refrigerator plants, and distribution equipment (Emona enterprise of Ljubljana).

According to the conclusions of the Mixed Committee, cooperation in industry and energy projects should become an important form of cooperation between the two countries in the future. So far, the following projects have been done in these areas:

"Galenika" of Belgrade has set up a mixed corporation, Galenika Nigeria Ltd., in Nigeria with headquarters in Lagos. The Yugoslav organization's share of total capitalization is 49 percent. In the present phase, Galenika Nigeria Ltd is occupied with commercial transactions, but discussions are in progress with the Nigerian Ministry of Health for an agreement to build a factory to produce pharmaceutical products; under the agreement, the ministry would become a third partner in the enterprise.

The Gorenje enterprise of Valenje has a subsidiary in Nigeria known as Gorenje Nigeria Ltd. It is working on a program for industrial cooperation in the production of household appliances and small tractors.

INA Naftagas of Zagreb and Naftagas of Novi Sad, as Yugoslav organizations of associated labor, are negotiating an agreement for cooperation with the Nigerian National Petroleum Company for the exploration of oil fields and their exploitation for the production of crude oil and gas, for drilling activities and engineering and consulting services in the development of Nigerian energy resources, as well as for the training of personnel.

Financial and Banking Cooperation

The Central Bank of Nigeria and the Yugoslav National Bank have agreed on cooperation in the exchange of information on the banking systems of the two countries and on other banking activities. The two banks also have agreed to establish cooperation between the commercial banks in each country and to make agreements for direct financial transactions between Nigeria and Yugoslavia, so as to avoid intermediate banks of third countries. In that connection, agreement has been reached to have the appropriate agencies of each country consider concrete possibilities for establishing joint banking institutions.

Transportation Cooperation

The maritime shipping organization "Splosna plovba" of Piran maintains regular service between Yugoslav and Nigerian ports. Besides conventional ships, this service includes semicontainer and log-carrying specialized vessels. Splosna plovba also has established commercial cooperation with the Nigerian National Shipping Line (NNSI).

The "Jugobrod" complex organization of associated labor of Belgrade has formed the mixed maritime enterprise Yugoherva Ltd in Lagos, which is involved in leasing ships for shipping goods to Nigeria. Jugobrod also is preparing for the construction of small drydock repair facilities in eastern Nigeria.

On 19 October 1979 in Belgrade, the Nigerian Federal Ministry for Transportation and the Yugoslav Federal Committee for Transportation and Communications signed

a memorandum on agreement, according to which agreement was reached on cooperation between the appropriate specialized organizations of the two countries that are involved in maritime operations for the training of personnel for land operations, the transfer of deck and machine officers to the Nigerian national maritime company, the training of Nigerian cadets in Yugoslav schools with practical work on Yugoslav ships, technical assistance in the development of technical personnel in Nigeria, and provisions for making Yugoslav maritime officers available for operations in Nigerian ports.

YUGOSLAV-IRAQI TRADE NOTED

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 19 Nov 81 p 1

[Text] Iraq is almost the only developing country with which Yugoslav economic relations are at the level of political relations. With respect to the volume and value of Yugoslav exports Iraq is our fourth largest trading partner, and for several years now it has been in first place among the developing countries. This observation was made in a plenary meeting of the Iraq Section of the Economic Chamber of Yugoslavia.

According to the figures presented, visible trade in 1980 exceeded $1.2 billion, and in the first 9 months of this year it was $682.5 million, $434.5 million of which consists of Yugoslav exports and $248 million imports. The forecast is for Yugoslav exports to reach a level of about $450 million by the end of the year, which would almost entirely fulfill the plan for 1981.

Most of the more than 1,000 products are industrial, and the list begins with machines and equipment, products of ferrous metallurgy, and so on. There is approximate balance of exports between two directions: to meet the needs of our construction contractors ($161.1 million) and Iraqi customers ($188.7 million). Exports amounting to $700 million, $189 million of this consisting of exports of meat and food products, have been proposed for 1982.

Petroleum continues to be the basis of imports ($198.8 million in the first 9 months of this year), representing 99.7 percent of the total value of imports. Dates and lamb skins are other important articles.

At the specially called meeting of the joint committee in May 1981 Iraq emphasized its interest in augmenting exports, and both sides expressed a desire for long-term cooperation in the fields of raw and processed foods and industrial products, which will undergo further discussion in early March 1982 at the meeting of the joint committee in Belgrade.

For several years cooperation in construction of capital investment projects has occupied first place in overall relations with Iraq, contracts outstanding at the moment amounting to $3 billion, and the contracts concluded just up to October amounted to $1.2 billion. In the light of these contracts and Iraq's plans to spend more than $133 billion for development up to 1985, several essential

questions have been raised concerning the level of organization of our effort in many aspects of the capital investment project field, and then questions related to problems of punctual payment for work, which will be discussed on the basis of serious criticisms at the meeting of the joint committee in Belgrade in March 1982.

The presence of Vido Knezevic, newly appointed Yugoslav ambassador in Iraq, added a particular aspect to the meeting in view of the seriousness of the questions raised.

YUGOSLAV TRADE WITH ALGERIA

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 19 Nov 81 p 1

[Text] Economic cooperation has been effective between Yugoslavia and Algeria, which cannot be said of the previous period, it was stated in a meeting of the Algeria Section of the Economic Chamber of Yugoslavia. The assessment is that economic cooperation has been more intensive since May 1979, following the meeting between Presidents Tito and Chadli [Bendjedid] and several visits and talks between top-level government representatives of the two countries during 1980 and 1981.

In 1980 Algeria's share in total Yugoslav commodity exports to the Arab countries was 7.5 percent, and in 1981 it is estimated that its share will be 9.8 percent. The forecast for 1982 sets this share at 12 percent. On the other hand, Algeria's share of total Yugoslav imports from the Arab countries was 7.4 percent in 1980, the forecast for 1981 envisages a share of 21.8 percent, and the plan for 1982 projects a share of 14.3 percent.

Visible trade occupies a special place, and in the first 9 months of 1981 amounted to $291.6 million, in which Yugoslav imports amounted to $199.3 million and its exports $92.3 million. The distribution of imports over the first 9 months consisted of crude petroleum ($197.9 million), iron ore ($550,000) and zinc ($600,000), while the distribution of exports consisted of automobiles, tractors and spare parts (with an overwhelming figure of $49.82 million), clothing, fabrics and blankets ($7.58 million), and then food and tobacco, products of the chemical industry, products of the metals industry, and so on.

The plan for 1982 calls for total visible trade with Algeria to reach $400 million, $160 million of which would be exports and $230 million of imports.

Contracts related to capital investment projects in Algeria are the most important after those on the markets of Iraq and Libya, and the value of contracts concluded or in the phase of negotiations is more than $677 million. In the meeting of the section several important questions were raised about obstacles to realization of potential cooperation through these contracts, and the Yugoslav section of the joint committee for cooperation with Algeria will be subsequently informed of them. According to Vuk Dragasevic, chairman of the Yugoslav section of the joint committee, the discussion in the meeting of the section did not fully cover the problems weighing down on organizations of associated labor.

PLANS FOR CONSTRUCTION WORK ABROAD IN 1982

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 25 Nov 81 p 1

[Text] Opportunities for greater involvement of Yugoslav builders in projects on the foreign market ought to be greater next year than up to now. The builders are prepared for this; they have gained a considerable reputation, but to carry out this task they also need help from the broader community, especially in credit policy and incentive measures.

This is the principal conclusion of the members of three committees of the General Association of Construction and the Building Materials Industry concerning the program for doing work on capital investment projects abroad next year. So far 1,500 organizations have reported to this association that they have work abroad, and by the end of the year it is expected that the total will go as high as even about 2,000 construction crews. Realistic estimates indicate that the amount of work to be done next year could be $2.37 billion, or 18.5 percent more than the value of work which our builders did this year on "foreign exchange" construction sites. Of course, the present number of about 25,000 employed persons working in 42 countries of Asia, Africa, the United States and Europe would increase by several thousand. Nearly two-thirds of this work would be done in the developing countries, and the builders would transfer 66 percent of the total value into the country, while they would spend 34 percent in the areas where they are working.

If these plans are to be carried out, the builders emphasized that the Law on Conduct of Operations Abroad, which is supposed to be adopted by the end of March next year, needs to be supplemented. Certain proposals which the builders have already sent concerning this document have not been honored, but they have an essential bearing on performance of jobs important to our country's payments-balance situation and to foreign trade. This especially applies to the unfavorable credit policy and the failure of the banks to accompany the builders, along with inadequate incentives. There still has been no acknowledgment, the builders say, that this form of export (of knowledge, equipment and technology) is a full-fledged contribution to the policy of economic stabilization, since it involves a broad group of our business people.

The program of work to be done abroad has been sent to the republics and provinces for mutual reconciliation, and it is expected that the action will be completed by mid-December. Along with adoption of important suggestions which

include even unified organizational linkage and efforts abroad on the principles of self-management and income-sharing, the builders say that their unused potential will also be activated to a fuller extent: more rapid, cheaper and better-quality construction on the foreign market to outdo the competition of other countries. The need for more effective enforcement of customs regulations was also pointed up, in addition to amendment of regulations for customs examination of machines being returned from abroad. That is, they are asking for equipment which has been more than 50 percent amortized to be exempted from duty and that the administrative procedure for obtaining consent, which consists of 36 different steps before work on the project begins and takes months, be simplified.

YUGOSLAV-ITALIAN TRADE ORGANIZATION REVIEWED

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 25 Nov 81 pp 1-2

[Article by Slobodan Tanovic: "Comprehensive Exchange of Opinion"]

[Excerpt] The anniversary meeting of the Jugital and Italjug chambers began with ceremonies in a meeting attended by more than 150 Yugoslav and Italian business executives.

The meeting was opened by Giancarlo Englara, president of Udine Province [where the meeting was held], and then Loris Fortuna, vice president of the Italian Parliament, who touched upon all aspects of cooperation between the two countries delivered a lengthy address to welcome the executives who had gathered. Vinko Mir, federal undersecretary for foreign trade, welcomes the business people who had gathered on behalf of the Federal Executive Council. The presidents of the two joint chambers, Ivo Gudeljevic and engineer Enrico Zucoli, recounted cooperation between the two chambers over the last 25 years. Certificates of recognition were then presented to distinguished individuals of the two countries who over the last quarter of a century had contributed to advancement of Yugoslav-Italian business cooperation. The working part of the meeting began in the afternoon and continued over the next 2 days.

Enviable Results

The fact that the Yugoslav-Italian chamber brings together a large number of business people who follow in their regular meetings the development of overall economic cooperation and examines specific matters in particular sectors and groupings shows the great interest on the part of our economy to collaborate with partners from friendly Italy.

In spite of the more difficult conditions visible trade, which traditionally has been the principal and most important aspect of cooperation, has been recording enviable results, as can be seen from the following table:

Year	Total Trade	Yugoslav Exports	Yugoslav Imports	Net Result	Coverage of Imports by Exports, %
1980	1,949.8	833.1	1,116.7	-283.6	74.6
1980/10	1,617.1	697.0	920.1	-223.1	75.7
1981/10	1,870.6	803.5	1,067.1	-263.6	75.3

Border trade on the basis of the Trieste and Gorica agreements have been taking place without major problems. Over the first 10 months of this year total trade under the Trieste Agreement reached a level of about 106.7 billion lire (a 78.1-percent increase over the same period of last year), about 52 billion lire of which represented exports and 54.8 billion lire imports.

Trade under the Gorica Agreement reached a level of 42 billion lire over the first 10 months, which represents a large increase over total trade over the same period of last year. Over the first 10 months exports under the Gorica Agreement amounted to about 20.6 billion lire, and imports reached a level of about 21.6 billion lire. The largest item in the distribution of exports under these agreements is livestock (cattle and horses), and then meat, lumber and metal products (which have a share of about 80 percent). The largest item in the distribution of imports is manufacturing materials, while consumer goods and equipment represent a relatively small volume.

Toward Higher Forms of Cooperation

Particular attention is being paid to higher forms of economic cooperation since only through long-term linkage of the interests of partners from the two countries are the conditions created for continuous cooperation.

In all 28 new contracts have been concluded over the last 3 years (1978-1980) concerning long-term industrial cooperation. In just the first 9 months of this year 15 contracts were concluded, 9 of which have already been registered and the other 6 are in the process of registration. A certain number of contracts from the previous period have expired.

In spite of the rather large number of contracts, the share of exports on the basis of long-term industrial cooperation in total Yugoslav exports is still relatively modest (10.4 percent in 1979 and 8.4 percent in 1980) and is showing a certain tendency to stay at the same level or to fall behind the growth trend of our exports. It is expected that the growth of exports on this basis will be larger when the contracts which have been concluded begin to be carried out.

The share of imports based on long-term industrial cooperation in total imports from Italy is also showing a slight tendency to decline (it was 6.8 percent in 1979, but 6.5 percent in 1980). This situation has largely been influenced by the general situation in the motor vehicle industry and machinebuilding, which accounts for the largest share of trade on the basis of this form of cooperation.

Though provision was made for trade based on long-term industrial cooperation to be in the relationship 1:1, this ratio is not being achieved under certain contracts. These problems are being overcome so as to achieve the appropriate reciprocity through the efforts of partners from both countries.

Conclusion of More Contracts

So far a total of 31 contracts have been concluded in the field of joint ventures with Italian partners. The total volume of funds invested by the Italian partners is relatively small. Two sizable contracts in the motor vehicle industry (between Fiat and the Crvena Zastava Plants) account for two-thirds of the total investments.

There are now 17 contracts in force in this field. Not a single new contract was concluded during 1980, but this year one contract in the textile industry is in the process of registration.

During 1980 14 contracts were concluded in the field of acquisition of material rights to technology, and in the first 9 months of this year 7 contracts were concluded (4 of which have been registered, while the other 3 are in the process of registration). Most of the contracts have been concluded in the metal manufacturing industry, construction, transportation, the food manufacturing industry, the chemical industry and the pharmaceutical industry.

Over the last 2 years the fewest contracts have been concluded between Italian and Yugoslav partners in the field of business and technical collaboration. Over the last year only one contract of this kind has been concluded.

In the period of 1978 and 1979 there was especially intensive cooperation between Italian firms and Yugoslav OUR's [organization of associated labor] in which the Italian firms did work on capital investment projects in Yugoslavia (14 contracts were concluded). Last year four contracts were concluded in which Italian firms were engaged to build large industrial projects in Yugoslavia. Over the first 9 months of this year there are three new contracts which are in the process of registration.

In 1979 Italian and Yugoslav partners concluded four contracts involving work on capital investment projects on third markets (Nigeria, Vietnam and Libya). In 1980 another two contracts were recorded, and over the first 9 months of this year nine contracts were concluded; five contracts have to do with setting up prefabricated housing for victims of earthquakes in southern Italy, and one pertains to construction of a hotel facility (Tarvisio, Italy). The other three contracts have to do with a joint effort on third markets (Libya and Czechoslovakia).

NEW ELECTRIC TRANSMISSION LINE TO ITALY

Belgrade EKONOMSKA POLITIKA in Serbo-Croatian 19 Oct 81 p 12

[Text] On Thursday, 22 October, a small ceremony was held at Divaca, Yugoslavia, and Redipuglia, Italy. Attending were the general directors of the Italian electric power system ENEL and its Yugoslav counterpart, JUGEL, as the long-distance transmission system Divaca-Redipuglia was placed into operation. It has a total length of 50 kilometers, of which 40 kilometers are in Yugoslavia and 10 kilometers in Italy. This is the first 400-kilovolt link between the two countries and, also, the first such Yugoslav connection with the Western European UCPTE system. The transmitting power of the long-distance system is 2,000 megawatts, which, considering the mutual assistance and exchange of electrical energy between the two countries, greatly improves the dependability of operations. For the sake of comparison, it should be noted that the total installed capacity of the Yugoslav electrical energy system is about 14,000 MW.

The Italian system is connected to the Yugoslav at the Divaca junction station, from which there are 400-kilovolt connections to Bericevo near Ljubljana, and to Meline near Rijeka. Recently, the southern main line of the basic 400-kilovolt system in Yugoslavia was connected, including Kosovo, Titograd, Mostar, Split, Rijeka, and Divaca (other than the connecting stations at Pristina and Titograd). This permits the long-distance transmission system to stretch throughout the country, contributing significantly to the dependability of operations of the electrical energy system.

The connection with Italy and the southern main line of the power grid has been completed at a time of tension in the Yugoslav energy situation. Since an agreement has been reached with the Italians to borrow a certain amount of electric power during the winter that can be returned in the spring, these new connections will help to ease this winter's power shortages.

STATUS OF TREPCA MINING, METALLURGICAL COMPLEX ARGUED

Manager Mikulovci Speaks Out

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1608, 25 Oct 81 pp 16-17

[Article by Svetislav Spasojevic based on interview of Nazmi Mikulovci, chairman of the Business Board of the Trepca Mining, Metallurgical and Chemical Complex in Kosovska Mitrovica: "A Boundary Underneath the Ground"]

[Text] We went to Kosovska Mitrovica to talk with Nazmi Mikulovci, chairman of the Trepca Business Board, so as to establish irrefutably how much truth there is if any in the slogan which was heard here at the time of the unwelcome events: "Belgrade is being built on Trepca's effort." The curiosity was not misplaced, and there are no reasons why this slogan should not be spoken about publicly and without shilly-shallying. It should, that is, be contested or confirmed, if that is possible.

"Certainly you would like me to answer for you the question of whether Trepca withdraws into itself and confines itself to the borders of the province. For Trepca even the entire space of Yugoslavia is too small, so there is no need for us to speak about the area of the province. And yet it is closed off. This assessment of mine means nothing unless at the same time we answer the question of whether this is an exclusiveness resulting from a policy to that effect or a policy of confinement has been imposed. Yes, Trepca is exploited, but this is not done because of its geographic position."

We obtained the answer, then, without even putting the question. The topic on which we talked is not one with which Mikulovci is unfamiliar. It might even be said that it has become a part of him. It is obvious that he has repeated the tale about Trepca's confinement countless times, but, if the truth be told, it has not become devoid of his own emotions.

A Voice Against Boundaries

"We have been compelled to seek ore wherever there is any regardless of provincial or republic boundaries," Mikulovci continued. "However, it is easier to obtain a license to explore in Turkey, Iraq or China than in some of our republics. Often we speak about confinement, that is, about the parcelization of the

Yugoslav market. That division begins with the failure to obtain the prospecting rights. Is it a normal thing for Trepca, which is mining ore on the border between the province and SR [Socialist Republic] Serbia proper, to be refused a permit to move onto the territory of Serbia proper beneath the ground when it is so compelled in exploring for the ore? After all, we, too, are located on the territory of SR Serbia, and the competent authorities ought to behave accordingly toward Trepca."

To make this assertion as authentic as possible, he cited as an example a detail from this year's "Report on Exploration and Exploitation of Lead and Nickel Ore in Serbia Proper," which was prepared by the Serbian Republic Secretariat for the Economy, the Economic Chamber of Serbia, and the Serbian Republic SIZ [Self-Managing Community of Interest] for Geological Explorations: "Since it is a question here of granting permission for exploration for lead and zinc in Serbia proper to a work organization registered in another republic, that is, SAP [Socialist Autonomous Province] Kosovo...."

New Factories

"I ask you, is Trepca a work organization which is located on the territory of another republic? The manifest involvement of forces from outside associated labor inevitably leads us toward discord," director Mikulovci states categorically. "Confinement has prevented us from developing normally. If we are to survive, we must prospect ore deposits somewhere. If we cannot do that in SR Serbia, in which we ourselves are located, as we are in Yugoslavia as well, then we are forced to do this abroad. It is obvious that Trepca has not closed itself off, but that it has been pushed back into Kosovo."

The activities of mining and metallurgy go back about 50 years here, but processing and manufacturing only some 10 years.

"Lead and zinc production is in an extremely difficult situation," Mikulovci emphasizes. "We are operating at a loss in this part of our production operation. Until some 10 years ago we produced only metal in ingots. We were meeting domestic needs and exporting. It is understandable that we should try not to export metal in ingots, but rather products made from the metal. There are things which are simply inexplicable and to which I cannot reconcile myself. One of them is the attitude taken by the Yugoslav government administration toward lead and zinc producers, that is, toward a labor force of 20,000 in Trepca. So long as I hold this position, that is the only view I can take. Some imaginary world exchange has jurisdiction over the pricing of our products. When the price on that exchange is low, then we honor it. Should it happen to be high, then any number of reasons are found against our raising the price of domestic lead, or at the least the application for the new price, though justified, is delayed indefinitely. Yet on the other hand our borders are closed, for example, to the import of color television sets, and the free setting of prices is allowed! The upshot is that production of color television sets is more important to Yugoslavia than the production of lead and zinc. It is in fact a question of different treatment of the people employed in these two production sectors. I would like to meet someone who would reconcile himself to that fact."

Then he returned once again to his assertion that Trepca is exploited, but he especially emphasized that this is not related to its geographic position. Trepca is not located only within the borders of the province, but is also located in SAP Vojvodina and SR Montenegro. "Finally, Bor, Zenica and quite a few other producers of raw materials are in the same position, but I have no right to speak about them, nor do I wish to do so. I know what is happening to Trepca. We have thought for a long time how we might oppose the government, that is, counteract the government policy toward producers of raw materials. The only right way is to build manufacturing plants. The first and greatest obligation of the 20,000 workers employed at Trepca is to build manufacturing plants in the most underdeveloped parts of SAP Kosovo."

In just the last year Trepca has opened up some 10 manufacturing plants all over the province. These are factories in Pec, Gnjilane, Djakovica, Vucitrn, Decani, Kosovska Mitrovica.... We asked Mikulovci where Trepca obtains so much money to build factories?

Parting of the Ways Without Obligations

"Some of the money was our own, but foreign credits make up the major portion. Today we are paying off those credits not only with money, but also with ore. When I speak of obligations, I must tell the story about how two organizations withdrew from our collective. It is a question of the mines Blagodet and Lece, which are in the southern part of SR Serbia. I do not want to repeat nor even to recall what happened before and during the withdrawal of those mines from Trepca. All of that should be forgotten as soon as possible. It is the consequences of that withdrawal I am referring to. We opened those mines, and in order to do so, we contracted indebtedness abroad. The obligations have come due, but Blagodet and Lece are not discharging their obligations. It is we who are doing it, since the creditors do not care whether those two mines have money or not. One cannot withdraw from a community and fail to accept certain obligations. We are discharging the obligations of someone else, yet we are not in a position to pay personal incomes to our labor force. Payday is supposed to be between the 5th and 10th of the month at the latest. In September we were paid only on the 25th, and this month, though we have already gone into the second half, most members of the labor force have not yet received their pay."

On the street in Zvecan and Stari Trg, watching the workers leaving the second shift and going to work on the third, one could see that Trepca is in a fairly difficult situation. Finally, one can also notice this on the basis of the stores in Kosovska Mitrovica itself. Though there are enough goods--even coffee, detergent and gasoline--and though the prices are cheaper than in other parts of the country, the stores are almost empty.

"We no longer have a rich deposit," Nazmi Mikulovci continues. "The ore is poorer and poorer. In addition, we have an old technology, and the working conditions are all but hopeless. To all this we must add the fact that the credits are smothering us. It is a fortunate circumstance that a few years ago we knew that this year, 1981, would be the most difficult. All that we are achieving in production is far below what we are capable of, not to even mention needs.

These, then, are the critical years. I think that 1983 will be the watershed year. Up to that point our manufacturing industry will be suffering from all the childhood diseases. It was well conceived and set up, and I am certain that it will soon return everything we invested in it and for the sake of which we find ourselves today in a very uncomfortable position."

Abuse of a Slogan

Mikulovci then complained of "certain comrades who tell us that our output is low." He mentioned that that has been the case with output for years and that it has nothing to do with Irredenta and counterrevolution in Kosovo. He is categorical when he says: "... Finally, the workers of Trepca did not participate in the demonstrations....

"We developed very rapidly and spent quite a bit of money on that development. We do not dispute the fact that the return of this money is going slowly. One should always be mindful of the fact that everything Trepca has built it has erected from scratch," Trepca's chief official said for NIN at the end of a 3-hour interview. "There is a huge difference when something is built, say, by Iskra. Aside from that, we are still in the stage of teaching people to do the job for which they are receiving personal incomes."

We hope we have answered the question put at the outset of this article: How much truth, if any, is in the slogan "Belgrade is being built on Trepca's effort"? There is no doubt that Trepca is making an effort, but its operation is not as good as it might be and should be. Belgrade is being built, but not as fast as it should. It is also true that quite a bit is being taken away from Trepca--just as is being done to Zenica, Bor.... If Trepca's name is not alone on the list of mines and smelteries which have been taken away from and are still being taken away from, then Belgrade is certainly not the only city which has been and is on the receiving end.

The essential part of the answer concerning the accuracy of the slogan is that which indicates that it has been abused and concerns the intentions of those who have already been convicted to use it in rallying people who are naive and sometimes innocent as well. This is the part which does not belong to that tale about a segment of Yugoslav reality which no one wants or intends to hide from the public.

Later Discussion

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1612, 22 Nov 81 p 19

[Article by Svetislav Spasojevic based on a meeting of the Economic Chamber of Serbia in which the charges of Nazmi Mikulovci were answered]

[Text] Even at the time of our interview with Nazmi Mikulovci, chairman of the Trepca Business Board, and a few days later, when we prepared the article for NIN (published in No 1608, 25 October 1981) we were certain that most of his assertions would evoke a reaction. A meeting which was held thereafter in the

Economic Chamber of Serbia concerning that article has among other things done much to confirm that assumption.

At that meeting of the chamber chairman Mikulovci was not so fervent in defending the views and assertions uttered to a NIN reporter some 10 days previously. One gained the impression that he was prepared to use the old tried and true method of putting the blame on the newsman.

To make the whole incident as clear as possible, we will first have to quote several of the most essential judgments and views of the chairman of the Trepca Business Board published in NIN's last October issue:

"Certainly you would like me to answer for you the question of whether Trepca withdraws into itself and confines itself to the borders of the province. For Trepca even the entire space of Yugoslavia is too small, so there is no need for us to speak about the area of the province. And yet it is closed off. This assessment of mine means nothing unless at the same time we answer the question of whether this is an exclusiveness resulting from a policy to that effect or a policy of confinement has been imposed. Yes, Trepca is exploited, but this is not done because of its geographic position...."

Then in the course of the conversation Mikulovci told us that Trepca was simply compelled to seek ore wherever it existed, regardless of whether provincial and republic boundaries cut across the deposit.

"However, it is easier to obtain a license to explore in Turkey, Iraq or China than in some of our republics.... Is it a normal thing for Trepca, which is mining ore on the border between the province and SR Serbia proper, to be refused a permit to move onto the territory of Serbia proper beneath the ground when it is so compelled in exploring for the ore? After all, we, too, are located on the territory of SR Serbia, and the competent authorities ought to behave accordingly toward Trepca...."

"... I ask you, is Trepca a work organization which is located on the territory of another republic? The manifest involvement of forces from outside associated labor inevitably leads us toward discord.... If we are to survive, we must prospect ore deposits somewhere. If we cannot do that in SR Serbia, in which we ourselves are located, as we are in Yugoslavia as well, then we are forced to do this abroad. It is obvious that Trepca has not closed itself off, but that it has been pushed back into Kosovo...."

And another quote from the same article. "Then he returned once again to his assertion that Trepca is exploited, but he especially emphasized that this is not related to its geographic position.... 'Finally, Bor, Zenica and quite a few other producers of raw materials are in the same position, but I have no right to speak about them, nor do I wish to do so. I know what is happening to Trepca. We have thought for a long time how we might oppose the government, that is, counteract the government policy toward producers of raw materials....'"

It would not take a wise man to understand that at least some of the countless assertions of chairman Mikulovci spread out over almost two pages of NIN would

arouse certain people to respond to them and thus attempt to contest them. That is what happened in this meeting in the Economic Chamber of Serbia which brought together representatives of OUR's [organization of associated labor] which are producers and users of lead and zinc from throughout the republic, representatives of the republic secretariat for the economy, representatives of the chamber....

"Up until 10 years ago or so we had a uniform law on mining, and that also applied to exploration," said Krsta Jovanovic, republic secretary for the economy and member of the Executive Council of the Assembly of SR Serbia. "Under the constitution, however, it became possible for each of the provinces to draft its specific laws differently. Our initiative for joint adoption of a law was thus simply rejected. It is our view even today--I am referring to the republic secretariat for the economy--that we should explore and use mineral resources jointly and not separately. In the end those are the joint resources of this republic and of the entire country."

Chairman Mikulovci did not answer the remarks of secretary Jovanovic, but often interrupted him: "Representatives of the governments of SAP Kovoso and SR Serbia ought to talk about all those things you are speaking of. After all, Trepca is in the republic at large, and not just in Kosovo."

The statement made by Milomir Bogdanovic, director of the Leposavic Mine, brought quite a bit of reason into the entire incident. This, incidentally, is a mine which extends over the border between the province and Serbia proper. What Bogdanovic said was that back in 1937 the English opened up a mine at Kopaonik, but they did not set up boundaries, and there is no reason for us today to do that either. In his judgment, and he is the head of that mine, it is impermissible for a mine to be divided into two basic organizations, even though it is divided by a boundary between a republic and province.

In the end this director was to be surprised when he heard that Momcilo Amasanovic, president of Novi Pazar Opstina, in which a portion of the Leposavic Mine is located, had been coming to Belgrade and had called upon certain competent agencies for the major portion of the lead being mined at the Leposavic Mine to be left to Novi Pazar for use in its storage battery factory. The opstina president had nothing against Trepca taking the remainder and of giving or selling it to whoever needed it.

The result of this meeting is the knowledge that there is no desire to build a new smeltery in Serbia proper. Finally, as was stated clear and loud at the meeting, SR Serbia has its own smeltery, which is located at Zvecan, which is near Kosovska Mitrovica. Which is why there was discussion of how it should best be equipped and modernized.

The principal message of this meeting lies in the fact that most of the participants are interested in a community effort, that is, in what is referred to as association based on the sharing of income. In this regard, it must be said, the chairman of the Trepca Business Board was somewhat more restrained.

BRIEFS

OIL DERIVATIVE SHORTAGE--Up to now 50 percent of the oil for the Yugoslav oil industry and consumers needed to be imported in November has been imported. Republics and provinces which were supposed to pay for imports with exports have already exhausted their balance of payments positions and this is the basic obstacle to planned oil purchases. As matters now stand, the situation in December will be even worse. There are no more reserves. Many factories are no longer operating. It is said in the General Association of the Oil Industry that "Naftagas" has stopped producing lubricating oil so that there will be more mazut. For some time already all republics and provinces have introduced electric power conservation measures and it is reliably known that the oil industry will not be able to produce nearly as much heating oil as was planned for this winter. [Excerpt] [Belgrade PRIVREDNI PREGLED in Serbo-Croatian 26 Nov 81 p 1]

CORN EXPORTS--Of the 300,000 tons of corn planned for export from Vojvodina, the sale of 110,000 tons to Romania and Bulgaria has been contracted for up to now. In addition, negotiations are underway to sell 50,000 tons to Switzerland and other countries. Also, despite the fact that exports are to the East European markets, payment will be made in convertible currency, because this has been agreed upon in the contract. Up to now only 6,500 tons have been shipped to buyers abroad from the province of Vojvodina. [Text] [Belgrade BORBA in Serbo-Croatian 21 Nov 81 p 14]

TRADE RELATIONS WITH ARAB COUNTRIES EXAMINED

Sofia VUNSHNA TURGOVIYA in Bulgarian No 9, 1981 pp 7-10

[Article by Sasha Grozdanova: "Trade and Economic Relations Between Bulgaria and Arab Countries"]

[Text] The role of developing countries in international economic relations and their influence in the solution of a number of global economic and political problems are increasing with detente.

The decisive efforts of the majority of developing countries to reorganize international economic relations and the active struggle they are waging against imperialist exploitation are supported by the Soviet Union and the other members of the socialist comity. It is on this basis that friendly relations, based on reciprocal advantages, respect for sovereignty and noninterference in domestic affairs, are created between CEMA-member and developing countries. However, these relations are not based on class solidarity, for most develcping countries are following the capitalist way and only a few of them have taken a socialist orientation. However, these are relations of a new type, characterized by international support and aid which the socialist countries are providing the developing states.

Bulgaria maintains particularly active and varied economic relations with the Arab countries.[1] This is based on a number of factors, such as our country's policy toward this group of countries, historical traditions, geographic vicinity, convenient transportation, complementing economic structures and so on.

Trade plays an important role in relations between Bulgaria and the Arab countries. In recent years (1979-1980), more than one half of our trade with developing countries and about 4 percent of our overall trade has been with this group of states. Our trade with the Arab countries increased from 123 million leva in 1970 to 936.2 million leva in 1980.

Bulgaria maintains particularly active relations with the progressive Arab systems. Our trade with Libya, Iraq, Algeria and Syria accounts for 77 percent of our global trade with the Arab world. In 1979, for example, Libya was our 10th biggest foreign trade partner, accounting for 280.8 million leva, followed by Iraq with 137.9 million, Algeria with 104.7 million and Syria with 61.8 million. These countries belong to the 10 developing countries with which Bulgaria maintains most active trade relations.

A study of the trade structure between Bulgaria and the Arab countries over the past 10 years shows a clear increase in the share of productive capital exported to these countries. Starting with 1978, machines and equipment have accounted for more than 50 percent of the total. This is important to the industrialization of the Arab countries, their socioeconomic development and their international economic relations in general. However, the growth rates of our exports of machines and equipment to the Arab countries are still behind the pace and volume of their imports of such goods. On the other hand, during the past few years some countries (Algeria and Iraq) have begun to organize their own production of some types of machines (tractors, metal processing machinery and others), as a result of which they have reduced their imports. At the same time, competition on the part of developed capitalist countries has become more active,[2] and the requirements of the Arab countries regarding the quality and technical standards of important machines and equipment have increased.

The structure of Bulgarian machine and equipment exports is quite varied. Bulgaria exports mainly metal processing, agricultural, hoisting, power and electrical engineering machinery and equipment. Most of the metal processing machines go to Iraq and Syria. In the future, it is expected that the Arab countries will increase their imports of metal processing machines regardless of their own efforts to increase their domestic production of such equipment. The share of higher precision and more specialized machines will be increased particularly.

The Arab countries will continue to meet their needs for lifting equipment, mainly through imports. For example, in 1979 Bulgaria delivered to Iraq, Lebanon and Egypt 214 forklift trucks, 177 gas-operated lift trucks and 88 electric hoists. Our exports have a good market in these countries. However, of late we have been facing the competition of capitalist countries and, particularly, Japan with increasing frequency.

The Arab world is quite interested in Bulgarian agricultural machinery. A promising market exists for soil cultivation, irrigation and harvesting machinery. Bulgaria exports to the Arab countries various energy and electrical engineering machines and equipment as well.

The increased share of Bulgarian machines and equipment in Arab imports is effectively based on the process of industrialization in the Arab countries. This is closely related to the efficient utilization of the advantages stemming from the participation of the individual countries in the international division of labor.

The Arab countries account for a considerable share of Bulgarian imports from the developing countries. Initially, such imports covered exclusively agricultural products such as rice, olives, citrus fruits, cotton and others. Our country offers a long-term stable market for the traditional agricultural commodities produced by these countries. However, Bulgaria not only imports from but exports to the Arab countries some types of agricultural commodities and foodstuffs. Such items account for 17 percent of our total exports to these countries. Many of them are traditional. This is yet another confirmation of the essentially new approach taken by our country to problems being resolved by the Arab countries, including that of food supplies.

In recent years we have also imported finished and semi-finished goods from the Arab countries. The industrialization underway in the Arab countries leads us to believe

that this process will be developed in the future considerably. With increasing frequency long-term trade agreements stipulate percentages of finished goods. Thus, the long-term cooperation program concluded between Bulgaria and Iraq stipulates imports of tape recorders, fluorescent tubes, fabrics and shoes from Iraq. We can expect that the processing industry which is developing in the Arab countries at a fast pace will offer new and even more interesting export commodities. Chemicals and some types of instruments and other items produced by the Arab countries have already reached our market.

Imports of raw materials from the Arab countries are increasing rapidly as well. They account for four fifths of our imports from these countries. Considerable changes have taken place in their structure as well. The share of industrial raw materials has increased. Imports of petroleum and chemical raw materials such as phosphates, ores and metals, have been increasing most rapidly. The Arab world is the second largest petroleum supplier to Bulgaria, the USSR being first. Most promising in this respect are our relations with Libya, Algeria and Iraq.

These countries can increase their exports of petroleum and mineral raw materials by increasing their output which, in turn, calls for the development of new deposits and installation of more productive capital. The Arab countries lack adequate experience and a number of them are short of means for carrying out such projects through their own efforts. Their cooperations with Bulgaria in surveying and developing their natural resources is substantial. It is consistent with reciprocal interests. Bulgarian geological groups are studying deposits, designing mines and mapping geological charts in Algeria, Tunisia, Syria, Morocco and Iraq. The production, financial and scientific and technical aid they are receiving from Bulgaria in development of some raw material sources make their increased exports to our country possible.

Along with the growth of trade between Bulgaria and the Arab countries, other more progressive forms of economic cooperation are being developed as well. Cooperation in the area of technical assistance is an example of a higher stage of development of such relations.

In recent years, a form of economic cooperation relatively new to our country has been developed: the export of complete projects to countries in that area. The main importers are Iraq, Syria, Algeria and Libya. Bulgaria supplies mainly food industry enterprises such as canneries, greenhouse complexes, light industry enterprises, electric motor production factories, technological lines and others.

Our country has shipped canneries to Ba'quba, Na'maniya, Hair and Shaqlawa and a starch and dextrin plant in Iraq. Feed plants, greenhouses and poultry farms will be delivered to that country.

The exporting of complete equipment for mines and concentration factories has been very successful. Thus, a mine and a phosphate concentration factory were built and equipped in Syria, equipment for the mining of iron ore deposits was delivered to Algeria and so on.

In this respect our country's activities are contributing to the comprehensive development of individual industrial sectors in the Arab countries. Such comprehensive

technical cooperation is very effective and its development will be expanded in the future. To Bulgaria this is a major means for increasing the export of machines and equipment. At the same time it guarantees imports of some raw materials and semi-finished and finished goods.

Another important foreign economic activity conducted by our country in the Arab states is the planning and construction of a variety of projects. This includes roads, airfields, bridges, public buildings, dams and irrigation systems. Syria was the first country in which construction projects were completed: a grain silo, the Rastan and Maharde Dams and other projects. A Bulgarian construction organization designed and built two complete airfields. Bulgarian construction workers completed the civil airport in Baghdad, the sports city in Tunis, sports complexes in Tripoli and Bengazi, the airport in Sebha, the sewer system in Tripoli and a wide network of polyclinics and hospitals in Libya.

Bulgarian construction projects carried out in the Arab countries are focused mainly on the construction of representative projects aimed at improving the infrastructure of the country, directly related to their economic development. Such projects contribute to the strengthening of the state economic sector in the Arab countries and lay the foundations for the development of new industrial sectors.

Scientific and technical cooperation with the Arab countries is developing positively. As a result of many years of colonial slavery, illiteracy in those countries is widespread. There are very few specialists, most of them trained in the former mother countries. The urgent need for scientific cadres of specialists became very quickly apparent as a result of the rapid development of the Arab countries. Such specialists could come from the developed capitalist countries as well. However, since this is a feature of the neocolonial policy of these countries, the Arab states are looking for other sources of such aid. This created objective prerequisites for rapidly increasing the scale of scientific assistance granted by the socialist countries, radically different from that offered by the West. Bulgaria and the remaining socialist countries pursue no secret objectives by assigning their specialists or accepting Arab young people for training in their schools. Thousands of Bulgarian scientific workers and specialists are providing aid on the spot in the areas of agriculture, industry, transportation and health care. Bulgarian specialists began to be assigned to those countries starting with the second half of the 1950s. Bulgarian specialists are at work in Syria, Kuwait, Iraq, Morocco and others. Bulgaria has organized in Arab countries schools, assigned teachers, and accepted specializing and postgraduate students in its schools. In recent years the number of young people from Arab countries undergoing their training in Bulgaria has been increasing rapidly. They come mainly from Algeria, the People's Democratic Republic of Yemen, Lebanon and Iraq. This process will be intensified, for the need for specialists is increasing steadily as a result of the accelerated industrialization of the Arab countries.

Cooperation between Bulgaria and the Arab countries will continue to develop and intensify. This is favored by friendly relations at the highest party and state level. The theses of the 12th BCP Congress reemphasize our country's readiness "to follow a line of accelerated development of foreign economic relations with developing countries," and to support the "struggle of the Arab peoples against imperialism, Zionism and reaction...."[3]

A number of problems arise in the course of the intensification and expansion of foreign economic relations between Bulgaria and the Arab countries. Their solution is hindered by the variety of political regimes in the Arab countries, frequent internal contradictions, which result in military conflicts, and the political instability of the area.

The close economic ties with the imperialist countries created during the colonial period present problems as well. For this reason, it is becoming increasingly necessary for the quality of our goods to meet world standards, to be adapted to the specific weather conditions of the Arab world and so on. Bearing in mind the ambitious economic development programs of the Arab countries, which stipulate the accelerated building of textile and food industries, machine building and metallurgical enterprises, Bulgaria could considerably increase its export of complete enterprises, based on its considerable production experience and cadres.

Agricultural equipment exports is a traditional element in our cooperation with the Arab countries. In order to develop it further, we must promptly organize the qualitative technical servicing of exported machines and equipment. Good service and regular availability of spare parts is of major importance in enhancing Bulgaria's reputation as an exporter of machines and is an additional factor in stimulating sales.

The timely delivery of goods to the Arab countries and improvements in advertising are important problems. Greater attention must be paid also to the study of the Arab market and to the search for less expensive and more efficient transportation roots.

Our imports from Arab countries face problems as well. The great backwardness of some Arab countries and the lack of export potential (other than petroleum) create a number of difficulties. Some countries try to balance their trade with Bulgaria, which is of essential importance to them. They try to pay for their imports with exports. However, because of their limited export possibilities, they impose deliberate restrictions to our exports.

The rapid development of the petroleum processing industry in the Arab world creates opportunities for increasing imports of petroleum products. We should ask our deliveries to be paid in raw materials. This is important in resolving the raw material problem of our country.

Socialist economic integration is one of the basic factors which contribute to the intensification of our relations with the Arab countries. It helps us steadily to improve production forces and to increase social labor productivity. This increases Bulgaria's export possibilities.

The successes achieved by CEMA-member countries in the development of their national economies are a major attractive force for the young independent countries. This interest was confirmed in 1975 when the first cooperation agreement was concluded between CEMA and the Arab state of Iraq. Its purpose is to promote comprehensive economic cooperation and, at the same time, to expand and intensify contacts on a bilateral basis.

The CEMA-member countries engage in joint and coordinated participation in construction projects, supply of complete enterprises and geological surveys in the Arab

countries. Bulgaria and the USSR have already completed several joint projects such as phosphate mines in Jordan, Morocco and Tunisia, and a complex for the production of chemical fertilizers and sulphuric and phosphoric acid in Iraq. Natural resources are being developed in Algeria through the joint efforts of Soviet, Bulgarian and Romanian specialists. Bulgaria, Poland, Romania and the GDR built and equipped three phosphate extraction industry projects in Syria.

However, the problem of engaging in more extensive production specialization and cooperation between CEMA-member countries and Arab states remains unresolved. The severe economic backwardness of the Arab world remains one of the basic reasons for this.

Improving the cooperation mechanism plays an important role in the development of various forms of foreign economic relations. An organizational-legal mechanism for their regulation has been elaborated. It includes bilateral intergovernmental treaties for trade, economic and scientific and technical cooperation and cooperation in carrying out specific projects. Agreements of a new type are being concluded, based on the adoption of long-term programs. They provide a stable foundation for the development of reciprocal economic relations and are becoming a factor in stabilizing the economy of the Arab countries. Bulgaria has organized mixed intergovernmental commissions with some of the bigger Arab countries. They call for the organization of work groups, sections and subcommissions with the participation of major specialists. This protects the interests of the countries and makes the coordination of joint measures possible.

The comprehensive economic and scientific and technical cooperation with the Arab countries and the implementation of a policy aimed at supporting their struggle for political and economic independence objectively strengthen the positions of the anti-imperialist front in the interest of detente and create opportunities for a radical reorganization of contemporary international economic relations. The intensification of such relations in the future may be expected. They are one of the effective means of supporting the Arab countries which enables them to follow the path of progressive social changes they have chosen.

FOOTNOTES

1. The Arab countries are: Algeria, Bahrain, Egypt, Iraq, Yemen, Jordan, the People's Democratic Republic of Yemen, Kuwait, Qatar, Libya, Lebanon, Mauritania, Morocco, the United Arab Emirates, Oman, Sudan, Saudi Arabia, Syria, Somalia and Tunisia. According to United Nations data, in 1978 the population of the Arab countries totaled close to 145 million people with a territory of 14 million square km spread over Asia and Africa. The territory of the Arab countries accounts for about 55 percent of the world's petroleum reserves and one sixth of the global reserves of natural gas.

2. For example, in recent years the developed capitalist countries have become the main partners of Egypt, Tunisia and Morocco.

STATISTICAL DATA ON BULGARIAN FOREIGN TRADE

Sofia VUNSHNA TURGOVIYA in Bulgarian No 9, 1981 pp 26-27

[Report: "1980 Foreign Trade of the Bulgarian People's Republic in Figures"]

[Text] In 1980, Bulgaria's foreign trade totaled 17,184,000,000 foreign exchange leva (8,901,500,000 leva exports and 8,282,900,000 leva imports). Between 1960 and 1980 foreign trade increased by a factor of 9 in physical terms; overall industrial output rose by a factor of 6, agricultural output doubled and the national income quadrupled.

The USSR accounts for about 54 percent of Bulgaria's trade, while the remaining CEMA-member countries account for 20 percent. Between 1960 and 1980 trade with CEMA-member countries increased by a factor of 14; trade with the developing countries increased by a factor of more than 15 (2.83 billion leva in 1980), and by a factor of 37 with the developing countries (1.52 billion leva in 1980).

Machine building output accounts for 42.2 percent of total exports. Specialized goods worth 1.79 billion leva were exported. Exports of complete projects totaled 278 million leva to the developing countries and 106 million to CEMA-member countries (mainly canneries for fruits and vegetables, and chemical and construction enterprises).

ESTIMATED COAL MINE EXHAUSTION DISCUSSED

Development of Sokolov Coal Mining District

Prague UHLI in Czech No 9, 1981 pp 323-327

[Article by Eng Josef Pluhar and Engr Jaroslav Krov, SHR [North Bohemian Brown Coal District], Teplice Mining Projects, k.u.o. [Specific Purpose Organization] Ostrov branch: "The Concept Underlying the Development of the Sokolovo Coal Mining District"]

[Text] Solid fuels are of key importance in the national economy for statisfying the fuel-energy needs of the society. Securing an adequate fuel and energy supply is becoming the potential basis of the entire state economy and, together with the application of the latest scientific and technological achievements for designating an economical type of energy consumption, determines the effective level of the entire national economy.

Solid fuels and, in the first place, coal, will constitute the basic component of the fuel-energy balance in the future, too. A number of analyses point to the worldwide necessity of using coal for production of energy.

In our fuel-energy situation, solid fuels play the principal role at the present time because they account for 62 percent of the total consumption of primary fuels for energy production. Total output was 125 million tons of coal and lignite in the CSSR in 1980, 97 million tons of which was brown coal. The planned structure in the production of graded types, however, was not attained. Moreover, the higher target of 98.5 million tons set for brown coal production was not met.

Electric energy consumption, whose principal production basis is brown coal, increased from 5 billion kWh in 1945 to 72 billion kWh in 1980. The task laid down by the guideline of the 15th CPCZ Congress to produce 77-79 billion kWh of electricity in 1980 was not accomplished.

Brown coal production of 97 million tons was achieved under demanding conditions of building new mining capacities, permanent deterioration of natural mining conditions and decline of qualitative parameters of mined coal. Due also to their more intensive exploitation in the past, several mining capacities are gradually approaching their depletion. The output increase was thus achieved by the opening of new mines and reconstruction, expansion and modernization of existing mining capacities.

While the upward statewide trend in production of solid fuels was rather significant, the Sokolov coal district achieved an even higher increase. A total of 3.3 million tons of coal were mined in the district in 1945, but coal output exceeded 20 million tons in 1980, a sixfold increase.

The development of the Sokolov brown coal district and the increase in output was characterized by the gradual transition from underground to surface mining with the use of modern technology and equipment, and centralization of the coal-preparation process. The degree of concentration of mining operations is clear from the fact that, while 33 mining plants (including 25 underground mines) extracted a total of 3.3 million tons of brown coal in 1945, the 1980 output was achieved by 8 surface and one underground mine.

The concentration and centralization of mining operations has been noticeably reflected in better economic results. This exerted positive influence on the reduction of mining and coal preparation costs, increase in labor productivity and substantially better exploitation of seams worked.

Mining conditions, however, continue to deteriorate because mining operations must be directed to lower depths with a thicker overburden and also to the areas disrupted by previous underground mining.

With the increased coal output, the Sokolov brown coal district assumed gradually greater importance in the fuel-energy balance of our state.

The past development of the Sokolov district was affected by the following basic factors:

--the volume of exploitable coal deposits, their location and quality;

--gradual concentration of mining operations, expansion of strip mining and factors contributing to better economic results;

--position of the coal district in the area with developed industry which is far from imported fuel and energy sources;

--traditional exports of coal to foreign countries;

--finally also by the fact that mining operations significantly affect economic and social life in the Sokolov district.

Together with the mining and technical conditions, these factors, even from the very outset, affected the concept of the long-term development of the district in which gradually conditions were created for the use of coal on the spot and for satisfying the needs of the national economy by the deliveries of briquettes, electric energy, gas and heat. At the same time, attempts were made to make more effective use of Sokolov coal, part of which is suitable for briquetting or gasification, and another considerable part--with low sulfur content and relatively low content of ash matters--for use in power plants.

Due to Sokolov coal's average caloric value of approximately 12.142 MJ, the considerable (40-45 percent) water content in raw coal reduces efficiency of its use in areas remote from the district.

The deadlines necessary for the preparation and implementation of investment projects providing for new mining capacities and even more demanding preparation and implementation of subsequent investments make it necessary to forecast and work out the long-range concepts of brown coal mining until the complete depletion of all known and proven deposits. The opinions on such a concept of the district's development were summarized by the Teplice Mining Projects specific purpose organization, Ostrov branch in 1980 under the title "A Special-Purpose Study of HDB [Brown Coal Mines And Briquette Plants] Sokolov--1980 updating."

The following developmental stages may be distinguished in the concept of long-term development:

--increased mining operations in the western area;

--increased mining operations in the eastern area;

--exploitation of safety pillars of Svatava and Ohre rivers together with the pillars of the town of Soklov;

--long-term prospects of the exploitation of the Karlovy Vary-Otovice district.

According to the assessment on 1 January 1980, there are approximately 834 million tons of exploitable brown coal deposits in the Sokolov district (the total amount of both definitely located and estimated deposits).

The division of the district into the western and eastern sections is determined by the natural boundary, that is the Ohre and Svatava riverbeds.

The long-term concept of the development of the district indicates a permanent decline in the output of the entire district, although the output from the eastern area is expected to increase significantly during the 1985-2010 period (Fig 1).

Fig 1 Development and Structure of Annual Coal Output in Sokolov District

Western Area

Eastern Area

annual coal output in entire district

pillars

The diagram in Fig 1 makes it clear that the decline in output would be even more significant without the exploitation of seams in the protective pillars and would shorten the service life of the entire district.

Another typical feature of the long-term development of the district is the general trend in extracted materials which has a rising tendency up to the year 2000 despite declining coal output (Fig 2). This is a natural consequence of the deteriorating overburden factor resulting from the geological position of seams.

Fig 2. Development of Annual Overburden Removal in the Sokolov District

annual overburden removal in entire district

Eastern area

The development of the indicator of the overburden removal in relation to the coal output is evident from Fig 3.

Fig 3. Relation of Overburden Removal to Coal Output in Sokolov District

There is a steadily increasing demand for a bigger output of coal in both districts under the Ore Mountains which is needed as raw material and in the power plants, while the conditions for the satisfaction of these needs are becoming increasingly complex even today--and even more so in the future. The existing coal deposits are exhaustible and the intensity of the annual outputs determines the time limit of their complete depletion.

Another major obstacle which will have to be overcome by the increased effort of the entire society is the problem of timely measures for the exploitation of residual safety pillars under the industrial and residential built-up area.

Moreover, additional specific, objectively existing problems in the Sokolov district must be taken into account:

--lack of waste dump areas in the varied terrain;

--compliance with the conditions of hydrogeological protection of curative springs in spas;

--difficulties connected with the potential appropriate relocation of the Ohre and Svatava riverbeds;

--demanding solution of the problem of releasing space under the town of Sokolov for mining operations.

The demanding nature and complex interdependence of all related areas of society's life makes it evident that the solution of most developmental problems requires unusually long periods for design, preparation and implementation. This means that a comprehensive solution must be worked out several decades ahead.

From the large initial and subsequent investments required by mining operations it is clear that the necessary capacity of supplier organizations has to be gathered together in the mining area. Such a task cannot be accomplished during the brief developmental period.

Development of Western Area

During the first stage of development of the Sokolov brown coal district, attention centered on the opening and development of the Silvestr, Medard I, Medard II, Gustav and Libik mines in the western section of the district. These mines possessed more advantageous mining-technical and economic conditions due to the better quality of coal, advantageous overburden-coal ratio, smaller necessary investments and, last but not least, also to the fact that their development did not require big initial investments since most of these mines were already in operation by then.

Through the development of mines in the western area, conditions were created for adequate coal supply to the Tisov power plant which was gradually put into operation during the 1959-1963 period with an installed output of 512 MW.

To make full use of the coal substance, a coal-preparation plant was built at Tisov with an annual capacity of 6 million tons and a briquetting plant with the annual capacity of 0.5 million tons of briquettes.

Apart from deliveries to the above-mentioned users, coal from these mines is delivered to the briquetting plant at Vresova, graded coal to households and communal services and high-quality, above all, fine coal is exported.

Due to the decreasing supplies in the mines now in operation, the coal output increase in the western area as illustrated in Fig 1 cannot be achieved without opening of additional mines, naturally after their detailed technical and economic evaluation, during the next stage of development.

This will include primarily the exploitation of residual coal deposits in the Josefska seam with a high sulfur content and of marginal, qualitatively inferior coal deposits of the Antonin seam. The common characteristic of these seams is the samll quantity of coal supplies and thus also small mining capacity which will not exceed 1.5 million tons per year in individual seams.

Due to the relatively high sulfur content, this coal will be possible to utilize after its homogenization in the preparation plants of the district so that the sulfur content does not exceed the tolerable limit.

Specifically, the plans for opening of the Madard-Josef and Michal II mines must be worked out in detail in connection with the gradual termination of mining operations in some of the mines.

Fig 4 illustrates the trend in coal output and Fig 5 the trend in overburden removal in the western area of the Sokolov district.

Fig 4. Trend in Annual Coal Output in the Western Area of the Sokolov District

Fig 5. Trend in Annual Overburden Removal in the Western Area

From the diagrams in Fig 4 and Fig 5, it follows that the drastic decline in output in the present mines of the western area can only be alleviated but not stopped by the development of new mines. It must be taken into account at the same time that the development of some of these mines will be technically as well as economically very demanding regardless of the complex problems in territorial relations and sales.

Development of Eastern Area

Because of the intensive exploitation of mines in the western area of the Sokolov district, mining operations are rapidly coming to an end. For this reason, mining operations will be expanded in the eastern section of the Sokolov district during the second stage. Extraordinary attention was paid to the development of the Jiri mine (originally the Jednota mine) and Druzba in recent years. Apart from these two mines, there is only one underground mine--Marie Majerova--in operation now. The present output in this area accounts for approximately 33 percent of the output in the Sokolov district.

The eastern part of the Sokolov district is of key importance for further development of the district. It is anticipated that it will be exploited up to the year 2020.

The mines of the eastern section constitute the raw materials basis for the Vresov Combine for Utilization of Brown Coal and for production of electric energy. The rest of coal deliveries is earmarked for other industries, households and communal economy. Coal from the Marie Majerova underground mine is delivered to glass, ceramics and textile industries, and coal yards.

The present concept of expanded mining operations in the eastern area has so far anticipated independent operation of the Jiri mine as the key mining locality, the Druzba mine, the Limicky mine and Marie Majerova underground mine with the exploitation of the Antonin seam.

In the giant Jiri mine, the preliminary plan calls for the exploitation of the Alberov section whose exploitable deposits in the Antonin seam represent 315 million tons of coal. The maximum annual coal outputs amounting to 9 million tons are planned for the 2000-2016 period. The advances of working faces based on the preliminary studies had to take into account the ban on mining in the area of Kralovske Porici and also the protective pillar of the CSD [Czechoslovak State Railways] track.

The relocation of the CSD Chomutov-Cheb line in the Chodov-Sokolov section which interfered with the desirable expansion of working faces in the Druzba and Jiri mines was completed in 1980.

The working faces of the Druzba mine are now directed to the exploitation of the released gangway pillar with the subsequent advance into the area of the former Nove Sedlo railway station.

The hydrogeological exploration completed and evaluated by now has opened the possibility of strip mining in the Kralovske Porici panel. Through this measure the long-term concept of mining in the eastern area enters a new stage in which the conclusions of exploration will be used for specific projects. The exploitable substance of the seam will substantially increase by the permission for strip mining in the areas protected so far, and the opening of a new mining location will make possible an increase in annual outputs in the eastern section of the district over the level previously anticipated.

At the present time, alternative variants to developing a new Marie Majerova mine are being studied in order to reach the final decision on its development. The directions of the working face advance must be mutually coordinated with the advances in the Jiri and Druzba mines, and the problem of waste dumps is linked to the situation in the entire district.

It is economically advantageous to employ efficient technological units of the TC 2 series in large mining areas of modern mines and thus, through concentrated output, to substantially raise the labor productivity level. Under the conditions of the eastern section, these units already operate in the Jiri mine. The mining and technical conditions of exploitation in other mines are suitable for employment of technological equipment of the TC 1 series.

The effort to increase annual coal outputs in the eastern area led to the tentative projects for intensified mining in the Lomnicky mine.

Another necessary prerequisite for the successful development of the eastern area is providing adequate areas for waste dumps and combining them with the waste dumps in the western area. This problem has not been satisfactorily solved as yet and constitutes one of the principal problems of further development of the Sokolov district which must be systematically studied and dealt with.

The increase in the annual coal output of the eastern section (Jiri, Druzba, Lomnice and Marie Majerova mines) is shown in Fig 6.

Exploitation of Supporting Pillars

The provisions of Law No 41/57 on exploitation of mineral wealth provide for the largest possible and, at the same time most economical, exploitation of minerals for socialist industrial production and construction.

For this reason, the already mentioned study prepared by the Teplice Mining Projects for the first time explores the possibilities and conditions of exploitation of supporting pillars. In the Sokolov district, this includes coal in pillars excluded from mining in the following areas: Cista, Habartov, Svatava community and river, Sokolov, Ohre River and CSD, Michal II, the Josef seam in the Alberov panel. The residual supplies representing 243 million tons of coal for the most part are located under the industrial and residential built-up area, and the preparation of and actual mining operations in these areas is, therefore, particularly demanding and expensive.

The new solutions proposed by the study interfere with the present concepts of other sectors in the area in question. It will, therefore be, necessary to evaluate them from the standpoint of the entire society and subsequently to revise the existing territorial plans. This is a time-consuming and very demanding task.

Karlovy Vary-Otovice Section of Sokolov District

The Karlovy Vary-Otovice district lies close to Karlovy Vary spa and extends from the community of Stara Role in the west across Cankov, Sedlec, Otovice to the communities of Lesov and Sadow in the east. The coal deposits here are situated in the Antonin seam with a variable thickness from 4 to 35 meters. The mining operations were extensive and scattered in the past. Individual sections are of different geological structure.

The complex relations between the developing of mines and actual mining operations and important interests of the entire society and nearness of the Karlovy Vary spa were and are being studied by experts from many areas, such as urbanism, ecology, climatology, hydrology and hydrogeology, who must also take into account broader social, economic and esthetic aspects.

Cheb Brown Coal District

The Cheb district consists of an extensive deposit not exploited at the present time which contains a considerable quantity of brown coal (more than a billion tons).

In comparison with the Sokolov district, the Antonin seam here is situated much deeper and less advantageously, and is substantially thinner (with the exception of the Oldrichov-Pochlovice section in the eastern area).

In the Sokolov district, the overburden-coal ratio reached the following values (cubic meters/ton):

1955 - 1.120	1970 - 2.143
1960 - 1.194	1975 - 2.314
1965 - 1.928	

and in the future, just before the depletion of the district, is expected to reach 3-3.5 cubic meters/ton.

In the Cheb district, it would be necessary to remove on the average 15-20 cubic meters of overlaying strata per ton of coal and only exceptionally would there be found a deposit with a 10 cubic meter/ton of overburden-coal ratio.

The present knowledge of properties and position of deposits in the Cheb district points to the unsuitability of their exploitation by strip mining from all key standpoints:

--considerable overburden-coal ratio, rather thinness of the coal seem, removal of huge quantities of overburden;

--complex and extraordinary demanding nature of protecting curative springs at Frantiskovy Lazne spa and sources of drinking water;

--expensive necessary investments, extensive devastation of the region and sequestration of agricultural land;

--demanding technical and investment requirements and economic unfeasibility.

For these reasons, the future will have to focus on the underground exploitation of deposits in the Cheb district.

The considerably area of tertiary productive strata (category C_2) of the Cheb district (approximately 119 square kilometers), relative lack of their exploration and the demanding nature and high costs of hydrogeological exploration in relation to the protection of natural curative springs of the Frantiskovy Lazne spa make it necessary to delimit, on the basis of present knowledge, those parts of the deposit (locations) which are suitable and possess prerequisites for mining operations. In locations promising for exploitation, it is necessary to carry out hydrogeological and deposit research to obtain documentary material and ascertain conditions under which mining operations could be carried out. In addition, in those locations in which it appears purposeful and advantageous, it is necessary to continue exploration and to make the deposit accessible through underground workings in order to better verify the properties of the coal seam and conditions of its exploitation, and to speed up the opening of the deposit and start of its exploitation.

For purposes of study and forecasting the brown coal output in the Cheb district, we can assume that if only one-third of total deposits of more than one billion tons, that is, 350 million tons of coal, could be extracted by underground mining, then allowing for 50 percent losses in the yield, there still will be approximately 170 million tons of coal available.

On this basis, the long-term plan of development can call for the establishment and operation of 4-5 underground mining plants with a total output of 3-4 million tons per year and an average period of exploitation of approximately 40 years. The annual output by one plant should amount to 0.5-1 million tons.

To achieve this goal, it would be necessary to select, during the Seventh Five-Year Plan, the locations suitable for underground mining and to specify the measures for protection of the springs at Frantiskovy Lazne as well as the conditions for safe underground operations. Later on, in the course of the Eighth Five-Year Plan, it would be necessary to create--possibly in the form of exploratory underground workings--conditions for verification of coal deposits and construction of one or two underground mining plants which would be put into operation as early as the Ninth Five-Year Plan.

The Sokolov district which since 1945 has gradually switched from rather extensive underground mining to stripping in the entire area of the Sokolov district (with the exception of the Marie Majerova pit) does not possess conditions for extensive underground mining at the present time.

The eventual decision on the preparation and development of underground mining in the Cheb district must, therefore, be preceded by creation of conditions for hiring of qualified labor force, training of apprentices for work in the mines, housing construction and so on.

Conclusions

The problems of expanding mining operations in the Sokolov brown coal district can thus be summarized as follows:

1. in view of the fact that the deposits in the western area will be soon exhausted, it is necessary to intensify the preparation of mining operations in the eastern area;

2. providing adequate waste dumps is one of the principal problems of the territorial plan;

3. a major problem of expanded coal mining operations is providing of mining locations with reliable mining and transportation equipment and organization of efficient repair shops;

4. the extent of investments during the long-term development points to the necessity of transferring adequate construction and assembly capacities to the district;

5. it is necessary to continue and evaluate hydrogeological research and define with more precision the measures designed to protect the natural sources of curative mineral waters at Karlovy Vary spa;

6. in connection with the depletion of deposits in the western area of the Sokolov district in sight, the focal point of mining operations will move eastward. The concentration of mining operations in the eastern area will give rise to problems in the distribution of employment;

7. the study makes it clear that within an urgently brief period it will be necessary to comprehensively cope with the problems related to the complete depletion of coal deposits in order to make possible the adoption, without serious consequences, of socially important decisions on the further development of the fuel-energy basis in the Sokolov district.

Development of Vrsany Mine

Prague UHLI in Czech No 9, 1981 pp 334-338

[Article by Eng Josef Marik and Eng Albert Hotovy, SHR, Teplice Mining Projects, k.u.o. [Specific Purpose Organization]: "The Concept Underlying the Development of Vrsany Mine"]

[Text] The intention of driving a separate opening in the southern part of the Sverma mine mining space is not new; it originated during the 1955-1960 period.

The 1971 forecast of the long-term development of the North Bohemian brown coal district and the 1972 study on supplying power plants with coal pointed to the necessity of making up for the decline in brown coal output after the closing down of the Smeral and Triskolupy mines by opening another mine. In this general area, the Havran panel of the Bylany mine and the southern part of the Sverma panel could be considered in this context.

In view of maximum economy in the use of coal and of utilization of inferior fuels some consideration was given at the outset to the development of the Bylany mine. In the course of preparation it became clear, however, that present power generating equipment cannot use these fuels effectively without expensive and time-consuming reconstructions.

The situation thus forced the development of the Vrsany mine with coal of higher quality prior to the development of the Bylany mine.

Exploitation of the Panel

The delimited panel with the area of 745 hectares contains approximately 113 million tons of exploitable deposits of brown coal used by the power plants with a caloric value of approximately 9.79 MJ/kg. The coal stratum consists of three seams.

The first top seam about 5 meters thick is situated 20 meters below the surface and thus intermingles with overburden. Its area is limited to the southwestern part of the panel and a narrow strip along the western and northern demarcation from the Sverma mine. It accounts for approximately 14 percent of exploitable deposits. Seams No 2 and No 3 are 15-17 meters thick. The stratum between the two seams is 15-20 meters thick. The intermediate seam, No 2, is separated from the top seam by a deep stratum which in some spots reaches a thickness of 60-70 meters. Seams No 2 and No 3 extend essentially over the entire area of the delimited panel and represent 59 percent plus 27 percent = 86 percent of exploitable deposits. The yield in the Vrsany panel is about 32.55 tons per cubic meter. [as published] So far as overlaying strata are concerned, approximately 350 million cubic meters will have to be removed. The overburden-coal ratio is 3.09 cubic meters per ton.

The complex tectonic conditions of coal deposits in the delimited area are further complicated by the sand strata inundated by water from artesian wells.

These basic conditions determine also the general concept of the deposit's exploitation.

Mining operations will be preceded by the intensive drainage of the solid stratum through barriers of borings which will be made ahead of the advancing working face in the overburden.

The advance of working faces both in the overburden and coal strata will be essentially parallel and will proceed from the southern boundary of the mine in the northern direction to the artificial northern demarcation of the panel of the Sverma mine.

As long as space in the mine is available, the completely exhausted Smeral mine has been designated as a waste dump. It has a free capacity of approximately 180 million cubic meters for earth and rocks with the permissible top of the pile reaching 315 meters above the sea level.

Prior to intensification, the excavations of overburden and interlaying strata will not exceed 17-18.5 million cubic meters per year, while the maximum annual coal output will be approximately 6 million tons.

The parameters of working faces in overburden--the height of cut 20 meters and the gradient 40-65 degrees--are affected mainly by the mechanical properties of soil, hydrological conditions in the overlaying strata and geometric parameters of giant machines. The same is true of the working faces in the waste dumps (15 meters) in which some additional important factors, such as quality of underlaying strata, gradient, hydrological conditions of the underlaying strata and so on must be taken into account.

It is clear from the above data that the rather complex conditions in the overlaying strata and waste dump sites will make it impossible to make use of the highest geometric parameters of excavators and stowing machines.

Technology of Deposit's Exploitation

The location of the deposits and techtonics in the Vrsany panel are relatively favorable. For this reason, the potential use of two basic technological equipment modes was explored:

--giant machines with standard-gauge transportation by rail;

--giant machines with long-distance conveyor belts.

Despite certain advantages and usability under the given conditions, the idea of transportation by rail was abandoned because of the general transition to conveyor-belt transportation by the brown coal mines of the North Bohemian Brown Coal District and because of the relative obsolescence and unavailability of equipment whose service life is coming to an end and whose production is being discontinued.

For opening of the mine and preliminary work on overburden, a power shovel of the E 302 type was used with a shovel capacity of 3 cubic meters and standard-gauge electrified transportation. Material excavated from the overlaying strata was deposited at the Velebudice waste dump by spreaders from the Sverma mine to whose trackage the Vrsany mine was connected.

For the removal of overlaying strata and exploitation of the deposit, it was proposed to use technological units of the TC 2 and TC 0 series with long-distance transportation by conveyor belts 1,800 and 1,200 millimeters wide. Overburden will be excavated by two TC 2s consisting of two-wheel excavators of the KU 800 type, long-distance transportation with conveyor belts 1,800 millimeters wide and two spreaders of the ZP 6600 type.

Coal will be mined by three-wheel excavators of the KU 300 type, transported over a long distance by conveyor belts 1,200 millimeters wide, crushed to 0-40 millimeters grains and loaded through the new hopper to the railroad cars on the trackage of the Smeral plant destined for the Pocerady power plant or other power plants outside the district.

In view of the complex geological conditions and location of the coal seam, it is anticipated that overburden, interlaying strata and coal will have to be alternatively mined (that is, operation of all excavators in the mixed working faces).

The distribution of extracted material and loading it on the overburden or coal belt conveyors respectively is made possible by the so-called distribution station located at the exit from the mine.

The distribution station consists of five so-called shiftable heads (vysuvne hlavy) (2 x 1,800 millimeters, 3 x 1,200 millimeters).

Essentially it is a travelling loop on the belt conveyor which pushes the dumping drum into the predetermined positions.

In the Vrsany mine, there are four positions with 16 and 10.5 meter spacings which correspond to two overburden- and two coal-carrying lines.

The complex will be controlled in a modern manner by dispatching the most varied types and modern equipment, including computers, equipped with links. There are plans for using automated control systems (ASR) in the future.

Stages of Development

The development of the mine was divided into two projects with specified stages of individual construction projects to be completed during the 1979-1985 period.

The first project was divided into preliminary work and two stages of construction to be completed during the 1977-1983 period.

The preliminary work was based on the opening of the mine with small machines and included construction of facilities necessary for the transition to the mining operations to be carried out by giant machines. During the preparatory period, an assembly shop for giant machines was set up and also the principal source of energy--the Lisnice transformation station--for mining operations was constructed.

The first state included the assembly of the first TC 2/11 technological unit and KU 300 S/16 excavator with transportation in the mine by belt conveyors 1,800 millimeters wide. The TC 2 was put into operation in 1981.

The second stage includes the assembly of the second TC 2/14 technological unit and putting into operation of the first coal transportation line 1,200 millimeters wide with a coal-crushing station and provisional coal loading in 1982.

The second project is divided into part B, mine section, and part A, surface plant, in accordance with FMTIR [Federal Ministry of Technological and Investment Development] Decree No 2 of 21 January 1977. The second project B is to be completed in two stages.

The first stage of the second project includes assembly of the second KU 300 S/38 excavator with the second coal-carrying line with a coal crusher, a storage site for crushed coal and a bin for loading the railroad cars. According to the plan, all these facilities are to be put into operation in 1984.

The second stage is to be completed in 1985 by the development of the mine and includes the introduction of the third KU 300 S/42 excavator with belt conveyors and the installation of the third conveyor stowing line with belts 1,800 millimeters wide on the dump site. During each stage, drainage barriers will be built around the mine ahead of the advancing work face.

The second part A includes the construction of the surface plant during the 1983-1986 period.

Past progress in construction does not conform to the original intentions because the first TC 2/11 was put into operation not in April 1980, but only in February 1981. This situation has been unfavorably reflected in planned output and particularly in overburden removal. Nevertheless, coal mining in 1982 should start in accordance with the original intentions.

Surface Construction

The opening of the mine requires construction of assembly centers, maintenance shops, warehouses, social, administrative, operations and auxiliary buildings, power-generating, water-conserving and transportation facilities.

Two centers have been built for assembly of giant machines with the total area of 6.6 hectares. The Vrsany combined assembly center was built close to the mine for assembly of KU 800 and KU 300 wheel excavators and a shop for assembly of ZP 6600 stowing machines was built near the dump site in the Smeral mine.

The advantageous conditions of communications and of location of the Vrsany combined assembly center were used for storing of the building contractor's equipment, and the area near the assembly center was made available to the supplier of technology.

The maintenance shop for the extensive technological equipment of the mine, necessary warehouses, auxiliary, social and administrative buildings are part of the surface plant which is located approximately 2 km from the entrance to the Vrsany mine. The project of a new surface plant makes maximum use of the existing buildings of the Smeral surface plant although some of them will have to be demolished. New construction will form an addition to the northern part of the present built-up area. It thus represents an expansion and reconstruction of the plant built toward

the end of the 1950's. It will serve the Smeral mine until 1986 as originally planned, but simultaneously also the Vrsany mine and also the Bylany mine in the near future. In this way, a combined maintenance, social and administrative center will be established for mining operations in the Slatinice-Bylany area.

The original project for the present plant did not anticipate its future expansion for new mines and was based on the needs of the Slatinice mine which was being developed at that time. Consequently, the roads were built, the site of the substation with the input and distributing lines was chosen and the buildings on the surface were constructed in accordance with the original project. In addition, the Lucní brook will have to be relocated beyond the boundary of the expanded plant.

This situation considerably interferes with the principles of building a new plant and complicates the situation for three communities--Semeral, Vrsany and Bylany.

The surface plant is situated on territory without coal seams and the area earmarked for the plant expansion is not agriculturally cultivated.

The built-up surface area for the Vrsany and Bylany mines is 43,300 square meters, and the total area of the surface plant is 26.2 hectares.

Environmental Problems and Necessary Additional Investments

The exploitation of the Vrsany panel is in harmony with the territorial plan for the North Bohemian Brown Coal District, forecast of long-term development made by the general directorate of the SHD [North Bohemian Brown Coal Mines] concern and estimates made by OVUP [expansion unknown] of the ONV [okres national committee] at Most.

The most unfavorable factor in the development of the mine and exploitation of the deposit is the considerable encroachment upon a territory with largely agricultural land.

In view of the fact that the coal in this part of the brown coal district has not been industrially extracted so far, there is no danger of spontaneous combustion and fires. Thus, it can be assumed that the air will not be seriously polluted by industrial fallout.

The communities of Bylany and Vrsany, situated near or directly in the panel of the mine, were relocated during the 1977-1979 period. The communities of Male and Vysoke Brezno are situated approximately 500 meters south of the demarcation line of the mine and may be affected only by the activity in connection with the mold and dusty earth dump. There are no other communities nearby.

The waste dump outside the mine, located in the Smeral mine which is about to be depleted and closed down, is closest to the community of Most. Even in this case, however, the sanitary zone has not been disrupted.

The surface plant is linked up to the Smeral plant and is being built on the devastated territory. It is separated from the immediate neighborhood by the Smeral plant and embankment of the railroad line to the Smeral mine which leads to the Velebudice dump site.

The implementation of these plans necessitated some additional related investments, among which the most important were:

--relocation of the communities of Vrsany and Bylany;

--relocation of the Lucni brook in the area of the plant;

--relocation of the Komorany-Chomutov hot-water pipe, carried out in two stages;

--relocation and adjustments on Highway III/2536.

Future Prospects

The further development of the mine after the year 2000 is possible, without interuption of operations, in the northern direction approximately up to the Holesice-Trebusice-Horany line with the estimated deposits of approximately 180 million tons of brown coal for industrial pruposes, and in the eastern direction up to the pillar of the Komorany-Horany-Bylany corridor with approximately 45-55 million tons of brown coal.

It is clear from the above that, from the standpoint of brown coal deposits and their location, the neighborhood of the mine offers good prospects for further expansion and intensification of mining operations on the basis of technology already known today.

The problem of dump sites, however, is very difficult. For the development and operation of the Vrsany mine with the presently specified parameters, there is available today only the room in the soon-to-be-depleted Smeral mine which, in view of the necessary protection of work faces and coal hoists approximately until the year 1986, seriously limits a free and undisturbed development of the dump site of the Vrsany mine--and thus the development of the entire mine.

The already exploited space of the Vrsany mine, in which both the eastern and western slopes will have to be kept free--due to the expansion of this mine into the "corridor" after the year 2000 and to the penetration of the Sverma mine into the free space of the western side slope of the Vrsany mine approximately by the year 2000--is not an ideal space for a large-capacity dump site in the foreseeable future.

From the standpoint of territorial planning of such extensive mining operations in a territory with intensive agricultural production and adjacent to the Most metropolitan area, various problems arise which will have to be solved simultaneously with the development of the mine.

Among the most important are the environmental problems, the problem of communications of all kinds, electric energy supply, questions of water supply and conservation, related investment projects, labor force and so on.

Conclusion

The intention to develop the new Vrsany mine in the general area of the Sverma mine which was planned to be exploited only after the year 2000 makes it possible to

start production of brown coal of rather good quality in a relatively short time.

This will make up for the decline in the production of fuels and energy which would otherwise occur due to the depletion of Smeral and Triskolupy mines during the Seventh Five-Year Plan.

The panel and its location make realistic the plans for the intensification of mining operations and further development of the mine into the neighboring free space after the year 2000.

The development of the Vrsany mine meets the basic requirements of securing an adequate fuel supply not only in terms of the present, but also for long-term future needs.

It is imperative, however, to develop the mine continuously and rapidly in accordance with the projects and to master and use new equipment in operations in order not only to attain, but also to surpass the planned production targets.

CONSTRUCTION INDUSTRY, TRADE UNION TASKS DISCUSSED

Budapest SZAKSZERVEZETI SZEMLE in Hungarian No 5, 1981 pp 3-12

[Article by Kalman Abraham, minister of construction and urban development: "Joint Tasks of the Construction Industry and the Trade Unions in the Sixth Five-Year Plan"]

[Text] The achievements of the construction industry developed significantly in the Fifth Five-Year Plan, and from year to year its activity has increased the national wealth of our country with the construction of thousands and thousands of buildings and facilities, increased the potential of the economy's producer branches, and improved the living and working conditions of the population. An increasing degree of maintenance work has served to protect the stock of national wealth embodied in buildings and structures.

In respect to production activity under the Fifth Five-Year Plan, the construction industry branch was marked by two, characteristically different, phases. The first phase from 1976 to 1978 was characterized by a vigorous 4 to 4.5 percent production growth. In the second phase from 1979 to 1980, the rate of production growth decelerated, or declined in 1980. The change in the trend corresponds with the change in domestic building demands. The process, as it has developed, is characterized by moderation in the already 30-year-old chronic tension that was caused by the lack of harmony between demand and capacity.

From the quantitative and qualitative viewpoint alike, the satisfaction of construction demands with ability to pay has improved, but we were not able completely to solve the problems of qualitative factors.

As a result of construction work, we built under the Fifth Five-Year Plan about 20 million cubic meters of industrial building space, 445,000 houses, rooms for 75,000 kindergarten children, 4,200 classrooms for general and secondary schools, 220,000 square meters of department store and business space, 7,500 hospital sick beds, and 1,300 kilometers of public roads.

Investments which significantly influence the production structure of the economy entered into production during the plan period, and they are carrying out their tasks as designed. A total of 45 large investments were put into operation, with a total value of 124 billion forints. Among other things, new energy and raw material supply capacities were developed, and with the expansion of food processing plants we gained new export possibilities.

All in all, the construction industry workers fulfilled the basic economic political goals of the Fifth Five-Year Plan.

Tasks of the Construction Industry in the Sixth Five-Year Plan, the Main Goals of Development

The Sixth Five-Year Plan has a special task in the development of the national economy. The main goal of economic policy is to restore and solidify the equilibrium situation of the economy. An epochal change is occurring in the development of the economy, and the conversion from the extensive development phase to the intensive is raising new requirements.

Among the economic political goals, the Sixth Five-Year Plan is emphasizing qualitative requirements. The requirement system of the plan conforms to ensuing economic policy and calls for a smaller extent of growth in national income. The growth rate in domestic consumption will be less than that of the national income, and net accumulation will decline.

The Main Tasks of the Construction Sub-Branch

The main task of the construction industry in the Sixth Five-Year Plan is to satisfy demand with ability to pay in a flexible, economic, good quality and timely manner. The qualitative factors of management will be emphasized instead of quantitative growth, for example, emphasis will be on the improvement of efficiency and the reduction of costs. Of decisive importance is a change in the production structure, which is evident in reducing the investment-construction ratio and in increasing the ratio of maintenance construction.

Indispensable to the implementation of our goals is the better use of existing fixed assets, the rational consumption of means that can be devoted to development, the discovery and exploitation of reserves latent in material and energy savings and in organization. We also wish to promote the realization of our plans by incentives based on higher achievements and quality wage payments. It is only in this way that we can achieve a more dynamic rise of work productivity in production.

In accordance with the planned development of the national income and domestic consumption, as much may be devoted to investments under the Sixth Five-Year Plan as in the previous five-year plan period. On the basis of demand with ability to pay in harmony with the plan, we are counting on a 11 to 14 percent growth in the national construction industry.

The construction requirement for investments is growing moderately, by about 4 percent, and the annual rate--following a small decline--will exceed the average in the second half of the plan period. The investment construction structure is being transformed, and the construction tasks of large investments are declining. The concentration of investments is increasing and the area points of main effort are being shifted. The overall housing construction task is smaller than what was realized in the Fifth Five-Year Plan period. As a consequence of demographic changes, there will be need for fewer nursery and kindergarten classrooms, but more school classrooms.

Despite the narrower investment possibilities, maintenance construction will increase dynamically by about 16 percent, and the area distribution will change. In accordance with economic-political thinking, the maintenance and construction demand for residential buildings and for health, social and educational facilities will be given priority. The growth of this demand within national building and fitting jobs will justify an increase of 1 to 1.5 percent in the ratio of maintenance construction. Capacity development is being built on the existing production level and on the conversion of capacity based on average technical preparedness.

According to plans, the construction industry consumption service development will surpass the maintenance construction average in the Sixth Five-Year Plan period. The population and housing maintenance service is a special task of the organizations concerned and affords the possibility of satisfying social demand.

A higher-level carrying out of the construction industry services is also promoted by the further development of small scale production and auxiliary activities and their organized inclusion in work.

The tasks of the construction industry will be altered radically in the new phase of the economy's development, and despite the moderate rate of development they will be more complex and difficult. This will require a stricter requirement system, which will call for intellectual and physical exertion by all members of the construction community.

Direction of Production Development

In the Sixth Five-Year Plan, the construction tasks and performance capability of the construction industry organizations must be in harmony at the national level. The management keeps its eyes on the structural, temporal and spatial congruence of construction tasks and implementation capacities, and the economic fulfillment of demands.

Economic planning work shows that the tensions between demands and the area placement of capacities will not be completely eliminated. The center of gravity for megye construction demands will be shifted. The ratio of Budapest construction tasks is increasing significantly, and the economic plan has labelled their execution as a special program.

The construction industry organizations are faced with fulfilling construction tasks which vary by area and composition. The fluctuation of demands and area dispersion places increased entrepreneurial readiness and greater flexibility in the center of development.

We must modify the operational areas of the enterprises, the organizational, internal management and incentive systems in such a way that they will be able to adjust to demand with a changing composition. Moreover, we must improve the cooperation of the construction industry organizations, broadening the relational system which has already developed (construction initiator, planner, subcontractor, supplier, and so forth). Only those enterprises are capable of managing successfully which can meet a new situation.

Tasks Relating to Living Standard Policy

a) Housing Construction

The responsibility of the builders is aprticularly great in the implementation of the living standard goals of the Sixth Five-Year Plan. When the development of the economy, for external and internal causes, does not make the accustomed rate of increase in real wages possible, the improvement of living conditions becomes a primary political task. The delivery of new houses on time and in good quality, the complex construction of residential sites, and the rapid and payable construction industry service may improve public opinion, but there may also be negative factors.

Under the Sixth Five-Year Plan, a total of 370,000 to 390,000 new houses may be built nationally, of which 115,000 to 120,000 will be built by the state. The housing construction goal in Budapest is 90,000 units. The number of houses built with modern technology will be 208,000 units, the same number as under the Fifth Five-Year Plan period. But the ratio in the whole of housing construction is greater (53 percent).

The reduction of project-type, multi-level housing construction tasks makes it possible and the use of developed modern manufacturing capacities makes it necessary that the organized construction industry (EVM [Ministry of Construction and Urban Development] enterprises and construction industry cooperatives) should undertake also to implement single partnership houses, family houses, detached row houses, and semi-fabricated houses that are being privately built. According to the planning goal, two-thirds of the 15,000 group family houses will be built by panel technology. It is the task of the implementers to discover these demands, include them in their undertakings, and see that they are carried out.

In conformity with demands, about 65 percent of the new houses are being built in the capital city and in other cities and urbanizing sites. To the extent possible, urban mass-housing construction is being realized on interconnecting areas together with the necessary infrastructure. We are appropriately developing the public utilities of the new residential quarters, energy supply and transportation connections, and the institutional network (general schools, nurseries, businesses, and so forth) serving the basic needs of the population. We are endeavoring to see that the level of facilities for the new and the existing old city districts resemble one another.

In a period of more moderate housing construction goals, a perceptible reduction in the number of rightful complaints regarding the quality of new houses, and the approximation of the level and usability of housing projects and houses to those of industrially developed countries is a task of equal rank with that of the quantitative indexes.

The state of the housing supply can be improved with the combined effort of the state and the population. We are stimulating private housing construction through manifold measures and the improvement of the material-technical conditions of construction.

In order to promote private housing construction, we are improving the supply of sites, making them more organized, and increasing the state offer of these sites.

We are stimulating more economic use of areas, and the extension of more urban group and individual housing construction forms. We are expanding the selection of technical plans, improving the modern material and fitting supply for housing construction, and the possibility for borrowing building machinery.

b) The Housing Supply

At the beginning of the Sixth Five-Year Plan, the Council of Ministers put new statutory provisions into effect for the development of a housing management system. The main goal of the measures is to promote the mobility of the population, stimulate the exchange of houses and the transfer of living space that exceeds requirements. This goal is served by multiple compensation for larger houses that are transferred, the construction of houses for pensioners with regular health care provisions and other services for the elderly.

The new measures also improve the chances of the young for acquiring a house. By terraced house arrangements, two or more housing demands can be satisfied with one house. Bachelor flats and houses with rooms for rent are being built in which young people can make ready for their final housing acquisition. We have created more favorable financial and repayment conditions for garret-space and additional stories. Young people are given preference in the allocation of houses without indoor toilet amenities if they are willing to undertake the installment of facilities. For the building of modern, group and family housing the future, socio-political subsidies will be granted for children. In certain programs, there exists opportunity for short-term credit to pay for the cash down payment. Easements may be granted for the repayment of the loan in the first 5 years.

c) House Maintenance

As a result of the new constructions targeted for the Sixth Five-Year Plan period and the modernization and renovation of houses, the living conditions will improve for about one and one-half million citizens.

In the Sixth Five-Year Plan period we are planning the renovation of about 90,000 to 100,000 state-owned, urban houses, and the modernization of about 40,000 to 50,000 houses without indoor toilets. As a result, the number of families per 100 houses will decline from 108 to 103, and the number of people per 100 rooms will decline from 150 to 140; the renovation lag will decline, and housing conditions will continue to improve.

We regard the systematic protection of the renovation of the existing stock of houses in the Sixth Five-Year Plan as a task equally important to new housing consturction. The development of housing maintenance must contribute more consistently than hereto fore to meeting the social needs of the housing supply.

The increasing renovation tasks make it justified to discover economy and cost-saving measures for renovation and modernization jobs, and also planned cost management in order that as much work as possible will be performed with the money available.

At the council organizations which handle real estate property, we wish to improve the technical preparation of renovation jobs, the quality of design plans, and the planned and organized conduct of implementation.

The construction industry capacity for the maintenance of houses may be created with selective development and regrouping as necessary. The greatest extent of regrouping is needed at construction industry council enterprises and construction industry cooperatives.

It is primarily the enterprises belonging under the supervision of the EVM that are preparing themselves for the renovation of houses built with factory technology, inasmuch as they differ substantially from the buildings made with other technologies. Continuous maintenance work on factory built houses is performed by enterprises dealing with real estate.

In the maintenance of houses owned by the state and private individuals, care must be given not only to large improvements but also to the satisfaction of maintenance needs which will assure continuous use of the house. Construction industry improvement services are carried out by the interested state enterprises, by the construction industry and housing cooperatives, and by the real estate organizations and artisans. We make it possible on a broad scale for the population to participate in organized work performance after working hours.

We are carrying out the tasks of building new homes and maintenance in accordance with technical conditions. With good cooperation among the investors, the planners and the implementers, we are promoting economic cost management and giving preference to solutions that accompany the elimination of economically built although fewer houses.

In maintenance, we bear in mind that the housing supply should contribute more consistently to meeting social needs. We are gradually carrying out the renovation of outmoded houses without indoor toilets and installing toilet facilities. We are devoting 47 billion forints for the renovation, maintenance and modernization of houses that are being handled by the local councils. This is more than we spent under the previous two five-year plans for the improvement of state-owned housing.

It is becoming necessary that we begin the development of construction industry organizations for carrying out the increasing renovation and modernization tasks in the capital city. The EVM has already carried out, in part, the measures related thereto, or in the course of further work it will create the conditions for fulfilling the goals.

In the future we will support the renovation of individual owned housing with long-term loans and with the improvement of the construction material supply. In this area we shall also expand service capacities, material and fitting supplies, and the loan of small machinery and means.

The use value of houses is influenced to an important extent by the nonproducer infrastructure. Therefore, the planned implementation of child, health, education and commercial facilities is closely related to the building of houses. In the Sixth Five-Year Plan period we will build 5,500 to 6,000 school rooms, and nursery and kindergarten quarters for 25,000 and 9,600 nursery pupils. In order to build the targeted 30,000 to 35,000 kindergarten quarters, it will be necessary to transform buildings that are in existence but were designed for other purposes.

In order to improve child, health and social facilities, we are planning to establish 6,500 to 7,000 hospital beds--chiefly with the expansion of existing institutions--, 5,500 to 6,000 quarters in social homes and 2,000 to 2,500 quarters for the placement of mentally retarded children.

All of the new schools and nurseries and 80 percent of the kindergartens will be built with new technologies. The planned technologies will take up about 80 percent of the light structural CLASP manufacturing capacity and 60 to 90 percent of the various ferro-concrete iron structures.

The limits on financial sources call for simplified and cost-saving solutions. The practical implementation will require continuously coordinated cooperation from both the investors and the affected implementers.

Manpower and Wage Management, Social Facilities

Sub-Branch Conditions and Tasks of Efficient Employment

More efficient construction work and the promotion of rational management has become a strained economic compulsion on the threshold of the Sixth Five-Year Plan, but at the same time it directly serves enterprise and individual interests, and it also signifies the fullest interest protection of the workers. Rational employment of the available manpower is of great importance also in increasing the efficiency of building activity.

On the basis of the MSZMP Central Committee 12 October 1978 resolution, the 12th Party Congress resolutions and the conditions system of the Sixth Five-Year Plan, we must carry out our sub-branch tasks that are most closely related to the living and working conditions of the workers. In the use of production factors, whatever is affirmed by our trade unions and the SZOT [National Congress of Trade Unions] congress--primarily in regard to the conditions for living standard policy goals and labor affairs activity--must take place as quality change.

The implementing construction industry fulfilled its tasks under the Fourth Five-Year Plan with an increase of 33,000 workers, and in the Fifth Five-Year Plan period with a reduction of 21,000 workers.

The general manpower shortage which existed earlier has been substantially eased, but the tensions primarily in the capital city and its environs and in certain trades have not declined. The trade knowledge of the workers and their production technology has continuously increased. One-half of the construction workers are skilled workers, one-third are semi-skilled. But at a significant share of the enterprises, the trade structure is not in harmony with the modified production tasks and with the technical-technological requirements, which together with the insufficient work and plant organization activity restrains the vigorous improvement of productivity.

Under the Sixth Five-Year Plan the declining production tasks will have to be fulfilled with about 20,000 fewer workers. The enterprises will be able to fulfill the goals in the economic plan and to conduct more profitable activity by means of more modestly extensive but intensive technical development and for the most part with the radical discovery of sources for increased productivity. To do this, we will have to realize one-third of the targeted manpower reduction in the medium-term plan in 1981.

Our construction organizations must achieve further improvement in building-fitting organization, in the results of cooperation relations, in the reduction of lost

time that is still significant, and in the improvement of work discipline. In this way we desire to save the work of 10,000 to 12,000 workers according to our plans. To do all this, enterprises must, as an unpostponable task, increase the strictness of their manpower and wage management and improve efficiency.

As a consequence of the changes in construction industry tasks, the manpower demand will increase in several areas (for example, in Budapest and environs, in Csongrad megye, and in certain districts in Transdanubia). As a consequence of the increase in maintenance and renovation jobs, aprticularly in the case of reconstruction works which require a greater amount of live labor, specific manpower needs will also increase in Budapest.

The solution to the manpower shortage in the capital city and in certain trades and the adjustment to changes in the production structure are possible by rational manpower regrouping in the enterprises, the development of rational employment ratios, and planned work distribution amoung the enterprises. The development of flexibility may be promoted by the redirection of manpower, the area widening of undertakings by implementers, the use of new work-right possibilities (for example, secondary occupation contracts signed with their own workers and incentive wage policy measures). The economic associations which are being formed in more and more megyes also provide an appropriate framework for labor affairs cooperation among the enterprises. In addition, we must also strengthen the cooperation with the megye (capital city) council organs.

Because of the significant changes in construction demands, an appropraite transformation of the trade structure and the organization of enterprise retaining the further training have become a vital question.

A better use of intellectual capacities and a more fundamental preparation of investments is promoted by a more purposeful work distribution among the implementers and the technical planners. One means of doing this is a circumspect carrying out of obligatory manpower reduction.

An urgent task is the more fundamental enterprise planning of employable manpower; a broader application of modern work plans that adjust to technological features; rationalization of work processes and work place activities; and the expansion of the responsibility and authority of production leaders.

The organization of the supplement to the 4.5 percent decline in the work-time base that accompanied the general introduction of the five-day work week will be a special sub-branch task beginning in 1982. The construction organizations must achieve the production and management targets of the Sixth Five-Year Plan through the realization of productivity requirements. To this area belong the modernization of the enterprise organization system and the gradual improvement in the level of skilled and expert training.

In wage management, we regard as the basic principles: distribution according to work, the differentiation of earnings, and a firmer realization of an improvement in work discipline. One of the most effective means of an increase in productivity is the expansion of performance requirements based on modern work norms, the extension of quality wage payments, wage forms which complexly stimulate savings, and chiefly the development of unified sum work and wage remittances.

We are striving to achieve two goals in sub-branch guidance work designed to develop wage systems: an increase in the incentive strength of applied wage forms and the development of incentive methods that can be understood by the workers and require the least administration. All this can be well linked with the necessary development of the internal incentive system of the enterprises. It is a basic requirement, however, that the producer organizations shall differentiate performance wages more firmly than heretofore.

For the attainment of a wage development of 23 percent (annual average of 4.5 percent) planned as a minimal goal in the implementation construction industry in the Sixth Five-Year Plan period, all this is the basis for the protection of the sub-branch and its indispensable condition. In addition, the fulfillment of the complex capital city housing construction tasks and the increasing reconstruction demands of public institutions make it necessary to have incentive wage preferences and the payment of an increased separate subsistence allowance.

Improvement of Social Facilities

The following are perhaps constant categories stemming from the production characteristics of the construction industry: changing work place, a nomad character, and constant commuting. Because of the difficult and characteristic work-place and work-order circumstances, we regard the development of work and health protection for the workers and their social facilities as of equal importance iwth the improvement of manpower and wage management.

In certain areas of social allowances we have managed to achieve considerable advances in the past 5 years. Organized plant cafeteria facilities--basic condition for work performance in the construction industry--have become normative requirements. Construction industry workers consume annually 33 million to 34 million meal[s] rations in subsidized plant cafeterias. Maintenance of the good level we have attained in this area is an important social requirement.

Further improvements in the living conditions of the 80,000 to 90,000 construction workers in workmen's hostels is a special task of ours. In the Fifth Five-Year Plan period, the hostel network of the sub-branch grew by 6,500 living quarters at the cost of 1 billion forints. Under the Sixth Five-Year Plan we will have to improve hostel conditions primarily in Budapest. This is also important for the fulfillment of the special construction tasks in the capital city.

The commuting conditions of the workers also improved in the Fifth Five-Year Plan period. Our enterprises have improved their own group and bus pools for workers' transportation, and have replaced vehicles which are not suitable for personnel transportation. This is a positive result, but the cost of daily transportation is very high. A total of 1.5 billion forints is devoted to this purpose every year. The expense can be moderated by cooperation among the enterprises operating in the district, and by better transport coordination. It has been our experience that more and more enterprises are recognizing these possibilities and taking concrete measures to this end.

Much remains to be done for the improvement of social conditions directly in the work place. There are many work places where dressing rooms, washrooms, and eating facilities are still unknown. We must make the elimination of these shortcomings a major development task in the coming years.

Assurance of the personal and objective conditions of work protection, the continuous development of working conditions, and the correction of working conditions that are harmful to health have become an organized part of annual and medium-term social plans. Increased workers security is a first-rate moral and responsible economic obligation of every leader in a producer cooperative and of the direct production manager.

Putting an end to unfavorable manpower circulation processes in a sub-branch is the condition for the fulfillment of further obligations. Therefore, of exceptional importance is the continuous development of social facilities for construction workers and the constant improvement of social conditions for work undertaking. Their realization depends on how--with emphasis on the special role of the human factors--we can improve production and management conditions and efficiency in accordance with the requirements of the economic plan.

Experiences and Major Tasks in the Cooperation of Leading Organs of Sub-Branch Management and Trade Unions

The Fifth Five-Year Plan results of the construction industry came about with the hard, self-sacrificing labor of the construction industry workers. All in all, an indispensable role was played in the attainment of the positive results by the guidance and control activity of EFEDOSZ [Trade Union of the Workers of the Construction, Woodworking and Building Material Industries] and by the mobilizing, initiating, organizing, educational and interest protection work of the area and work-place trade unions. The sub-branch management always carries out its major labor, socio-political advisory, regulatory and control functions in close cooperation with EFEDOSZ and HVDSZ, which also forms the foundation of our joint work and tasks. The medium-term concepts which we have formed jointly are clear, and are in the end realized in the medium-term management programs of the enterprises.

The ministry and the leadership of the trade unions have been regularly evaluating every year since 1967--at least in two combined sessions--the experiences of the cooperation and have determined the joint tasks for fulfilling sub-branch goals, and the joint tasks for improving the living and working conditions of the workers. For the solution of problems stemming from the complex activities of construction work and from working conditions, we always strive as equal partners, in lively realistic debate and on the basis of interest identity.

In searching for solutions--and we believe this is the correct principle--we generally do not see the fault in the working man but in shortcomings involving the creation of conditions and a requirement system of continuous work performance. If we desire more organized work, quality improvement, conscientious and economic management, then progress is the joint task of the state and trade union.

Another important basic principle of ours is that social allowances, which are closely linked to work performance, and concern for work protection conditions which secure the health and life of the worker cannot be a function of profitability points of view.

Every year we conduct discussions on eight to ten special subjects with the leading bodies of the trade unions which are closely linked with the interest protection of the workers.

The secretary of the EFEDOSZ is a standing invitee to ministerial conferences; in the various work committees the representation of the two organs is mutual and regular; and a continuous and open work relationship has developed between the ministerial departments and the divisions of the trade union. Commissioned and responsible leaders attend to the continuous coordination of our work and to the harmonizing of measures.

In our guiding sub-branch work, cooperation is characterized by a program approach and by agreement. Accordingly, the great majority of the sub-branch and supervisory measures were passed in agreement with the trade union; differences of view in principle or difference of opinion in regard to methods of practical solution did not develop, and only in a few instances did it occur that supervision measures were not prearranged, but in the course of execution mutual understanding was arrived at.

The resolutions of our trade unions and of the SZOT congress, the detailed coordination of the 1981 annual and the Sixth Five-Year planning goals, and the preparatory-evaluatory work related thereto determine the bases of the joint guidance activity for the 1981 and the medium-term plan period.

Among such joint tasks we must recognize the most important factors for fulfilling the increasing efficiency requirements. We must work together in preparing the general introduction of the five-day work week with its work-time reduction. Satisfaction of the manpower demands for the capital city construction tasks requires a joint effort. We must also jointly settle the situation of deficit enterprises and fund shortages. Joint guidance tasks are, for example, the following: stronger realization of the sub-branch characteristics of wage management and wage payments; development of the internal incentive system of the enterprises; realization of the proper sequence of work protection and socio-political tasks and the development of enterprise organizations.

For the drafting of plan goals and undertaking programs of the producer organizations we have published joint guidelines and guide books.

We developed, in agreement with the central leaderships concepts of the sub-branch, the sub-branch guidelines and guide books for the collective contracts of the Sixth Five-Year Plan period for the introduction of the five-day work week from eigen sources.

With joint announcements and continuous work we are striving for the development of the socialist work competition movement and the innovators' movement, for the improved and systematic control of work protection activity, and for the development of the workers' educational and sports movements.

The joint tasks, guidance, and organization of economic construction work stand at the center of our tasks. Its success will depend to a large degree on the further development of socialist democracy, the development of initiative action, a demo-

cratic atmosphere, and the more substantive operation of democratic forums. Systematic cooperation with the trade unions, basic discussion, and our guidance work are primarily necessary for this kind of control. The principles and basic methods of our relationship system have succeeded, and we do not need to change but to improve them.

In our 1981 work plans we are devoting particular attention to the successful solution of tasks deriving from the altered situation of the construction industry and the substantially modified operation conditions, and to the creation of conditions promoting their application. It is our conviction that the workers of the sub-branch will realize our goals through the more organized work of workers and economic and trade union leaders and through unity. We are counting on the help of every official of EFEDOSZ and HVDSZ and on their mobilization and educational work.

ECONOMIC SITUATION CHARACTERIZED AS 'SLUMPFLATION'

Warsaw ZYCIE GOSPODARCZE in Polish No 47, 22 Nov 81 p 9

[Article by Grzegorz W. Kolodko: "Slumpflation--Polish Style"]

[Text] Disruption and chaos are increasingly the hallmarks of the present situation in the marketplace. Under conditions marked by the uncontrolled redistribution of incomes there has been a simultaneous decline in consumption. The value of our currency is being debased. This drastic state of affairs is an outward manifestation of the slumpflation which has lately been a characteristic feature of our economy.

Slumpflation Defined

Addressing this issue in the most general terms, slumpflation boils down to the simultaneous occurrence of economic recession and inflation. Theoretically speaking, inflationary processes can occur in three kinds of situations, i.e., in a large-scale capital replacement environment (the sensu stricto definition of inflation), in a small-scale capital replacement environment (stagflation), and in a restricted capital replacement environment (slumpflation).

The macroeconomic processes that have been under way in Poland in recent years prove to us that slumpflation can also occur in a socialist economy. However, in different social and political systems the causes, mechanisms, and effects of this process differ from one another in fundamentally important ways. It will suffice at least to identify the demand-side (capitalist) and supply-side (socialist) preconditions that give rise to economic recessions.

The two primary attributes of slumpflation are economic recession and inflation. We are therefore able to say that the slumpflation process in Poland got started around the end of 1978 and the beginning of 1979, and there is every indication that the magnitude of this slumpflation is tending to increase.

The causes of this state of affairs have been widely discussed, and for the most part there is a general consensus of opinion on this score. It is worth pointing out, however, that among these causes a role of no small importance is being played--especially during the past year--by factors of a political nature, factors which played a critical role in forcing us to accept a lot of patent economic nonsense. This nonsense consisted of apportioning the consequences of the decline in the national income in such a way that it seemed as if people were talking about allocating the benefits of an increase in the national income.

Slumpflation in Poland--apart from its gigantic scope and its marked acceleration during 1981--has a number of unique features.

The Nature of Inflationary Processes

In my further remarks I will avoid discussing the causes and mechanisms of economic recession, except to take note of the fact that in 1981 all categories of macroeconomic indicators are on the downturn--apart from net agricultural output, and this also includes--for the first time on such a large scale--a reduction in the level of consumption as defined in aggregate terms.

The nature of inflationary processes, their complexity and multifaceted characteristics, inclines certain authors to express doubts as to whether "....the very term 'inflation' might not be an inappropriate definition of what is going on in our country."[1]

Depending on its causes, mechanisms, consequences, scope, manifestations, and other criteria, there are at least several dozen types of inflation that have been identified in the professional literature. It is for this reason that the question sometimes arises as to whether this is really inflation or perhaps something entirely different. It would therefore be a good idea to examine the inflationary processes that are now wreaking havoc with our national economy from the perspective of these various distinctions.

1. Inflation is now a worldwide phenomenon, and this is its most important feature. The impact of inflation on our economy as a result of developments in the terms-of-trade area cannot be minimized, but it would also be a mistake to exaggerate the importance of this factor, an excuse which was eagerly embraced by news media during the pre-August period. This is because inflationary processes are in the main not the result of imported inflation, rather they are the result of internal social and economic processes and--in our present situation--political processes. So, what we are dealing with here is internal inflation.

2. As far as the origins of inflation are concerned, we draw a distinction between cost-push and demand-pull inflation. The former is based on rising prices resulting from increased production costs. The latter is the classic inflation of rising prices in the marketplace resulting from an upward "sucking" motion that seeks to reach a level of equilibrium prices, something which happens when demand reaches excessive proportions. At the present time both of these processes are overlapping each other in a very forceful way, and they are mutually reinforcing, among other ways, as a result of the wage-price spiral. However, there is no way to come up with a precise estimate of the extent to which each of these two brands of inflation contribute to the total rate of inflation, which, on the one hand, has to be reduced to the magnitude of the price hikes that are absolutely essential in order to reach some kind of market equilibrium and which, on the other hand, serves as an accurate reflection of the social costs of production.

---

1. Vide W. Herer and W. Sadowski, "The Inflationary Curve (part 1)--What It Is and How It Works," ZYCIE GOSPODARCZE, 1981, No 32, p 9.

3. As far as the symptoms of inflation are concerned, we draw a distinction between open inflation and suppressed inflation. In the first case the inflationary rise in prices--something which occurs spontaneously--pushes these prices up to the point where supply equals demand. In the second case--owing to a centralized policy dedicated to stabilizing prices at existing levels--a certain percentage of personal incomes is transformed into forced savings in the form of "unwanted" deposits in bank savings accounts, or some of this personal income might also be set aside in the form of cash reserves (so-called hot money).[2]

The unique nature of inflation in Poland is based on the fact that we are now faced with an interlocking pattern that involves both of these processes, but this is accompanied by a pronounced tendency on the part of suppressed inflation to gain the upper hand. Apart from the aforementioned forced savings, this is manifested in the form of the ever growing system of rationed goods, increasingly longer queues, the presence of a black market, and rampant speculation. It is against this background that money is doing an increasingly poorer job of performing its normal functions. This is because in this kind of environment it has ceased to be regarded as a unit of universal equivalent value and is therefore losing its meaningfulness as a medium of exchange. Suppressed inflation is a characteristic feature of the situation that now prevails in the socialized sector of the marketplace. It is estimated that during the first half of this year retail prices in this sector grew at a rate slightly in excess of 8 percent. On the other hand, in the nonsocialized trade sector--and here we are dealing with a classic type open inflation--this same indicator amounted to approximately 50 percent.

The intertwining character of the open and suppressed inflationary processes also gives rise to certain complications with regard to measuring the scale and intensity of this brand of inflation. In the former case, theoretically speaking, the yardstick used to measure this scale and intensity is the rate of inflation, which is expressed by the indicator reflecting the rise in the aggregate level of consumer goods prices. In the latter case the yardstick is the magnitude of the inflationary gap.[3] At the present time, the usefulness of both of these yardsticks taken by themselves is limited, since they cannot be added together. So, the best way to illustrate the scale of inflation is to cite the potential rate of inflation, i.e., the rate of inflation that reflects the absolutely necessary, from the standpoint of bringing prices back to the point where market equilibrium is achieved, level of the rise in retail prices (taking into account the abstract assumption, that, as far as the realities of life in Poland today are concerned, price hikes are not offset by corresponding rises in nominal incomes).

---

2. For accuracy's sake it should be noted that hot money should also include "a vista" type savings accounts, i.e., demand deposits.
3. For a broader discussion of this subject vide G.W. Kolodko, "The Inflationary Curve and the Inflationary Gap," ZYCIE GOSPODARCZE, No 38, 1981.

At this point it would be a good idea to call attention to still another consequence of inflation in an environment characterized by restricted capital replacement. Namely, insofar as the concept of inflation--as I am trying to define it here--serves as an adequate description of the brutalities of our economic reality, then under these circumstances the concept of the growth rate of real wages and incomes tends to become all the more meaningless. This is because the growth of real wages and incomes tends to become all the more meaningless. This is because the growth of real wages and incomes is possible solely as a result of the level of output of goods for sale in the marketplace, and not as a result of an increase in the supply of money flowing into the marketplace. In the case of a stabilized marketplace this growth rate can be readily determined through a simple comparison of indicators reflecting the growth rate of nominal incomes and the growth rate of retail prices. But since real incomes represent the sum total of consumer goods that can be purchased at a given level of nominal incomes, this indicator will cease to serve any useful purpose under conditions marked by a falloff in the level of consumption. Economists and statisticians must therefore come up with a new definition of a situation in which nominal wages and incomes are growing at a faster rate than the general level of retail prices coupled with a simultaneous decline in real incomes.

Notwithstanding its awkwardness, I will confine myself to defining what is meant by the notion of a nominal rise in real incomes. This phenomenon can occur not only in an environment characterized by slumpflation, but also in a classic inflationary situation insofar as this inflation is suppressed to some degree and followed by the emergence of forced savings.[4] Let us realize at the same time that this nominal rise in real incomes may be something we have to live with for a long time to come (and even then we will also be able to talk about a genuine rise in real incomes) as a result of the assertion of pent up demand following the stabilization of the marketplace coupled with a major increase in the supply of consumer goods.

4. The distinction that is drawn between civilized inflation and so-called barbarian inflation is also noteworthy. These two kinds of inflation are to a large extent related to the two types of inflation described above, i.e., open inflation and suppressed inflation.

Open inflation, whose greatest evil resides in the uncontrolled and economically unjustified redistribution of incomes, has one good side in that it produces goods that are available in the marketplace. This is because this is a stabilized marketplace. And this in fact is what civilized inflation is all about, since it does not lead to the destruction of the market, and the functioning of the market continues to be governed by the ironclad rules of supply and demand. This sort of situation is typical of the kind of inflation (including slumpflation) that exists in capitalist economies.

---

4. This observation can be illustrated by taking 1980 as an example. Namely, according to what was said in a Main Statistical Office announcement (TRYBUNA LUDU, No 30, 1981 pp 3, 6), real per capita personal income increased during 1980 by approximately 1 percent (whereas real wages went up by 2.8 percent), which--taking into account a simultaneous decline in production and a negligible 0.6 percent increase in sales of finished goods--gave rise to the phenomenon of forced savings. In essence, then, mean real incomes this year have tended to stagnate, and not increase.

Barbarian inflation--and this is precisely the kind of inflation that we are faced with--destroys the market and relentlessly disrupts the mechanisms that make the market work. Money is constantly chasing after--increasingly to no avail--goods. Things get to the point where it is even more of a bother to spend money than it is to earn it. And, for that matter, the incentives to earn more money grow constantly weaker. Owing to the fact that the national economy functions as a system of integrated control levers, any disruptions that occur in the realm of distribution or allocations is going to carry over into the realm of production where they will fester and reinforce each other.

It might be said that civilized inflation is a kind of "elitist inflation" in the sense that it does not affect everyone equally; civilized inflation is not too much of a burden for economically privileged social and occupational groups. Barbarian inflation is a kind of "egalitarian inflation." Almost everyone--with the exception of a small group of people who in various ways enjoy easier access to certain kinds of goods--are subjected to equally rough, if not cruel treatment by the marketplace (or rather by what passes as a caricature of the marketplace).

5. Economic theory also draws a distinction between, creeping inflation, galloping inflation, and hyperinflation. The criteria governing the classification of these individual types of inflation are determined by the scope of the inflationary processes and their consequences, and in this connection certain differences of opinion have already come to the fore. While some--even though they do not cite any satisfactory theoretical grounds for this--advocate using the level of the inflation rate as a classification criterion, others are searching for the same criterion in the realm of the social and economic consequences of inflation, the magnitude of which is strictly a simple function of the level of the rate of inflation.

We can talk about creeping inflation when the redistributive impacts of this inflation are so negligible that they do not give rise to any major dislocations in distribution and consumption relationships, sever the essential bond between incomes and labor productivity, and thereby diminish the incentive role played by wages.

Galloping inflation does possess all of these characteristics, but hyperinflation makes it utterly impossible to perform normal cost accounting functions, makes efficient management an impossibility by depriving decisionmakers of the objective information they need concerning the availability of individual productive resources, and as a result, fostering the wholesale disruption and disintegration of the economy, and halts economic growth.

In Poland we are now faced with a situation where galloping inflation is being transformed into hyperinflation. This argument is being substantiated by a whole host of developments which are clearly evident in the performance of our economy. Inflationary processes are growing ever stronger. During the period from January to August 1981 labor productivity declined by 13.3 percent in comparison with the same period last year, while during this same period personal cash incomes went up by as much as 22.9 percent. On the other hand, deliveries of goods to the market increased by a mere 1.4 percent, and this increase is measured in current

prices. The persistence of these trends is bound in a short period of time to bring us to the point where we will have passed over into the stage of open hyperinflation. So, it needs to be said that we are already on the threshold of entering this stage and only a series of radical measures--on both the supply and demand sides of the equation--can avert this danger.

Slumpflation and Economic Reform

So, slumpflation is the name of the disease raging through the increasingly weaker organism of our economy. The spread of this disease can be described as a cumulative process, and at the same time it is distinguished by a number of unique features, among which should be included first and foremost the unprecedented falloff in production and an even larger increase in personal nominal incomes and inflation that is barbarian in nature. Such is the magnitude of the difficulties that have to be overcome in order to put a stop to the destructive processes in our economy.

A great deal of hope is being invested in the radical reform of the system according to which our government and economy are run. And there are sound reasons for entertaining such hopes. But at the same time one should be mindful of the fact that special dangers are raised by theoretically erroneous views which hold that it is possible to carry out an economic reform under conditions marked by intensifying inflationary processes.

Economic reform is not feasible in the face of the mounting inflation that we now have to contend with; the decentralization of the economy--including the decentralization of price setting powers, something which ought to be an indispensable attribute of such a process--could only, and in a short span of time, serve to intensify inflationary processes and thereby thwart the realization of the valid and unquestioned goals of the reform. It is for this reason that the widely supported argument (for reasons having to do with its cheap popularity) advocating the postponement[5] of retail price changes is tantamount to the invalidation of the fundamental premises of the economic reform.

If this were to happen, we would of course still go ahead with the economic reform, but before long this reform process would take off in an entirely different direction. We would be forced to introduce an extremely centralized wartime economy accompanied by a universal system of rationing, and the next step would be to introduce a new currency and so on and so forth. For such is the inexorable logic of the hyperinflation that still looms before us, the kind of inflation that would set our economy back not just by one decade, but rather by several decades. Insofar as there prevails a general consensus of opinion as to the fact that price reform (including both wholesale and retail prices) is an integral part of a comprehensive process of economic reform, then it needs to be strongly emphasized that it is absolutely necessary that this reform process should be launched with price changes--or, to put it more precisely, price hikes.

---

5. Vide, inter alia, J. Kaleta, "How To Wipe Out the Inflationary Curve?" KULTURA, No 40, 1981.

Just as it is hard to share the view that we should wait until economic equilibrium has been restored before we embark upon the implementation of economic reform, it is equally inadmissable that we should go to the other extreme and regard economic reform as some kind of panacea for all of our social and economic problems. The implementation of economic reform and the gradual restoration of economic equilibrium--a process which has to be gradual inasmuch as a reformed economy does not automatically bring into play control levers that would guarantee the establishment of equilibrium--is a parallel process which is intertwined with a whole host of contradictions. Unprecedented skills will have to be applied, skills that are by no means confined to the realm of economic theory, in order to resolve these contradictions.

CRITICAL ANALYSIS OF ECONOMIC REFORM PLAN PUBLISHED

Warsaw ZYCIE GOSPODARCZE in Polish No 47, 22 Nov 81 p 8

[Article by Wojciech Huebner and Dariusz Rosati: "A Plan or a Forecast?"]

[Text] There are barely 2 months left until the start of 1982. Economic management authorities have entered the final phase of their work on the preparation of a draft version of the socioeconomic plan. But this is where similarities with the way things were done in the past come to an end. This time neither the magnitude of the problems associated with the drafting of this plan, the uncertainty as to what the future holds in store for the economy, nor, finally, the overall situation in which the country finds itself have any past counterparts.

The year 1982 looms before us as a big question mark. The year 1982 may bring a further deterioration in our economic situation, but it may also go down in history as a turning point, a year in which the downward slide of the economy was halted and the process of finding solutions to the crisis was begun.

Uncertainty about the future is a prominent feature of all of the pronouncements and documents that are being formulated as part of work on the drafting of next year's plan. This applies in particular to official predictions on the future development of the economy, one of the most noteworthy of which was recently submitted to the Sejm in the form of the draft version of the basic provisions of the national socioeconomic plan for 1982.

We were motivated to speak out on this subject both by the way in which the whole range of issues associated with the process of overcoming the crisis has been treated, as set forth in the draft plan, and also by certain of the draft plan's detailed proposals relative to concrete actions in the realm of economic management. This is because we are tormented by serious doubts as to whether the submitted draft plan lives up to public expectations, sets forth an optimal array of goals and the means for their realization, and, finally, as to whether this draft plan is the fullest possible response to the specific situation in which the Polish economy finds itself at the close of 1981 and the beginning of 1982.

It would seem that any attempt to develop a mental image of what is going to happen to the economy in the immediate future must take as its point of departure two factors which serve as a general description of both the present economic situation and the justifications, based on choices made by society at large, of the thrust of future economic transformations, namely:

--the all-encompassing crisis which is having an impact in all spheres of social life;

--the projected launching of an economic reform starting on 1 January 1982.

This approach is dedicated to testing the validity of all of the assumptions contained in the plan from two basic perspectives, i.e., do they give due consideration to the necessity of curbing process that are leading to the disintegration of our economy and of putting the economy back onto a growth track and are these planning assumptions consistent with and logically interrelated to the goals and assumptions of the economic reform?

It is our opinion that a number of the assertions made in the 1982 draft plan do not fulfill these two basic conditions.

The first general observation that comes to mind in the course of reading this document has to do with the peculiar school of philosophy upon which this document is based. That is to say that this is a document which appears to be much more of a forecast than a plan. We are to be sure mindful of the fact that the times in which planners are now called upon to fulfill their duties are characterized by an extremely high degree of uncertainty. But, nevertheless, it would seem that the proportions according to which the plan's basic assumptions were subdivided into planning- and forecast-oriented sections have been largely twisted around in favor of the latter. Anyone who reads this draft plan gets the impression that this is the analysis of an unbiased observer who is making a record of processes and developments, without making any effort to channel these processes and developments in a direction that is consistent with what he wants to achieve. So, it is worth pointing out that an economic plan must continue to serve as a statement of what planners want to achieve in terms of active efforts dedicated to the "realization" of clearly defined goals. Thus, many of the official pronouncements on the subject of proposed programs for 1982 are in fact devoid of any clearly articulated statement of such goals. The dominant theme of these documents is rather a passive recitation of a scenario of events that in effect boils down to a prediction of future developments, a scenario that, depending on whether or not certain events come to pass, may turn out to be more or less favorable.

The proposed 1982 draft plan is devoid of any ideas geared toward the active shaping of economic processes, the exploitation of favorable developments and the taking of measures to counter unfavorable developments so as to insure, in keeping with the various scenarios, the optimal realization of predetermined goals. As one might assume, these goals have to do with putting a stop to the decline in the national income and initiating processes geared toward economic growth under conditions where provisions have been made for insuring minimum social welfare standards and the full implementation of economic reform.

Unfortunately, in accordance with the assumptions set forth in the plan, the domestic net material product may go up by only 2.2 percent, but it might also drop by a full 8.3 percent, which when figured in absolute terms amounts to a not inconsiderable gap of Zl 180 billion. Things are much the same in the case

of the other targets projected by the plan such as consumption, industrial production, and foreign trade turnover. So, the question arises as to whether Poland is still a country with a centrally planned economy, or have we given up on all forms dedicated to the efficient regulation of economic development?

The foregoing remarks are in no way intended to call into question the legitimacy and usefulness of giving consideration to several different alternatives as to the future course of events, and this in fact is the approach that was taken by the draft plan, in which a distinction is made between a fearful option, a hopeful option, and the most likely option relative to what will happen in the future. But it is one thing to come up with diverse scenarios of future developments over which we have no control and another thing to cultivate the skills that are needed in order to develop practical ways and means dedicated to the realization of certain fundamental goals notwithstanding the fact that circumstances might combine to present a worst case situation. In the meantime, the series of economic policy instruments that have been made public thus far with a view to insuring the realization of accepted assumptions normally fare rather poorly when viewed against the background of the draft plan's overall context and they are worded in a very vague and generalized term.

As a kind of parenthetical comment on the overall "philosophy" of the plan the enormously important question arises as to the relevance of emerging government documents to existing (?) plans for the future economic development of the country over a somewhat longer time span, e.g., through 1985. To what extent are these documents and plans still consistent and to what extent will economic activity in 1982 make it easier (or perhaps harder) to fulfill tasks of a more strategic nature?

Unfortunately, in the couse of studying the draft plan one gets the impression that the authors of the plan are totally uninterested in what happens to the economy after 31 December 1982.

Another fundamental doubt which arises has to do with the enormous onesidedness of the proposed draft plan. In the first place, it seems to be highly questionable that one should take the approach that raising the level of coal production (and to some extent the level of field crop production in the agricultural sector) is the sole key to resolving all of our problems. This issue was presented in an almost extreme fashion in the introductory provisions of next year's draft plan, where all options, including first and foremost the degree to which fundamental goals are feasible, rest on a single pillar: coal. So, the national income will go up or down by one-tenth depending on whether miners succeed in producing 155 or 175 million tons, while the value of the shortfall in goods for sale in the marketplace will range between Zl 108 billion and Zl 567 billion.

This line of reasoning is burdened by the errors of the ignominious heritage of the purely allocative model of bureaucratic planning. This is no sign in this approach of any attempts to seek out alternative methods for the realization of proposed goals or of any attempts to go beyond traditional stereotyped approaches to the formulation of annual plans, according to which a coal production record of 155 million tons (per the "fearful" option), which is by no means an insigificant record of performance on a worldwide scale, is inevitably supposed to lead

to an approximately 23 percent decline in the domestic net material product and to an approximately 25 percent decline in the level of industrial output in relation to 1980, a record of performance that would be almost equivalent to the total collapse of the economy.

Regardless of the extent to which the optional approach to the forecasting of what will happen next year might appear to be one of the more useful virtues of the provisions set forth in the 1982 plan, this approach still contributes nothing toward choosing a set of centralized control levers, rather it confines itself to a mere recitation of three options relative to coal production prospects. This is indicative of, among other things, the extreme sensitivity of our economy to the level of coal deliveries.

However, the crux of the matter lies in the fact that the courses of action that are now being laid before us do not spell out precisely what steps should be taken in the event that the level of coal production turns out to be even lower than that set forth under the terms of the "fearful" option. In our opinion the acceptance of such drastic reductions in the level of the national income and industrial output is unacceptable. Some consideration needs to be given to the proposition as to whether or not it is high time to assess the so-called coal problem--which during the past few months has grown to truly monstrous proportions--from an entirely different perspective.

The sooner we realize that when you get right down to it we are one of the world's pre-eminent coal producers, the sooner we will be able to come to grips with the coal problem not only in the realm of coal production, but also, and most importantly, in terms of an efficient and long-range program dedicated to the conservation of this raw material. It is really hard to understand why the present version of the draft plan fails to take into account an altogether more broadly construed series of programs, in addition to the small number of purely ad hoc cuts which it advocates, dedicated to conservation in a large number of areas where such programs could be implemented. The sooner we realize the importance of looking for more efficient ways to exploit our coal resources, the sooner we declare war on the colossal waste which is rampant throughout our power, manufacturing, transportation, and construction industries, and the sooner we realize that it is cheaper to save a ton of coal rather than to produce an extra ton of coal, then the faster we will succeed in breaking out of the present crisis.

A similar onesided approach is a concomitant feature of the way the draft plan addresses the problems of agriculture and food supplies. Here too it seems as though the central planner has become a passive slave of nature, declaring the level of consumption to be a function of weather and harvests, without making any effort to tamper with the structure of the agricultural sector or to fashion a system of specific solutions that would lay a suitable groundwork for reform by establishing the requisite framework of relationships between urban and rural areas. And so, as is similarly the case with coal, this problem area too is dominated by a passive kind of fatalism, by the hope for good harvests, and by making the level of economic activity contingent to an excessive degree on the whims of nature.

Regardless of the extent to which the draft plan as a whole betrays the absence of an aggressive approach to the problems at hand, this passivity is especially evident in the section dealing with foreign trade. It seems as though our enormous indebtedness has all but paralyzed our foreign trade. We are cutting back on imports wherever we can, and, as a result, we are stifling export sales. This is a disastrous policy in the long run. An analysis of the overall chain of interdependent relationships that exist between foreign trade and industry leads us to the conclusion that, given the present situation in which the country finds itself, the promotion of export sales is a critical factor that will help to pull our economy out of its depression. A program of policies geared toward boosting export sales should be without question the focal point of economic policymakers. Such a program should not be confined to the realm of ad hoc measures, rather it should be regarded as a primary objective of the economic reform.

Under circumstances marked by the underutilization of production capacities, and this is precisely the kind of situation with which we are now confronted, all kinds of opportunities exist in our economy for setting into motion special kinds of multiplier mechanisms which make it possible to raise the level of consumption by several times over as a result of a one-time increase in the volume of export sales.*

One of the most important results that should be expected to issue in wake of a radical reform of our economy is its reorientation with regard to developments of an economic and technical nature taking place in the world economy. Our efforts in the realm of economic endeavor must not only be effective in terms of meeting contractual obligations undertaken on the domestic market, rather they must also meet the objective and demanding standards that obtain on world markets. Our economy needs to be reoriented toward the production of goods for sale on the international market, since it is only in this arena that we can put the quality and uptodateness of our products to a real test. The vast majority of enterprises must become involved as soon as possible in the planning of programs designed to meet the demand of this market. Who knows but that this might prove to be the most troublesome and most painful element of the reform process. But in the long run there is simply no other way to go about solving this problem.

However, the imperative calling for an absolute increase in export sales is not just a product of the objectives of the reform process or of the necessity of offsetting growing import and balance-of-payments requirements. We must focus our attention on export sales as the cheapest way of restructuring the resources at our disposal in this country in a direction that is conducive to meeting our wants as end-use consumers. This is by far a cheaper and faster method than technological realignment, that is, the reordering of production priorities.

* It is easy to calculate that by channeling 1,000 zlotys worth of goods into export markets instead of the domestic market, on the assumption that the import coefficient equals 3 percent and the marginal propensity favoring export sales equals 30 percent, after a certain period of time demand on the domestic market will increase by Zl 6,000. This example clearly points out the absurdity of the charge that the domestic market is being "stripped bare" by export sales, as long as the foreign exchange earned from these export sales is reinvested in an efficient manner.

Finally, and this is of the utmost importance, increased export sales are the best way to advertise the gradual restoration of economic equilibrium in our country, something which will place us in a much stronger bargaining position in negotiations on debt servicing deferments as well as on applications for new loans. Unfortunately, the draft plan has very little to say about plans for boosting export sales. There is no mention in the draft plan of the need to develop a strong system of incentives designed to encourage export sales coupled with a far-reaching program of financial privileges. The draft plan does not take into account any of the new opportunities for expansion that are opening up in certain sectors of the export sales market, e.g., in the areas of construction services, specialist services, and so on. The basic provisions of the draft plan make no provision whatever for increased export sales. The realistic option projects a 0.5 percent decline in export sales, which is tantamount to an 8 percent decline in relation to 1980. This opens the way for the operation of multiplier mechanisms and gives a strong boost toward the persistence of trends that favor economic stagnation.

As far as capital construction ventures are concerned, it is noteworthy that the draft plan calls for aggregate capital spending to be reduced from Zl 460 billion in 1981 to Zl 430 billion in 1982. However, certain questions are also raised by the way in which it is proposed that these resources should be distributed. It seems as though that, after subtracting the volume of capital construction funds that are absolutely essential in order to pay for the maintenance and regeneration of capital stock in areas where this is economically justified, the rest of these capital construction funds will be distributed on an efficiency-pegged competitive basis coupled with a discount rate that might go as high as 15-20 percent. It would then become possible for these funds to be spent by those enterprises which promise to yield the most advantageous economic dividend.

The concluding passages of the draft plan deal with rules and procedures governing the management of the process whereby the planned targets set for the economy are to be realized. The paucity of economic policy instruments proposed by this draft plan, especially when it comes to the setting up of a full-scale system of administrative-legal instruments for running the economy, suggests that the magnitude of the problems now facing the Polish economy exceeded the creative powers of the authors of this document. It is their view that the only way to cope with these problems lies in the return to traditional management methods, e.g., the centralized allocation of basic raw materials and fabricating materials, monopoly control over the purchase and sale of raw materials, the setting of directive-type tasks in the realm of export sales, the centralized control over the capital investment process, and so on.

It is hard to see how this kind of approach will do anything to advance the cause of economic reform, and this is undoubtedly the reason why there has been so much talk lately not so much about reform as about provisional measures designed to patch up the system. However, provisional and temporary solutions have a surprising capacity to become entrenched as permanent solutions. This is why it is necessary to come out with a clear and forthright statement as to the direction in which the Polish economy should be headed. And the 1982 plan should be dedicated to realizing the goals set forth in such a statement.

CURRENCY REFORM PROPOSED AS AID TO ECONOMIC CHANGE

Warsaw ZYCIE GOSPODARCZE in Polish No 46,15 Nov 81 pp 1, 6

[Article by Kazimierz Ryc: "The New Zloty"]

[Text] The declining industrial output and national income which Poland is now experiencing, a hallmark of our deepening crisis, is primarily and directly attributable to the severe shortage of basic productive resources, including first and foremost raw materials, fabricating materials, products manufactured under the terms of co-production agreements, and fuels. Then again, there is also the shortage of a whole host of capital goods, and this in turn means that there is a shortage of manufacturing capacities in branches which now qualify as bottlenecks in our economy, e.g., coal mining, power production, transportation, and so on. In many sectors of the economy there is also a shortage of manpower coupled with simultaneous overemployment in other sectors.

Defining the Economic Crisis

The next direct cause of this productive resources deficit is:

--the low productivity of fixed and working capital;

--the poor quality of productive resources and consumer goods that is leading to accelerated depreciation and difficulties in export markets;

--disequilibrium in the structure of the economy as a result of imbalanced growth patterns.

The crisis per se began at the moment when this productive resources deficit could no longer be alleviated by deliveries from abroad purchased on credit. This is also the reason behind our most acutely felt hardship--the shortage of foreign exchange which is strangling our economy.

It was possible to overcome the previous economic breakdowns of 1953, 1962, and 1970 by shifting priorities in the realms of capital spending and production. The escalation of tensions threatening to produce a crisis situation was not as severe in those days (with the exception of the 1953 crisis, since at that time the economy was less diversified and more autarchic). Also, the level of the nation's indebtedness was not as serious as it is now. The most recent attempt to shift priorities in 1976--the so-called economic stratagem--was a failure and the crisis emerged with full force in the form of a decline in production and the national income. Without going into the reasons for the failure of the

"stratagem," it can be said that during the phase when the crisis was already severe and growing worse the methods which had been tried out previously, methods which now are referred to generally as "restructuring," were by that time already too little and too late.[1] And so it is now too that it will not be possible to surmount this crisis without making far-reaching changes in the way the economy is run.

Does the Crisis Have To Play Itself Out?

The full-blown crisis, as manifested in the falloff in economic activity, including a decline in production and the national income, is already in its third year and it still has not entered the phase where it could be called a depression, i.e., the curbing of a further decline in economic activity and the levelling off of production at a level lower than that which prevailed prior to the onset of this crisis. Why are things working out this way? Are present political conditions driving us into an ever deeper crisis, a sort of political and economic stranglehold, or has the crisis proper not yet played itself out? I do not want to pass judgment, but I will try to offer some suggestions. Namely, the ultimate playing out of this crisis is based on, among other things, the winnowing out of the least advantageous applications of productive resources. In a market economy this is reflected in the bankruptcy of inefficient producers. These bankruptcies give others a chance for growth and the economy a chance for revival, i.e., a chance for a renewed increase in production and the national income. In the past the counterpart of these "bankruptcies" in a planned economy has always been the cancellation of a multitude of capital investment projects. As a rule, this has sufficed. The resources that were released in this way and transferred to other sectors and branches of the economy helped to bring about a revival of economic activity. In the face of the present crisis similar decisions, made too late and in a haphazard fashion, have not been able to produce the same results. In the long run we are still going to be faced with the problem of winnowing out those applications of productive resources that are least effective.

Actions along these lines are being taken. On the one hand, the Operational Crisis Management Staff is trying to reallocate resources, while, on the other hand, "experts" representing various political forces are enumerating and identifying the kinds of reallocations that ought to be made in order to bring about the desired economic revival. Both sides are trying to find a replacement for what Adam Smith called the "invisible hand" that infallibly identifies which applications of productive resources are least effective. This is because this is not merely a problem of defining the kind of restructuring that is indispensable on a scale that encompassed the economy as a whole, but also of defining the kind of restructuring that must and should take place in each and every enterprise and which of these enterprises and ventures should be discarded, and which should be given a chance.

---

1. I presented an account of the mechanisms that give rise to and encourage the development of crisis strains for the first time in an article entitled "The Growth of the National Income and Consumption in an Environment of Restricted Capital Spending," published in EKONOMISTA, No 3, 1967.

Who is it that will be in a position to identify all of these ineffective applications of productive resources and who is it that will be in a position to accomplish the desired restructuring by administrative means? This can only be accomplished by economic means. This does sound like a harsh judgment, but if an economy that already functions in accordance with the dictates of a command-distributive system has entered into a crisis phase, if not a state of crisis-like strains that could be counteracted by resorting to a reordering of priorities as was the case in 1953, 1962, and 1970, then the first order of business should be to reinstate the priority of economic relationships (economic levers) so that work can proceed on the differentiation and elimination of the least effective applications of productive resources and then look forward to an economic revival and the lending of further impetus to this revival. It may be then and only then that the crisis will be able to play itself out and open up prospects for future growth. It is probably along these lines that one should also interpret the generally accepted view that there is no chance for extricating the economy from this crisis without reforming the system of rules according to which the economy functions.

To be sure, this does not detract from the importance of all of those actions which are being taken to do away with practices that are symptomatic of the wasteful management of the forces of production or also to eradicate the obviously ineffective ways in which these forces of production are being harnessed. This is an essential part of the crisis management campaign, but it is not enough.

Restructuring and Reform

Restructuring and reform are urgently needed in order to resolve the economic crisis. These two policies in favor of change cannot be pursued in isolation from each other. Restructuring without reform will prove to be an exercise in futility, and economic reform, if it does not lead quickly to a restructuring of the economy, i.e., to structural changes that contribute to a boost in the productivity of productive resources, will lead just as quickly to economic collapse in view of persisting shortages of productive resources. Thus, in order to extricate ourselves from this crisis it is of the utmost importance to find answers to the following questions:

—How are we going to go about reordering production priorities (restructuring I) in favor of those sectors which are of critical importance to finding a solution to the crisis, including first and foremost agriculture, extractive industries, and export-oriented industries? The need for such a reordering of priorities is indisputable.

--How are we going to go about implementing an economic reform in the face of a severe shortage of a multitude of productive resources and foreign exchange and, consequently, in the face of a profound disequilibrium in the flow of supplies and in the marketplace? Economic reform is predicated on yet another reordering of priorities (restructuring II) in favor of increasing the productivity of productive resources, also including the productive resources of individual enterprises.

The problem boils down to a lack of equilibrium, since an abundance of cash guarantees demand for all manner of goods, and this brings economic restructuring instruments close to the point of being totally ineffectual. The decline in the value of the zloty has encouraged the spread of barter transactions. So, what we have in this country is a large quantity of different kinds of currency that cannot be readily enumerated. This is due to the lack of a single, commonly accepted unit of equivalent value, and the real or artificial shortfall in output is a trump card in the hands of producers. This output is coming to be regarded as "money" in negotiations with suppliers and co-producers. Nor is there any possibility of restructuring the economy by resorting to administrative methods in view of the fact that the ability to control the economy has been forfeited, as well as in view of the nature of the country's social and political system.

Under these money-supply and market-related circumstances the chances for an effective reform are also not very likely. The productive resources deficit means that it will be necessary to carry on with the policy based on the distributive allocation of many fabricating materials and finished goods, and this in turn means that we will be forced to take a command approach to the formulation of production programs, even in cases where there is still a buyers' monopoly when it comes to the procurement of those products which are most scarce.

Experience teaches us that the command-distributive system develops in an evolutionary fashion and does so relentlessly. The volume of mandatory production quotas tends to increase rather than tending to diminish. It is only the severe crunches that occur from time to time that tend to reduce temporarily the volume of these mandatory quotas. This is by no means a consequence of ill will on the part of the economic bureaucracy, but rather of the logic of the practice of shifting the burden of scarcities in an economy that is operating in a stressful environment. A great deal has already been written on this subject.[2]

However, wherever and whenever the command-distributive system goes on the retreat there emerges a strong tendency toward rising prices, a tendency marked by mutually reinforcing inflationary trends. The possible future introduction of price controls will not be very effective. To enhance the effectiveness of this policy by setting prices by fiat will mean that prices will continue to be false parameters and that the system of barter transactions will persist. And this will be attended by the persistence of a multiplicity of currencies. All in all, this will do nothing to help bring about the desired reordering of priorities in favor of the increased productivity of productive resources. The passage of an economic reform under these circumstances might result not in increased productivity, but rather in an increase in prices as well as in a gradual return to the command-distributive system. However, if we were to make a consistent effort to gradually do away with the distributive and command approach to the allocation of resources while trying to set prices that are conducive to equilibrium, then the results might also turn out to be not so very encouraging, i.e., galloping

2. Vide, inter alia, one of the oldest studies on this subject: J. Beksiak and U. Libura, "Rownowaga gospodarcza w socjalizmie" [Economic Equilibrium Under Socialism], PWN, 1969.

inflation accompanied by a policy dedicated to income redistribution. If in the final analysis inflation holds sway as a result of cutbacks in budget appropriations and the allocation of credits, then we will be left with an inequitable distribution of incomes and perhaps even unemployment.

The absence of a commonly accepted unit of equivalent value does not offer very much hope for the success of either restructuring or economic reform. It is impossible not to see that in the midst of all this chaos, which is a product of the existence of barter transactions and a multiplicity of diverse currencies, a commonly accepted unit of equivalent value is emerging in the form of a foreign convertible currency. It goes without saying that it would be absurd to use a foreign currency as a commonly accepted unit of equivalent value in Poland. The possibility does exist of finding an alternative, better solution to this problem--a question to which I will return later on.

Can the Zloty Be Saved for the Sake of Reform?

Even at the start of this year I was convinced that this is possible.[3] And even now this is still possible, though less probable. In order to restore to the zloty the attributes of a commonly accepted unit of equivalent value it is necessary to greatly reduce its purchasing power and the amount of zlotys in circulation. In the course of the past year the inflationary gap has gotten much worse and the money supply has increased. Among the necessary measures that have to be taken to achieve this goal the first thing that comes to mind, and rightly so, is price reform. Price reform stands for:

--Raising and changing the structure of prices charged for consumer goods, raw materials, fabricating materials, and so on. This program, which is slated to go into effect on 1 January 1982, will in effect be tantamount to the adoption of nothing more than a "rock-bottom package" of consumer good price changes. It would be naive to conclude that we are going to stabilize the prices of these kinds of goods by enacting this price increase. If the wholesale goods market is going to function normally, then it will be necessary to move toward the adoption of further "adaptive" price changes that will be conducive to equilibrium. It is not hard to foresee the direction that changes in the overall level of wholesale prices will take, i.e., a trend toward higher prices. An increase in the prices of wholesale goods will exert pressure tending to bring about an increase in the prices of consumer goods.

--It will become necessary to raise the prices of consumer goods, especially foodstuffs, in order to guarantee the profitability of their production and bring these prices closer into line with equilibrium prices. Even this price change will be preliminary in nature, a price change that will be followed by further increases. An inflationary trend in all categories of prices will contribute nothing toward bringing about a reduction in manufacturing costs or toward making the exploitation of productive resources more efficient. The economic consequences of these price increases may prove to be unsatisfactory,

---

3. Vide M. Gorski and K. Ryc: "What Way To Stabilization," ZYCIE GOSPODARCZE, Nos 11, 12, and 13, 1981.

since it is common knowledge that inflation contributes nothing toward the adoption of more efficient management practices.

Price increases should also serve another purpose. Namely, they should help to bring the level of real personal incomes closer into line with the level of deliveries of consumer goods and services, and they should furthermore, in the opinion of experts, help to reduce the real purchasing power of the forced savings amassed by individuals, the so-called inflationary curve. To this end, it is being suggested that there should be radical increases in the prices of manufactured goods, especially higher quality goods, which are perversely referred to as luxury goods. This is supposed to be an indirect "luxury" tax, the kind of policy that is easier to enforce than a direct tax or a reduction in nominal wages.

All of this has to be supported by a tight money policy vis-a-vis enterprises and institutions, a policy of stringent budget cuts, and various programs geared toward reducing the volume of too much money chasing too few goods in the marketplace, programs such as domestic loans, the paying of higher interest rates on long-term deposits, an advance-sale system patterned after the advance sales of automobiles, and so on. This package of programs pretty much speaks for itself as far as the stabilization of the economy is concerned. The question as to whether it is appropriate under conditions marked by a downward trend in industrial output and under circumstances marked by severe social tensions is another matter. The point is that the level of real incomes should be brought into line with the level of deliveries to the marketplace in a situation where such deliveries are declining with each passing month. This is also a question of bringing the level of real personal incomes into line with the constantly declining level of consumption, a level which for the time being has to decline even further before it matches the level of deliveries to the marketplace, since it is necessary to rebuild inventories so that the marketplace can function at least somewhat better than it does now.

What Kind of Alternative?

If all of these programs proved to be successful, then the economic mechanisms that are being introduced by the reform would have a chance to perform their intended functions. The groundwork would also be laid for resolving our present crisis. However, if this package of programs does not succeed, or if it succeeds only in part, that is, if it does nothing more than alleviate strains in the marketplace and in the realm of wholesale goods deliveries, then the prospects of the reform are not good. This is because inflationary pressures will be generated that will make inflation even more rampant, and attempts to counteract these pressures will tend toward the revival of administrative instruments, which will mean the gradual reinstatement of the command-distributive system. Under these conditions the implementation of the reform will be predicated on a long-term commitment on the part of the authorities in favor of the consistent implementation of the reform process, notwithstanding temporary setbacks, and, what is most likely equally important, on the long-term patience of the general public that is bearing the brunt of this economic crisis. The general public has to be prepared to live with a long-term "transitional period," the ultimate outcome of which is by no means clearly positive. It is also hard to foresee the social consequences of having to spend several years living in a depression.

Under these circumstances, while sparing no pains to lay the groundwork for the implementation of economic reform, a strong effort needs to be made to seek out alternatives to this package of programs, a package which is deemed to be essential in order for the economic reform to produce the desired results, and we are not altogether certain that these results are attainable.

If the zloty cannot be saved for the sake of the economic reform, then the alternative is to sacrifice the zloty for the sake of reform and the restructuring of the economy. There is a whole host of proposals as to how this sacrifice should be made. There is only one such proposal which, in my opinion, ought to be ruled out, namely, the nonequivalent option such as the one that was adopted in 1950. This is not merely a question of the savage nature of such a program (which was aptly described by R. Skarzynski in ZYCIE GOSPODARCZE, No 41/1981) and its negative social consequences, rather it is first and foremost a question of seeing to it that the zloty, which is not a commonly accepted unit of equivalent value, is not replaced by another currency which also does not possess this attribute or which will lose this status just as quickly. In a word, one cannot advocate currency substitution just for the sake of wiping out an inflationary gap or an inflationary curve, since conditions will very quickly revert back to their previous state. New economic mechanisms must precede the possible future adoption of a new currency.

Compromise proposals have also been made. One of these proposals calls for the temporary suspension of the requirement to accept part of the proceeds due under the terms of bills of sale in the form of National Bank of Poland notes, over and above specified sums paid in the form of earnings or savings account withdrawals. This would be tantamount to a compulsory government loan. A proposal has also been made advocating a ration coupon form of currency, a proposal which would in effect contribute nothing toward restoring economic equilibrium, even though it might make things easier for consumers in terms of selecting goods on the list of rationed commodities. There are other proposals favoring a "coupon" currency which would give certain people the right to do their shopping without waiting in lines, that is, those people in whom we have a special interest when it comes to the creation of incentives to work or engage in some form of economic activity. An interesting proposal advocating this type of currency was presented by A. Nalecz-Jawecki (ZYCIE GOSPODARCZE No 44/81). It also seems to be fitting that we should accept the argument advanced by W. Bien (ZYCIE GOSPODARCZE No 42/81) who says that, "....putting a privileged currency into parallel circulation is in essence tantamount to the adoption of a nonequivalent currency denomination (i.e., the zloty--K.R.)," even though some of the other arguments advanced by this author are debatable, especially when it comes to his interpretation of Copernicus'-Greshma's Law. Reducing the money supply by temporarily suspending the requirement to accept part of a payment due under the terms of bills of sale in the form of NBP notes can do nothing more than to facilitate the restoration of a relative kind of equilibrium and serve as a substitute for price increases. But this would reduce public confidence in our currency and would not lay lasting foundations for the restoration of orderly monetary transactions. On the other hand, a coupon-type currency might make it easier to find solutions to many of our most pressing problems such as the revival of the farm products procurement system or also the creation of stronger incentives that would encourage people to work harder, but it would not resolve the fundamental problem, i.e., the creation of a monetary incentive that would stimulate the restructuring of the economy and an improvement in the efficiency of management.

The most responsible solution, a solution that represents a realistic alternative to the package of measures geared toward the restoration of economic equilibrium, would be to introduce a new currency to replace the zloty, a new currency that would perform all of the normal functions of a unit of monetary value, including convertibility into foreign currencies. The adoption of a "full-service" currency accompanied by the implementation of the basic premises of economic reform would signify the laying of a genuinely new, and positive groundwork that would help to encourage efficient performance on the part of all participants in the economic process. A monetary reform cast in this mold was enacted in Poland in 1924, and similar reforms were also enacted in other countries, for example, in the FRG after the war. It is my belief that such a solution is not realistic. Our economy would not be able to stand up to a confrontation with the world market. Without repudiating the ideals of putting a sound currency to work to restore the economy's health and forcing participants in the economic process to behave in a way that is conducive to greater efficiency and to bring about the desired restructuring of industry, it is for this reason also that it is necessary to search for more complex, atypical solutions, for the situation in which our country now finds itself is also highly complex and atypical.

A Proposal for the Adoption of a New Currency

It is being proposed that a "new zloty" should be introduced in order to rescue the economy from the perils of galloping inflation, eliminate the administrative constraints on the implementation of economic reform, minimize the adverse consequences of price controls, including in particular the adverse consequences of attempts to close the inflationary gap and eliminate the inflationary curve, avoid a doubling of prices charged for scarce productive resources (producers' prices), lend new impetus to the production of scarce goods, and encourage their economical consumption. The adoption of a new currency would have nothing in common with a currency substitution similar to that which took place in 1950, but it would signify the making of an attempt to re-establish the rules of efficient management practices accompanied by the implementation of an economic reform. A new currency would make it possible to resurrect the economic bonds that hold the economy together, starting with those branches of the economy which are economically the most efficient performers by endowing them with a privileged status, and it would give other branches and enterprises a strong incentive to match this performance record. This would then result in the demanded and desired restructuring of productive resources and finished goods.

The new zloty would be a convertible currency with a set rate of exchange in relation to the principal convertible foreign currencies. This is not to rule out transitional quota restrictions on the amount of currency exported abroad by tourists. The printing of a new zloty would be based on a loan issued by the International Monetary Fund, the foreign exchange holdings of private citizens deposited in savings banks (the source of possible future internal foreign exchange loans), the temporarily idle foreign exchange assets of economic organizations, other foreign loans taken out in order to stabilize the Polish economy, and so on.

The new zloty would be used to pay for imported goods, domestically manufactured goods that could be sold for a profit on export markets, and goods intended to take the place of imported goods. This would apply first and foremost to critical raw materials and foodstuffs.

The new zloty would also supplant "Pewex" commodity coupons.

Enterprises would use the new zloty to purchase all productive resources without limits or restrictions as to whether they made these purchases on the domestic market or on foreign markets. In order to give preference to domestically manufactured goods tariffs would be introduced payable in new zlotys. The prices of goods purchased with new zlotys would be equilibrium prices, prices which would naturally be comparable to world price ratios.

It might be that the new zloty would be paid in the form of a portion of the wages and bonuses paid to workers employed in enterprises earning revenues in the form of this currency (ideally, this should apply to all wages and bonuses). The way in which these revenues are to be distributed would be determined by the self-governing bodies of these enterprises. The new zloty could be traded in the marketplace to buy all kinds of consumer goods without restrictions, as well as other scarce items (e.g., building materials, building lots, land, and so on).

The "old zloty" would continue to be an operative currency in tandem with the new zloty. The old zloty would serve as legal tender within the context of the allocation of producers goods and for wholesale deliveries of all other producers goods which do not figure prominently in international trade for reasons having to do with their quality, terms of sale, and so on. Old zlotys would be used as a medium of exchange in the allocation of rationed consumer goods and other regulated commodities (commodities distributed by means of allocations, coupons, and so on). Old zlotys would be used to pay all duty taxes and to purchase all goods not paid for in new zlotys. Wages and other cash benefits would continue to be paid in old zlotys until such time as enterprises and institutions would begin to earn revenues in the form of new zlotys, thereby enabling them at first to make some, and later on all payments of wages and cash benefits in the form of new zlotys. The old zloty would be convertible to the new zloty at a rate of exchange matching the supply of and demand for the new zloty.

The process whereby the new zloty would be disseminated through the economy would be economic, and not administrative in nature. The supply of new zlotys would be a function of the extent to which it is backed up by foreign exchange reserves. It would not be possible to earn new zlotys as a result of any negotiations other than commercial negotiations. This means that it would be possible to earn revenues in the form of new zlotys only insofar as it proves to be possible to find buyers for goods and services who would be prepared to pay for these goods and services in new zlotys. All that would be left for the government to do would be to take the first steps toward putting this new zloty into circulation.

It is being proposed that the new zloty should be put into circulation in accordance with the scenario described below.

The new zloty would be used to pay for the output produced by the mining industry and for the purchase of foodstuffs from farmers through the procurement system.

New zlotys would also be earned by enterprises for export sales of their products. All other enterprises would be able to earn revenues in the form of new zlotys provided that they sold their products for export or to farmers, the mining industry, or also to other enterprises producing goods for sale in export markets. This means that these sectors of the economy would be put in a highly privileged position. Nor would enterprises in these sectors have any problems in meeting their manpower needs, since they would be able to pay a portion of the compensation owed to employees in the form of new zlotys. And the rate of exchange for the new zloty in relation to the old zloty would be highly favorable to start with. The impact of the new zloty would be "infectious." All enterprises would be looking for ways to earn new zlotys by making their product mix more attractive to consumers. At the same time, they would be forced to follow strict policies dedicated to the conservation of all of those productive resources which have to be paid for in new zlotys, i.e., those forces of production which are in short supply in our economy. The increasingly more widespread use of the new zloty in transactions among enterprises would be accompanied by the desired restructuring of industry and an increase in its performance efficiency.

The relationships between the old and new currencies would probably evolve in the following direction.

For as long as both types of currency remain in circulation the "superior" currency will be immune to inflation. In keeping with Copernicus'-Gresham's law the new zloty would be an object to be hoarded and deposited in savings accounts. This would tend to create increased opportunities for issuing new zlotys that are backed up by a "safe" margin of foreign exchange reserves. The "issue initiative" taken by the bank issuing the new currency would turn out to be an important contribution toward building up the fiscal strength of the country. Further issues and the more widespread circulation of the new currency would in time lead to the complete eradication of the old currency. Government revenues earned from taxes and tariffs paid in new zlotys would make it possible for the government to use these new zlotys to pay an increasingly larger share of the salaries of employees working for publicly funded institutions and cash benefits for the public at large.

The transition to the use of a new currency to pay for wages and transfer payments would mark the end of the processes of "pegging" wages to current cost of living standards, the restructuring of prices, the elimination of all rationing programs, the elimination of the inflationary gap in the economy, the elimination of the inflationary curve, and so on.

It may be that it will not be possible to take this approach in order to extricate ourselves from this economic crisis while preserving the same standard of living that prevailed prior to the onset of this crisis. But the foundations will have been laid for an improvement in living standards as a result of the improvement in the performance efficiency of management which will succeed in squeezing "sound money" out of the economy.

In the realm of production the adoption of a new currency to replace the "old" currency would at one and the same time signify:

--the restructuring of productive industries along lines that favor those sectors and branches of the economy that are now classified as bottlenecks, i.e., agriculture and the materials-coproduction infrastructure, including in particular those industries producing goods for export,

--the effective exploitation of the economy's productive forces and the elimination of the least effective applications of these resources,

--a test of the validity of the structure of production from the standpoint of end-user demand on the domestic and foreign markets,

--the elimination of the least efficient economic entities which are not able to meet the demands of the marketplace, that is, those which are not able to reassess the way in which they manage their productive resources and test the validity of their product mix, and so on.

Improved efficiency in the management of productive resources and the wholesale restructuring of industry would signify the permanent eradication of the repetitive cycle of crisis-producing tensions, and not just an effort to come to grips with the present crisis.

Together With or a Substitute for Economic Reform?

This is not just a rhetorical question. It goes without saying that the new zloty can yield the expected benefits only in a reformed economy. It is my belief that this is a proposal that could be acted on right away. Even though, to put it mildly, we are faced with a future in which foreign exchange earnings are going to be very meager, this is all the more the reason why economic organizations should be given a chance:

--to buy what they need in Poland at lower prices than those which prevail abroad,

--to earn profits from export sales and co-production arrangements with enterprises producing goods for export,

--to revive the production of goods that are especially scarce,

--to cultivate opportunities for building up "retained earnings" and for the more careful and economical management of liquid assets.

The country's needs can be effectively addressed with the help of import and export tariffs--in the case of scarce raw materials and fabricating materials--without going too far toward tying up funds that are needed to pay for imports of essential raw materials and fabricating materials that cannot be produced domestically. The supply of raw zlotys may at first not be large enough to finance purchases of all the producers goods that are needed by agriculture and the mining industry. During this initial period it will be necessary to restrict purchases to just some of these producers goods and wait until later on to enlarge the purchasing quota list.

The adoption of an alternative currency is attended by a certain element of risk. This is the risk of setting out into uncharted territory. But, as I said before, the situation in which our economy finds itself is not typical. If we do not take this risk and lay the groundwork for the implementation of an economic reform and if the economy is "taken by surprise" by the introduction of efficiency-boosting mechanisms, then this proposal may come to be regarded as some kind of curiosity. It will be relegated to the realm of intellectual game playing. After many years have gone by our economy will gradually move closer to the point where it is endowed with a sound and convertible currency, something which is essential for the sake of efficient economic management. If, on the other hand, the economic reform is a failure and enterprises do not respond with programs geared toward promoting efficiency and bringing about the desired restructuring of their product lines--a possibility that unfortunately cannot be ruled out--then this "new currency" may prove to be absolutely essential as a means of extricating ourselves from this chaos and crisis which will grow even worse. In this case the dissemination of a new currency may serve as a way to promote the more widespread acceptance of new rules of economic conduct, rules governed by the laws of the market.

Neither at this juncture can one rule out the kind of economic development scenario according to which the command-distributive approach to economic management would cease to function in an effective manner without there being any way of guaranteeing the enforcement of discipline among subordinate economic entities. Faced with mounting difficulties, enterprises would begin to be guided by the principle of "every man for himself." Under these circumstances the adoption of a new currency would become unavoidable, since, otherwise, a convertible foreign currency would begin to fulfill the functions of a new currency. This is because an advanced economy cannot get by with simple barter transactions.

However, it may be more likely that a second scenario will be played out, according to which, acting in the best interests of the enterprises themselves, it will be possible to preserve a bare minimum of the discipline that is necessary in order to enforce the decisions made by higher ranking economic institutions. In this case the system based on the distributive allocation of productive resources and the rationing of consumer items of fundamental importance to the people's standard of living will remain intact. Thus, management practices similar to those now in force will remain in effect. In this case too, the adoption and dissemination of a new currency may herald the adoption and general acceptance of new rules of economic management. The adoption of this new currency will then be followed by economic reform.

CONFLICT OF PLANNING METHODS PUBLISHED

Warsaw ZYCIE GOSPODARCZE in Polish Nos 45, 46, 8, 15 Nov 81

[Article by Jozef Kubas]

[Part One, 8 Nov 81 p 4]

[Text] The article "Concerning the NPSG [National Socioeconomic Plan] for 1982" (ZYCIE GOSPODARCZE No 31/1981) unleashed a public discussion over the form and character of the economic plan for 1982. It is not a trifling question, since it concerns a period linked with society's hopes for the reversal of the unfortunate turn of economic events, by means of economic reform and actions taken to stabilize the government.

It is not my intention to polemicize directly with the theses of the above article for two reasons. First, I am in disagreement with them to such an extent that a probable rejoinder would, of necessity, lend my answer the character of a review; second, by polemicizing I would be depriving myself of the possibility of presenting public opinion with the views of the economists grouped together in the CENPLAN Government Center of Information Science and with my views as well on basic questions associated with the preparation of a draft plan for next year.

The above-mentioned article is merely an overture to the game of the form to be taken by the plan for 1982. Since the time of its issuance, the Planning Commission under the Council of Ministers has been circulating a document entitled "Initial Assumptions for the Draft of the Socioeconomic Plan for 1982" (ZYCIE GOSPODARCZE No 38/1931).

By reading it, one is able to become much better informed about the approach proposed by central planners to the structure of the draft plan for the coming year.

I shall evaluate this document from the viewpoint of certain criteria which, in our opinion, should correspond to the central yearly plan prepared for the actual particular conditions of the operation of the Polish economy during the coming year.

It is our belief that the goals, the tasks and the centrally administered funds for their implementation, as well as the parameters guiding the economic-financial system of the economy should be directly aimed toward its stabilization and the

consistent application of economic reform. The bases for actions taken in this area are the "Government Program for Overcoming the Crisis and Stabilizing the National Economy" and "The Directions of Economic Reform," both of which are known to society.

The structure of the plan for 1982 should have a problematic character and should be based on the principle of the selection of vital elements. The proposed concept enables the concentration of governmental attention and public energies on the most important questions, as well as on strengthening desirable developmental processes and neutralizing negative tendencies.

In the establishment of the proper implementation policies in the course of planning, care should be taken to select the right tools for the creation of these policies, i.e., tools appropriate to governmental operation under conditions of a reformed national economy.

Getting out of the economic crisis takes energy, the intellectual stimulation of society and the utilization of society's initiative and resourcefulness to overcome mounting difficulties. One road leading to this goal is the drawing up of the plan in a dialogue with society. The methodology of the planning process should determine the forms and procedure of its socialization.

To what extent do the "Initial Assumptions" correspond to the criteria presented above?

The document under discussion has, as its primary goal, "the restoration of developmental processes in the economy..." The authors of the document also subjugate the available remedial measures and the actions which have been taken to this end. They make the statement in the introduction that "an important new factor for economic activity is the introduction of economic reform and the reform of producer prices on 1 January 1982...as well as the planned reform of retail prices...." However, the projected socioeconomic situation of the country according to the document does not yet consider this factor from the viewpoint of the positive--or negative--effect of reform activities upon the processes of economic growth.

After making the statement that the results of the application of economic reform are difficult to predict, they cite, among the factors determining this situation, only the problem of intensifying coal production, the balance of payments deficit and the implications flowing therefrom, the situation in agriculture and the growth of the inflationary gap on the domestic market.

As a consequence of the abandonment of even an attempt to gauge the effect of the planned reform on the development of economic events in 1982, the picture of planned governmental tasks in the economic field in the "Initial Assumptions" is greatly impoverished and is completely inadequate for such a difficult crisis situation of the Polish economy. It is almost wholly reduced to shooting at one basket: an increase in coal production, the several varieties of which become the sole determining factor in our economy and national living standard. This seems more than doubtful.

I would like to be clearly understood. I am well aware of the significance of coal for getting us out of the current, unusually burdensome situation, and I

consider the intensification of coal production to be most essential. At the same time, however, I remember that less than 2 years ago we produced over 200 million tons of coal, and in spite of this the economy began to drop. Therefore, even if we reach the level of coal production prescribed by the "variant of hopes," unfortunately it does not mean that we will achieve the hoped-for improvement in the state of the economy. This depends on a change in the social and economic-financial conditions within which it will come to operate. The assumptions are linked with this in name only and do not anticipate the economic consequences of the planned reform, which is their basic shortcoming.

The assumptions are totally devoid of elements of the active state economic policy which must be conducted for the fulfillment of the "variant of hopes" and the avoidance of the "variant of fears." Second, the assumptions continue to express the idea of the separation of so-called material planning from financial planning. This was sharply criticized in the past and it cannot be upheld now when the organizational units of the national economy, enterprises, are to operate under principles symbolized by three "S's": self-government [samorzadnosc], independence [samodzielnosc] and self-financing [samofinansowanie].

Of incomparable significance from the societal viewpoint is the government's submission of planned policies in selected fields of the economy to public discussion with regard to the importance of the quantitative characterization of the social and economic goals confronting society. No one doubts the government's good will in its intention to attain these goals, but it is more important to inform society how it proposes to achieve them.

Now I would like to give others the opportunity to rigorously criticize the draft plans advanced by economists working in the CENPLAN Government Center for Information Science in those fields of economic policy which are of prime interest to central planners.

First I will present the assumptions of the policy of regulatory control in the area of raw and other materials which, in our opinion, should be carried out next year:

1. The Planning Commission under the Council of Ministers prepares the balance-sheet of raw and other materials by agreement with the Ministry of the Material Economy and other interested ministries.

The Planning Commission may authorize the appropriate economic organizations working in the sphere of the wholesale turnover in raw materials and balance materials centrally to prepare the respective balance-sheets for the needs of central planning.

2. A primary goal of the prepared balance-sheets is to gain practical knowledge of the state of available raw and other materials resources and of the development of their yield and domestic production, and to analyze the physical and economic limitations for the development of the national economy issuing therefrom.

A basic function of the balance-sheets is their informational function. This is why they should also be made known to central planners and to economic organizations working directly within the production sphere. The balance-sheets of raw

and other materials prepared for the needs of central planning should be published, and the central plan should point out the implications of these balance-sheets on the production and developmental policy of production and service organizations.

The balance-sheets of raw and other materials must be updated continually on the basis of the analysis of the formation of the general volume of supply and demand as a result of changes in price determinants which cut off supplies of ineffective item demand.

The balance-sheets of raw and other materials prepared at the central level thus cease to have an exclusively quantitative character and acquire the form of an economic category.

3. The balance-sheets of raw and other materials are not confirmed. They have the value of a diagnostic prognosis and are useful in the process of central planning. During a transitional period, a few of them may serve as a foundation for the preparation of raw and other materials distribution lists, confirmed according to the appropriate procedure.

4. The balance-sheets of raw and other materials prepared at the central level likewise demonstrate their economic character in that they are set up according to economic systems, i.e., allocations are made toward ultimate goals and not toward consumers. Balance-sheets set up according to consumer-oriented expenditures, beginning with the balance-sheets prepared for planning needs for 1982, are being abandoned. In this way, the raw and other materials balance-sheet has stopped being a distribution index, because of the nature of things.

5. We propose that the expenditures side of the raw and other materials balance-sheets prepared for the needs of central planning for 1982 temporarily have the following structure:

1. socially protected needs, specified in concrete goods and services;

2. export, in the system: goods supply of specified export production; the direct export of a given raw material or other material;

3. intermediary reserves at the central level;

4. the remaining needs of the domestic market.

The raw and other materials distribution lists for 1982 confirmed by the Council of Ministers should have a similar structure.

6. We propose that the distribution for 1982 include only the following raw and other materials:

Name of Material	Implementor of Distribution List
1. Hard coal and hard coal briquettes	Central Office of Coal Purchasing
2. Coke and semi-coke	Central Office of Metallurgy Supply
3. Fuel for combustion and diesel engines, heating oil	Central Office of Oil Products
4. Products of ferrous metallurgy	Central Office of Steel Purchasing
5. Products of the nonferrous metals industry	Central Office of Nonferrous Metals Trade
6. Products from precious metals	State Mint
7. Cement	Bureau of Cement, Limestone and Gypsum Purchasing
8. Electrical power and gas	Main Inspectorate of Power Industry Management

7. We propose the following procedure for the regulatory control of raw and other materials for 1982.

Based on the directives of the Planning Commission, the proper implementor of the distribution list (central office of purchasing) for the given raw or other material grants the appropriate authorization for the purchase of the amount of raw or other material necessary for the manufacture of a given product to the central office of domestic trade dealing in the turnover of the product (which serves to meet protected social needs). At the same time, it indicates the production volume for the product for which the authorization is granted. The central office of domestic trade next concludes a contract with the producer or producers of the given product concerning the implementation of production. At the same time, all or part of the allotment of raw or other material is delivered.

In this way, the legal relationships between both central offices are administrative relationships (granting of the authorization), while the relationships between the central office of domestic trade and the producer of the given product are economic relationships spelled out by contract. In this way as well, the state acquires a legal and economic guarantee, highly effective under conditions of a reformed economy, that the distributed raw or other material will serve the manufacture of socially preferred production and not just any sort of production. Such a danger, on the other hand, really does exist when the authorization for the purchase of raw (or other) material indispensable for the manufacture of a specific item is granted to its producer without the simultaneous legal binding of the producer to implement its production.

The implementor of the distribution list should proceed similarly with regard to products specified in export, with the difference that the consignee of the materials authorization would be the appropriate foreign trade organization.

(36) prepared by the CENPLAN Government Center for Information Science; author, Dr J. Kubas

The "flow diagram for a system of regulatory control of raw and other materials in the market system" clarifies the above concept of regulatory control proposed for use during the transitional period of the application of economic reform.

The remaining demand of production and service units of the national economy for controlled raw and other materials should be met through the appropriate central office of purchasing at stable market prices, i.e., inclining upward from the purchase price. In this way, the economic process of eliminating ineffective demand for limited raw and other materials from the national economy will be set in motion.

The proposed solutions enable the simultaneous operation of economic mechanisms and distribution.

[Part Two, 15 Nov 81 p 6]

[Text] In the previous issue we published the first part of the article by Jozef Kubas. In that part the author criticized the proposed planning methodology set forth in Erwin Plichcinski's article (ZYCIE GOSPODARCZE No 31/1981) and began to introduce ideas for solving problems in economic policy in those fields which are of foremost interest to central planners. These are concepts prepared by the CENPLAN Government Center for Information Science. In the previous article J. Kubas presented assumptions for a policy of regulatory control in the area of raw and other materials.

Next, in the sphere of wages we see the need for an economic policy to be carried out which would take into account the following observations and solutions.

Within the framework of the intended economic reform, the following three variants of an incentive system within the enterprise are proposed:

Model A--based in part on an increase in the average wage independently of the success of the enterprise, and in part on the average wage contingent upon its success, or on profit sharing. It is a weakness of this concept that wage guarantees based on the average wage signify the identical treatment of enterprises independently of the degree to which their products or services are accepted by society.

In consequence of the adoption of model A, the following may occur:

--a continued state of market instability,

--the financing of hidden unemployment,

--the weakening of employee morale due to the considerable relaxation of the economic link between work results and remuneration,

--the creation of a substantial obstacle to the restructuralization of employment in the economy.

Model B--based on the parallel utilization of measures of income and profits as tools for regulating the wage fund. This model, which is in essence similar to the WOG [Large Economic Organizations] model, has the following shortcomings:

--it is a model based on two kinds of criteria; consequently, it makes use of at least two wage funds: a wage fund calculated on costs and an incentive fund based on profit, which may lead to the undesirable disintegration of the work force,

--it requires complex financial tools for the regulation of enterprise income and the income of individual employees.

Model C--the use of which is favored by our community, is a model based on the independent sharing of income by the enterprise. It envisages the greatest degree of autonomy of economic organizations in proportionate sharing at the level of the economic organization. Income is understood as the difference between receipts from sale, product-type subsidies and extraordinary profits, and the obligations of the enterprise (with regard to budget, banks and other organizational units), costs (with the exception of wages and such elements as, up to this time, have been an additional product, e.g., ZUS [Social Security Agency] dues and bank interest) and extraordinary losses.

Income is subject to verification for the purpose of: eliminating irregular profits (attained by the violation of legal regulations) and independent profits (the result of decisions of state authorities in the area of prices and other price-fixing standards, organizational changes during a transitional period made as a result of a state initiative or of the initiative of the enterprises themselves). The claims and principles for the verification of income should be

specified in a normative document, the contents of which are to be agreed upon by trade unions. Irregular income is turned over to the budget (together with a 50 percent sanction in the event of its concealment); independent income is subject to accounting with the state budget in the form of a quota tax or a compensatory subsidy.

The state acts to control the amount of the wage funded created independently by the enterprise through indirect means. The following solutions are proposed in this area.

In state enterprises, control of the wage fund is exercised by means of a progressive system of taxing that part of an enterprise's income which is designated for wages. The basis of taxation is the new average level of the wage fund calculated per employee (the average wage expected to be implemented during the settlement of accounts period). The scale of the taxing progression should be uniform, and it should be linked to the rate and size of the average wage increase within the entire economy. By way of example, it may shape up in the following manner:

Average wage increase during the settlement of accounts period over and above the average wage level free from taxation--basis of the tax	Size of individual tax		Net wage increase to be implemented (cumulatively)
	percent	quota (cumulatively)	
1--100	15	15	85
101--200	30	45	155
201--200	45	90	210
301--400	60	150	250
401--500	75	225	275
501 and above	80		

For state enterprises with limited self-government (participatory model), which include: the fuel industry, raw materials industry and industries of basic semi-finished products, creating a state monopoly and the state economic infrastructure; as well as for community service enterprises for which prices are fixed by administrative organs, central and local, the category of the guaranteed wage fund is introduced. It is defined as the product of the established percentage--lower than 100 percent--of the base, average wage and the base employment rate. The average wage calculated in this manner should take into consideration cost of living increases. In the event that the enterprise is lacking its own means, this fund is covered out of a special bank credit granted, under a gurantee of the state budget, for a period of not more than 1 year. If, during this time, the enterprise does not bring in enough income to enable payment of the credit, the budget is obliged to pay it instead of the enterprise.

In addition to the control of the wage fund in the enterprise, the individual income of employees is likewise subject to state regulation by means of a system of compensatory taxation. This tax should take into account the level of expenses (and not income) incurred by a family member as the basis for taxation.

The tax rate and the procedure for compensatory taxation requires separate regulation determined in consultation with society.

For the purpose of warding off the socially negative consequences of the easy attainment of high profits during the first period of reform as well as counteracting high payments into the wage fund as a result of such profits, the following bases of the economic-financial system of enterprises are proposed for stimulating the producers' base:

1. Payments into the wage fund shall be made within the framework of the available funds, after the timely payment of all of the enterprise's obligations with regard to budget, banks and creditors. The granting of bank credit earmarked for wages imposes upon the bank the obligation to make a careful check into the financial situation of the enterprise. It is also tied in with the limitation of the maximum average wage to be paid during the given period even if the credit granted is merely auxiliary.

2. Enterprises are obliged to create a wage reserve fund in an amount corresponding to the sum of wages. This fund is created over a period of 3 successive years out of enterprise profits, with half the targeted amount being set aside in the first year. If the enterprise shows balance-sheet losses, these losses are covered in the first order out of the wage reserve fund. Any sort of reduction in the wage reserve fund during a given settlement of accounts period (1 year) must be made up in the required amount during the next period. The wage reserve fund is free from taxation.

3. The state budget provides enterprises shifting over to a reformed financial system with an enterprise statute fund, in an amount equal to the net value of durable resources. Upon its turnover, this fund is amassed from the enterprise's own profits during the course of its economic activity. This financial requirement makes necessary the use of bank credit at a high rate of interest for turnover purposes, with a different interest rate on organizational units [plant and equipment].

We may expect that in this way enterprises will be relatively more strongly interested in liquidating their expensive turnover credit, designating the excess of income brought in over outlays and profits, for the financing of turnover funds. With the progressive taxation of the created wage fund in relation to the average wage free from taxation, the sum of the rate of the progressive tax and the interest rate of turnover credit becomes the measure of losses, i.e., the profits forfeited if, instead of increasing the size of its own fund in turnover, the enterprise designates the income brought in to increase wages.

An added benefit of the above principles is their strong effect on the freeing up of raw and other material reserves and reserves of other semi-finished products, which, when directed to other producers, will bring about an increase in the rate of production.

In the field of investments, we consider it to be essential that the implementational policy in the plan for 1982 be based on the following assumptions:

1. Investments of the national economy are conceived of in two ways in the draft plan:

--as the general investment activity of the national economy,

--as concrete central investments.

The central investments comprised by the draft plan are specified by name and are planned in material-financial categories.

All remaining types of investments as well as the general investment activity of the national economy are planned in categories of the general input-output accounting.

2. The yearly plan shall mark out the developmental directions which are the subject of particular governmental concern. The task of the government is to implement these directions by the creation of suitable conditions for investors for efficient and timely investment in all areas of the national economy.

3. The plan shall specify the guidelines for the parameters or the values of the parameters guiding investment activity. It shall also outline governmental investment policy for 1982. It shall establish the guidelines for banking institutions and the directions of their operation via a credit policy suited to the economic-financial situation of investors, subject to the progress made in achieving the investment results envisaged in the plan.

4. The plan does not assign directive-type investment tasks for economic organizations. Its assumptions merely make recommendations and provide information for these organizations.

The central investments plan, with regard to the investments of economic organizations, includes:

1. the designation, on the basis of aggregated balances of production and services, of the developmental directions preferred by the centex. These constitute an informational base for the investment activity of enterprises,

2. an estimate of projected maximum financial outlays associated with the above directions,

3. a forecast of the funds possessed by economic organizations to be earmarked for investments and of the extent of bank credit.

5. In the draft plan for 1982, all investments which have begun to be implemented, whether continued or halted, shall be classified according to a uniform type-structure for investments, and the principles of their continued financing shall undergo the appropriate changes. To this end, the Planning Commission under the Council of Ministers, acting by agreement with the proper ministries and banks, in the course of its work on the draft plan, shall conduct negotiations with those enterprises which are investors in investments in progress, for the purpose of coordinating the principles and conditions for continuing them in 1982 and during subsequent years.

The Planning Commission under the Council of Ministers shall designate a list of investments in progress which it proposes to implement in 1982 as central investments in the understanding of the new principles of investment. This list shall be adopted as the basis for negotiations with economic organizations. This list of continued central investments, cleared with enterprises, must be approved by the Council of Ministers and the Sejm while the preparation of the draft plan is still in progress.

6. In the course of negotiations on the principles and conditions of continuing investments in progress in 1982, the following premises should be observed:

1) the financing of investments according to their previous forms and principles ceases at the latest on 31 December 1981.

2) enterprises themselves should decide which investments they wish to continue, based on their own funds or under the condition that they secure bank credit,

3) a change of investors is permitted if, in the course of negotiations, it is acknowledged that under conditions of a reformed economy, another investor shall guarantee the more efficient implementation of the given investment, and then, the more effective utilization of the newly created production or service capacities,

4) those investments which enterprises do not wish to continue based on their own funds alone or for which they do not secure credit, may be continued by several enterprises jointly or on the basis of foreign capital (joint ventures),

5) with regard to other investments in progress, the following actions should be taken (in order of preference):

a. a joint venture may be created with a partner from socialist countries,

b. a joint enterprise with firms from socialist countries may be created,

c. with regard to investments of great importance to the economy, which enterprises choose not to continue using their own funds, the appropriate ministry concludes a contract with one of several enterprises in cooperation with a bank, to implement the investment and immediately to include it among central investments; the contract defines the state's share in the form of budgetary subsidies and, if need be, other economic preferences, e.g., guaranteeing sale at specified prices. An alternative may be the opening of a new enterprise to operate on the basis of the new investment.

Finally, we believe that the rights of enterprises in the processing industry in the area of foreign trade are subject to basic restructuring within the framework of economic reform. In particular this restructuring should consist of the following:

1. The right of enterprises to possess their own accounts and foreign-exchange funds in the Trade Bank is recognized, as well as their freedom to utilize these funds for purposes justified by their production or development needs, under the

condition that they obtain import approval (import license) from the Ministry of Foreign Trade. The importation may be carried out with the use of the enterprise's own funds or on credit acquired domestically or abroad.

2. A tax on the foreign-exchange net profits of enterprises is initiated, i.e., profits after foreign-exchange outlays are deducted. The tax is calculated in advance, separately for every transaction and finally once a year for all trade from a given payments area. We propose the following taxation system.

Percentage share of foreign-exchange net profits in the total earnings of an enterprise for the year	Percentage tax rate	Distribution of relative foreign-exchange profits (calculated cumulatively)	
		for the enterprise	into the budget
up to 5.0	85	0.75	4.25
5.1--10.0	80	1.75	8.25
10.1--15.0	75	3.00	12.00
15.1--20.0	70	4.50	15.50
20.1--30.0	65	8.00	22.00
30.1--40.0	60	12.00	28.00
40.1--50.0	55	16.50	33.50
over 50.0	50	21.50	38.50

The adoption of the principle of applying the formula of taxing foreign-exchange profits clarifies for enterprises what funds they have or what funds they have available for production and developmental purposes; it provides an indispensable perspective for the independent making of economic decisions in the sphere of foreign trade and, consequently, for the responsible and reliable undertaking of trade obligations.

The proposed rate and tax system offer producers a very strong incentive to export.

3. The tax on foreign-exchange income is collected during the course of foreign-exchange redemption from the enterprise's foreign exchange account by the bank acting in the name of the budget, at the compulsory rate of exchange on the day payment is received from the foreign contractor.

4. During the transitional period, the use of foreign-exchange settlement of accounts is permitted between domestic enterprises. The purpose of this is to create conditions for the rationalization of import from the viewpoint of the interest of the economy as a whole: it will be cheaper and, perhaps, generally more profitable for the manufacturer to purchase the essential raw and other materials, and even cooperative elements, domestically than abroad.

Foreign exchange income of domestic enterprises issuing from domestic settlement of accounts are subject to the normal foreign-exchange taxation going into the budget.

5. Production and service enterprises acquire the right to enter into international agreements and economic relations, on the condition that such are approved by the appropriate minister and that they fulfill the obligation of registering in the Polish foreign trade house and the registry of enterprises. At the same time, they acquire the right to undertake economic endeavors domestically and abroad making use of the foreign funds of socialist and capitalist countries, under the above conditions.

6. Production and services enterprises have the freedom to select foreign trade enterprises for the implementation of the export and import ventures (transactions). The danger of competition among particular phz [foreign trade enterprises] on foreign markets should be limited by means of the creation of sector agreements of production enterprises having the task of coordinating their activities in the field of trade turnovers abroad.

7. It is assumed that foreign trade enterprises operate on foreign markets at their own expense and their own risk and not as commissioned agents. This should bring about a considerable improvement in the effectiveness of foreign trade and should reduce selling costs.

8. In order to enable access to foreign-exchange funds by economic organizations operating exclusively in the sphere of domestic production-trade relations or in a nonproduction sphere, the distribution of these means should be continued temporarily, on the condition that the foreign-exchange allotments for economic production and services units occur at a rate that approximates the market rate.

Foreign-exchange allotments have a product-type character in purpose. They are granted by the Trade Bank upon a recommendation to this effect made by interested institutions, to the extent that the funds are available.

9. The sale of foreign-exchange funds for the needs of the population is conducted by the NBP [Polish National Bank] at an exchange rate approximating the market rate.

I believe that the rationing program outlined above, in areas of controversial economic drafts plans and systems solutions, may awaken public discussion over the problems of next year's central plan and will enable the greater clarification of the role it is to play in getting us out of the current crisis.

MINISTER DISCUSSES RESTRUCTURING OF METALLURGICAL, MACHINERY INDUSTRIES

Warsaw ZYCIE GOSPODARCZE in Polish No 46, 15 Oct 81 p 9

[Interview with Zbigniew Szalajda, minister of metallurgy and machinery industry, by Aleksander Jedrzejczak: "Changes Within Reason"; date and place not given]

[Text] [Question] I am not claiming that, after your ministry announced its intentions, we received only letters--which we publish elsewhere in this issue--demanding that the machinery industry provide greater assistance to other sectors of the economy, or even that most of the letters were in that category.

[Answer] I bet that most of the letters concerned the further spread of motor vehicles.

[Question] Of course, as always, they did.

[Answer] What conclusions do you draw from it?

[Question] Letters to the editor are not a representative sample, but even so it is worth noting that "people are very attached to their dreams."

[Answer] Precisely, and we will speak here of matters that are rather unpleasant, of necessities that many accept reluctantly or refuse to recognize at all, as well as of issues that at first glance clash with the slogan "Endure." It is easy to guess the direction in which you are steering this interview, so let me tell you in advance that the range of our production must include a certain amount of products of which people dream and for which they are ready to sacrifice something, abstain from something, force themselves to think and exert a greater effort. This, however, is only by and by.

We are converting some factories to the kinds of production that are most needed, even though this involves considerable economic and technical problems.

[Question] I toured the Chemak Plant and the Zygmunt Iron and Steel Plant and there I heard these issues mentioned. But for the moment I should like to return to the question of the assistance of heavy industry for other branches and sectors, as requested in those letters to the editor, since those other branches and sectors much more directly affect [the nation's ability to] "Endure." In the hierarchy of human needs, milk and shoes rank ahead of, say, stereo radios.

[Answer] But I would prefer to describe competently--that is, more broadly--the ministry that I happen to direct, and especially what we already have done and are doing under emergency programs. I am not saying this in order to boast about past accomplishments but in order to point to certain dependences, interconnections, limitations. Then my reservations too will be understood more easily.

[Question] Let us begin with metallurgy. Power experts, or at least some of them, claim that the energy shortages will necessitate curtailing steel output to 15 or even 12 million tons annually. They consider it an indispensable prerequisite for restoring the equilibrium of the energy balance.

[Answer] This year steel output will be about 15.5 million tons; that is, 4 million less than last year.

[Question] That is about as much as in the early 1970's.

[Answer] We produced exactly as much steel in 1973. And it appears that we will produce only that much until the end of this decade.

[Question] You do not anticipate a decline to 12 million tons?

[Answer] What I anticipate, what I must consider and what I must be prepared for in view of the realities and the nation's indispensable needs--that is one thing. As for the current, numerous prescriptions for rescuing the Polish economy, that is another thing. Prescriptions for salvation are written the more easily the less one is aware of the economic realities of the branches and sectors. I am familiar with that prescription based on 12 million tons--how nice. The only problem is that it would first be necessary to create and build an industry capable of satisfying the nation's needs with such a low steel output, whereas plants capable of processing the currently produced steel already exist and they must adapt themselves to the gradual structural changes within the ministry.

[Question] But some radical surgery is needed.

[Answer] The term "surgery" is not particularly felicitous. We are deliberately curtailing production. This year, for example, we shut down the three most energy-intensive blast furnaces and seven open-hearth furnaces, selected on the basis of standard-criteria. This was insufficient. Technological considerations--you must accept this term and pass it on to your readers; I cannot here explain the interconnections and interrelations in iron and steel plants--precluded the possibility of closing other, most energy-intensive units in the older iron and steel plants. We thus settled for the repair of one blast furnace each in the Lenin and Katowice iron and steel plants. I am not even mentioning coke-oven batteries, they require no explanation.

We attempt to minimize the inconveniences experienced by our customers due to the curtailment of production; above all, we try not to confuse the actually determined priorities. Hence we have been curtailing the production of quality-steel products as little as possible. We keep up production in areas deemed most important by the government program for emerging from the crisis.

[Question] But there have been horrendous complaints made by the metal plants.

[Answer] Unfortunately, the scale of the necessary restrictions is so large that the established principles for selection cannot always be followed. The shortages are even beginning to spread to the protected spheres. And yet, 4 million tons of steel is a lot and, above all, its consequences are far-reaching.

[Question] I would not reduce all complaints to a suddenly reduced supply of steel.

[Answer] This was not my intention either, please understand. At all such plants the good of the state is in collision with the good and interests of the individual plant; the problems ensue chiefly from the generally adopted principles for coal allocation. When the supply of coal, liquid fuels or energy is low, nearly everyone agrees that the quantities supplied to heavy industry should be reduced. This is logical, just and easy to understand. But certain plants view this differently. Their personnel cannot avoid seeing equipment that remains unused due to the fuel shortage; moreover they are aware that their curtailment of production will cause problems in other plants that need their products. Then there also are considerations of the entire economics and employment.

[Question] You are placing marked emphasis on the coal shortage, but electric power and liquid fuels also come into play.

[Answer] The coal shortage is the most important. The decline in coal extraction is a direct blow to us, chiefly due to the attendant decrease in the production of coke. It also hits us indirectly through the shorter operating hours of electric power plants and shortages of electric power.

[Question] Since we cannot discuss all the vital problems or even the greatest bottlenecks in your entire, huge ministry, let us limit our interview to changes in production structure and to the issues considered in the letters to the editor.

[Answer] Quite so, at the machinery plants we have markedly reduced the production of energy- and fuel-intensive products that are not of primary importance to the economy. Thus, we reduced the output of Syrena passenger cars by 13,000; Tarpan cars, by 1,000; San buses, by 1,000; Star trucks, by 3,000; freight cars, by 2,500. We also reduced to some extent the production of construction machinery, electric locomotives, machine tools and cranes. These restrictions will save considerable quantities of auto-body sheet metal, aluminum, castings, and forgings, as well as of such chemical products as tires, lacquers and plastics. In addition, we have curtailed the output of many luxury products; dishwashers, campers, electronic watches, stereophonic radios, radio-tape recorders and silver and gold products. For example, the production of automatic washing machines under the Blamberg license has been completely halted, as has been the production of stereophonic phonographs, electric heaters and M2412-SD magnetic tape recorders. All these products are highly import-intensive.

The released production capacities and limited material resources are being used to expand the production of standard products, while the available limited amounts of foreign currencies are being used to acquire indispensable elements and components. This perhaps justifies stating that we are focusing on such a restructuring of production programs as would allow--with optimally utilizing the limited material resources and foreign-exchange funds--concentrating on the production of goods most needed by society.

[Question] This probably also concerns production for agriculture.

[Answer] Above all, this concerns the production of machinery and spare parts for agriculture, especially for private farms. We are curtailing the production of, among other things, grain harvesters, self-propelled straw cutters, potato harvesters and other high-capacity machines while at the same time increasing the production of the equipment used chiefly by private farmers: haymaker-rakers, sheaf-binders, potato-digging machines, mowers, harrows and plows. This list is, of course, not exhaustive. Agricultural machines exist in a broad variety. At the same time, we are developing and starting the production of new and completely modernized machines such as twin-axle manure spreaders, portable all-purpose sprayers and seeder-seed dressing machines.

[Question] Would you name the plants that are rapidly retooling for production for the needs of agriculture?

[Answer] It is best if I begin by naming a couple of examples. The Rawent Plants in Skierniewice--here I name only the plants under the Ministry of Metallurgy and Machinery Industry--undertook the production of straw and hay blowers. The technical equipment plant in Gliwice started to produce grinding rollers. The Zygmunt Iron and Steel Plant started to produce tractor-drawn rototillers; the Chemak Plant in Bidgoszcz, container equipment for cooling milk in containers; and the Ostrowiec and Stalowa Wola iron and steel plants, elements of cultivators and tractor-drawn harrows. Due to these steps, this year the supply of agricultural equipment for private farms will reach about 16 billion zlotys compared with 14-odd billion last year.

[Question] Farmers' representatives are still protesting that this is too little. There is no need to prove that they are right.

[Answer] Please do not forget that the oversights had been growing many years, while the needs of agriculture are extremely varied. I have just mentioned that we are increasing the output of equipment needed by private farmers at the expense of, among other things, reducing the output of large high-capacity machinery needed on large tracts. Let me now add that such a solution can be only interim, and in some ways harmful. All sectors of agriculture should have their needs equally supplied. Hence as soon as next year we anticipate expanding output of all varieties of agricultural machinery, not just those designed for smaller farms.

[Question] Would not it help to commit a larger number of plants to production for agriculture? In the Diet a deputy mentioned that that production has been undertaken by a much smaller number of plants than had been assumed.

[Answer] Broad and comprehensive steps have been taken on this matter. Offers of design blueprints and technical and technological assistance have been made and negotiations with more than 500 plants have been conducted. By now as many as 34 plants have for the first time in their existence undertaken the production of agricultural machinery. An additional 30 to 50 plants will join in that production within the next 2 or 3 months, although here the number of plants is not the decisive factor. More important are their facilities, the skills of their personnel, their supply, and organization of labor. Above all in the economy there always occurs what could be termed the limit of reason. That limit should not be exceeded under the pressure of the moment, because usually this proves an extremely costly step. Certainly, production for agriculture should be undertaken wherever warranted by organizational changes. When some important changes in technological facilities are involved, the matter becomes complicated. I have been reading many articles on this subject and I cannot resist the impression that in the imagination of their authors agricultural machinery can be manufactured from anything and with anything. This is a great misunderstanding.

Finally, there is the most difficult issue--the question of the future consequences of the abandonment of traditional types of production. The related interconnections often are quite intricate--we are supposed to provide not only implements of labor but also goods for which farmers will be willing to sell their produce. But to return to the starting point, this concerns the mass production of agricultural equipment rather than the production of discrete specimens by cottage-industry methods. This concerns, among other things, the cost and hence the prices of these products. Plants converting to the production of agricultural machinery offer their products at prices twice or thrice as high as those asked by specialized plants. Thus, here cost effectiveness should also be taken under consideration.

[Question] But still [agricultural] machinery and implements appear to be the most important issue. You mentioned at the outset the crucial importance of the goods manufactured within your ministry. Seen from that standpoint, the machinery industry may produce a cumulative satisfying effect deriving from both the satisfaction of the wish for ownership and the high efficiency of operation.

[Answer] Surely that is so. I am not claiming either that the entire potential within the ministry has already been exploited. What concerns me is that the most spectacular solution--the conversion of entire factories or departments--is not the only solution and that soon industry's performance will be analyzed normally according to the quantity of equipment produced and the degree of demand satisfied.

[Question] You mentioned other solutions.

[Answer] It is highly important, for example, that the newly undertaken production match needs. Recently extensive consultations have been carried out to determine the needs as precisely as possible. They resulted in drafting an agreed estimate of the demand for agricultural machinery in 1982 and a tentative estimate for demand during the period until 1985 for about 300 types of machinery

and implements. Of this group, 65 varieties considered fundamental to private farms have been selected. The other types of production also will be significantly expanded. The production of many of these varieties will double compared with the current years, but 2 or 3 years will be needed to satisfy the demand. Even after such a marked expansion of output, individual gminas and villages will complain that, though production increased, machinery continues to be unavailable. This will continue until the market is completely saturated with agricultural equipment.

[Question] Let us now consider the issues mentioned in the letters to the editor. Agriculture is not the only branch of the economy to expect assistance from the "mother of industries." The queue is being joined by more and more branches of the food and light industry, by the trading apparatus, chemical industry, mining industry. I omit transport, because the production of motor vehicles and railroad cars is within the jurisdiction of your ministry itself and I already have information on the measures taken to save transport.

[Answer] Please do not consider my comments as direct answers to the questions from the letters. They will rather be general comments, which however should be considered. The "overheating" of industry mentioned in the letters was due to, among other things, the fact that each type of production undertaken was justified in principle but, taken together, they resulted in the current situation. The author of one letter mentions an improbable mosaic of machinery and equipment imported from abroad--should we reproduce that mosaic in the machinery industry? The entire industry, including that segment controlled by my ministry, must implement definite social goals rather than satisfy sector ambitions even if these are valid and justified when considered by experts from a given sector.

[Question] I am not speaking of overblown sector ambitions but only of what is essential to the functioning of, for example, food, textile and other plants, in which the machinery industry could help them.

[Answer] We do not avoid providing assistance, but I must consider the technological realities of the plants under the auspices of my ministry. Certain branches within my ministry have evolved in a manner that does not satisfy the current needs of our nation and economy. But still this is a large, modern, well-equipped industry. After all, we are not going to demolish and plow it up, contrary to the advice of some people. The existing industry must produce, must bring profits. Our business--ours, that is, of the central administration and the plant management and crews--is to restructure that potential on the run, as it were. What is needed is not demolition but change at the lowest possible cost so as to retool to the production of the most needed things: agricultural machinery, spare parts, manufactured consumer goods and, what is particularly important, profitable export products. This was what, among other things, I meant when I declared that the existing industry must earn the funds for the necessary structural changes, seek markets for what it can produce, earn from exports and use the resulting funds to finance the necessary changes, while at the same time use the earned foreign-exchange funds to help others and primarily to restore the equilibrium of our balance of payments.

[Question] Strange things are often heard concerning the profitability of exports of heavy-industry products.

[Answer] This is a major subject in itself. For the present we must be content with the most general thesis of the need to export what is profitable. And profitable products are not necessarily those so considered by common opinion. Among us, for example, there has arisen the belief, disproved for quite a long time now, that only the exports of highly processed products are profitable. No one is drawing conclusions from the fact that Swedes export not only medical equipment and electronic products but also iron ore, for example. Instead of believing in myths, let us calculate accurately. The decisive factors are productivity and the demand on world market; that is, prices. Under our conditions and those of the world market, the exports of many consumer products are unprofitable; radio sets, radiomagnetic tape recorders and many others. We will thus concentrate on profitable exports of nonconsumer goods. As for consumer goods, let them remain on the shelves of our stores, so that finally those shelves will not be empty.

[Question] This comment needs no elaboration, but I was more concerned with the extremely limited possibilities especially for the imports of spare parts for the consumer goods plants--parts that those plants themselves cannot manufacture. The machinery industry can accomplish more and operates extensive research facilities.

[Answer] What do you think? Research and development, application and technical development and the like are expensive but may result only in the production of some component that is needed in the amount of 100 units annually. This is not cost effective from the standpoint of economic common sense.

[Question] The slogan "Endure" postulates resorting to resources and methods that are nonoptimal from the standpoint of the commonly accepted categories. Seen from this standpoint, research and design may be viewed differently; they may be considered the nucleus of structural changes in the machinery industry--changes that by fairly common consensus are regarded as indispensable. The entire, and by now large, household appliance industry originated from secondary production undertaken by the plants of machinery and heavy industry within the framework of the post-October renewal.

[Answer] I repeat, please do not misunderstand me. We will not avoid assisting other ministries and sectors; we shall help in measure with our present and gradually expanded new possibilities. But these can increase only gradually. I also recognize the necessity of carrying out essential changes in production structure. But such matters cannot--even under more normal conditions--be translated into reality from 1 month to another, or even from 1 year to another. And the fanning of hopes that are not justified by economic and technical realities is to me a symptom of irresponsibility, a harmful action. I wish to avoid this at any price. The numerous currently advanced prescriptions for a quick cure of the economy--nearly all entailing heavy industry--seem so attractive and simple chiefly because they are based on extremely superficial knowledge of the

facts. Reality is more complicated. You too will certainly remain dissatisfied with this interview; you would prefer to hear more encouraging comments on the subjects broached by those letters. But I am not and do not wish to be a fabricator of illusions.

[Question] You judge me too severely. Of course, at a couple of spots in this interview I would have preferred to hear something different, but I appreciate deeply an awareness of economic realities, not only among ministers. Thank you for the interview.

SOVIET COOPERATION OF INDUSTRIAL PROJECTS IN YUGOSLAVIA

Belgrade MEDJUNARODNI UGOVORI in Serbo-Croatian No 13, 6 Nov 81 pp 830-833

[Agreement Concerning Economic and Technical Cooperation in the Construction and Reconstruction of Industrial and Other Projects in the Socialist Federal Republic of Yugoslavia]

[Text] The Federal Executive Council of the Parliament of the Socialist Federal Republic of Yugoslavia and the Government of the Union of Soviet Socialist Republics, who maintain friendly relations with each other and who both strive for the further development and strengthening of economic and technical cooperation between the two countries on an equal basis, and who both foresee a mutual benefit from economic and technical cooperation on a long-term basis, have agreed to the following:

Article 1

The Federal Executive Council of the Parliament of the Socialist Federal Republic of Yugoslavia and the Government of the Union of Soviet Socialist Republics will collaborate from 1981 to 1985 on the construction and reconstruction of industrial and other projects in the Socialist Federal Republic of Yugoslavia listed in the Addendum, which is an integral part of this agreement.

Article 2

In order to provide the cooperation referred to in Article 1 of this agreement, Soviet organizations will do the following: perform the planning required for the projects; delivery machinery and equipment manufactured in the Soviet Union to Yugoslav organizations; send specialists to the Socialist Federal Republic of Yugoslavia to collaborate on a technical basis with Yugoslav organizations in construction, reconstruction, installation, testing, and operation of the equipment and machinery which is to be delivered from the Union of Soviet Socialist Republics; admit Yugoslav specialists into the process of consultation and into production and technical training.

Article 3

In order to provide the cooperation anticipated in Article 1 of this agreement, Yugoslav organizations will do the following: insure the installation of the equipment and machinery in accordance with contracts which have been signed by

organizations of both sides, and insure the performance of the necessary construction, assembly, and operation of the equipment and machinery; supply to the Soviet organizations engaged in the formulation of project plans all fundamental data necessary to the planning process which is available.

Article 4

The Government of the Union of Soviet Socialist Republics will guarantee a loan to the Federal Executive Council of the Parliament of the Socialist Federal Republic of Yugoslavia in the amount of $450 million (U.S.) at an annual interest rate of 4 percent, for the payment of equipment and machinery delivered from the Union of Soviet Socialist Republics for the construction and reconstruction of industrial and other projects listed in the Addendum of this agreement.

The Yugoslav side will pay back the aforementioned loan in 10 years in equal annual installments, with the first payment due 2 years after the end of the year in which some part of the equipment and machinery has been delivered.

The interest on the loan will be calculated from the day that the corresponding part of the loan is utilized. The date of the utilization of the loan will be considered to be the date konosmana or the date of the stamp on the railroad bill of lading at the border station of the country of the supplier.

The interest on the loan will be paid during the first quarter of the year following the one for which it is being calculated. The last interest payment will be made with the last payment of the principal of the loan.

The Federal Executive Council of the Parliament of the Socialist Federal Republic of Yugoslavia and the Government of the Union of Soviet Socialist Republics will take measures so that the total amount of credit established by this article is not exceeded.

If the value of the actual deliveries of equipment and machinery exceeds the amount of credit approved by this article, such excess will be paid by the Yugoslav side in accordance with the current Yugoslav-Soviet trade and payment agreement, based on negotiation by the interested organizations of both parties.

Article 5

The Yugoslav side will pay off the loan and interest for the delivery of goods to the Union of Soviet Socialist Republics within the framework of Yugoslav-Soviet trade agreements which are in effect at the time of the repayment of the loan.

The amount of each payment will be corrected by the authorized banks of both sides of those who participated in the signing of contracts if the value of the special right of withdrawal unit in U.S. dollar changes, in comparison to the rate of exchange of the International Monetary Fund announced 3 working days before the payment day, by more than ±2.25 percent on either side in comparison to the basic value expressed in U.S. dollars for the special right of withdrawal unit on the day before the day that the individual contracts between

Yugoslav and Soviet organizations are signed. In the event of a change in the mechanisms for determining the value of the special right of withdrawal unit which would invalidate the use of the special right of withdrawal for the aforementioned correction, the two sides will, as agreed, establish other mutually acceptable mechanisms which will protect both sides from loss due to fluctuation in the international currency market.

The loan and the interest will be paid by recording the appropriate amounts in U.S. dollars in special accounts which have been opened by the authorized banks of both sides in accordance with the Payment Agreement between the Federal People's Republic of Yugoslavia and the Union of Soviet Socialist Republics of 5 January 1955, or in another manner which is provided for in the agreement between the two sides concluded while this agreement is in effect.

The loan payment date will be considered to be the date that the payment amount is recorded in the special manner devised.

Amounts in the aforementioned account for the repayment of the loan and for the payment of interest charges which are left over will be taken into consideration by the two sides when the lists of goods and the volume of reciprocal deliveries of goods for the corresponding calendar year are reconciled.

Article 6

The National Bank of Yugoslavia and the Bank for Foreign Trade of the Union of Soviet Socialist Republics together will establish the technical procedure for maintaining the accounts and the accounting for the utilization and repayment of the loan money from this agreement and for the calculation and the payment of interest charges.

Article 7

Soviet specialists will be sent to the Socialist Federal Republic of Yugoslavia and Yugoslav specialists will be accepted in the Union of Soviet Socialist Republics for production and technical training, in accordance with this agreement, in accordance with the Agreement between Yugoslavia and the USSR concerning conditions of sending Yugoslav experts to the USSR and Soviet experts to Yugoslavia for the purpose of providing technical assistance and other services dated 29 April 1964, notes exchanged 24 September 1979, in Belgrade, and the Agreement between Yugoslavia and the USSR concerning the conditions of production and technical training of Yugoslav and Soviet specialists and workers dated 29 April 1964.

Yugoslav specialists will be received in the Union of Soviet Socialist Republics for the purpose of consultation, in accordance with this agreement, under the conditions provided for by contracts between Yugoslav and Soviet organizations.

Article 8

Payment of expenses of Soviet organizations in connection with planning services which have been performed and for the sending of Soviet specialists to the

Socialist Federal Republic of Yugoslavia and the receiving of Yugoslav specialists in the Union of Soviet Socialist Republics will be carried out on the basis of current Soviet-Yugoslav trade and payment agreements.

Article 9

Technical documentation which is received by Yugoslav and Soviet organizations in accordance with this agreement will be used exclusively for the production of the corresponding products in the Socialist Federal Republic of Yugoslavia and cannot be given to other countries, nor to any authorized persons of foreign countries without the consent of the appropriate organization of both sides.

Article 10

In order to carry out this agreement the appropriate Yugoslav and Soviet organizations are concluding mutual agreements which determine the amount and the time periods for carrying out planning services, the deliveries of technical documentation, the deliveries of equipment and machinery, the number of Soviet specialists who will be sent to the Socialist Federal Republic of Yugoslavia, their specialties and the time of their reception and stay, the number of Yugoslav specialists who will be received in the Union of Soviet Socialist Republics, their specialties and the time of their reception and stay, the conditions of the delivery of technological processes, scientific and technical results and experiments, warranty conditions, and other details of conditions which are necessary for the implementation of mutual responsibilities in accordance with this agreement. Prices in the contracts for all deliveries will be established on the basis of prices in the world market.

The appropriate Soviet and Yugoslav organizations will coordinate the annual volume of deliveries of equipment and machinery for each calendar year. Moreover, the appropriate organizations engaged in the distribution of the delivery of equipment for each industry or other project will proceed from the possibilities of maximum utilization of the capacity of Yugoslav machinery construction.

The contracts for the delivery of equipment and machinery will be signed by the appropriate Yugoslav and Soviet organizations not later than 1 April of the year preceding the year in which delivery is to take place.

Article 11

In the event of differences and disputes in the interpretation while carrying out this agreement, those differences and disputes will be resolved by representatives of both sides of those who are involved in the signing of contracts.

Article 12

This agreement is subject to ratification, and goes into effect on the day the ratified documents are exchanged, while it will be temporarily applicable from the day it is signed. The ratified documents will be exchanged in Moscow as soon as possible.

Composed in Belgrade 29 May 1981 in two original copies, in the Serbo-Croatian and Russian languages; in addition, both texts have the same significance.

By the authority of the Federal Executive Council of the Parliament of the Socialist Federal Republic of Yugoslavia, signed Radoje Kontic.

By authority of the Government of the Union of Soviet Socialist Republics, signed V. G. Morozov.

Addendum to the Yugoslav-Soviet agreement of 29 May 1981.

List of industrial and other projects in whose construction and reconstruction the two parties will collaborate under conditions of approved credit, and the distribution of the sum of the loan by project

Project name	Time period of delivery of equipment	Amount of loan for payment of deliveries (in U.S. millions of dollars)
Electric Energy		
TE (Thermoelectric "Tuzla-Velika" capacity 500 MW (megawatts)	1984-86	120
TE "Ugljevik II" capacity 300 MW	1983-86	45
TE "Kovin I" capacity 210 MW	1983-85	40
TE "Bitola IV" capacity 210 MW	1984-86	30
TE-TO "Trbovlje" capacity 180 MW	1984-86	30
Nonferrous Metallurgy		
Lead and zinc mine and flotation "Suplja stijena" expansion of capacity from 200,000 to 1 million tons of ore per year	as agreed upon by both parties	8
Mining-metallurgical and chemistry plant "Trepca"-fuming process installation for obtaining lead and zinc, capacity 20,000 tons per year	" "	25
Lead and zinc mine and flotation "Blagodat" Vranje-expansion of capacity from 350,000 to 540,000 tons per year	" "	3.5
Mining-metallurgical plant "Zajaca" expansion of mine and flotation "Rajiceva gora" from 40,000 to 250,000 tons antimony ore per year	" "	14.5

Project name	Time period of delivery of equipment	Amount of loan for payment of deliveries (in U.S. millions of dollars)
Chemical plant "Zorka" Sabac lead and zinc mine "Sastavci" capacity 150,000 tons of ore per year	as agreed upon by both parties	13
Lead and zinc mine and flotation "Vares" expansion from 300,000 to 600,000 tons per year	1983-85	7
Nickel factory in Pristina expansion of capacity from 12,000 to 18,000 tons of nickel in ferronickel per year (different forms of auxiliary equipment)	as agreed upon by both parties	22
Light metals factory "Boris Kidric" expansion of capacity to 100,000 tons of rolled aluminum product and aluminum alloy per year	1983-85	50
Geological exploration		
Geological exploration in the area of oil and gas ("Naftagas" Novi Sad)	as agreed upon by both parties	7
Construction materials industry		
Cement factory capacity 600,000 tons cement per year (by dry procedure) Serbia	1983-85	20
Factory for production of glass insulation, capacity 10,000 tons per year, Arandjelovac	as agreed upon	15

Note: The time periods of collaboration and the technical characteristics of the projects will be established in more detail when the contracts are signed.

Article 3

This law goes into effect 8 days after being published in the Yugoslav Official Register.

EXCERPTS OF 1981-1985 PLAN; 1982 PLAN, BUDGET PUBLISHED

1981-1985 Economic Plan

East Berlin NEUES DEUTSCHLAND in German 5-6 Dec 81 pp 3-4

[Official text of "Excerpts from the Law of 3 December 1981 on the Five-Year Plan for the Development of the Economy of the GDR During 1981-1985"]

[Text] In conformity with the decisions adopted by the 10th SED Congress, the Five-Year Plan for the Development of the Economy of the GDR During 1981-1985 is geared toward the consistent all-round consolidation, by means of a high rate of economic growth, of the GDR as a socialist state of the workers and farmers. Thereby further advances are to be made in the shaping of the developed socialist society.

The five-year plan serves the well-being of the workers class and all the people. The focal point lies on carrying on throughout the 1980's our main task policy which deals with economic and social welfare tasks as a unity. It amounts to further elevating the people's material and cultural standard of living based on high speed in the development of socialist production, greater efficiency, scientific-technical progress and growth in labor productivity. The main content of the five-year plan and its implementation are the 10 key points of the economic strategy adopted by the 10th SED Congress.

The broad discussion of implementing the tasks of the directive by the 10th SED Congress for the five-year plan for the development of the economy of the GDR during 1981-1985 involved millions of working people in the combines, enterprises, facilities and cooperatives actively in preparing the five-year plan, who submitted many proposals on the basic issues of our economic strategy for the 1980's, especially for improving our performance and efficiency. That expresses the GDR population's broad agreement with the SED policy for successfully carrying on our proven main task policy.

There has been a new strong boost in our socialist competition, organized by the trade unions and aimed at the implementation of the 10th SED Congress decisions. The competition initiatives must receive every kind of encouragement from the state managers for meeting the five-year plan goals. They are to be directed toward the implementation of this principle: "High economic growth through increasing labor productivity, efficiency and quality--Everything for the well-being of the people and for peace!"

The successful continuation of our policy, as aimed at the well-being of the people, requires that in the 1980's we purposefully proceed toward a higher production and efficiency level. More and more must performance improvements and efficiency be determined by the most advanced achievements in science and technology. It is imperative to turn the experiences of the best workers in all combines, enterprises, facilities and cooperatives into the criterion for anyone's own performance and to apply consistently the principles of socialist economic management and socialist thrift. On that basis reserves at new dimensions have to be tapped in all areas of the economy, high and stable production and productivity growth rates beyond the previous degree have to be achieved, and the cost/benefit ratio must be decisively improved in all fields.

In implementation of the GDR-USSR production specialization and cooperation program up to 1990, the all-round economic and scientific-technical cooperation between our two countries is being consolidated and expanded. The accords made for deepening socialist economic integration in the plan coordination with the USSR and the other CEMA countries form a stable basis for implementing our five-year plan for the development of the economy of our republic.

The reality of this strategy relies on our consolidated socialist production relations, on modern socialist management and the high skill of our workers, engineers and researchers. On this basis it is possible to achieve a perceptible performance thrust toward higher productivity, efficiency and quality.

The further strengthening of our economic capacity is of great weight to the GDR's peace policy which, in the sense of peaceful coexistence, serves political and military detente in Europe and the recovery of the political climate in the world.

I

The following main indicators have been laid down for the development of the GDR's national economy 1981-1985:

	1985/1980 %
Produced national income	128
Manufacturing output, industrial ministries	131
Manufacturing output, national economy	128
Increase in labor productivity, industrial ministries	129
Output of construction industries	118
Output of construction, construction ministry	123
Transport and telecommunications	112
Export to the socialist economic region	150
	in 1985
Crop production output in grain units per hectare of farmland	43.7-44.2 dt
State output	
--Fattened cattle	2,400 kt
--Milk (4-percent fat content)	6,930 kt
Collection and utilization of secondary raw materials	30 million t

	1981-1985 average annual %
Reduction in specific production consumption figures for major energy sources, raw materials and semimanufactures	6.1

Total 1981-1983	
Investments --Economy on the whole	M 256 billion

The people's material and cultural standard of living attained must be ensured and gradually further raised. To that end the following targets are laid down:

Total 1981-1985	
Dwellings to be provided, newly built and modernized	940,000 dwelling units
--of which: newly built	600,000 dwelling units

	1985/1980 %
Retail trade turnover	120
Net monetary income of the population	120

The supply of consumers with commodities in daily use, services, rents and fares are to be ensured at stable prices, and so is the satisfaction of the growing health, social and intellectual-cultural needs of the population, in conformity with economic performance development in the 1981-1985 period, up to M 295 billion. That amounts to a growth rate of 126 percent.

Training and education must be developed in such a way that they are relevant to practical life and encourage creative thinking and acting, the initiative and dedication of youth and its class-bound standpoint and conscious political conduct.

Medical and social services for the population, notably health care for the working people, are to be purposefully improved in quality and effectiveness for the good of the citizens.

Social care, notably for mother and child, the veterans of labor and the disabled, must be systematically further extended through close cooperation between state areas and social organizations.

The working people's working and living conditions in the enterprises are to be further improved, mainly through a progressive reduction in heavy physical and hazardous jobs, the perfecting of workers' welfare and the extension of labor-medical consultation and care. Further qualitative improvements are required in recreational opportunities for the working people.

Berlin, capital of the GDR, must be further developed as the political, economic and intellectual-cultural center of the socialist GDR. The central youth project, "FDJ Initiative Berlin," has to be promoted purposefully, and all bezirks have to make an increasing contribution to it.

II

The five-year plan is aimed at the implementation of the 10 key points in the economic strategy for the development of the GDR economy in the 1980's, as issued by the 10th SED Congress.

1. As a decisive condition for our performance growth and for improving our economic efficiency, the advantages of socialism have to be closely combined with the achievements of the scientific-technical revolution. Through science and technology the necessary lead time has to be ensured for our intensively expanded reproduction, especially through the development and introduction of new products, procedures and technologies. On that basis the R&D contribution to increasing our national income has to be perceptibly increased. R&D has to be speeded up, and there is a priority on ensuring a rapid application of research data in production. Top-standard achievements have to be increased in number and have to be used at a large range.

The priority here is placed on speeding up the development and application of microelectronics, robot technology, and electronic computer technology for a more efficient organization of production and administrative projects.

To boost the economic effectiveness of science and technology, the following targets are set down:

-- In the economy we must achieve an annual saving of working time from 490 million hours in 1981 increasing roughly to 660 million in 1985, while simultaneously assign manpower to other, more productive, labor and achieve further improvements in the working people's working and living conditions;

-- the specific energy consumption is to be reduced, up to 1985, by an equivalent of 70 million tons of raw lignite compared with 1980; the use of heating oil as energy source and of imported pit coal and pit coal coke for energy purposes must be extensively reduced;

--in the 1981-1985 period the following material savings are to be achieved:

Rolling steel	roughly 2.2 million t
Aluminum	more than 50 kt
Copper	roughly 15 kt
Cement	1.9 million t

Research collectives are to be assigned, mainly, ambitious tasks for top achievements and high economic objectives commensurate with the advanced status and developmental trends of science and technology in the world.

2. A vastly higher level of labor productivity is to be attained through high scientific and technical effects at a large scope. In a growing number of enterprises and combines we must ensure a faster growth of labor productivity than of industrial commodity production, mainly by raising the technological level of production, a more rapid generalization of the experiences of the best workers and the reduction of unjustified differences in levels.

The number of jobs saved, on the basis of an extensive reconstruction and rationalization of extant enterprises or of production sectors, must more and more exceed the number of jobs to be newly created.

For implementing our socialist performance principle, we must extend the systematic introduction of productive wages through performance-oriented basic wages and salaries. Payments must be closely connected with scientific labor organization and the application of performance indicators.

3. A decisive five-year plan emphasis is given to enhanced refinement and the more extensive use and utilization of economically available energy sources, raw materials and working materials at all stages of production.

The requisite improvement of performance and providing more and better end products for public supplies, the economy and export have to be accomplished by approximately an unchanged volume of raw materials and energy sources.

All combines and enterprises have to solve the task of producing high-grade commodities from every kilogram of raw material, through skilled labor, at a maximum volume. To that end, a high degree of refining and recycling of every available raw and working material has to be ensured in each production branch.

As a fundamental task for materially ensuring our performance development, the collection and reutilization of available secondary raw materials and industrial waste products must be increased. That pertains in particular to ferrous and nonferrous metal scrap, waste paper, timber offcuts, plastic materials and fixing baths, bones, fatty compounds, corundum grains and waste sulphite liquor, used oil, old textiles, thermoplastic waste, scrap tires, electronic scrap, return-container glass and old fire-resistant materials.

4. As a fundamental task, a high qualitative production level at our entire economic range has to be ensured across all preparatory and intermediate steps down to the final products. The top-product output with the quality seal "Q" must be raised to circa M 100 billion by 1985.

5. Labor efficiency must be greatly improved during the five-year plan period. The cost/benefit ratio must be decisively improved by using the latest scientific and technological data, the most economical use of live and embodied labor, mainly of base material, energy, propellants and fuels, and through the most rational use of investments and all economic resources.

In 1985, the national economy must experience at least a 15-percent reduction of social expenditures compared with 1980.

In industry, prime costs have to go down by 3 percent each year.

The most effective use of all available resources and the thriftiest handling of all material and financial assets must be enforced as a principle of socialist economic management in all areas of the economy. The effectiveness of economic cost accounting must be further improved to that end.

Currency control must be strengthened to enforce the economic demands placed on efficiency development.

6. Comprehensive socialist rationalization has to save working hours, enhance the quality of labor and improve the working people's working conditions. There must be a decisive boost in the proportion of investments in socialist rationalization.

In the 1981-1985 period, 45,000 industrial robots have to be produced and used highly effectively in our economy. Per industrial robot used an average of 2.5 manpower is to be released for other tasks.

7. Through a resolute implementation of socialist intensification and rationalization, basic assets and investment effectiveness must be raised significantly in all economic areas. We must improve the utilization of the available important potential of our basic assets. Investments must be aimed at perfecting our material-technical base in qualitative respects.

Through cooperating with the planned preventative maintenance, the reconditioning and modernization of the constantly greater resources of basic assets must receive an absolute priority in the placing of investments.

Through investment concentration realization periods must be greatly reduced. A maximum of 2 years is to be established as a social norm for realizing investment projects. Thereby we can critically reduce the volume of incomplete investments in our economy. Investments must cut back more jobs than create new ones.

The construction share of investments must be greatly reduced in all economic areas, those in industry at least to 25 percent.

The most important production equipment must be allowed 16 to 17 hours per calender day in 1985.

8. For public supplies, far more and better consumer goods have to be manufactured, including the needed ancillary products and semifinished products and an adequate assortment of spare parts. At the same time it is necessary greatly to increase supplies in novel, high-grade consumer goods in excellent quality and design, especially those that are much in demand among the public and on international markets.

The combines making means of production have to raise their contribution to consumer goods production rigorously, particularly by developing and producing new high-grade consumer goods or through a targeted increase in their production of means of rationalization and of components for the consumer goods industry.

9. The five-year plan is to achieve high dynamics for the social production and the national income. That depends on a much higher effectiveness of all qualitative factors in the reproduction process.

10. In conformity with our economic strategy, the scope and quality of our social production must continue to be improved, increasing in weight, by our intensively expanded reproduction. Our material-technical base must be extended further, principally by means of intensification.

The tasks for economically ensuring our national defense and our internal security and order have to be secured comprehensively, and on a priority basis, in accordance with the demands of the 1981-1985 period. State and economic management organs, the combines, enterprises, facilities and cooperatives must conscientiously meet the obligations resulting therefrom.

III

For the further extension of the material-technical base of our economy as the critical basis for further ensuring stable economic growth, the following tasks are laid down:

1. The Energy and Raw Material Base of the Economy

The energy and raw material base of the economy is to be further developed by raising the supplies in indigenous raw materials, comprehensively using secondary raw materials and waste products and a new quality of our entire energy and materials economy, mainly by comprehensive refining.

The highest rank is to be granted to an economical use of energy sources, raw materials and working materials in all combines and enterprises.

The production of important energy sources and raw materials is to be developed as follows:

	Unit of quantity	1985
Softcoal mining	million tons	290
Electrical energy production	billion kilowatt	112
Carbide	1,000 tons	1,250
Plastics, elastics	1,000 tons	1,300
Synthetic fibre materials	1,000 tons	150
Nitrogen fertilizers	1,000 tons N	1,200
Potash fertilizers	1,000 tons K_2O	3,450
of which granular and globular	1,000 tons K_2O	2,245
Rolled steel total	1,000 tons	9,282
of which refined rolled steel	1,000 tons	7,393

All economic areas have to carry out target-directed measures to save energy.

Primary energy is to be developed by more of a use of domestic softcoal and nuclear energy. We must crucially reduce here the use of heating oil, pit coal and pit coal coke and fuels.

In forestry, through comprehensive intensification measures, the production and yield guarantees of forest resources must be raised, and lumber supplies must increase to from 10 to 10.2 million cubic meters in 1985.

2. Production, and Providing for, Equipment, Machines, Ancillary Supplies and Spare Parts

The production of high-grade machines, equipment and devices for the rationalization of our own economy and for export, conforming to the intrinsic value and performance parameters of the highest scientific-technical standards, is above average through the broad application of microelectronics, electronic control and testing equipment and means of automation in its intended development.

We must achieve above-average growth rates in the production of products of ADP techniques and telecommunication techniques, scientific equipment construction, and automation and control techniques.

The production of microelectronic components has to be more than doubled and to be raised three to fivefold for optometric and performance-electronic components.

Machine building must boost its production by 141 percent up to 1985, which must come mainly from an intensively expanded reproduction.

The capabilities of the ancillary industry and spare part production have to be increased in accordance with the requirements for ensuring final production.

3. Consumer Goods Production

The production of essential consumer goods is to be increased at the following rate:

Product	Unit of quantity	1985
Household refrigerators	thousand	859
Electric ranges	thousand	232
Washing machines and combined washing devices for domestic use	thousand	521
Radios	thousand	1,426
Color television sets	thousand	510
Heavy detergents	metric tons	200
Paints and varnishes	metric tons	368
Car tires	thousand	5,500
Textile floor covering	million square meter	39
Walking shoes	million pairs	45.8
Furniture and upholstered goods at industrial sales price of	million Marks	7,295
Household and hotel porcelain at industrial sales price of	million Marks	709

In the bezirk-managed industry the newly formed combines have to be consolidated and extended.

The crafts have to make a significant contribution, in conformity with territorial and craft-specific conditions, to meeting public demands, especially in individually designed consumer goods, and to improving the supply level in qualitative terms.

4. Agriculture, Food Production and the Foodstuffs Industry

Agriculture and the food industries must further raise their production and its efficiency by making a better use of their own resources to ensure stable and constantly improving public supplies through high-grade foodstuffs and agricultural raw materials for industry.

In conformity with economic requirements, the cost/benefit ratio must be vastly improved in our socialist agriculture. The main course for improving the capability of agriculture and the food industries is a continuing rigorous intensification and rationalization based on science and technology and the full utilization of the great development potentials of socialist agriculture. Emphases are the increasing of grain, basic fodder, produce and fruit production and higher potato and sugar beet yields. An effective and complete use of every square meter of soil and a constant improvement of its fertility is a first-rank task of great economic weight.

The total yields in crop production is to be raised by 1985 to between 43.7 and 44.2 metric tons of grain units per hectare of agricultural acreage, those of grain to 39.5, potatoes to 220, and sugar beets to 330. On that basis we will achieve a grain output of at least 10.4 million tons by 1985. The state production of fruit is to be raised to 610 kilotons and of produce, to 1,368 kilotons in 1985.

The following state quotas are stipulated for the more important animal products:

	Unit of quantity	1985
Fat stock	1,000 tons	2,400
Milk (4% fat)	1,000 tons	6,930
Eggs	millions	4,720
Wool	tons	7,000

With it, one has to ensure a systematic reproduction of cattle stocks and improved breeding results, mainly by reducing animal losses and good animal care and maintenance. From each kilogram of fodder more animal products must be produced.

The consolidation and deepening of cooperation relations are to be aimed more consistently still at a high increase in performance and the use of all inherent potentials of the agriucltural production cooperatives, state farms and their cooperative facilities.

5. Construction

The building industry must improve its performance and efficiency to strengthen further our economic efficiency and consistently carry out our housing program.

In the construction ministry area, labor productivity has to be increased by 119 percent. Emphases are the reduction of specific building expenditures, while maintaining our economic and sociopolitical goals, by 15 percent and reducing construction schedules by 30 to 50 percent, especially for industrial and science projects.

The proportion of construction measures for reconstruction and modernization is nearly to be doubled up to 1985.

The development of the building materials and prefabrication industry must consistently be aimed at supplying the economy, the population and export with building materials and prefabricated elements proper as to needs and qualities.

6. Transport/Postal and Telecommunications Service

In the transport sector a higher quality of services is to be attained in passenger transport, goods traffic and transit trade. To reduce social expenditures in the economy and for reasons of our energy economy specific transport costs must be lowered in all economic branches through optimizing delivery and transport relations.

By resolutely transferring part of the freight haulage from road to rail and by expanding the amount of freight transported by inland navigation, the division of labor among the freight carriers has become more effective. To make the railroad more efficient, we must electrify a section of between 700 and 750 kilometers, and more efficient operational technologies are to be introduced for making better use of freight car parks and trailer camps and transport installations.

In passenger transport, to improve further the working people's working and living conditions, the quality and reliability have to be improved for commuter and pupils' transport services and for travel.

In the postal and telecommunications sector, services are to be increased to 113 percent, and their efficiency and quality must also be improved.

7. Water Management and Environmental Protection

Through our water management we have to improve our supplying the population, industry and agriculture with drinking and service water proper as to quality. We have to ensure a rational management of our water resources through minimal expenditure and effective use of the water management installations in all areas of the economy. Environmental conditions have to be improved especially in industrial centers and conurbations.

IV

To elevate the population's material and intellectual-cultural standard of living, the following targets are set down:

1. Working and living conditions in the combines, enterprises, facilities and cooperatives must systematically be improved as a basic element of the working people's material and intellectual-cultural standard of living.

In industry, the building trade and the transport sector, circa 1,100,000 jobs have to be newly set up or reorganized between 1981 and 1985 through the use of the data of scientific labor organization, and for circa 300,000 working people, the existing labor hazards are to be eliminated.

In conformity with the steadily growing comprehensive material funds and the increase in modern highly-productive equipment and installations, enterprises and combines will have to take purposeful measures to prevent fire, disturbances and breakdown to improve labor and production safety.

Catering facilities on the shop floor, especially for shift workers who are working under cumbersome conditions, are to be perfected. Especially in the building and assembly enterprises and in the small and medium-size enterprises must catering facilities be improved.

Meals for pupils and pre-school children are to be further improved.

2. The long-term housing construction program, the centerpiece of our social policy, is to be steadily advanced between 1981 and 1985 by the new construction and modernization of 940,000 dwellings, especially for workers' and large families and young couples. There are 600,000 new dwellings among them that are to be completed.

We must see to it that the proportion of dwellings to be built by workers' cooperative house-building societies comes to between 42 and 45 percent of industrial new housing construction, and that of private homes and rural homes to circa 10 percent of it each.

For housing structure and dwelling unit maintenance, we have to provide, between 1981 and 1985, for a circa 125-percent increase in building repair services over the 1976-1980 period.

3. The net monetary incomes of the population are to be raised by 120 percent in 1985 over 1980, as our production and efficiency goals are being met. The increased monetary income of the working people must mainly be ensured through their work income on the basis of our proficiency-oriented wage policy.

4. To improve public consumer goods supplies, retail turnover is to be increased by 120 percent in 1985 over 1980.

The production and supplies of high-grade consumer goods are to be raised significantly on the basis of the latest data of scientific-technical progress.

Supplies to consumers of commodities of daily use, mainly of basic foodstuffs varieties and baby-food products, must be ensured on a steady basis and proper as to demands. Supplies to consumers, proper as to demands, in the assortments of the "thousand small items" must likewise be ensured. Spare part supplies must be noticeably improved at a broad range.

Consumer durables have to be offered at stable consumer prices. In view of the development of more differentiated needs, goods are to be made available in all price categories, with goods in the medium price range, solid in quality, making up the main portion of our commodity supplies.

To take care of the population and the social institutions, services have to be systematically expanded through raising the efficiency of state-owned service enterprises and the promotion and better utilization of the capacities of the craft producers cooperatives and the individual crafts. Public repairs and services are to be increased to 120 percent in 1985 over 1980.

Maintenance and repair of technical consumer goods have to be increased by 123 percent in the current five-year plan period.

5. In the field of public education, the development of the 10-grade general-education polytechnical secondary school is to be carried on systematically. This further shapes the polytechnical character of the secondary school. All children get a high-level secondary school education, and their communist education is being further improved.

Building kindergarten facilities makes sure that in all territories children are taken care of in kindergartens, if their parents want them to, and are being prepared for school.

In vocational training, we must ensure high-grade training for circa a million of young specialists. We must see to it that this new generation of specialists is trained for all areas and occupations and assigned appropriately, in particular the new industrial workers.

The combines and enterprises must gear the working people's advanced training to high performance improvements. The proportion of certified working people, especially among the women, has to be raised further.

At universities, colleges and technical schools the basic task is the training and communist education of the students and of the new generation of scientists at a high technical level and in the spirit of the scientific world-outlook of the workers class. Research at universities and colleges must still more effectively be focused at science development and economic efficiency improvement. The application and use of research data must be ensured through keepingin close touch with practical life.

6. Through public health and social services we must further improve public health protection, make the achievements of modern medicine serviceable to the citizens and further improve the quality and effectiveness of medical and social care.

Mainly such measures have to be carried out that are of importance to the majority of our citizens and have a beneficial effect on our population's state of health. That concerns in particular improvements in basic medical care in large cities and conurbations and in out-patient care in general medicine, dentistry and neurology/psychiatry.

A total of 2,100 medical and dental positions have to be created, mainly in out-patient and polyclinics. Through reconstruction, modernization and new construction, 8,500 new beds are to be made available for hospital patients. We also have to create 55,000 new places in day-nurseries and 18,500 in old-age and nursing homes.

Recreational opportunities for the working people are to be further improved up to 1985 through more package holidays sponsored by the trade unions and individual firms, to 4,7 million trips.

The FDJ initiatives for the maintenance, reconstruction and modernization of leisure-time and youth recreation facilities are to be encouraged and supported by the state organs.

In the central pioneer camps, the FDJ and the Ernst Thaelmann pioneer organization must by 1985 enjoy the use of 39,000 places per event. A comprehensive reconstruction of camps must be continued. The proportion of capacities that can be used all year long is to be raised to 13,000 places per event by 1985.

Physical culture and sports must be promoted all the way. The citizens' desire for health, joy in life, recreation, efficiency and well-being up to old age has to be fostered.

7. The artists have the task to contribute through new works of literature and art to the shaping of socialist personalities and the socialist way of life. Through unfolding the various talents and skills of the population, especially of youth, and the close contact of the working people with art, we have to mold further the mass character of socialist culture and art and their socialist content of ideas.

We must further expand the opportunities for high-level youth leisure-time activities, especially for the work of the FDJ youth clubs and for dances for the young.

By opening the concert hall on the Platz der Akademie and the reconstruction of the Friedrich City Palace in Berlin, capital of the GDR, the new Gewandhaus in Leipzig and the Dresden Semper Opera House, a significant contribution is to be made to the enrichment of cultural life in the GDR.

V

A crucial prerequisite for continuing stable economic and social development in the GDR is the purposeful deepening of our socialist economic integration with the USSR and the other CEMA countries. This ties the GDR ever more firmly to the community of socialist states and its main force, the USSR.

Through resolutely implementing the GDR-USSR production specialization and cooperation program up to 1990, the agreements with the other CEMA countries and the long-term target programs of CEMA, which also render the comprehensive program of CEMA more specific and develop it further, the GDR economy must become increasingly more entwined with the economies of the USSR and of the other socialist countries.

The tasks of export to the USSR and the other socialist countries have to be made, and be fulfilled as, standard components of the plans and accounts on all economic levels, as a precondition for implementing the accords made on the import of raw materials, fuels, machines, installations and consumer goods.

Economic and scientific-technical relations with the developing countries, mainly those that have taken the socialist course, have to be further extended and to be developed on a long-term basis.

Relying on the firm foundation of our economic relations with the socialist countries, we have to develop and expand our foreign trade with the capitalist industrial countries. That serves the policy of peaceful coexistence and promotes economic growth in our republic.

*

The GDR Council of Ministers, in conformity with the law on the Council of Ministers, is charged with the implementation of the 1981-1985 Five-Year Plan, based on the 10th SED Congress directive, and with supervising its fulfillment. It must prepare the annual economic plans on the basis of that law and thus ensure the fulfillment of the goals and tasks of the 1981-1985 Five-Year Plan.

The People's Chamber of the GDR calls on the workers, the cooperative farmers, the members of the intelligentsia and all other working people to devote all their strength to the fulfillment of the tasks of the 1981-1985 Five-Year Plan, strengthen the GDR in every way as an inseparable part of the socialist community of states that is rallied around the Soviet Union, and contribute to the further consolidation of the positions of socialism, peace and international security.

1982 Economic Plan

East Berlin NEUES DEUTSCHLAND in German 5-6 Dec 81 p 4

[Official text of the "Law of 3 December 1981 on the 1982 Economic Plan"]

[Text] The 1982 National Economic Plan, in implementation of the 10th SED Congress decisions and of the Law on the Five-Year Plan for the Development of the Economy of the GDR During 1981-1985, is aimed at continuing the all-round strengthening of the GDR. Its goals conform with a consistent continuation of the main task with its economic and social welfare tasks as a unity. That continues our successful course of performance improvements for the good of the people, for further advances in the shaping of developed socialism and for the strengthening of peace. The main content of the 1982 National Economic Plan and of its implementation are the 10 key points of economic strategy adopted by the 10th SED Congress.

I

The following growth rates have to be implemented for the development of the national economy in 1982:

	$\frac{1982}{1981}$*
Produced national income	104.8
Manufacturing output, industrial industries	105.1
Manufacturing output, national economy	104.6
Labor productivity, industrial ministries	104.5

Capital investment per M 100 in commodity production, industrial ministries	96.9
Output of construction industries	102.5
Housing construction, new buildings plus modernization	102.9
Production and services in agriculture, forestry and agricultural processing	100.2
Transport and telecommunications	104.8
Retail trade turnover	104.9
Net monetary income of the population	104.9
Foreign trade turnover	115.0

The capital of the GDR, Berlin, is to be further developed systematically as the political, economic, intellectual and cultural center of the GDR. All-out support is to be given to the FDJ Berlin Initiative, the central youth project, for which a high contribution must be ensured from all bezirks.

The tasks accruing from the safeguarding of national defense and internal order and security are to be ensured comprehensively and as priorities. The obligations resulting therefrom are to be met conscientiously by government and central economic departments, combines, enterprises, institutions and cooperatives.

II

It is a fundamental task of the 1982 National Economic Plan significantly to speed up scientific-technical progress as a crucial condition for performance growth and increased efficiency. On this basis, the effectiveness of the qualitative factors of economic growth has to be raised and, through further reducing the social expenditures in implementing the reproduction process, the cost/benefit ratio has to be significantly improved in all areas of the economy.

Scientific-technical solutions have to be worked out and applied in production which, on the basis of optimum refinement of available raw materials and working materials, ensure the manufacture of products that help determine advanced international standards in terms of their intrinsic value parameters, costs, durability, reliability and design features.

--Through measures of scientific-technical progress, 479 million working hours are to be saved in industry and the building trade.

--The manufacture of "Q" quality seal products is to be raised to 119 percent.

--The specific consumption of vital energy sources, raw materials and working materials is to be reduced, in comparison with 1981, as follows:

Energy intensity at least by	4.0 percent
Rolled steel in metalworking industry by	6.5 percent
Rolled steel in the building industry by	3.9 percent
Cement in the building industry by	5.5 percent

--The utilization of secondary raw materials, especially the metallic ones, old oil, lumber residues, returned glass containers and waste paper, and industrial waste products, is to be raised to 104.0 percent.

--The manufacture of branch-specific means of rationalization in the economic branches must be raised to 113 percent.

--Prime costs in industry must be reduced by 2.7 percent and in construction, by 1.4 percent.

On the basis of the further deepening of socialist economic integration, foreign trade must be purposefully developed with the USSR and the other countries in the community of socialist states. Economic and scientific-technical relations with the developing countries are to be stably and consistently developed further. Foreign trade with the capitalist industrial countries will continue to be based on equality and mutual advantage.

III

The 1982 National Economic Plan establishes the following targets for continuing production increases:

Ministry	Industrial production $\frac{1982}{1981}$%
Coal and Energy	103.7
Ore Mining, Metallurgy and Potash	103.3
Chemical Industry	106.0
Electrical Engineering and Electronics	107.7
Heavy Engineering and Industrial Plant	105.7
Machine Tools and Processing Machinery Manufacture	108.7
General Mechanical, Farm and Automotive Engineering	106.7
Light Industry	103.7
Glass and Ceramics Industry	104.2
Bezirk-managed Industry and Food Industry	104.6

The production of economically important products is to be as follows:

	Unit	1982
Electricity	GWH	103,400
Raw lignite	1,000 metric tons	271,900
Lignite briquettes	1,000 metric tons	50,020
Products further processed by the metalworking industry	1,000 metric tons	3,114
Steel pipes	1,000 metric tons	585
Potassic fertilizer	1,000 metric tons of K_2O	3,450
Man-made filament	tons	66,892
Man-made fibres	tons	81,907
Cutting-type machine tools	millions of marks	2,593
Cold-forming machine tools	millions of marks	788
Plastics and elastomere processing machinery	millions of marks	497
Machinery and equipment for the textile, clothing and leather industries	millions of marks	792
Valves, fittings and accessories	millions of marks	1,522
Anti-friction bearings	millions of marks	647

Low-voltage switchgear	millions of marks	1,012
Process instrumentation and control engineering equipment	millions of marks	1,633
Textile floor covering	1,000 square meters	34,294
Knitted outerwear	thousand	48,994
Hosiery	millions of pairs	358
Furniture and upholstered commodities	millions of marks	5,955
Household washing machines	thousand	493
Household refrigerators	thousand	690
of which deep-freezers	thousand	234
Gas ranges	thousand	207

Geological prospecting in 1982 must ensure the requisite supply base for a greater use of indigenous raw materials.

In the construction industry the following increase in output is to be achieved:

	1982/1981 %
Output of the Ministry for the Construction Industry	102.2
Manufacturing output of the ministry	100.2

The following state quotas are stipulated for the more important products of agriculture, forestry and food production:

	Unit	1982
Fat stock	1,000 metric tons	2,430
Milk (4% fat)	1,000 metric tons	6,850
Chicken eggs	millions	4,700
Vegetables, total	1,000 metric tons	1,350
Fruit	1,000 metric tons	53[illegible]

Forestry is to make available in 1982 9.6 million cubic meters of trunk timber.

In the transport sector the volume of goods transported (in tons) is to be increased to 103.5 percent for the railroad and to 102.4 percent for domestic waterways. The transshipment capacity of the ports is to be raised to 106.2 percent.

In the postal and telecommunications sector services are to be raised to 102.9 percent.

Through water management the requisite measures for ensuring the housing construction program have to be taken. The stabilization of drinking and service water supplies to households, industry and agriculture has to be improved, and the schemes for improved supplies and sewage treatment are to be continued systematically in Berlin, capital of the GDR, Leipzig and other cities.

To enhance the landscape and the protection of the environment, measures are to be taken to keep the water and the air clean, for the utilization of waste products or their harmless disposal and for reducing noise levels, primarily in industrial conurbations and cities.

IV

To ensure a gradual rise in the material and cultural standards of the people the following tasks are to be fulfilled in 1982:

--in housing construction:	
Dwellings to be provided	179,600
of which:	
newly built	117,540
modernized	62,060
of which:	
individual housing construction	13,300
newly built and modernized dwellings for Berlin, capital of the GDR	19,750

The output of the construction industry which is earmarked for the maintenance and modernization of housing is to be increased to 105.1 percent in 1982.

Provisions of consumer goods and services:	1982/1981 %
Retail trade turnover	104.0
Net monetary income of the population	104.0

Commensurate with the crucial contribution the workers class is making to creating our national income, the proportion of working income for the workers and employees to the monetary income of the population is to be raised systematically. The proven way for implementing the socialist performance principle is to be continued through the introduction of incentive wages. In 1982 there are to be introduced for another 473,000 workers, foremen, and university and technical school graduates proficiency-guided basic wages and salaries in combination with scientific labor organization and the application of efficiency indicators.

For further improving the output of services, the following targets are laid down:

	1982/1981 %
Services and repairs for the population	105.0
Motor vehicle repair and maintenance services for the population	104.9

In the education system the following capacities are to be newly created in 1982:

In public education:	
Classrooms	2,530
Places in kindergartens	25,740
Places in boarding schools and homes	670
School gymnasiums	150

In vocational training:

Classrooms	140
Places in apprentice hostels	4,200
School gymnasiums	10

At universities, colleges and technical schools some 80,200 students are to be enrolled in 1982, including 60,700 full-time students. The following facilities are to be newly provided:

Places in halls of residence	2,270
Places in lecture halls and seminar rooms and jobs	3,740

Medical and social services for the population are to newly provide the following capacities in 1982:

Posts for doctors in outpatient units	250
Posts for dentists	230
Places in day nurseries	12,100
Places in establishments for the treatment and training of physically and mentally handicapped children and adolescents	1,000
Places in homes for senior citizens and nursing homes	3,900

In the recreation sector, the following tasks are to be performed in 1982:

Package holidays sponsored by the FDGB and individual firms	4,600,000
Provision of new places in FDGB holiday homes	300

For leisure pursuits and the recreation of young people, youth tourism establishments are to be further reconstructed and modernized in 1982. Through comprehensive housing construction, 2,510 places in youth club facilities are to be newly created.

In the central pioneer camps for the FDJ and the Ernst Thaelmann pioneer organization capacities are to be raised to 34,400 places per booking in 1982. The number of places useable throughout the year is to be raised to 4,566.

The People's Chamber of the GDR by this law calls on all citizens of the country to implement, and exceed in a targeted fashion, with all their knowledge and skill and creative energy, the targets of the 1982 National Economic Plan for the all-round strengthening of the GDR, the socialist workers and farmers state on German soil.

Budget for 1982

East Berlin NEUES DEUTSCHLAND in German 5-6 Dec 81 p 5

[Official text of the "Law of 3 December 1981 on the 1982 State Budget"]

[Text] In agreement with the 1982 National Economic Plan, the People's Chamber of the GDR adopts the following Law on the 1982 National Budget Plan:

Article 1

The following state revenue and expenditure, the National Budget Plan of the GDR and the funds of state-owned combines and enterprises from profits are confirmed:

	State revenue and expenditures	National Budget Plan	Funds of state-owned combines and enterprises from profits
	- in million Marks -		
Revenue	194,512,4	177,912,7	16,599,7
Expenditure	194,437,4	177,837,7	16,599,7
Difference between revenue and expenditure in 1982	75,0	75,0	-

Article 2

The following main items of revenue and expenditure under the 1982 National Budget Plan are confirmed:

	- in million Marks -	
	Revenue	Expenditure
State-owned economy (without agriculture, forestry and the food industry)	130,287,6	39,296,0
State-owned and cooperative agriculture, forestry and the food industry	6,088,8	12,138,8
Including:		
--Price subsidies for means of production for agricultural enterprises as a result of changes in industrial prices	-	(7,688,3)
--Expenditure on amelioration, supplements for certain regions and other production-enhancing measures in agriculture	-	(2,795,7)
Academy of Sciences	234,7	812,2
Maintenance of the communications network	-	3,238,0
Taxes and levies	15,219,0	-
Housing construction and housing management	-	8,543,4
Of which:		
--Large-scale housing construction		(2,200,5)
--Modernization of apartments		(336,4)
--Building repairs		(1,397,0)
--Housing management		(2,252,1)
--Interest and repayment of investment loans for housing construction		(2,357,4)

Replacement and expansion of fixed assets in cultural, social and educational facilities not connected with large-housing construction	-	1,503,2
Budget funds for investments and science and technology for university and technical school affairs, public health and other state organs and institutions	-	1,079,1
Subsidies for ensuring stable prices for staple goods and tariffs for the population	-	21,181,5
Public education	368,2	7,696,2
Universities, colleges and technical schools	269,4	2,395,2
Vocational training	7,4	862,0
Adult education	37,6	107,3
Health and social services	6,898,7	11,111,9
Including:		
National insurance payments on health care	(5,495,0)	-
Remittance of credits granted to young married coupes and remittance of interests for credits	-	230,0
National insurance and other benefits granted by the state	15,646,3	30,213,8
Facilities for youth	153,3	321,9
Culture	467,2	1,753,8
Sports	106,0	394,9
Recreation and holiday services	87,1	449,8
Foreign tourism (subsidy)	-	258,1
Radio and television	519,7	727,9
Local government measures and services	133,8	829,3
State administration and economic bodies	280,5	3,760,9
Foreign policy tasks	-	201,7
National defense	-	10,776,4
Public security, administration of justice and securing the state frontier	-	4,178,0

Article 3

In accordance with Article 2, social funds amounting to M 61,686,8 million shall be made available from the National Budget, taking into consideration the main items of revenue and expenditure, to ensure and gradually further improve the material standards and cultural level of the people.

Article 4

(1) The Central Budget Plan is confirmed as follows:

Revenue	141,585,6 million Marks
Expenditure	141,510,6 million Marks

(2) The budget plans of the national insurance scheme, as an independent part of the National Budget, are confirmed as follows:

	Production and office workers	Members of socialist cooperatives and other working strata
	- in million Marks -	
Revenue	13,705,0	1,643,1
Expenditure	25,719,9	3,433,0
Subsidies from the National Budget	12,014,9	1,789,9

Article 5

(1) The budget plans for Berlin, capital of the GDR, and the bezirks are confirmed in the following form:

Including: Proportion of overall National Budget revenue

	Revenue and expenditure	Total	Including specified investments	Cash balance on 1 January 1982 and 31 December 1982
		- in million Marks -		
Berlin	3,913,8	2,298,5	664,8	39,0
Cottbus	1,912,6	1,033,5	187,1	16,0
Dresden	3,532,7	1,823,6	336,7	36,0
Erfurt	2,490,1	1,305,2	261,7	24,0
Frankfurt/Oder	1,706,5	1,023,6	172,9	13,0
Gera	1,608,3	866,1	167,9	16,0
Halle	3,497,6	1,897,1	355,8	33,0
Karl-Marx-Stadt	3,555,9	1,735,4	365,7	33,0
Leipzig	2,726,4	1,360,8	248,9	27,0
Magdeburg	2,700,5	1,400,6	249,7	27,0
Neubrandenburg	1,565,3	985,8	119,7	19,0
Potsdam	2,394,8	1,295,7	232,6	24,0
Rostock	2,145,4	1,287,0	171,1	22,0
Schwerin	1,446,5	792,4	148,6	16,0
Suhl	1,130,7	625,2	100,1	11,0
Total:	36,327,1	19,730,5	3,783,3	356,0

(2) Local assemblies shall finance their planned projects from
--levies paid by enterprises under their control, revenues of their departments and institutions subordinated to them;
--taxes (excluding wage taxes) and levies from communities;
--their share in the overall National Budget revenues.

(3) In keeping with legal provisions, villages and towns under kreis jurisdiction shall have available means and funds of the local assemblies and other sources for the effective encouragement of socially useful citizen initiatives aimed at the all-round fulfillment of the plan and its overfulfillment in certain sections in the interest of social life and the improvement of working and living conditions.

Article 6

In accordance with Article 4 of the National Budget Act of the GDR of 13 December 1968 (GBL, Part I No 23, p 383), the Council of Ministers approves of the alterations to the 1982 National Budget Plan necessary in implementation of the plans. The surplus of revenue over expenditure laid down in Article 1 must not be changed.

Article 7

The regulations to implement the budget shall be issued by the Minister of Finance.

Article 8

(1) This law shall enter into force on 1 January 1982.

(2) On the same date there shall be repealed:

(a) the law on the 1981 National Budget Plan of 17 December 1980 (GBL, Part I No 35, p 359);

(b) the law of 9 February 1950 on the dues of the republic and the other territorial bodies and on establishing a tax administration in the republic (tax law) (GBL, No 17 p 130); and

(c) the law of 7 February 1952 on the redemption and interest payments for the amounts of the construction lottery for the National Construction Program Berlin 1952 (GBL, No 19, p 109).

DEFICIENCIES IN COMBINE MANAGEMENT, ORGANIZATION DISCUSSED

West German Commentary

Bonn IWE-TAGESDIENST in German No 171, 23 Nov 81 pp 2-3

[Report from Berlin: "Serious Organizational Deficiencies in GDR Industrial Combines." A translation of the East Berlin WIRTSCHAFT article cited below follows this commentary]

[Text] Rigid and unintelligible organizational structures, obscured competencies and excessive administrative efforts are cutting into the efficiency of the GDR's industrial combines formed in recent years, as the most recent edition of the East Berlin WIRTSCHAFT (No 11, 1981) has criticized. Often combine management authority with respect to subordinated yet legally independent combine enterprises had not been clearly defined, and there was a big difference in the organizational levels of the various enterprises. In the years ahead, so says the East Berlin paper, rational solutions should have to be achieved in the organizational form of combine management and suitable overall combine structure, with tasks clearly separated between combine management and the managements of the enterprises. Altogether, the number of management levels should be reduced, management and administrative efforts be diminished, and the management system be improved in its effectiveness.

Focus on Structure, Responsibilities

East Berlin DIE WIRTSCHAFT in German Vol 36 No 11, 12 Nov 81 p 12

[Article by Dr Horst Koehler, Friedrich Schiller University, Jena: "The Way to a Uniform Combine Organization"]

[Text] A basic demand of the economic strategy for the 1980's is to develop further the combines under central and bezirk management in industry, construction, transport and telecommunications as a whole. That implies exhausting all possibilities of organization as a productive force. Thus it is inherent in long-term combine development to orient organizational work more at shaping and enforcing streamlined organizational forms and processes making comprehensive use of ADP. In short, it is a matter of creating a streamlined combine organization which is thoroughly uniform in its basic structure. The goal and the solution are particularly derived in this from our extending our concentration, specialization and cooperation.

Altered development conditions and new economic policy goals call for a change in the handling of tasks in economic organization. Which also means that "combine organization" must not be understood as more or less identical with the previous "enterprise organization" or merely as a change in terms. Certainly, our combine organization must get the benefit from the rich store of experiences of our work in enterprise organization during the years when our state enterprises were under development. But we must also look at the totally different basic structure of economic organization that conforms to the changed reproduction profile and the new organizational forms of management.

Dividing Processes into Intelligible Elements

A special problem lies in sorting out the requirements of "uniform combine organization" into tenable and feasible elements or building blocks. That would result in concrete handles and a uniform basis for the working methods for the procedures along the lines of a division of labor used by the various operational and application work collectives. The approach to it must be seen to be directly project-or-process-related.

As a model for such sorting out in the reproduction and management process in terms of partial sectors that are to be worked on substantively and administered organizationally we may take the "instruction systems" (combine and enterprise regulations) that exist in all combines with their project and requirement specifications with their nomenclature. Such codifications contain circa 30 to 50 tasking areas that have been given up to 300 regulations as instructions. Sure enough, the matters and partial processes dealt with in them are usually too narrowly defined if one considers the process building blocks of uniform combine organization that are to be created. Exceptions are such regulations that deal with larger cross sections of the process, as for instance a combine's planning system. This explains that the process building blocks to be created must be complex in nature and normally entail a total run through several management areas and subject fields. Contact and juncture points have to be taken into account, the cooperation of all involved must be ensured, and the existing organizational rules must be respected. At the same time it is a matter of finding a rational process alternative and using computers for routine processes.

As an example for such a process building block we may take the uniform combine development of the "development and application processes for novel products." That process runs through various areas of responsibility, at least through the central technical field or the R&D enterprise, the centralized fields for techniques and technology and production and production preparation, the end producer (the combine enterprise) and finally the cooperation partner. To render uniform or take account of here are:

--the various activities in the different areas of responsibility and the cooperation among the participating areas and specialized fields;
--the detailed structuring of rational computer-aided processes relying on a uniform basis for organizational processes in the form of streamlined key systems and primary data, primary ADP documentation and preprinted forms;
--a greater use of streamlined ADP projects;
--the conformity with other organizational projects;
--attention to the organizational rules for the process under consideration; and
--enforcing the rationalization of management and administration.

Another central question pertains to the accountabilities for uniform combine organization. Experiences tell us that one needs an overall conception with long-term ideas as well as clear decisions on preparatory and operational steps to be taken.

Precise Determination of Accountability

This requires of the general director to instruct the combine about the organizational work. It has also been found useful for combine organization to set up central working teams made up of experienced technical and operational directors, executive associates and specialists. The combine's technical director for data processing should coordinate the preparation of documents for decision-making and their activities in their implementation in that field. It is of special interest to draw up "organizational authorizations" and set down the responsibilities the technical directors in combine management have. Their responsibility for the organizational matters within the scope of their "process responsibility" always relates to a clearly delineated partial process on the scale of the combine. That responsibility thus enters deeply into the spheres of responsibility of the directors of the combine enterprises and their authorizations in enterprise organization. Within the obligation the technical directors in the combine have to instruct analogous technical areas in the enterprises, the general director may, as one knows, assign the right to give instructions for specific tasks as well. Practically, there still is some lack of clarity in this field. What should have to be above all unequivocal is the relationship between the responsibility of the various technical directors for their process field and the functional responsibility of the technical directors for organization and data processing. The latter should then have to ensure that the organizational measures taken in any individual technical area suit the overall uniform organization while help reduce managerial and administrative expenditures.

The Relation between Combine and Enterprise Organization

The question about the limits of overall uniform combine organization must be answered in view of the position of the combine enterprises as economically and legally independent economic units. Within the scope of their responsibility the enterprise directors must bring their influence to bear on the structuring of the enterprise organization. On the other hand, concrete enterprise organization must rationally undergird and complete the basic uniform combine organization with its own ways and means and possibilities, tap reserves and awaken initiatives. No solutions must be allowed that would infringe either the effectiveness of the overall process or the interests of the enterprise collectives. Within the basic uniform combine organization serious particulars in enterprises must be taken into account. It must also be ensured centrally that the organizational levels of all combine enterprises are approximately even. From the function of the combine organization we also derive the duty to analyze and supervise the development of the organization of the enterprises.

However, this basic uniform combine organization is not a matter of formally demanding and setting down rigid organizational forms and processes, but it is always a matter of finding the most efficient solutions for the whole.

Topical Basic Issues in Organizational Work

Though organizational levels differ in the combines, one may summarize by referring to those focal points in our work on which organizational efforts will have to concentrate in the years ahead:

--Clarification of development matters in the streamlining of combines, prerequisite to further perfecting uniform combine organization. As a rule such streamlining leads to changes of economic organization in the structure of the enterprises, enterprise departments, production shops and centralized management areas in the technical fields (-directorates).

--In accordance with the principle: "Combine formation is mainly the formation of efficient combine enterprises" we must accomplish a manageable number, a rational solution in the organizational form of combine management and a suitable overall structure of the combine, with requirements clearly divided between combine management and the enterprise managements. On the whole, we must minimize the number of management levels and reduce the managerial and administrative efforts on the various management levels and develop to that end a normative base for management organization. The system of instruction also must be perfected, kept up-to-date and be improved in its effectiveness.

--In the field of computer-aided organization, the various solutions in enterprise organization that stem from differences in historic development must be gradually reduced, especially also in their primary organization, keys, documentations and preprinted forms. Of special importance to making combine organization more uniform is a direct processing organization by means of standardized technological primary documents.

CHANGES IN ALLOCATION OF FOREIGN EXCHANGE FOR 1981

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 62, 20 Nov 81 pp 1583-1589

[Order of the Federal Executive Council issued in Belgrade 22 October 1981, signed by chairman Veselin Djuranovic: "Order Amending the Order on Allocation of Foreign Exchange To Meet the Needs of Federal Bodies and Agencies and To Discharge the Rights and Perform the Duties of the Federation in 1981"]

[Text] 1. In the Order on Allocation of Foreign Exchange To Meet the Needs of Federal Bodies and Agencies and To Discharge the Rights and Perform the Duties of the Federation in 1981 (SLUZBENI LIST SFRJ, No 2, 1981), in Paragraph 1, Subparagraph 1, the number "24,993,925,300" shall be replaced by the number "22,652,456,900," the number "3,234,077,000" by the number "2,991,077,645" and the number "21,127,053,000" by the number "19,184,986,000."

In Paragraph 2 the number "632,795,300" shall be replaced by the number "476,393,255."

2. The allocation of foreign exchange for 1981 is hereby amended as follows:

"No 1	Recipient 2	Expressed in Dinars 3	
1	State Presidency of the Socialist Federal Republic of Yugoslavia

INVESTMENTS IN FIXED ASSETS

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 4 Dec 81 p 5

[Text] The tendency toward a slower growth of payments on investment projects which in the first 9 months of the year was reflected in the decline of the real volume of investment in fixed capital continued in the fourth quarter as well. Payments for work on investment projects in October were up 13 percent in nominal terms over the same month of 1980, but when this rate is adjusted for the rise of prices in the construction industry and on the market for equipment, the real volume of investments was down more than 25 percent. This means that investment spending in October had been brought into line with the aims of economic policy, since the Resolution on Policy for Implementing in 1981 the Social Plan of Yugoslavia envisaged that the real level of investment in fixed capital would be lower than the level in 1980, calling moreover for a reduction of about 30 percent in the value of nonproductive and noneconomic investments, except for investments in housing construction.

Investments in Fixed Capital, in millions of dinars

Investments	Oct 81	Jan-Oct 81	Oct 81 / Oct 80	Jan-Oct 81 / Jan-Oct 80
Total	50,670	415,812	113	120
OUR's [organization of associated labor] in the economy	19,271	144,318	123	127
OUR's outside the economy	5,692	41,747	134	125
Self-managing communities of interest	2,319	17,884	125	114
Banks	17,814	179,091	87	109
Lendings through banks	4,987	27,648	122	183
Sociopolitical communities	587	5,124	106	100
Opstinas	354	2,966	118	117
Republics and provinces	99	1,462	59	84
Federation	134	696	221	83

Reduced Use of Bank Resources

The greatest impact on the slowing down of investments in October was exerted by payments from bank resources, which were down 13 percent in nominal terms from

the same month of the previous year, while in real terms the reduction was more than 45 percent. This very rapid drop in the use of bank resources for investment projects is the result of reduced liquidity of the banks and the decline of their credit potential. This was favored by the measures of the National Bank in restricting the growth of credit. In addition, regulations reducing the possibility for use of short-term funds for investment projects also tended to reduce the credit potential of the banks.

In the January-October period investments grew 20 percent in nominal terms over the same period of last year, while the real volume of investment was down about 20 percent. With respect to source, payments on investment projects from the resources of organizations of associated labor in the economy were up 27 percent, those of organizations of associated labor outside the economy were up 25 percent, those of self-managing communities of interest were up 14 percent, and those of banks were up 9 percent, while investments from the funds of sociopolitical communities remained at last year's level in nominal terms. In the distribution of payments by sociopolitical communities, payments from the resources of opstinas were up 17 percent, while payments from the resources of republics and provinces were down 16 percent and those from federal funds were down 17 percent.

Within the payments from bank resources, which, as is evident from the table, amounted to 17.9 billion dinars and represented over 40 percent of total investments, the financing of housing construction had a share of 5.5 billion, or one-third. This intensive credit financing of housing construction helped to raise the share of this form of investment project from 13 percent in 1980 to 14 percent this year, which is in line with the policy established in this sector of the standard of living.

The distribution among basic purposes shows that the share of economic investments in total investments in fixed capital increased from 64 percent in the first 9 months of 1980 to 64.1 percent in the same period of this year, while investments in housing, utilities and municipal services increased from 25.3 percent to 26.8 percent, and the share of noneconomic investments dropped from 12.7 to 9.1 percent.

Largest Increase in Montenegro

In the breakdown by republics and provinces, payments on investment projects in the first 9 months rose 22 percent in Bosnia-Hercegovina, 84 percent in Montenegro, 16 percent in Croatia, 17 percent in Macedonia, 14 percent in Slovenia and 18 percent in Serbia. Within Serbia, the growth in Serbia proper was 22 percent, in Vojvodina 23 percent, and investments in Kosovo were up 12 percent over the same period of last year.

The high growth in Montenegro was the result of augmented investments in order to repair earthquake damage, while the growth rates in other regions were mainly dependent on the phase of construction of projects already under way and on the intensity of progress in completing them.

Viewed as a whole, we can say that in 1980 there was a favorable change of direction in the trend of investments, since the real volume was considerably reduced, but it still has not been brought altogether into conformity with the available resources and the aims of stabilization.

CROATIA, BOSNIA-HERCEGOVINA COOPERATE ON LAND RECLAMATION

Belgrade BORBA in Serbo-Croatian 22 Nov 81 p 4

[Article by B. Santic]

[Text] By interrepublic cooperation in seven communes of Bosnia-Hercegovina and Croatia following land reclamation projects, income will be increased several times over and poverty will be transformed into abundance.

Mostar. One more attractive example of interrepublic cooperation and mutual enterprise presages a great new labor success. Bosnia-Hercegovina and Croatia have been engaged in a joint land reclamation project at Imotsko-Bekijsko Polje that should make this border region between the two republics a "food factory." For decades now, since the time of Austrian and Turkish occupation, this idea has been in the air, but it remained nothing but an empty dream. And now all at once, that which emperors and kings could not achieve has been done by a few Yugoslav collectives. This great interrepublic undertaking was recently given strong support at a meeting in Grude that was attended by the presidents of the Croatia and Bosnia-Hercegovinian presidiums, Jakov Blazevic and Raif Dizdarevic.

Representatives of the investors, project organizations and builders told presidents Blazevic and Dizdarevic about the most important aspects of this land reclamation and hydroelectrical energy project. The project involved the regulation of unfavorable water level phenomena, because of which 10,000 hectares of tillable land, which makes up Imotsko-Bekijsko Polje, previously produced essentially nothing. Specifically, spring rains bringing major floods made timely planting impossible, and summer brought drought, followed in fall by renewed flooding. Thus there was water when it was not needed, but none when it was most necessary.

The implementation of the project involved the residents of Imotsko, Grude, Vrgorac, Posusje, Caplina, Ljubusko and Citluk, along with the water management and agricultural organizations of both republics, and electrical power collectives that were involved because the plan included construction of two hydroelectric power plants. Total investments in the project amounted to 3 billion dinars, but the impoverished region that encompasses all seven of the communes named above, with a total land surface of 28,000 hectares, will gain unheard of possibilities for abundance.

The first two phases of implementation of the project will cost 910 million dinars, and by its completion in the coming 2-3 years, it will eliminate the dangers of flooding and direct the water into reservoirs that will subsequently irrigate the land during dry periods. The reservoir is also required for the development of hydroelectric power.

There is no doubt that this multipurpose installation, and the investments of 250,000 dinars per hectare, will pay off very quickly, but as Jakov Blazevic noted, it is particularly significant that this sort of project shows the strength of socialist self-management, as confirmed by the mutuality, brotherhood and unity on the project. Thus this undertaking is of significance for all of Yugoslavia.

SARAJEVO PRIVATE ARTISANS ACCUSED OF ABUSES

Belgrade BORBA in Serbo-Croatian 24 Nov 81 p 2

[Article by Enver Demirovic]

[Text] As intermediaries, the craft cooperatives in Sarajevo have made agreements with private craftsmen that are worth fully 4 billion dinars.

At a recent session of the sociopolitical council of the Sarajevo city assembly, a delegate posed approximately the following question in the name of his constituency: "Is it true that independent craftsmen, private merchants in Sarajevo, are taking in millions through the craft cooperatives that are officially handling transactions for them, and that their activities are taking place outside of any sort of social control or responsibility?"

It Is Important To Be a Member

It is not correct that they are bringing in millions by performing transactions as proteges under the patronage of their cooperatives; rather, they are taking in billions! According to official information that the inspectors of the Sarajevo city secretariat for inspection have already made public, it is estimated that "by means of craft cooperatives and other organizations of associated labor, which are involved as intermediaries, independent craftsmen in Sarajevo are receiving about 4 billion new dinars for various services being performed in structures that are being constructed within the city and elsewhere."

That this is a matter of mutually beneficial and "enriching" transactions is confirmed by the list of craft cooperatives, which besides the cooperatives "Sloga," "Jedinstvo," and "Mala Industrija" of Sarajevo, and "Tehnograda" from nearby Pala and their affiliates, includes trade cooperatives from all the socialist republics that have opened their business offices in Sarajevo for the purpose of being the intermediaries for these transactions. Along with them there are various so-called "engineering" basic organizations of associated labor, contracting organizations of associated labor, and special youth employers and other services that serve as middlemen in arranging for and carrying out capital construction projects and other projects actually done by independent craftsmen. Yet there is no doubt that the craft cooperatives are the leaders. How else could it be, when it is sufficient merely to appear before the investors and take on the jobs, and then turn them over to the private craftsmen for the actual performance of the work. For this simple act of "sealing the deal," they receive the intermediaries' cut of 5 to 15 percent of the total value of the project. There are no records about the pay of those employed by the craft

or "GG" [expansion unknown] cooperatives, but judging from the fact that each of them has a permanent work force of generally two, and never more than four persons, their earnings are certainly not small.

The Law Behind the Chimney

The Law on Craft Cooperatives specifies that independent craftsmen can employ no more than five workers to do their work and that the annual value of work performed cannot exceed 500,000 dinars. In practice, however, the situation is totally different. It could truly be said that the word of the law has been disposed of "behind the chimney." For example, Josip Zavrsnik, a mason from the town of Hadzici, has performed various contract capital construction projects for "Sipad Jahorina," a basic organization of associated labor for lumber operations, for the basic organization of associated labor at the Hadzici cabinet factory, for the Tarcin local community and other organizations, with a total value surpassing 4.5 million dinars.

Jovan Tintor, a painter from Bogosca, has contracted through the craft cooperative "mala industrija" to complete projects worth about 2.9 million dinars for the Pale housing interest community. Nedo Perkovic, a mason from Ilidza, has accepted building contracts for an express restaurant in Sarajevo worth more than 2 million dinars. An entire list of "cooperative members" could be presented for whom the limit of 500,000 dinars is obviously a completely unknown category. Among them would be Osman Kamarasevic of Vinkovci with about 3.3 million dinars in jobs, and Hajdar Jazic from Hadzici with 1.8 million.

That, however, is not the end of the illegal activities of cooperative members. They perform jobs for which they are not qualified, using tens of workers, they do not pay the obligatory contributions for employees, they conceal income that is subject to taxes, and they find their own social "channels" for acquiring materials. All of this, naturally, is done with the protection of the cooperatives and other official entrepreneurs who, in the interest of their own benefit, do not begrudge either time or their official seals to write out and confirm everything for their members so that they can carry out this dirty business without disturbance.

The delegate's question reached its target, and the first civil and criminal actions have been initiated, along with requests for the return of illegally earned income.
